Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.149.2.6 `virtual void decaf::io::ByteArrayOutputStream::reset () throw (IOException) [virtual]`

Clear current Stream contents.

Exceptions

IOException (p. 1707)

6.149.2.7 `virtual void decaf::io::ByteArrayOutputStream::setBuffer (std::vector< unsigned char > & buffer) [virtual]`

Sets the internal buffer.

This input stream will wrap around the given buffer and all writes will be performed directly on the buffer. This object does not retain control of the buffer's lifetime however - this is the job of the caller.

Parameters

buffer The target buffer.

6.149.2.8 `virtual std::size_t decaf::io::ByteArrayOutputStream::size () const`
[inline, virtual]

Get the Size of the Internal Buffer.

Returns

size of the internal buffer

6.149.2.9 `virtual const unsigned char* decaf::io::ByteArrayOutputStream::toByteArray () const`
[inline, virtual]

Get a snapshot of the data.

Returns

pointer to the data

6.149.2.10 `virtual const std::vector<unsigned char> decaf::io::ByteArrayOutputStream::toByteArrayRef () const` [inline, virtual]

Get a snapshot of the data.

Returns

reference to the underlying data as a const std::vector<unsigned char>&

6.149.2.11 `std::string decaf::io::ByteArrayOutputStream::toString () const`

Converts the bytes in the buffer into a standard C++ string.

Returns

a string containing the bytes in the buffer

6.149.2.12 `virtual bool decaf::io::ByteArrayOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.149.2.13 `virtual void decaf::io::ByteArrayOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.149.2.14 `virtual void decaf::io::ByteArrayOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.149.2.15 `virtual void decaf::io::ByteArrayOutputStream::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2938).

6.149.2.16 virtual void decaf::io::ByteArrayOutputStream::wait
 (long long *millisecs*, int *nanos*) throw
 (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalArgumentException,
 decaf::lang::exceptions::IllegalMonitorStateException,
 decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements decaf::util::concurrent::Synchronizable (p. 2940).

6.149.2.17 virtual void decaf::io::ByteArrayOutputStream::write (unsigned char
c) throw (IOException) [virtual]

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implements decaf::io::OutputStream (p. 2318).

6.149.2.18 virtual void decaf::io::ByteArrayOutputStream::write (const unsigned
 char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (
 IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters

- buffer* The array of bytes to write.
- offset* the position to start writing in buffer.
- len* The number of bytes from the buffer to be written.

Exceptions

- IOException* (p. 1707) thrown if an error occurs.
- NullPointerException* thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 2317).

6.149.2.19 `virtual void decaf::io::ByteArrayOutputStream::write (const
std::vector< unsigned char > & buffer) throw (IOException)
[virtual]`

Writes an array of bytes to the output stream.

Parameters

- buffer* The bytes to write.

Exceptions

- IOException* (p. 1707) thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2317).

6.149.2.20 `void decaf::io::ByteArrayOutputStream::writeTo (OutputStream * out
) const throw (IOException, lang::exceptions::NullPointerException)`

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using `out.write(buf, 0, count)`.

The documentation for this class was generated from the following file:

Creates a array object that wraps the given array.
- **ByteArrayPerspective** (int *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a array object that wraps the given array.
- **ByteArrayPerspective** (short *array, std::size_t capacity, bool own=false) throw (lang::exceptions::NullPointerException)
Creates a array object that wraps the given array.
- virtual ~**ByteArrayPerspective** ()
- **ByteArrayPerspective * takeRef** ()
Takes a reference to this Perspective and returns a pointer to this so that a caller can take a ref and get a ref in one call.
- void **returnRef** ()
Returns a reference to this Perspective, when the count is zero it should be deleted.
- int **getReferences** () const

6.150.1 Detailed Description

This class extends ByteArray to create a reference counted byte array that can be held and used by several different ByteBuffers and allow them to know on destruction whose job it is to delete the perspective. Creating an instance of this class implicitly takes a reference to it, so a creator must return its ref before the count will be zero.

6.150.2 Constructor & Destructor Documentation

6.150.2.1 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (std::size_t capacity)`

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

6.150.2.2 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (unsigned char * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.3 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (char * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.4 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (double * *array*, std::size_t *capacity*, bool *own* = *false*) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.5 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (float * *array*, std::size_t *capacity*, bool *own* = *false*) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.6 decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (long * *array*, std::size_t *capacity*, bool *own* = *false*) throw (lang::exceptions::NullPointerException)

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.7 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (int * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.8 `decaf::internal::nio::ByteArrayPerspective::ByteArrayPerspective (short * array, std::size_t capacity, bool own = false) throw (lang::exceptions::NullPointerException)`

Creates a array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

capacity - size of the array, this is the limit we read and write to.

own - is this class now the owner of the pointer.

Exceptions

NullPointerException if buffer is NULL

6.150.2.9 `virtual
decaf::internal::nio::ByteArrayPerspective::~~ByteArrayPerspective ()
[inline, virtual]`

6.150.3 Member Function Documentation

6.150.3.1 `int decaf::internal::nio::ByteArrayPerspective::getReferences () const
[inline]`

Returns

the current number of reference on this perspective

6.150.3.2 `void decaf::internal::nio::ByteArrayPerspective::returnRef () [inline]`

Returns a reference to this Perspective, when the count is zero it should be deleted.

6.150.3.3 ByteArrayPerspective* decaf::internal::nio::ByteBufferPerspective::takeRef () [inline]

Takes a reference to this Perspective and returns a pointer to this so that a caller can take a ref and get a ref in one call.

Returns

this

6.151 decaf::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

```
#include <src/main/decaf/nio/ByteBuffer.h>
```

Inheritance diagram for decaf::nio::ByteBuffer:

Public Member Functions

- virtual **~ByteBuffer** ()
- virtual std::string **toString** () const
- **ByteBuffer** & **get** (std::vector< unsigned char > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **ByteBuffer** & **get** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- **ByteBuffer** & **put** (**ByteBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the bytes remaining in the given source buffer into this buffer.
- **ByteBuffer** & **put** (const unsigned char *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers bytes into this buffer from the given source array.
- **ByteBuffer** & **put** (std::vector< unsigned char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source byte array into this buffer.
- virtual bool **isReadOnly** () const =0

Tells whether or not this buffer is read-only.

- virtual unsigned char * **array** ()=0 throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException)

Returns the byte array that backs this buffer.

- virtual std::size_t **arrayOffset** () const =0 throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException)

Returns the offset within this buffer's backing array of the first element of the buffer.

- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible byte array.

- virtual **CharBuffer** * **asCharBuffer** () const =0

Creates a view of this byte buffer as a char buffer.

- virtual **DoubleBuffer** * **asDoubleBuffer** () const =0

Creates a view of this byte buffer as a double buffer.

- virtual **FloatBuffer** * **asFloatBuffer** () const =0

Creates a view of this byte buffer as a float buffer.

- virtual **IntBuffer** * **asIntBuffer** () const =0

Creates a view of this byte buffer as a int buffer.

- virtual **LongBuffer** * **asLongBuffer** () const =0

Creates a view of this byte buffer as a long buffer.

- virtual **ShortBuffer** * **asShortBuffer** () const =0

Creates a view of this byte buffer as a short buffer.

- virtual **ByteBuffer** * **asReadOnlyBuffer** () const =0

Creates a new, read-only byte buffer that shares this buffer's content.

- virtual **ByteBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

Compacts this buffer.

- virtual **ByteBuffer** * **duplicate** ()=0

Creates a new byte buffer that shares this buffer's content.

- virtual unsigned char **get** () const =0 throw (BufferUnderflowException)

Relative get method.

- virtual unsigned char **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual char **getChar** ()=0 throw (BufferUnderflowException)

Reads the next byte at this buffer's current position, and then increments the position by one.

- virtual char **getChar** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads one byte at the given index and returns it.
- virtual double **getDouble** ()=0 throw (BufferUnderflowException)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual double **getDouble** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual float **getFloat** ()=0 throw (BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual float **getFloat** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual long long **getLong** ()=0 throw (BufferUnderflowException)
Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual long long **getLong** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads eight bytes at the given index and returns it.
- virtual int **getInt** ()=0 throw (BufferUnderflowException)
Reads the next four bytes at this buffer's current position, and then increments the position by that amount.
- virtual int **getInt** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads four bytes at the given index and returns it.
- virtual short **getShort** ()=0 throw (BufferUnderflowException)
Reads the next two bytes at this buffer's current position, and then increments the position by that amount.
- virtual short **getShort** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Reads two bytes at the given index and returns it.
- virtual **ByteBuffer** & **put** (unsigned char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given byte into this buffer at the current position, and then increments the position.
- virtual **ByteBuffer** & **put** (std::size_t index, unsigned char value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given byte into this buffer at the given index.

- virtual **ByteBuffer** & **putChar** (char value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.
- virtual **ByteBuffer** & **putChar** (std::size_t index, char value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes one byte containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putDouble** (double value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer** & **putDouble** (std::size_t index, double value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putFloat** (float value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer** & **putFloat** (std::size_t index, float value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putLong** (long long value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer** & **putLong** (std::size_t index, long long value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes eight bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putInt** (int value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.
- virtual **ByteBuffer** & **putInt** (std::size_t index, int value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes four bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** & **putShort** (short value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (std::size_t index, short value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes two bytes containing the given value, into this buffer at the given index.
- virtual **ByteBuffer** * **slice** () const =0
Creates a new byte buffer whose content is a shared subsequence of this buffer's content.
- virtual int **compareTo** (const **ByteBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **ByteBuffer** &value) const
- virtual bool **operator==** (const **ByteBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **ByteBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **ByteBuffer** * **allocate** (std::size_t capacity)
Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **ByteBuffer** * **wrap** (unsigned char *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **ByteBuffer** (p. 848).*
- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)
*Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 848).*

Protected Member Functions

- **ByteBuffer** (std::size_t capacity)
*Creates a **ByteBuffer** (p. 848) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.151.1 Detailed Description

This class defines six categories of operations upon byte buffers: 1. Absolute and relative get and put methods that read and write single bytes; 2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array; 3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer; 4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order; 5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and 6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p.861) float getFloat(int index) void **putFloat(float f)** (p.869) void putFloat(int index, float f)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the **FloatBuffer** (p.1562) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.151.2 Constructor & Destructor Documentation

6.151.2.1 decaf::nio::ByteBuffer::ByteBuffer (std::size_t *capacity*) [protected]

Creates a **ByteBuffer** (p.848) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

6.151.2.2 virtual decaf::nio::ByteBuffer::~~ByteBuffer () [inline, virtual]

6.151.3 Member Function Documentation

6.151.3.1 static ByteBuffer* decaf::nio::ByteBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity - the internal buffer's capacity.

Returns

a newly allocated **ByteBuffer** (p. 848) which the caller owns.

6.151.3.2 virtual unsigned char* decaf::nio::ByteBuffer::array () throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException) [pure virtual]

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 812).

6.151.3.3 virtual std::size_t decaf::nio::ByteBuffer::arrayOffset () const throw (ReadOnlyBufferException, lang::exceptions::UnsupportedOperationException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position `p` corresponds to array index `p + arrayOffset()` (p. 854).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is backed by an array but is read-only

UnsupportedOperationException - If this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteBuffer** (p. 812).

6.151.3.4 **virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer () const**
[pure virtual]

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 813).

6.151.3.5 **virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer () const**
[pure virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 813).

6.151.3.6 **virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer () const**
[pure virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 813).

6.151.3.7 virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer () const [pure virtual]

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 814).

6.151.3.8 virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer () const [pure virtual]

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 814).

6.151.3.9 virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer () const [pure virtual]

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 814).

6.151.3.10 **virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer () const**
[pure virtual]

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 741), which the caller then owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 815).

6.151.3.11 **virtual ByteBuffer& decaf::nio::ByteBuffer::compact () throw (**
ReadOnlyBufferException) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 848)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 815).

6.151.3.12 **virtual int decaf::nio::ByteBuffer::compareTo (const ByteBuffer &**
value) const [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.151.3.13 virtual ByteBuffer* decaf::nio::ByteBuffer::duplicate () [pure virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 816).

6.151.3.14 virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & value) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.151.3.15 ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char > buffer) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this Byte **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length bytes remaining in this buffer

6.151.3.16 `virtual unsigned char decaf::nio::ByteBuffer::get () const throw (BufferUnderflowException)` [pure virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position

Exceptions

BufferUnderflowException (p. 774) - If the buffer's current position is not smaller than its limit

Implemented in `decaf::internal::nio::ByteBuffer` (p. 816).

6.151.3.17 `virtual unsigned char decaf::nio::ByteBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the byte is to be read

Returns

the byte that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in `decaf::internal::nio::ByteBuffer` (p. 816).

6.151.3.18 `ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)`

Relative bulk get method.

This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies `length` bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length bytes remaining in this buffer

NullPointerException if the passed buffer is null.

6.151.3.19 virtual char decaf::nio::ByteBuffer::getChar () throw (BufferUnderflowException) [pure virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 817).

6.151.3.20 virtual char decaf::nio::ByteBuffer::getChar (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Reads one byte at the given index and returns it.

Parameters

index - the index in the **Buffer** (p. 741) where the byte is to be read

Returns

the char at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 817).

6.151.3.21 `virtual double decaf::nio::ByteBuffer::getDouble () throw (BufferUnderflowException)` [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in `decaf::internal::nio::ByteBuffer` (p. 817).

6.151.3.22 `virtual double decaf::nio::ByteBuffer::getDouble (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters

index - the index in the `Buffer` (p. 741) where the bytes are to be read

Returns

the double at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in `decaf::internal::nio::ByteBuffer` (p. 818).

6.151.3.23 `virtual float decaf::nio::ByteBuffer::getFloat () throw (BufferUnderflowException)` [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in `decaf::internal::nio::ByteBuffer` (p. 818).

6.151.3.24 `virtual float decaf::nio::ByteBuffer::getFloat (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Reads four bytes at the given index and returns it.

Parameters

index - the index in the **Buffer** (p. 741) where the bytes are to be read

Returns

the float at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 818).

6.151.3.25 `virtual int decaf::nio::ByteBuffer::getInt () throw (
BufferUnderflowException) [pure virtual]`

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 819).

6.151.3.26 `virtual int decaf::nio::ByteBuffer::getInt (std::size_t index)
const throw (lang::exceptions::IndexOutOfBoundsException) [pure
virtual]`

Reads four bytes at the given index and returns it.

Parameters

index - the index in the **Buffer** (p. 741) where the bytes are to be read

Returns

the int at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 819).

6.151.3.27 `virtual long long decaf::nio::ByteBuffer::getLong () throw (BufferUnderflowException) [pure virtual]`

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 819).

6.151.3.28 `virtual long long decaf::nio::ByteBuffer::getLong (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Reads eight bytes at the given index and returns it.

Parameters

index - the index in the **Buffer** (p. 741) where the bytes are to be read

Returns

the long long at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 820).

6.151.3.29 `virtual short decaf::nio::ByteBuffer::getShort () throw (BufferUnderflowException) [pure virtual]`

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer..

Exceptions

BufferUnderflowException (p. 774) - If there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 820).

6.151.3.30 `virtual short decaf::nio::ByteBuffer::getShort (std::size_t index)
 const throw (lang::exceptions::IndexOutOfBoundsException) [pure
 virtual]`

Reads two bytes at the given index and returns it.

Parameters

index - the index in the **Buffer** (p. 741) where the bytes are to be read

Returns

the short at the given index in the buffer

Exceptions

IndexOutOfBoundsException - If there are not enough bytes remaining to fill the requested Data Type

Implemented in **decaf::internal::nio::ByteBuffer** (p. 820).

6.151.3.31 `virtual bool decaf::nio::ByteBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 821).

6.151.3.32 `virtual bool decaf::nio::ByteBuffer::isReadOnly () const [pure
 virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 821).

6.151.3.33 `virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer &
 value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.151.3.34 `virtual bool decaf::nio::ByteBuffer::operator==(const ByteBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.151.3.35 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value - the byte value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::ByteArrayBuffer` (p. 821).

6.151.3.36 `virtual ByteBuffer& decaf::nio::ByteBuffer::put (std::size_t index, unsigned char value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the byte to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 821).

6.151.3.37 ByteBuffer& decaf::nio::ByteBuffer::put (ByteBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the bytes remaining in the given source buffer into this buffer.

If there are more bytes remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 746), then no bytes are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `n = src.remaining()` bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src - the buffer to take bytes from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining bytes in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.151.3.38 ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers bytes into this buffer from the given source array.

If there are more bytes to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer - The array from which bytes are to be read
offset - The offset within the array of the first byte to be read;
length - The number of bytes to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer
ReadOnlyBufferException (p. 2520) - If this buffer is read-only
NullPointerException if the passed buffer is null.

6.151.3.39 `ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)`

This method transfers the entire content of the given source byte array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters

buffer - The buffer whose contents are copied to this **ByteBuffer** (p. 848)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.151.3.40 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 822).

6.151.3.41 `virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (std::size_t index, char value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 822).

6.151.3.42 `virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 823).

6.151.3.43 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble
 (std::size_t *index*, double *value*) throw
 (lang::exceptions::IndexOutOfBoundsException,
 ReadOnlyBufferException) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 823).

6.151.3.44 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float *value*)
 throw (BufferOverflowException, ReadOnlyBufferException) [pure
 virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 824).

6.151.3.45 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat
 (std::size_t *index*, float *value*) throw (lang::exceptions::IndexOutOfBoundsException,
 ReadOnlyBufferException) [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 824).

6.151.3.46 `virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (std::size_t index,
int value) throw (lang::exceptions::IndexOutOfBoundsException,
ReadOnlyBufferException) [pure virtual]`

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 824).

6.151.3.47 `virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int value) throw
(BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 825).

6.151.3.48 `virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 825).

6.151.3.49 `virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 826).

6.151.3.50 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort
(std::size_t index, short value) throw
(lang::exceptions::IndexOutOfBoundsException,
ReadOnlyBufferException) [pure virtual]`

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 827).

6.151.3.51 `virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (short value)
throw (BufferOverflowException, ReadOnlyBufferException) [pure
virtual]`

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value - The value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there are fewer than bytes remaining in this buffer than the size of the data to be written

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ByteBuffer** (p. 826).

6.151.3.52 `virtual ByteBuffer* decaf::nio::ByteBuffer::slice () const [pure
virtual]`

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 848) which the caller owns.

Implemented in **decaf::internal::nio::ByteBuffer** (p. 827).

6.151.3.53 `virtual std::string decaf::nio::ByteBuffer::toString () const [virtual]`

Returns

a `std::string` describing this object

6.151.3.54 `static ByteBuffer* decaf::nio::ByteBuffer::wrap (unsigned char
* array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **ByteBuffer** (p. 848).

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **ByteBuffer** (p. 848) that is backed by buffer, caller owns.

6.151.3.55 `static ByteBuffer* decaf::nio::ByteBuffer::wrap (std::vector< unsigned
char > & buffer) [static]`

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 848).

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns

a new **ByteBuffer** (p. 848) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/ByteBuffer.h

6.152 cms::BytesMessage Class Reference

A **BytesMessage** (p. 874) object is used to send a message containing a stream of unsigned bytes.

```
#include <src/main/cms/BytesMessage.h>
```

Inheritance diagram for cms::BytesMessage:

Public Member Functions

- virtual **~BytesMessage** ()
- virtual void **setBodyBytes** (const unsigned char *buffer, std::size_t numBytes)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
sets the bytes given to the message body.
- virtual unsigned char * **getBodyBytes** () const =0 throw (cms::MessageNotReadableException, cms::CMSEException)
Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual std::size_t **getBodyLength** () const =0 throw (cms::MessageNotReadableException, cms::CMSEException)
Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()=0 throw (cms::MessageFormatException, cms::CMSEException)
Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a byte to the bytes message stream as a 1-byte value.
- virtual std::size_t **readBytes** (std::vector< unsigned char > &value) const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a byte array from the bytes message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

- virtual std::size_t **readBytes** (unsigned char *buffer, std::size_t length) const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a portion of the bytes message stream.

- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a portion of a byte array to the bytes message stream.

- virtual char **readChar** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a Char from the Bytes message stream.

- virtual void **writeChar** (char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a char to the bytes message stream as a 1-byte value.

- virtual float **readFloat** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 32 bit float from the Bytes message stream.

- virtual void **writeFloat** (float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a float to the bytes message stream as a 4 byte value.

- virtual double **readDouble** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 64 bit double from the Bytes message stream.

- virtual void **writeDouble** (double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a double to the bytes message stream as a 8 byte value.

- virtual short **readShort** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 16 bit signed short from the Bytes message stream.

- virtual void **writeShort** (short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a signed short to the bytes message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 16 bit unsigned short from the Bytes message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () const =0 throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException)
*Reads an UTF String from the **BytesMessage** (p. 874) stream.*
- virtual void **writeUTF** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
*Writes an UTF String to the **BytesMessage** (p. 874) stream.*
- virtual BytesMessage * **clone** () const =0
Clones this message.

6.152.1 Detailed Description

A **BytesMessage** (p. 874) object is used to send a message containing a stream of unsigned bytes. It inherits from the **Message** (p. 2036) interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 874) interface.

The **BytesMessage** (p. 874) methods are based largely on those found in **decaf.io.DataInputStream** (p. 1291) and **decaf.io.DataOutputStream** (p. 1300).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when `clearBody` is called, the body of the message is in write-only mode. After the first call to `reset` has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called `reset` so that the message body is in read-only mode for the client.

If `clearBody` is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 2187) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 2188) is thrown.

Since

1.0

6.152.2 Constructor & Destructor Documentation

6.152.2.1 `virtual cms::BytesMessage::~~BytesMessage () [inline, virtual]`

6.152.3 Member Function Documentation

6.152.3.1 `virtual BytesMessage* cms::BytesMessage::clone () const [pure virtual]`

Clones this message.

Returns

a deep copy of this message.

Exceptions

CMSException (p. 960) - if an internal error occurs while cloning the **Message** (p. 2036).

Implements **cms::Message** (p. 2041).

6.152.3.2 `virtual unsigned char* cms::BytesMessage::getBodyBytes () const throw (cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

CMSException (p. 960) - If an internal error occurs.

MessageNotReadableException (p. 2187) - If the message is in Write Only Mode.

6.152.3.3 `virtual std::size_t cms::BytesMessage::getBodyLength () const throw (cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

CMSException (p. 960) - If an internal error occurs.

MessageNotReadableException (p. 2187) - If the message is in Write Only Mode.

6.152.3.4 `virtual bool cms::BytesMessage::readBoolean () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.5 `virtual unsigned char cms::BytesMessage::readByte () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.6 `virtual std::size_t cms::BytesMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.7 `virtual std::size_t cms::BytesMessage::readBytes (unsigned char * buffer, std::size_t length) const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an `IndexOutOfBoundsException` is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSEException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.8 virtual char cms::BytesMessage::readChar () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.9 virtual double cms::BytesMessage::readDouble () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSEException) [pure virtual]

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.10 `virtual float cms::BytesMessage::readFloat () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.11 `virtual int cms::BytesMessage::readInt () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.12 `virtual long long cms::BytesMessage::readLong () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.13 virtual short cms::BytesMessage::readShort () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.14 virtual std::string cms::BytesMessage::readString () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.15 virtual unsigned short cms::BytesMessage::readUnsignedShort () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.16 `virtual std::string cms::BytesMessage::readUTF () const throw (cms::MessageEOFException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads an UTF String from the **BytesMessage** (p. 874) stream.

Returns

String from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.152.3.17 `virtual void cms::BytesMessage::reset () throw (cms::MessageFormatException, cms::CMSException) [pure virtual]`

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

CMSException (p. 960) - If the provider fails to perform the reset operation.

MessageFormatException (p. 2141) - If the **Message** (p. 2036) has an invalid format.

6.152.3.18 `virtual void cms::BytesMessage::setBodyBytes (const unsigned char * buffer, std::size_t numBytes) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

sets the bytes given to the message body.

Parameters

buffer Byte Buffer to copy

numBytes Number of bytes in Buffer to copy

Exceptions

CMSException (p. 960) - If an internal error occurs.

MessageNotWriteableException (p. 2188) - if in Read Only Mode.

6.152.3.19 `virtual void cms::BytesMessage::writeBoolean (bool value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value boolean to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.20 `virtual void cms::BytesMessage::writeByte (unsigned char value)
throw (cms::MessageNotWriteableException, cms::CMSEException)
[pure virtual]`

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

value byte to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.21 `virtual void cms::BytesMessage::writeBytes (const
std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure
virtual]`

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

value bytes to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.22 `virtual void cms::BytesMessage::writeBytes (const unsigned
char * value, std::size_t offset, std::size_t length) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure
virtual]`

Writes a portion of a byte array to the bytes message stream.

size as the number of bytes to write.

Parameters

value bytes to write to the stream
offset the initial offset within the byte array
length the number of bytes to use

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.23 `virtual void cms::BytesMessage::writeChar (char value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a char to the bytes message stream as a 1-byte value.

Parameters

value char to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.24 `virtual void cms::BytesMessage::writeDouble (double value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a double to the bytes message stream as a 8 byte value.

Parameters

value double to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.
MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.25 `virtual void cms::BytesMessage::writeFloat (float value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a float to the bytes message stream as a 4 byte value.

Parameters

value float to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.26 `virtual void cms::BytesMessage::writeInt (int value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

value signed int to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.27 `virtual void cms::BytesMessage::writeLong (long long value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

value signed long long to write to the stream

Exceptions

CMSEException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.28 `virtual void cms::BytesMessage::writeShort (short value) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]`

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

value signed short to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.29 `virtual void cms::BytesMessage::writeString (const std::string & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes an ASCII String to the Bytes message stream.

Parameters

value String to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.30 `virtual void cms::BytesMessage::writeUnsignedShort (unsigned short value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

value unsigned short to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.152.3.31 `virtual void cms::BytesMessage::writeUTF (const std::string & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes an UTF String to the **BytesMessage** (p. 874) stream.

Parameters

value String to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of bytes stream has been reached.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

The documentation for this class was generated from the following file:

6.153 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

```
#include <src/main/activemq/cmsutil/CachedConsumer.h>
```

Inheritance diagram for activemq::cmsutil::CachedConsumer:

Public Member Functions

- **CachedConsumer** (cms::MessageConsumer *consumer)
- virtual ~**CachedConsumer** ()
- virtual void **close** () throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual cms::Message * **receive** () throw (cms::CMSEException)
Synchronously Receive a Message.
- virtual cms::Message * **receive** (int millisecs) throw (cms::CMSEException)
Synchronously Receive a Message, time out after defined interval.
- virtual cms::Message * **receiveNoWait** () throw (cms::CMSEException)
Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (cms::MessageListener *listener) throw (cms::CMSEException)
Sets the MessageListener that this class will send notifis on.
- virtual cms::MessageListener * **getMessageListener** () const throw (cms::CMSEException)
Gets the MessageListener that this class will send mew Message notification events to.
- virtual std::string **getMessageSelector** () const throw (cms::CMSEException)
Gets this message consumer's message selector expression.

6.153.1 Detailed Description

A cached message consumer contained within a pooled session.

6.153.2 Constructor & Destructor Documentation

6.153.2.1 `activemq::cmsutil::CachedConsumer::CachedConsumer (cms::MessageConsumer * consumer)` [inline]

6.153.2.2 `virtual activemq::cmsutil::CachedConsumer::~~CachedConsumer ()` [inline, virtual]

6.153.3 Member Function Documentation

6.153.3.1 `virtual void activemq::cmsutil::CachedConsumer::close ()` throw (cms::CMSEException) [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 952).

6.153.3.2 `virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener ()` const throw (cms::CMSEException) [inline, virtual]

Gets the MessageListener that this class will send new Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::MessageConsumer` (p. 2081).

6.153.3.3 `virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector ()` const throw (cms::CMSEException) [inline, virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSEException - If an internal error occurs.

Implements `cms::MessageConsumer` (p. 2081).

6.153.3.4 `virtual cms::Message* activemq::cmsutil::CachedConsumer::receive ()` throw (cms::CMSEException) [inline, virtual]

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2082).

6.153.3.5 `virtual cms::Message* activemq::cmsutil::CachedConsumer::receive (int
milliseconds) throw (cms::CMSEException) [inline, virtual]`

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2082).

6.153.3.6 `virtual cms::Message* ac-
tivemq::cmsutil::CachedConsumer::receiveNoWait ()
throw (cms::CMSEException) [inline, virtual]`

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2082).

6.153.3.7 `virtual void activemq::cmsutil::CachedConsumer::setMessageListener
(cms::MessageListener * listener) throw (cms::CMSEException)
[inline, virtual]`

Sets the MessageListener that this class will send notifs on.

Parameters

listener The listener of messages received by this consumer.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::MessageConsumer** (p. 2082).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CachedConsumer.h**

6.154 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

#include <src/main/activemq/cmsutil/CachedProducer.h>

Inheritance diagram for activemq::cmsutil::CachedProducer:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** *producer)
- virtual **~CachedProducer** ()
- virtual void **close** () throw (cms::CMSEException)
Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **send** (**cms::Message** *message) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (const **cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)
Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **setDeliveryMode** (int mode) throw (cms::CMSEException)
Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () const throw (cms::CMSEException)
Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value) throw (cms::CMSEException)
Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () const throw (cms::CMSEException)
Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value) throw (cms::CMSEException)
Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () const throw (cms::CMSEException)
Gets if Message Time Stamps are disabled for this Producer.
- virtual void **setPriority** (int priority) throw (cms::CMSEException)
Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () const throw (cms::CMSEException)
Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time) throw (cms::CMSEException)
Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () const throw (cms::CMSEException)
Gets the Time to Live that this producer sends messages with.

6.154.1 Detailed Description

A cached message producer contained within a pooled session.

6.154.2 Constructor & Destructor Documentation

- 6.154.2.1** `activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * producer) [inline]`
- 6.154.2.2** `virtual activemq::cmsutil::CachedProducer::~~CachedProducer () [inline, virtual]`

6.154.3 Member Function Documentation

- 6.154.3.1** `virtual void activemq::cmsutil::CachedProducer::close () throw (cms::CMSEException) [inline, virtual]`

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements `cms::Closeable` (p. 952).

- 6.154.3.2** `virtual int activemq::cmsutil::CachedProducer::getDeliveryMode () const throw (cms::CMSEException) [inline, virtual]`

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2191).

6.154.3.3 `virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID () const throw (cms::CMSEException) [inline, virtual]`

Gets if Message Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2191).

6.154.3.4 `virtual bool activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp () const throw (cms::CMSEException) [inline, virtual]`

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2192).

6.154.3.5 `virtual int activemq::cmsutil::CachedProducer::getPriority () const throw (cms::CMSEException) [inline, virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2192).

6.154.3.6 virtual long long activemq::cmsutil::CachedProducer::getTimeToLive () const throw (cms::CMSEException) [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2192).

6.154.3.7 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message) throw (cms::CMSEException) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message The message to be sent.

Exceptions

CMSEException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2194).

6.154.3.8 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message) throw (cms::CMSEException) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination The destination on which to send the message

message the message to be sent.

Exceptions

CMSEException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2194).

6.154.3.9 `virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * destination, cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)` [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2193).

6.154.3.10 `virtual void activemq::cmsutil::CachedProducer::send (cms::Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException)` [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException - if an internal error occurs while sending the message.

MessageFormatException - if an Invalid Message is given.

InvalidDestinationException - if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperationException - if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 2192).

6.154.3.11 `virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int mode) throw (cms::CMSEException) [inline, virtual]`

Sets the delivery mode for this Producer.

Parameters

mode The DeliveryMode

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2195).

6.154.3.12 `virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool value) throw (cms::CMSEException) [inline, virtual]`

Sets if Message Ids are disabled for this Producer.

Parameters

value boolean indicating enable / disable (true / false)

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2195).

6.154.3.13 `virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool value) throw (cms::CMSEException) [inline, virtual]`

Sets if Message Time Stamps are disabled for this Producer.

Parameters

value - boolean indicating enable / disable (true / false)

Exceptions

CMSEException - if an internal error occurs.

Implements **cms::MessageProducer** (p. 2195).

6.154.3.14 `virtual void activemq::cmsutil::CachedProducer::setPriority (int priority) throw (cms::CMSEException) [inline, virtual]`

Sets the Priority that this Producers sends messages at.

Parameters

priority int value for Priority level

Exceptions

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p. 2195).

6.154.3.15 `virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long long time) throw (cms::CMSEException) [inline, virtual]`

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

time default time to live value in milliseconds

Exceptions

CMSEException - if an internal error occurs.

Implements `cms::MessageProducer` (p. 2196).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CachedProducer.h`

6.155 decaf::util::concurrent::Callable< V > Class Template Reference

A task that returns a result and may throw an exception.

```
#include <src/main/decaf/util/concurrent/Callable.h>
```

Public Member Functions

- `virtual ~Callable ()`
- `virtual V call ()=0 throw (decaf::lang::Exception)`

Computes a result, or throws an exception if unable to do so.

6.155.1 Detailed Description

`template<typename V> class decaf::util::concurrent::Callable< V >`

A task that returns a result and may throw an exception. Implementors define a single method with no arguments called `call`. This interface differs from the `Runnable` interface in that a **Callable** (p. 897) object can return a result and is allowed to throw an exceptions from its `call` method.

The `Executors` class contains utility methods to convert from other common forms to **Callable** (p. 897) classes.

Since

1.0

6.155.2 Constructor & Destructor Documentation

6.155.2.1 `template<typename V > virtual decaf::util::concurrent::Callable< V >::~~Callable ()` [inline, virtual]

6.155.3 Member Function Documentation

6.155.3.1 `template<typename V > virtual V decaf::util::concurrent::Callable< V >::call ()` throw (`decaf::lang::Exception`) [pure virtual]

Computes a result, or throws an exception if unable to do so.

Returns

Computed Result.

Exceptions

Exception If unable to compute a result.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Callable.h`

6.156 decaf::util::concurrent::CancellationException Class Reference

```
#include <src/main/decaf/util/concurrent/CancellationException.h>
```

Inheritance diagram for `decaf::util::concurrent::CancellationException`:

Public Member Functions

- **CancellationException** () throw ()
Default Constructor.

- **CancellationException** (const decaf::lang::Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **CancellationException** (const CancellationException &ex) throw ()
Copy Constructor.
- **CancellationException** (const std::exception *cause) throw ()
Constructor.
- **CancellationException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **CancellationException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CancellationException * clone** () const
Clones this exception.
- virtual **~CancellationException** () throw ()

6.156.1 Constructor & Destructor Documentation

6.156.1.1 decaf::util::concurrent::CancellationException::CancellationException () throw () [inline]

Default Constructor.

6.156.1.2 decaf::util::concurrent::CancellationException::CancellationException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.156.1.3 decaf::util::concurrent::CancellationException::CancellationException (const CancellationException & ex) throw () [inline]

Copy Constructor.

Parameters

ex - The Exception to copy in this new instance.

References decaf::lang::Exception::Exception().

6.156.1.4 decaf::util::concurrent::CancellationException::CancellationException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.156.1.5 decaf::util::concurrent::CancellationException::CancellationException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
msg - The message to report
... - list of primitives that are formatted into the message

6.156.1.6 decaf::util::concurrent::CancellationException::CancellationException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs
lineNumber - The line number where the exception occurred.
cause - The exception that was the cause for this one to be thrown.
msg - The message to report
... - list of primitives that are formatted into the message

6.156.1.7 virtual decaf::util::concurrent::CancellationException::~~CancellationException () throw () [inline, virtual]

6.156.2 Member Function Documentation

6.156.2.1 virtual CancellationException* decaf::util::concurrent::CancellationException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CancellationException.h`

6.157 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

```
#include <src/main/decaf/security/cert/Certificate.h>
```

Inheritance diagram for `decaf::security::cert::Certificate`:

Public Member Functions

- virtual `~Certificate ()`
- virtual `bool equals (const Certificate &cert) const =0`
Compares the encoded form of the two certificates.
- virtual `void getEncoded (std::vector< unsigned char > &output) const =0 throw (CertificateEncodingException)`
Provides the encoded form of this certificate.
- virtual `std::string getType () const =0`
Returns the type of this certificate.
- virtual `PublicKey * getPublicKey ()=0`
Gets the public key of this certificate.
- virtual `const PublicKey * getPublicKey () const =0`
Gets the public key of this certificate.
- virtual `void verify (const PublicKey &publicKey) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)`
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual `void verify (const PublicKey &publicKey, const std::string &sigProvider) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

- virtual std::string **toString** () const =0
Returns a string representation of this certificate.

6.157.1 Detailed Description

Base interface for all identity certificates.

6.157.2 Constructor & Destructor Documentation

- 6.157.2.1** virtual decaf::security::cert::Certificate::~Certificate () [inline, virtual]

6.157.3 Member Function Documentation

- 6.157.3.1** virtual bool decaf::security::cert::Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters

cert The certificate to be tested for equality with this certificate.

Returns

true if the given certificate is equal to this certificate.

- 6.157.3.2** virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & *output*) const throw (CertificateEncodingException) [pure virtual]

Provides the encoded form of this certificate.

Parameters

output Receives the encoded form of this certificate.

Exceptions

CertificateEncodingException (p. 904) if an encoding error occurs

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 2292).

- 6.157.3.3** virtual PublicKey* decaf::security::cert::Certificate::getPublicKey () [pure virtual]

Gets the public key of this certificate.

Returns

the public key

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 2293).

6.157.3.4 `virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey () const` [pure virtual]

Gets the public key of this certificate.

Returns

the public key

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 2293).

6.157.3.5 `virtual std::string decaf::security::cert::Certificate::getType () const` [pure virtual]

Returns the type of this certificate.

Returns

the type of this certificate

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 2294).

6.157.3.6 `virtual std::string decaf::security::cert::Certificate::toString () const` [pure virtual]

Returns a string representation of this certificate.

Returns

a string representation of this certificate

Implemented in `decaf::security_provider::unix::openssl::OpenSSLX509Certificate` (p. 2295).

6.157.3.7 `virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey, const std::string & sigProvider) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)` [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Uses the verification engine of the specified provider.

Parameters

publicKey The public key used to carry out the validation.

sigProvider The name of the signature provider

Exceptions

NoSuchAlgorithmException (p. 2272) - on unsupported signature algorithms.

InvalidKeyException (p. 1698) - on incorrect key.

NoSuchProviderException (p. 2277) - if there's no default provider.

SignatureException (p. 2779) - on signature errors.

CertificateException (p. 906) - on encoding errors.

6.157.3.8 virtual void decaf::security::cert::Certificate::verify (const PublicKey & publicKey) const throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException) [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters

publicKey The public key used to carry out the validation.

Exceptions

NoSuchAlgorithmException (p. 2272) - on unsupported signature algorithms.

InvalidKeyException (p. 1698) - on incorrect key.

NoSuchProviderException (p. 2277) - if there's no default provider.

SignatureException (p. 2779) - on signature errors.

CertificateException (p. 906) - on encoding errors.

- virtual ~**CertificateEncodingException** () throw ()

6.158.1 Constructor & Destructor Documentation

6.158.1.1 `decaf::security::cert::CertificateEncodingException::CertificateEncodingException () throw () [inline]`

Default Constructor.

6.158.1.2 `decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.158.1.3 `decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const CertificateEncodingException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.158.1.4 `decaf::security::cert::CertificateEncodingException::CertificateEncodingException`
 (`const char * file`, `const int lineNumber`, `const char * msg`, ...)
 throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.158.1.5 `virtual`
`decaf::security::cert::CertificateEncodingException::~~CertificateEncodingException`
 () throw () [inline, virtual]

6.158.2 Member Function Documentation

6.158.2.1 `virtual CertificateEncodingException* de-`
`caf::security::cert::CertificateEncodingException::clone (`
`) const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p.908).

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.160.1.4 `decaf::security::cert::CertificateExpiredException::CertificateExpiredException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.160.1.5 `virtual decaf::security::cert::CertificateExpiredException::~CertificateExpiredException () throw () [inline, virtual]`

6.160.2 Member Function Documentation

6.160.2.1 `virtual CertificateExpiredException* decaf::security::cert::CertificateExpiredException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p.908).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/cert/CertificateExpiredException.h`

6.161 decaf::security::cert::CertificateNotYetValidException Class Reference

```
#include <src/main/decaf/security/cert/CertificateNotYetValidException.h>
```

Inheritance diagram for `decaf::security::cert::CertificateNotYetValidException`:

Public Member Functions

- **CertificateNotYetValidException** () throw ()
Default Constructor.
- **CertificateNotYetValidException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **CertificateNotYetValidException** (const **CertificateNotYetValidException** &ex) throw ()
Copy Constructor.
- **CertificateNotYetValidException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **CertificateNotYetValidException** * clone () const
Clones this exception.
- virtual ~**CertificateNotYetValidException** () throw ()

6.161.1 Constructor & Destructor Documentation

6.161.1.1 `decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException () throw () [inline]`

Default Constructor.

6.161.1.2 `decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.161.1.3 `decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const CertificateNotYetValidException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.161.1.4 `decaf::security::cert::CertificateNotYetValidException::CertificateNotYetValidException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.161.1.5 `virtual decaf::security::cert::CertificateNotYetValidException::~~CertificateNotYetValidException () throw ()` [inline, virtual]

6.161.2 Member Function Documentation

6.161.2.1 `virtual CertificateNotYetValidException* decaf::security::cert::CertificateNotYetValidException::clone () const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::cert::CertificateException` (p.908).

The documentation for this class was generated from the following file:

Inheritance diagram for `decaf::lang::Character`:

Public Member Functions

- `Character` (char value)

- virtual int **compareTo** (const **Character** &c) const
*Compares this **Character** (p. 914) instance with another.*
- virtual bool **operator==** (const **Character** &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Character** &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const char &c) const
*Compares this **Character** (p. 914) instance with a char type.*
- virtual bool **operator==** (const char &c) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const char &c) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (const **Character** &c) const
- bool **equals** (const char &c) const
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character** **valueOf** (char value)
*Returns a **Character** (p. 914) instance representing the specified char value.*
- static bool **isWhitespace** (char c)
Indicates whether or not the given character is considered whitespace.

- static bool **isDigit** (char c)
Indicates whether or not the given character is a digit.
- static bool **isLowerCase** (char c)
Indicates whether or not the given character is a lower case character.
- static bool **isUpperCase** (char c)
Indicates whether or not the given character is a upper case character.
- static bool **isLetter** (char c)
Indicates whether or not the given character is a letter.
- static bool **isLetterOrDigit** (char c)
Indicates whether or not the given character is either a letter or a digit.
- static bool **isISOControl** (char c)
Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.
- static int **digit** (char c, int radix)
Returns the numeric value of the character ch in the specified radix.

Static Public Attributes

- static const int **MIN_RADIX** = 2
The minimum radix available for conversion to and from strings.
- static const int **MAX_RADIX** = 36
The maximum radix available for conversion to and from strings.
- static const char **MIN_VALUE** = (char)0x7F
The minimum value that a signed char can take on.
- static const char **MAX_VALUE** = (char)0x80
The maximum value that a signed char can take on.
- static const int **SIZE** = 8
The size of the primitive character in bits.

6.163.1 Constructor & Destructor Documentation

6.163.1.1 decaf::lang::Character::Character (char value)

Parameters

value - char to wrap.

6.163.2 Member Function Documentation

6.163.2.1 `virtual unsigned char decaf::lang::Character::byteValue () const`
`[inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.163.2.2 `virtual int decaf::lang::Character::compareTo (const char & c) const`
`[inline, virtual]`

Compares this **Character** (p. 914) instance with a char type.

Parameters

c - the char instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **char** > (p. 1010).

6.163.2.3 `virtual int decaf::lang::Character::compareTo (const Character & c) const`
`[inline, virtual]`

Compares this **Character** (p. 914) instance with another.

Parameters

c - the **Character** (p. 914) instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.163.2.4 `static int decaf::lang::Character::digit (char c, int radix) [static]`

Returns the numeric value of the character *ch* in the specified radix.

If the radix is not in the range `MIN_RADIX <= radix <= MAX_RADIX` or if the value of *ch* is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

* The method `isDigit` is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned. * The character is one of the

uppercase Latin letters 'A' through 'Z' and its code is less than $\text{radix} + 'A' - 10$. In this case, $\text{ch} - 'A' + 10$ is returned. * The character is one of the lowercase Latin letters 'a' through 'z' and its code is less than $\text{radix} + 'a' - 10$. In this case, $\text{ch} - 'a' + 10$ is returned.

Parameters

c - the char to be converted
radix - the radix of the number

Returns

the numeric value of the number represented in the given radix

6.163.2.5 `virtual double decaf::lang::Character::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.163.2.6 `bool decaf::lang::Character::equals (const char & c) const [inline, virtual]`

Returns

true if the two Characters have the same value.

Implements `decaf::lang::Comparable< char >` (p.1010).

6.163.2.7 `bool decaf::lang::Character::equals (const Character & c) const [inline]`

Returns

true if the two **Character** (p.914) Objects have the same value.

6.163.2.8 `virtual float decaf::lang::Character::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.163.2.9 `virtual int decaf::lang::Character::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.163.2.10 `static bool decaf::lang::Character::isDigit (char c) [inline, static]`

Indicates whether or not the given character is a digit.

6.163.2.11 `static bool decaf::lang::Character::isISOControl (char c) [inline, static]`

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters

`c` - the character, including supplementary characters

Returns

true if the char is an ISO control character

6.163.2.12 `static bool decaf::lang::Character::isLetter (char c) [inline, static]`

Indicates whether or not the given character is a letter.

6.163.2.13 `static bool decaf::lang::Character::isLetterOrDigit (char c) [inline, static]`

Indicates whether or not the given character is either a letter or a digit.

6.163.2.14 `static bool decaf::lang::Character::isLowerCase (char c) [inline, static]`

Indicates whether or not the given character is a lower case character.

6.163.2.15 `static bool decaf::lang::Character::isUpperCase (char c) [inline, static]`

Indicates whether or not the given character is a upper case character.

6.163.2.16 `static bool decaf::lang::Character::isWhitespace (char c) [inline, static]`

Indicates whether or not the given character is considered whitespace.

6.163.2.17 `virtual long long decaf::lang::Character::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.163.2.18 `virtual bool decaf::lang::Character::operator< (const Character & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

`c` - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.163.2.19 `virtual bool decaf::lang::Character::operator< (const char & c) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

`c` - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< char >` (p. 1011).

6.163.2.20 `virtual bool decaf::lang::Character::operator== (const Character & c) const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

`c` - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.163.2.21 `virtual bool decaf::lang::Character::operator== (const char & c) const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

`c` - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< char >** (p. 1011).

6.163.2.22 `virtual short decaf::lang::Character::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.163.2.23 `std::string decaf::lang::Character::toString () const`

Returns

this **Character** (p. 914) Object as a String Representation

6.163.2.24 `static Character decaf::lang::Character::valueOf (char value) [inline, static]`

Returns a **Character** (p. 914) instance representing the specified char value.

Parameters

value - the primitive char to wrap.

Returns

a new Charactor instance that wraps this value.

6.163.3 Field Documentation

6.163.3.1 `const int decaf::lang::Character::MAX_RADIX = 36 [static]`

The maximum radix available for conversion to and from strings.

6.163.3.2 `const char decaf::lang::Character::MAX_VALUE = (char)0x80 [static]`

The maximum value that a signed char can take on.

6.163.3.3 `const int decaf::lang::Character::MIN_RADIX = 2 [static]`

The minimum radix available for conversion to and from strings.

6.163.3.4 `const char decaf::lang::Character::MIN_VALUE = (char)0x7F [static]`

The minimum value that a signed char can take on.

6.163.3.5 const int decaf::lang::Character::SIZE = 8 [static]

The size of the primitive character in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/Character.h

6.164 decaf::internal::nio::CharArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/CharArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::CharArrayBuffer:

Public Member Functions

- **CharArrayBuffer** (std::size_t capacity, bool **readOnly**=false)
*Creates a **CharArrayBuffer** (p. 922) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **CharArrayBuffer** (char *array, std::size_t **offset**, std::size_t capacity, bool **readOnly**=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **CharArrayBuffer** (p. 922) object that wraps the given array.*
- **CharArrayBuffer** (ByteArrayPerspective &array, std::size_t **offset**, std::size_t length, bool **readOnly**=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.*
- **CharArrayBuffer** (const **CharArrayBuffer** &other)
*Create a **CharArrayBuffer** (p. 922) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.*
- virtual ~**CharArrayBuffer** ()
- virtual char * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the character array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual CharBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only char buffer that shares this buffer's content.
- virtual CharBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.

- virtual CharBuffer * **duplicate** ()
Creates a new char buffer that shares this buffer's content.
- virtual char **get** () throw (decaf::nio::BufferUnderflowException)
Relative get method.
- virtual char **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible char array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual CharBuffer & **put** (char value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given char into this buffer at the current position, and then increments the position.
- virtual CharBuffer & **put** (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given char into this buffer at the given index.
- virtual CharBuffer * **slice** () const
Creates a new CharBuffer whose content is a shared subsequence of this buffer's content.
- virtual lang::CharSequence * **subSequence** (std::size_t start, std::size_t end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteBuffer** (p. 806) as Read-Only.*

Protected Attributes

- bool **readOnly**
- internal::nio::ByteBufferPerspective * **__array**
- std::size_t **offset**

6.164.1 Constructor & Destructor Documentation

6.164.1.1 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **CharArrayBuffer** (p. 922) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.164.1.2 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (char * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **CharArrayBuffer** (p. 922) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.164.1.3 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t length, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.

The capacity and limit of the new **CharArrayBuffer** (p. 922) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p. 843) to wrap

offset - the offset into array where the buffer starts

length - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.164.1.4 `decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & other)`

Create a `CharArrayBuffer` (p. 922) that mirrors this one, meaning it shares a reference to this buffers `ByteArrayPerspective` (p. 843) and when changes are made to that data it is reflected in both.

Parameters

other - the `CharArrayBuffer` (p. 922) this one is to mirror.

6.164.1.5 `virtual decaf::internal::nio::CharArrayBuffer::~~CharArrayBuffer ()` [virtual]

6.164.2 Member Function Documentation

6.164.2.1 `virtual char* decaf::internal::nio::CharArrayBuffer::array ()` `throw (decaf::lang::exceptions::UnsupportedOperationException,` `decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::CharBuffer` (p. 935).

6.164.2.2 `virtual std::size_t decaf::internal::nio::CharArrayBuffer::arrayOffset ()` `throw (decaf::lang::exceptions::UnsupportedOperationException,` `decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 936).

6.164.2.3 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 936).

6.164.2.4 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this CharBuffer

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 937).

6.164.2.5 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate () [virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char Buffer which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 938).

6.164.2.6 `virtual char decaf::internal::nio::CharArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]`

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements **decaf::nio::CharBuffer** (p. 938).

6.164.2.7 `virtual char decaf::internal::nio::CharArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Absolute get method.

Reads the char at the given index.

Parameters

index - the index in the Buffer where the char is to be read

Returns

the char that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::CharBuffer** (p. 938).

6.164.2.8 `virtual bool decaf::internal::nio::CharArrayBuffer::hasArray () const [inline, virtual]`

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 940).

6.164.2.9 `virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly () const`
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.164.2.10 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put`
`(char value) throw (decaf::nio::BufferOverflowException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value - the char value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 942).

6.164.2.11 `virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put`
`(std::size_t index, char value) throw (`
`decaf::lang::exceptions::IndexOutOfBoundsException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given char into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the char to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 942).

6.164.2.12 **virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool value)** [inline, protected, virtual]

Sets this **ByteBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.164.2.13 **virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice ()**
const [virtual]

Creates a new CharBuffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create CharBuffer which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 944).

6.164.2.14 **virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence (std::size_t start, std::size_t end) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)** [virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 746) + start, and its limit will be **position()** (p. 746) + end. The new Buffer will be read-only if, and only if, this buffer is read-only.

Parameters

start - The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 746)

end - The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 746)

Returns

The new character buffer, caller owns

Exceptions

IndexOutOfBoundsException - If the preconditions on start and end fail

Implements **decaf::nio::CharBuffer** (p. 945).

6.164.3 Field Documentation

6.164.3.1 **internal::nio::ByteArrayPerspective***
decaf::internal::nio::CharArrayBuffer::_array [protected]

6.164.3.2 **std::size_t decaf::internal::nio::CharArrayBuffer::offset** [protected]

6.164.3.3 **bool decaf::internal::nio::CharArrayBuffer::readOnly** [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/CharArrayBuffer.h

6.165 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:

```
#include <src/main/decaf/nio/CharBuffer.h>
```

Inheritance diagram for decaf::nio::CharBuffer:

Public Member Functions

- virtual **~CharBuffer** ()
- virtual std::string **toString** () const
- **CharBuffer & append** (char value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value) throw (BufferOverflowException, ReadOnlyBufferException)
Appends the specified character sequence to this buffer.
- **CharBuffer & append** (const lang::CharSequence *value, std::size_t start, std::size_t end) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException)

Appends a subsequence of the specified character sequence to this buffer. If value is Null the the string "null" is appended to the buffer.

- virtual char * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

Returns the character array that backs this buffer (optional operation).

- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **CharBuffer** * **asReadOnlyBuffer** () const =0

Creates a new, read-only char buffer that shares this buffer's content.

- char **charAt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Reads the character at the given index relative to the current position.

- virtual **CharBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)

Compacts this buffer.

- virtual **CharBuffer** * **duplicate** ()=0

Creates a new char buffer that shares this buffer's content.

- virtual char **get** ()=0 throw (BufferUnderflowException)

Relative get method.

- virtual char **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- **CharBuffer** & **get** (std::vector< char > buffer) throw (BufferUnderflowException)

Relative bulk get method.

- **CharBuffer** & **get** (char *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method.

- virtual bool **hasArray** () const =0

Tells whether or not this buffer is backed by an accessible char array.

- std::size_t **length** () const

Returns the length of this character buffer.

- **CharBuffer** & **put** (**CharBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the chars remaining in the given source buffer into this buffer.

- **CharBuffer** & **put** (const char *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)

This method transfers chars into this buffer from the given source array.

- **CharBuffer** & **put** (std::vector< char > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source char array into this buffer.

- virtual **CharBuffer** & **put** (char value)=0 throw (BufferOverflowException, ReadOnlyBufferException)

Writes the given char into this buffer at the current position, and then increments the position.

- virtual **CharBuffer** & **put** (std::size_t index, char value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)

Writes the given char into this buffer at the given index.

- **CharBuffer** & **put** (const std::string &src, std::size_t start, std::size_t end) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException)

Relative bulk put method (optional operation).

- **CharBuffer** & **put** (const std::string &src) throw (BufferOverflowException, ReadOnlyBufferException)

Relative bulk put method (optional operation).

- virtual std::size_t **read** (**CharBuffer** *target) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, ReadOnlyBufferException)

Attempts to read characters into the specified character buffer.

- virtual lang::CharSequence * **subSequence** (std::size_t start, std::size_t end) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

- virtual **CharBuffer** * **slice** () const =0

*Creates a new **CharBuffer** (p. 930) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (const **CharBuffer** &value) const

Compares this object with the specified object for order.

- virtual bool **equals** (const **CharBuffer** &value) const

- virtual bool **operator==** (const **CharBuffer** &value) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const **CharBuffer** &value) const

Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **CharBuffer** * **allocate** (std::size_t capacity)
Allocates a new character buffer.
- static **CharBuffer** * **wrap** (char *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **CharBuffer** (p. 930).*
- static **CharBuffer** * **wrap** (std::vector< char > &buffer)
*Wraps the passed STL char Vector in a **CharBuffer** (p. 930).*

Protected Member Functions

- **CharBuffer** (std::size_t capacity)
*Creates a **CharBuffer** (p. 930) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.165.1 Detailed Description

This class defines four categories of operations upon character buffers: o Absolute and relative get and put methods that read and write single characters; o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer. o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the CharSequence interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package decaf.util.regex.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

```
cb.put("text/"); cb.put(subtype); cb.put("; charset="); cb.put(enc);
```

can, for example, be replaced by the single statement

```
cb.put("text/").put(subtype).put("; charset=").put(enc);
```

6.165.2 Constructor & Destructor Documentation

6.165.2.1 decaf::nio::CharBuffer::CharBuffer (std::size_t *capacity*) [protected]

Creates a **CharBuffer** (p. 930) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

6.165.2.2 virtual decaf::nio::CharBuffer::~~CharBuffer () [inline, virtual]

6.165.3 Member Function Documentation

6.165.3.1 static CharBuffer* decaf::nio::CharBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new character buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Char buffer in chars (1 byte).

Returns

the **CharBuffer** (p. 930) that was allocated, caller owns.

6.165.3.2 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*, std::size_t *start*, std::size_t *end*) throw (decaf::lang::exceptions::IndexOutOfBoundsException, BufferOverflowException, ReadOnlyBufferException)

Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.

Parameters

value - the CharSequence to append.

start - the index to start appending from.

end - the index to append to.

Returns

a reference to this modified **CharBuffer** (p. 930)

Exceptions

BufferOverflowException (p. 771) if there is no more space

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

IndexOutOfBoundsException if start > end, or > length of sequence.

6.165.3.3 CharBuffer& decaf::nio::CharBuffer::append (char *value*) throw (BufferOverflowException, ReadOnlyBufferException)

Appends the specified character to this buffer.

Parameters

value - the char to append.

Returns

a reference to this modified **CharBuffer** (p. 930)

Exceptions

BufferOverflowException (p. 771) if there is no more space

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

6.165.3.4 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*) throw (BufferOverflowException, ReadOnlyBufferException)

Appends the specified character sequence to this buffer.

If value is Null the the string "null" is appended to the buffer.

Parameters

value - the CharSequence to append.

Returns

a reference to this modified **CharBuffer** (p. 930)

Exceptions

BufferOverflowException (p. 771) if there is no more space

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

6.165.3.5 virtual char* decaf::nio::CharBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 925).

6.165.3.6 `virtual std::size_t decaf::nio::CharBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 925).

6.165.3.7 `virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer () const
[pure virtual]`

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 926).

6.165.3.8 `char decaf::nio::CharBuffer::charAt (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Reads the character at the given index relative to the current position.

Parameters

index - The index of the character to be read relative to position

Returns

The character at index **position()** (p. 746) + index

Exceptions

IndexOutOfBoundsException

6.165.3.9 `virtual CharBuffer& decaf::nio::CharBuffer::compact () throw (ReadOnlyBufferException)` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \mathbf{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\mathbf{limit}()$ (p. 745) - 1 is copied to index $n = \mathbf{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 930)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 926).

6.165.3.10 `virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & value) const` [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.165.3.11 `virtual CharBuffer* decaf::nio::CharBuffer::duplicate () [pure virtual]`

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 926).

6.165.3.12 `virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & value) const [virtual]`

Returns

true if this value is considered equal to the passed value.

6.165.3.13 `virtual char decaf::nio::CharBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 927).

6.165.3.14 `virtual char decaf::nio::CharBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method.

Reads the char at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the char is to be read

Returns

the char that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 927).

6.165.3.15 **CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > *buffer*)**
throw (BufferUnderflowException)

Relative bulk get method.

This method transfers chars from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **CharBuffer** (p. 930)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length chars remaining in this buffer

6.165.3.16 **CharBuffer& decaf::nio::CharBuffer::get (char * *buffer*, std::size_t**
***offset*, std::size_t *length*) throw (BufferUnderflowException,**
lang::exceptions::NullPointerException)

Relative bulk get method.

This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies length chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length chars remaining in this buffer

NullPointerException if the passed buffer is null.

6.165.3.17 `virtual bool decaf::nio::CharBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in `decaf::internal::nio::CharArrayBuffer` (p. 927).

6.165.3.18 `std::size_t decaf::nio::CharBuffer::length () const [inline]`

Returns the length of this character buffer.

Returns

the length of this buffer from the position to the limit.

6.165.3.19 `virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.165.3.20 `virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.165.3.21 `CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & src
) throw (BufferOverflowException, ReadOnlyBufferException,
 lang::exceptions::IllegalArgumentException)`

This method transfers the chars remaining in the given source buffer into this buffer.

If there are more chars remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 746), then no chars are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `n = src.remaining()` chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src - the buffer to take chars from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining chars in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.165.3.22 `CharBuffer& decaf::nio::CharBuffer::put (const char *
 buffer, std::size_t offset, std::size_t length) throw
 (BufferOverflowException, ReadOnlyBufferException,
 lang::exceptions::NullPointerException)`

This method transfers chars into this buffer from the given source array.

If there are more chars to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no chars are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer- The array from which chars are to be read

offset- The offset within the array of the first char to be read;

length - The number of chars to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only
NullPointerException if the passed buffer is null.

6.165.3.23 virtual CharBuffer& decaf::nio::CharBuffer::put (char *value*) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value - the char value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 928).

6.165.3.24 virtual CharBuffer& decaf::nio::CharBuffer::put (std::size_t *index*, char *value*) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]

Writes the given char into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the char to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 928).

6.165.3.25 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*, std::size_t *start*, std::size_t *end*) throw (BufferOverflowException, ReadOnlyBufferException, decaf::lang::exceptions::IndexOutOfBoundsException)

Relative bulk put method (optional operation).

This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if `end - start > remaining()` (p. 746), then no characters are transferred and a **BufferOverflowException** (p. 771) is thrown.

Returns

a reference to this buffer

Otherwise, this method copies `n = end - start` characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by `n`.

Parameters

src - the string to copy from
start - position in *src* to start from
end - the position in *src* to stop at

Returns

a reference to this **CharBuffer** (p. 930)

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not
IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.165.3.26 CharBuffer& decaf::nio::CharBuffer::put (const std::string & src) throw (BufferOverflowException, ReadOnlyBufferException)

Relative bulk put method (optional operation).

This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form `dst.put(s)` behaves in exactly the same way as the invocation

Parameters

src - the string to copy from

Returns

a reference to this **CharBuffer** (p. 930)

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.165.3.27 CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source char array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters

buffer - The buffer whose contents are copied to this **CharBuffer** (p. 930)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.165.3.28 virtual std::size_t decaf::nio::CharBuffer::read (CharBuffer * *target*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, ReadOnlyBufferException) [virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

target - the buffer to read characters into

Returns

The number of characters added to the buffer, or string::npos if this source of characters is at its end

Exceptions

NullPointerException - If target is Null

IllegalArgumentException - If target is this

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.165.3.29 virtual CharBuffer* decaf::nio::CharBuffer::slice () const [pure virtual]

Creates a new **CharBuffer** (p. 930) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 930) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 929).

6.165.3.30 **virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence**
(std::size_t start, std::size_t end) const throw (
decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 746) + start, and its limit will be **position()** (p. 746) + end. The new **Buffer** (p. 741) will be read-only if, and only if, this buffer is read-only.

Parameters

start - The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 746)

end - The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 746)

Returns

The new character buffer, caller owns

Exceptions

IndexOutOfBoundsException - If the preconditions on start and end fail

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 929).

6.165.3.31 **virtual std::string decaf::nio::CharBuffer::toString () const** [virtual]

Returns

a std::string describing this object

6.165.3.32 **static CharBuffer* decaf::nio::CharBuffer::wrap (char ***
array, std::size_t offset, std::size_t length) throw (
lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **CharBuffer** (p. 930).

The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **CharBuffer** (p. 930) that is backed by buffer, caller owns.

6.165.3.33 static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & buffer) [static]

Wraps the passed STL char Vector in a **CharBuffer** (p. 930).

The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **CharBuffer** (p. 930) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/CharBuffer.h

6.166 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 946) is a readable sequence of char values.

```
#include <src/main/decaf/lang/CharSequence.h>
```

Inheritance diagram for decaf::lang::CharSequence:

Public Member Functions

- virtual **~CharSequence** ()
- virtual std::size_t **length** () const =0
- virtual char **charAt** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Returns the Char at the specified index so long as the index is not greater than the length of the sequence.
- virtual **CharSequence** * **subSequence** (std::size_t start, std::size_t end) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
*Returns a new **CharSequence** (p. 946) that is a subsequence of this sequence.*
- virtual std::string **toString** () const =0

6.166.1 Detailed Description

A **CharSequence** (p. 946) is a readable sequence of char values. This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 946) should implement comparable, it is therefore up to the dervied classes that implement this interface to define equality, which implies that comparison of two CharSequences does not have a contract on equality.

6.166.2 Constructor & Destructor Documentation

6.166.2.1 `virtual decaf::lang::CharSequence::~~CharSequence () [inline, virtual]`

6.166.3 Member Function Documentation

6.166.3.1 `virtual char decaf::lang::CharSequence::charAt (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index - position to return the char at.

Returns

the char at the given position

Exceptions

IndexOutOfBoundsException if index is > than `length()` (p. 947)

6.166.3.2 `virtual std::size_t decaf::lang::CharSequence::length () const [pure virtual]`

Returns

the length of the underlying character sequence.

6.166.3.3 `virtual CharSequence* decaf::lang::CharSequence::subSequence (std::size_t start, std::size_t end) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Returns a new **CharSequence** (p. 946) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index `end - 1`. The length (in chars) of the returned sequence is `end - start`, so if `start == end` then an empty sequence is returned.

Parameters

- start* - the start index, inclusive
- end* - the end index, exclusive

Returns

a new **CharSequence** (p. 946)

Exceptions

IndexOutOfBoundsException if start or end > **length()** (p. 947)

6.166.3.4 `virtual std::string decaf::lang::CharSequence::toString () const [pure virtual]`

Returns

the string representation of this **CharSequence** (p. 946)

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**CharSequence.h**

6.167 decaf::lang::exceptions::ClassCastException Class Reference

```
#include <src/main/decaf/lang/exceptions/ClassCastException.h>
```

Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** () throw ()
Default Constructor.
- **ClassCastException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1476).*
- **ClassCastException** (const **ClassCastException** &ex) throw ()
Copy Constructor.
- **ClassCastException** (const std::exception *cause) throw ()
Constructor.
- **ClassCastException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- **ClassCastException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ClassCastException** * clone () const
Clones this exception.
- virtual ~**ClassCastException** () throw ()

6.167.1 Constructor & Destructor Documentation

6.167.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException () throw () [inline]

Default Constructor.

6.167.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.167.1.3 decaf::lang::exceptions::ClassCastException::ClassCastException (const ClassCastException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.167.1.4 decaf::lang::exceptions::ClassCastException::ClassCastException (const std::exception * cause) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.167.1.5 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.167.1.6 `decaf::lang::exceptions::ClassCastException::ClassCastException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.167.1.7 `virtual decaf::lang::exceptions::ClassCastException::~~ClassCastException () throw () [inline, virtual]`

6.167.2 Member Function Documentation

6.167.2.1 `virtual ClassCastException* decaf::lang::exceptions::ClassCastException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/ClassCastException.h`

6.168 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/decaf/io/Closeable.h>
```

Inheritance diagram for decaf::io::Closeable:

Public Member Functions

- virtual `~Closeable()`
- virtual void `close()` throw (io::IOException)
Closes this object and deallocates the appropriate resources.

6.168.1 Detailed Description

Interface for a class that implements the close method.

6.168.2 Constructor & Destructor Documentation

6.168.2.1 virtual decaf::io::Closeable::~~Closeable () [inline, virtual]

6.168.3 Member Function Documentation

6.168.3.1 virtual void decaf::io::Closeable::close () throw (io::IOException)
 [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException (p. 1707) if an error occurs while closing.

Implemented in `activemq::transport::mock::MockTransport` (p. 2229), `decaf::net::BufferedSocket` (p. 757), `decaf::net::TcpSocket` (p. 2961), and `decaf::util::logging::StreamHandler` (p. 2889).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/Closeable.h`

6.169 cms::Closeable Class Reference

Interface for a class that implements the close method.

```
#include <src/main/cms/Closeable.h>
```

Inheritance diagram for cms::Closeable:

Public Member Functions

- virtual `~Closeable ()`
- virtual void `close ()=0 throw (CMSEException)`

Closes this object and deallocates the appropriate resources.

6.169.1 Detailed Description

Interface for a class that implements the close method. A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since

1.0

6.169.2 Constructor & Destructor Documentation

6.169.2.1 virtual `cms::Closeable::~~Closeable ()` [inline, virtual]

6.169.3 Member Function Documentation

6.169.3.1 virtual void `cms::Closeable::close () throw (CMSEException)` [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSEException (p. 960) - If an error occurs while the resource is being closed.

Implemented in `activemq::cmsutil::CachedConsumer` (p. 889), `activemq::cmsutil::CachedProducer` (p. 892), `activemq::cmsutil::PooledSession` (p. 2354), `activemq::commands::ActiveMQTempDestination` (p. 457), `activemq::core::ActiveMQProducer` (p. 369), `cms::Connection` (p. 1053), and `cms::Session` (p. 2667).

The documentation for this class was generated from the following file:

- `src/main/cms/Closeable.h`

6.170 activemq::transport::failover::CloseTransportsTask Class Reference

```
#include <src/main/activemq/transport/failover/CloseTransportsTask.h>
```

Inheritance diagram for `activemq::transport::failover::CloseTransportsTask`:

Public Member Functions

- **CloseTransportsTask** ()
- virtual **~CloseTransportsTask** ()
- void **add** (const **Pointer**< **Transport** > &transport)
*Add a new **Transport** (p. 3066) to close.*
- virtual bool **isPending** () const
This Task is pending if there are transports in the Queue that need to be closed.
- virtual bool **iterate** ()
Return true until all transports have been closed and removed from the queue.

6.170.1 Constructor & Destructor Documentation

- 6.170.1.1** **activemq::transport::failover::CloseTransportsTask::CloseTransportsTask**
 () [inline]
- 6.170.1.2** **virtual**
activemq::transport::failover::CloseTransportsTask::~~CloseTransportsTask
 () [inline, virtual]

6.170.2 Member Function Documentation

- 6.170.2.1** **void activemq::transport::failover::CloseTransportsTask::add** (const
Pointer< **Transport** > & *transport*)

Add a new **Transport** (p. 3066) to close.

- 6.170.2.2** **virtual bool activemq::transport::failover::CloseTransportsTask::isPending**
 () const [virtual]

This Task is pending if there are transports in the Queue that need to be closed.

Returns

true if there is a transport in the queue that needs closed.

Implements **activemq::threads::CompositeTask** (p. 1016).

- 6.170.2.3** **virtual bool activemq::transport::failover::CloseTransportsTask::iterate** (
) [virtual]

Return true until all transports have been closed and removed from the queue.

Implements **activemq::threads::Task** (p. 2956).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**CloseTransportsTask.h**

6.171 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p.969) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p.1103) to operate on.

```
#include <src/main/activemq/cmsutil/CmsAccessor.h>
```

Inheritance diagram for activemq::cmsutil::CmsAccessor:

Public Member Functions

- **CmsAccessor** ()
- virtual **~CmsAccessor** ()
- virtual **ResourceLifecycleManager** * **getResourceLifecycleManager** ()
- virtual const **ResourceLifecycleManager** * **getResourceLifecycleManager** () const
- virtual void **setConnectionFactory** (**cms::ConnectionFactory** *connectionFactory)
Set the ConnectionFactory to use for obtaining CMS Connections.
- virtual const **cms::ConnectionFactory** * **getConnectionFactory** () const
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual **cms::ConnectionFactory** * **getConnectionFactory** ()
Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual void **setSessionAcknowledgeMode** (**cms::Session::AcknowledgeMode** sessionAcknowledgeMode)
Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.
- virtual **cms::Session::AcknowledgeMode** **getSessionAcknowledgeMode** () const
Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- virtual void **init** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.
- virtual void **destroy** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Shuts down this object and destroys any allocated resources.
- virtual **cms::Connection** * **createConnection** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
Create a CMS Connection via this template's ConnectionFactory.
- virtual **cms::Session** * **createSession** (**cms::Connection** *con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)

Create a CMS Session for the given Connection.

- virtual void **checkConnectionFactory** () throw (decaf::lang::exceptions::IllegalStateException)

Verifies that the connection factory is valid.

6.171.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 969) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1103) to operate on. The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 957) adds further, destination-related properties.

Not intended to be used directly.

activemq.cmsutil.CmsDestinationAccessor (p. 957)
activemq.cmsutil.CmsTemplate (p. 969)

6.171.2 Constructor & Destructor Documentation

6.171.2.1 **activemq::cmsutil::CmsAccessor::CmsAccessor** ()

6.171.2.2 **virtual activemq::cmsutil::CmsAccessor::~~CmsAccessor** () [virtual]

6.171.3 Member Function Documentation

6.171.3.1 **virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory** () throw (decaf::lang::exceptions::IllegalStateException) [protected, virtual]

Verifies that the connection factory is valid.

6.171.3.2 **virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection** () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns

the new CMS Connection

Exceptions

cms::CMSException (p. 960) if thrown by CMS API methods

6.171.3.3 `virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * con) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]`

Create a CMS Session for the given Connection.

Parameters

con the CMS Connection to create a Session for

Returns

the new CMS Session

Exceptions

cms::CMSException (p. 960) if thrown by CMS API methods

6.171.3.4 `virtual void activemq::cmsutil::CmsAccessor::destroy () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [inline, protected, virtual]`

Shuts down this object and destroys any allocated resources.

Reimplemented in `activemq::cmsutil::CmsDestinationAccessor` (p. 959), and `activemq::cmsutil::CmsTemplate` (p. 973).

6.171.3.5 `virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.171.3.6 `virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory () const [inline, virtual]`

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.171.3.7 `virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () [inline, virtual]`

6.171.3.8 `virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager () const [inline, virtual]`

6.171.3.9 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode () const [inline, virtual]`

Return the acknowledgment mode for CMS sessions.

Returns

the acknowledgment mode applied by this accessor

6.171.3.10 `virtual void activemq::cmsutil::CmsAccessor::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [inline, protected, virtual]`

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Reimplemented in `activemq::cmsutil::CmsDestinationAccessor` (p.959), and `activemq::cmsutil::CmsTemplate` (p.975).

6.171.3.11 `virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * connectionFactory) [inline, virtual]`

Set the ConnectionFactory to use for obtaining CMS Connections.

6.171.3.12 `virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode sessionAcknowledgeMode) [inline, virtual]`

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

Default is AUTO_ACKNOWLEDGE.

Parameters

sessionAcknowledgeMode the acknowledgment mode

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/CmsAccessor.h`

6.172 `activemq::cmsutil::CmsDestinationAccessor` Class Reference

Extends the `CmsAccessor` (p.954) to add support for resolving destination names.

```
#include <src/main/activemq/cmsutil/CmsDestinationAccessor.h>
```

Inheritance diagram for `activemq::cmsutil::CmsDestinationAccessor`:

activemq::cmsutil::CmsDestinationAccessor::~~CmsDestinationAccessor ()` [virtual]

6.172.3 Member Function Documentation

6.172.3.1 `virtual void activemq::cmsutil::CmsDestinationAccessor::checkDestinationResolver ()` throw (`decaf::lang::exceptions::IllegalStateException`) [protected, virtual]

Verifies that the destination resolver is valid.

6.172.3.2 `virtual void activemq::cmsutil::CmsDestinationAccessor::destroy ()` throw (`cms::CMSException`, `decaf::lang::exceptions::IllegalStateException`) [protected, virtual]

Calls `destroy()` (p. 959) on the destination resolver.

Reimplemented from `activemq::cmsutil::CmsAccessor` (p. 956).

Reimplemented in `activemq::cmsutil::CmsTemplate` (p. 973).

6.172.3.3 `virtual const DestinationResolver* activemq::cmsutil::CmsDestinationAccessor::getDestinationResolver ()` const [inline, virtual]

6.172.3.4 `virtual DestinationResolver* activemq::cmsutil::CmsDestinationAccessor::getDestinationResolver ()` [inline, virtual]

6.172.3.5 `virtual void activemq::cmsutil::CmsDestinationAccessor::init ()` throw (`cms::CMSException`, `decaf::lang::exceptions::IllegalStateException`) [protected, virtual]

Initializes the destination resolver.

Reimplemented from `activemq::cmsutil::CmsAccessor` (p. 957).

Reimplemented in `activemq::cmsutil::CmsTemplate` (p. 975).

6.172.3.6 virtual bool activemq::cmsutil::CmsDestinationAccessor::isPubSubDomain () const
[inline, virtual]

6.172.3.7 virtual cms::Destination* activemq::cmsutil::CmsDestinationAccessor::resolveDestinationName (cms::Session * *session*, const std::string & *destName*) throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException)
[protected, virtual]

Resolves the destination via the DestinationResolver (p. 1415).

Parameters

session the session

destName the name of the destination.

Returns

the destination

Exceptions

cms::CMSException (p. 960) if resolution failed.

decaf::lang::exceptions::IllegalStateException (p. 1618) if the destination resolver property is NULL.

6.172.3.8 virtual void activemq::cmsutil::CmsDestinationAccessor::setDestinationResolver (DestinationResolver * *destRes*) [inline, virtual]

6.172.3.9 virtual void activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain (bool *pubSubDomain*) [inline, virtual]

Reimplemented in *activemq::cmsutil::CmsTemplate* (p. 980).

Referenced by *activemq::cmsutil::CmsTemplate::setPubSubDomain()*.

The documentation for this class was generated from the following file:

- *src/main/activemq/cmsutil/CmsDestinationAccessor.h*

6.173 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

```
#include <src/main/cms/CMSException.h>
```

Inheritance diagram for cms::CMSException:

Public Member Functions

- **CMSEException** () throw ()
- **CMSEException** (const **CMSEException** &ex) throw ()
- **CMSEException** (const std::string &message, const std::exception *cause) throw ()
- **CMSEException** (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()
- virtual ~**CMSEException** () throw ()
- virtual std::string **getMessage** () const
Gets the cause of the error.
- virtual const std::exception * **getCause** () const
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual void **printStackTrace** () const
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const
Gets the stack trace as one contiguous string.
- virtual const char * **what** () const throw ()
*Overloads the std::exception **what**() (p. 963) function to return the cause of the exception.*

6.173.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes. This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an std::exception.

Since the contained cause exception is of type std::exception and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSEException** (p. 960). To that end the class hands off the exception to each successive copy so care must be taken when handling **CMSEException** (p. 960) instances.

Since

1.0

6.173.2 Constructor & Destructor Documentation

- 6.173.2.5** virtual cms::CMSException::~~CMSException () throw () [virtual]

6.173.3 Member Function Documentation

- 6.173.3.1** virtual const std::exception* cms::CMSException::getCause () const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

- 6.173.3.2** virtual std::string cms::CMSException::getMessage () const [virtual]

Gets the cause of the error.

Returns

string errors message

- 6.173.3.3** virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace () const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

6.173.3.4 `virtual std::string cms::CMSException::getStackTraceString () const [virtual]`

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

6.173.3.5 `virtual void cms::CMSException::printStackTrace () const [virtual]`

Prints the stack trace to std::err.

6.173.3.6 `virtual void cms::CMSException::printStackTrace (std::ostream & stream) const [virtual]`

Prints the stack trace to the given output stream.

Parameters

stream the target output stream.

6.173.3.7 `virtual void cms::CMSException::setMark (const char * file, const int lineNumber) [virtual]`

Adds a file/line number to the stack trace.

Parameters

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

6.173.3.8 `virtual const char* cms::CMSException::what () const throw () [virtual]`

Overloads the std::exception `what()` (p. 963) function to return the cause of the exception.

Returns

const char pointer to error message

6.175 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

```
#include <src/main/cms/CMSProperties.h>
```

Inheritance diagram for cms::CMSProperties:

Public Member Functions

- virtual `~CMSProperties ()`
- virtual bool `isEmpty ()` const =0
Returns true if the properties object is empty.
- virtual const char * `getProperty (const std::string &name)` const =0
Looks up the value for the given property.
- virtual std::string `getProperty (const std::string &name, const std::string &defaultValue)` const =0
Looks up the value for the given property.
- virtual void `setProperty (const std::string &name, const std::string &value)`=0
Sets the value for a given property.
- virtual bool `hasProperty (const std::string &name)` const =0
Check to see if the Property exists in the set.
- virtual void `remove (const std::string &name)`=0
Removes the property with the given name.
- virtual std::vector< std::pair< std::string, std::string > > `toArray ()` const =0
Method that serializes the contents of the property map to an array.
- virtual void `copy (const CMSProperties *source)`=0
Copies the contents of the given properties object to this one.
- virtual `CMSProperties * clone ()` const =0
Clones this object.
- virtual void `clear ()`=0
Clears all properties from the map.
- virtual std::string `toString ()` const =0
Formats the contents of the Properties Object into a string that can be logged, etc.

6.175.1 Detailed Description

Interface for a Java-like properties object. This is essentially a map of key-value string pairs.

Since

1.1

6.175.2 Constructor & Destructor Documentation

6.175.2.1 `virtual cms::CMSProperties::~~CMSProperties () [inline, virtual]`

6.175.3 Member Function Documentation

6.175.3.1 `virtual void cms::CMSProperties::clear () [pure virtual]`

Clears all properties from the map.

Implemented in `activemq::util::ActiveMQProperties` (p. 376).

6.175.3.2 `virtual CMSProperties* cms::CMSProperties::clone () const [pure virtual]`

Clones this object.

Returns

a replica of this object.

Implemented in `activemq::util::ActiveMQProperties` (p. 376).

6.175.3.3 `virtual void cms::CMSProperties::copy (const CMSProperties * source) [pure virtual]`

Copies the contents of the given properties object to this one.

Parameters

source The source properties object.

6.175.3.4 `virtual const char* cms::CMSProperties::getProperty (const std::string & name) const [pure virtual]`

Looks up the value for the given property.

Parameters

name The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in `activemq::util::ActiveMQProperties` (p. 377).

6.175.3.5 `virtual std::string cms::CMSProperties::getProperty (const std::string & name, const std::string & defaultValue) const` [pure virtual]

Looks up the value for the given property.

Parameters

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

Implemented in `activemq::util::ActiveMQProperties` (p. 377).

6.175.3.6 `virtual bool cms::CMSProperties::hasProperty (const std::string & name) const` [pure virtual]

Check to see if the Property exists in the set.

Parameters

name the name of the property to check

Returns

true if property exists, false otherwise.

Implemented in `activemq::util::ActiveMQProperties` (p. 377).

6.175.3.7 `virtual bool cms::CMSProperties::isEmpty () const` [pure virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implemented in `activemq::util::ActiveMQProperties` (p. 378).

6.175.3.8 `virtual void cms::CMSProperties::remove (const std::string & name)` [pure virtual]

Removes the property with the given name.

Parameters

name the name of the property to be removed.s

Implemented in `activemq::util::ActiveMQProperties` (p. 378).

6.175.3.9 `virtual void cms::CMSProperties::setProperty (const std::string & name, const std::string & value) [pure virtual]`

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name The name of the value to be written.

value The value to be written.

Implemented in `activemq::util::ActiveMQProperties` (p. 378).

6.175.3.10 `virtual std::vector< std::pair< std::string, std::string > > cms::CMSProperties::toArray () const [pure virtual]`

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implemented in `activemq::util::ActiveMQProperties` (p. 378).

6.175.3.11 `virtual std::string cms::CMSProperties::toString () const [pure virtual]`

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implemented in `activemq::util::ActiveMQProperties` (p. 379).

- virtual long long **getReceiveTimeout** () const
- virtual void **setExplicitQosEnabled** (bool explicitQosEnabled)
Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.
- virtual bool **isExplicitQosEnabled** () const
If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.
- virtual void **setDeliveryPersistent** (bool deliveryPersistent)
Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

- virtual void **setDeliveryMode** (int deliveryMode)
Set the delivery mode to use when sending a message.
- virtual int **getDeliveryMode** () const
Return the delivery mode to use when sending a message.
- virtual void **setPriority** (int priority)
Set the priority of a message when sending.
- virtual int **getPriority** () const
Return the priority of a message when sending.
- virtual void **setTimeToLive** (long long timeToLive)
Set the time-to-live of the message when sending.
- virtual long long **getTimeToLive** () const
Return the time-to-live of the message when sending.
- virtual void **execute** (**SessionCallback** *action) throw (cms::CMSEException)
Executes the given action within a CMS Session.
- virtual void **execute** (**ProducerCallback** *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (cms::Destination *dest, **ProducerCallback** *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (const std::string &destinationName, **ProducerCallback** *action) throw (cms::CMSEException)
Executes the given action and provides it with a CMS Session and producer.
- virtual void **send** (**MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the default destination.
- virtual void **send** (cms::Destination *dest, **MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the specified destination.
- virtual void **send** (const std::string &destinationName, **MessageCreator** *messageCreator) throw (cms::CMSEException)
Convenience method for sending a message to the specified destination.
- virtual cms::Message * **receive** () throw (cms::CMSEException)
Performs a synchronous read from the default destination.
- virtual cms::Message * **receive** (cms::Destination *destination) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.

- virtual **cms::Message** * **receive** (const std::string &destinationName) throw (cms::CMSEException)
Performs a synchronous read from the specified destination.
- virtual **cms::Message** * **receiveSelected** (const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (cms::Destination *destination, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.
- virtual **cms::Message** * **receiveSelected** (const std::string &destinationName, const std::string &selector) throw (cms::CMSEException)
Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Static Public Attributes

- static const long long **RECEIVE_TIMEOUT_NO_WAIT** = -1
Timeout value indicating that a receive operation should check if a message is immediately available without blocking.
- static const long long **RECEIVE_TIMEOUT_INDEFINITE_WAIT** = 0
Timeout value indicating a blocking receive without timeout.
- static const int **DEFAULT_PRIORITY** = 4
Default message priority.
- static const long long **DEFAULT_TIME_TO_LIVE** = 0
My default, messages should live forever.

Protected Member Functions

- void **init** () throw (cms::CMSEException, decaf::lang::exceptions::IllegalStateException)
Initializes this object and prepares it for use.
- void **destroy** () throw (cms::CMSEException, decaf::lang::exceptions::IllegalStateException)
Clears all internal resources.

Friends

- class **ProducerExecutor**
- class **ResolveProducerExecutor**
- class **SendExecutor**

- class **ReceiveExecutor**
- class **ResolveReceiveExecutor**

6.177.1 Detailed Description

CmsTemplate (p. 969) simplifies performing synchronous CMS operations. This class is intended to be for CMS what Spring's **JmsTemplate** is for JMS. Provided with a CMS **ConnectionFactory**, creates and manages all other CMS resources internally.

Before using **CmsTemplate** (p. 969) the user must first set the destination (either by name or by setting the destination object directly) and then call **init** to initialize the object for use.

CmsTemplate (p. 969) allows the user to get access to a CMS **Session** through a user-defined **SessionCallback** (p. 2676). Similarly, if the user wants direct access to a CMS **MessageProducer**, it can provide a **ProducerCallback** (p. 2443). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the **send** methods.

See also

SessionCallback (p. 2676)
ProducerCallback (p. 2443)
MessageCreator (p. 2083)

6.177.2 Constructor & Destructor Documentation

6.177.2.1 `activemq::cmsutil::CmsTemplate::CmsTemplate ()`

6.177.2.2 `activemq::cmsutil::CmsTemplate::CmsTemplate (cms::ConnectionFactory * connectionFactory)`

6.177.2.3 `virtual activemq::cmsutil::CmsTemplate::~~CmsTemplate () [virtual]`

6.177.3 Member Function Documentation

6.177.3.1 `void activemq::cmsutil::CmsTemplate::destroy () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]`

Clears all internal resources.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 959).

6.177.3.2 `virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * action) throw (cms::CMSException) [virtual]`

Executes the given action within a CMS Session.

Parameters

action the action to perform within a CMS Session

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.3 virtual void activemq::cmsutil::CmsTemplate::execute (ProducerCallback * *action*) throw (cms::CMSException) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

action the action to perform

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.4 virtual void activemq::cmsutil::CmsTemplate::execute (cms::Destination * *dest*, ProducerCallback * *action*) throw (cms::CMSException) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

dest the destination to send messages to

action the action to perform

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.5 virtual void activemq::cmsutil::CmsTemplate::execute (const std::string & *destinationName*, ProducerCallback * *action*) throw (cms::CMSException) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

destinationName the name of the destination to send messages to (to internally be resolved to an actual destination)

action the action to perform

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.6 virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Non-const version of this method.

6.177.3.7 `virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination () const [inline, virtual]`

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Const version of this method.

6.177.3.8 `virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName () const [inline, virtual]`

Gets the name of the default destination to be used for send/receive operations.

The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns

the default name of the destination for send/receive operations.

6.177.3.9 `virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode () const [inline, virtual]`

Return the delivery mode to use when sending a message.

6.177.3.10 `virtual int activemq::cmsutil::CmsTemplate::getPriority () const [inline, virtual]`

Return the priority of a message when sending.

6.177.3.11 `virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout () const [inline, virtual]`

6.177.3.12 `virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive () const [inline, virtual]`

Return the time-to-live of the message when sending.

6.177.3.13 `void activemq::cmsutil::CmsTemplate::init () throw (cms::CMSException, decaf::lang::exceptions::IllegalStateException) [protected, virtual]`

Initializes this object and prepares it for use.

This should be called before any other methods are called.

Reimplemented from `activemq::cmsutil::CmsDestinationAccessor` (p. 959).

6.177.3.14 `virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled () const [inline, virtual]`

If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.

Otherwise, the default values, that may be set administratively, will be used.

Returns

true if overriding default values of QOS parameters (deliveryMode, priority, and timeToLive)

See also

`setDeliveryMode` (p. 979)

`setPriority` (p. 980)

`setTimeToLive` (p. 981)

6.177.3.15 `virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled () const [inline, virtual]`

6.177.3.16 `virtual bool activemq::cmsutil::CmsTemplate::isMessageTimestampEnabled () const [inline, virtual]`

6.177.3.17 `virtual bool activemq::cmsutil::CmsTemplate::isNoLocal () const [inline, virtual]`

6.177.3.18 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * destination) throw (cms::CMSException) [virtual]`

Performs a synchronous read from the specified destination.

Parameters

destination the destination to receive on

Returns

the message

Exceptions

cms::CMSException (p. 960) thrown if an error occurs

6.177.3.19 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & destinationName) throw (cms::CMSException) [virtual]`

Performs a synchronous read from the specified destination.

Parameters

destinationName the name of the destination to receive on (will be resolved to destination internally).

Returns

the message

Exceptions

cms::CMSEException (p. 960) thrown if an error occurs

6.177.3.20 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receive ()
 throw (cms::CMSEException) [virtual]`

Performs a synchronous read from the default destination.

Returns

the message

Exceptions

cms::CMSEException (p. 960) thrown if an error occurs

6.177.3.21 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected
 (const std::string & selector) throw (cms::CMSEException)
 [virtual]`

Performs a synchronous read consuming only messages identified by the given selector.

Parameters

selector the selector expression.

Returns

the message

Exceptions

cms::CMSEException (p. 960) thrown if an error occurs

6.177.3.22 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected
 (cms::Destination * destination, const std::string & selector) throw
 (cms::CMSEException) [virtual]`

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

destination the destination to receive on.

selector the selector expression.

Returns

the message

Exceptions

cms::CMSException (p. 960) thrown if an error occurs

6.177.3.23 `virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & destinationName, const std::string & selector) throw (cms::CMSException)` [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

destinationName the name of the destination to receive on (will be resolved to destination internally).

selector the selector expression.

Returns

the message

Exceptions

cms::CMSException (p. 960) thrown if an error occurs

6.177.3.24 `virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination * dest, MessageCreator * messageCreator) throw (cms::CMSException)` [virtual]

Convenience method for sending a message to the specified destination.

Parameters

dest The destination to send to

messageCreator Responsible for creating the message to be sent

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.25 `virtual void activemq::cmsutil::CmsTemplate::send (const std::string & destinationName, MessageCreator * messageCreator) throw (cms::CMSException)` [virtual]

Convenience method for sending a message to the specified destination.

Parameters

destinationName The name of the destination to send to.

messageCreator Responsible for creating the message to be sent

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.26 `virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * messageCreator) throw (cms::CMSException) [virtual]`

Convenience method for sending a message to the default destination.

Parameters

messageCreator Responsible for creating the message to be sent

Exceptions

cms::CMSException (p. 960) thrown if an error occurs.

6.177.3.27 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * defaultDestination) [inline, virtual]`

Sets the destination object to be used by default for send/receive operations.

If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters

defaultDestination the default destination

6.177.3.28 `virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & defaultDestinationName) [inline, virtual]`

Sets the name of the default destination to be used from send/receive operations.

Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters

defaultDestinationName the name of the destination for send/receive to by default.

6.177.3.29 `virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int deliveryMode) [inline, virtual]`

Set the delivery mode to use when sending a message.

Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

deliveryMode the delivery mode to use

See also

`isExplicitQosEnabled` (p. 976)

6.177.3.30 virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool *deliveryPersistent*) [inline, virtual]

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT". Default it "true" aka delivery mode "PERSISTENT".

See also

`setDeliveryMode(int)` (p. 979)

6.177.3.31 virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool *explicitQosEnabled*) [inline, virtual]

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also

`setDeliveryMode` (p. 979)

`setPriority` (p. 980)

`setTimeToLive` (p. 981)

6.177.3.32 virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool *messageIdEnabled*) [inline, virtual]**6.177.3.33 virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool *messageTimestampEnabled*) [inline, virtual]****6.177.3.34 virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool *noLocal*) [inline, virtual]****6.177.3.35 virtual void activemq::cmsutil::CmsTemplate::setPriority (int *priority*) [inline, virtual]**

Set the priority of a message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also

`isExplicitQosEnabled` (p. 976)

6.177.3.36 virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool *pubSubDomain*) [inline, virtual]

Indicates whether the default destination is a topic (true) or a queue (false).

Calling this method will set the `defaultDestination` property to NULL.

Parameters

pubSubDomain indicates whether to use pub-sub messaging (topics).

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 960).

References **activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain()**.

6.177.3.37 `virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long receiveTimeout)` [inline, virtual]

6.177.3.38 `virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long timeToLive)` [inline, virtual]

Set the time-to-live of the message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

timeToLive the message's lifetime (in milliseconds)

Public Member Functions

- virtual `~Collection ()`
- virtual `bool add (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)`
Returns true if this collection changed as a result of the call.
- virtual `bool addAll (const Collection< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)`
Adds all of the elements in the specified collection to this collection.
- virtual `void clear ()=0 throw (lang::exceptions::UnsupportedOperationException)`
Removes all of the elements from this collection (optional operation).
- virtual `bool contains (const E &value) const =0 throw (lang::Exception)`
Returns true if this collection contains the specified element.
- virtual `bool containsAll (const Collection< E > &collection) const =0 throw (lang::Exception)`
Returns true if this collection contains all of the elements in the specified collection.
- virtual `bool equals (const Collection< E > &value) const =0`
Compares the passed collection to this one, if they contain the same elements, i.e.
- virtual `bool isEmpty () const =0`

- virtual bool **remove** (const E &value)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes a single instance of the specified element from the collection.
- virtual bool **removeAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Removes all this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (const **Collection**< E > &collection)=0 throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)
Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual std::size_t **size** () const =0
Returns the number of elements in this collection.
- virtual std::vector< E > **toArray** () const =0
Returns an array containing all of the elements in this collection.

6.178.1 Detailed Description

template<typename E> class decaf::util::Collection< E >

The root interface in the collection hierarchy. A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 982) implementation classes (which typically implement **Collection** (p. 982) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 982), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 982) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw `UnsupportedOperationException` if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an `UnsupportedOperationException` if the invocation would have no effect on the collection. For example, invoking the `addAll(Collection)` method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in Collections Framework interfaces are defined in terms of the `equals` method. For example, the specification for the `contains(Object o)` method says: "returns true if and only if this collection contains at least one element `e` such that `(o==null ? e==null : o.equals(e))`."

Since

1.0

6.178.2 Constructor & Destructor Documentation

6.178.2.1 `template<typename E> virtual decaf::util::Collection< E >::~~Collection () [inline, virtual]`

6.178.3 Member Function Documentation

6.178.3.1 `template<typename E> virtual bool decaf::util::Collection< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [pure virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 982) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implemented in `decaf::util::AbstractQueue< E >` (p. 135), `decaf::util::PriorityQueue< E >` (p. 2416), `decaf::util::StlList< E >` (p. 2838), `decaf::util::StlSet< E >` (p. 2868), `decaf::util::StlList< CompositeTask * >` (p. 2838), `decaf::util::StlList< URI >` (p. 2838), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2838), `decaf::util::StlList< PrimitiveValueNode >` (p. 2838), `decaf::util::StlList< Pointer< Command > >` (p. 2838), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2838), `decaf::util::StlSet< transport::TransportListener * >` (p. 2868), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2868), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2868).

```

6.178.3.2  template<typename E> virtual bool decaf::util::Collection<
             E >::addAll ( const Collection< E > & collection ) throw
             ( lang::exceptions::UnsupportedOperationException,
             lang::exceptions::IllegalArgumentException,
             lang::exceptions::IllegalStateException ) [pure
             virtual]

```

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection - **Collection** (p. 982) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implemented in **decaf::util::AbstractCollection< E >** (p. 122), **decaf::util::AbstractQueue< E >** (p. 135), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 122), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 122), **decaf::util::AbstractCollection< CompositeTask * >** (p. 122), **decaf::util::AbstractCollection< URI >** (p. 122), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 122), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 122), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 122), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 122), and **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 122).

```

6.178.3.3  template<typename E> virtual void decaf::util::Collection< E >::clear (
             ) throw ( lang::exceptions::UnsupportedOperationException ) [pure
             virtual]

```

Removes all of the elements from this collection (optional operation).

This collection will be empty after this method returns unless it throws an exception.

Exceptions

UnsupportedOperationException

Implemented in **decaf::util::AbstractCollection< E >** (p. 123), **decaf::util::AbstractQueue< E >** (p. 136), **decaf::util::PriorityQueue< E >** (p. 2417), **decaf::util::StlList< E >** (p. 2840), **decaf::util::StlSet< E >** (p. 2869), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 123), **decaf::util::AbstractCollection< Pointer< Synchronization > >**

> (p. 123), decaf::util::AbstractCollection< CompositeTask * > (p. 123), decaf::util::AbstractCollection< URI > (p. 123), decaf::util::AbstractCollection< ActiveMQSession * > (p. 123), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 123), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 123), decaf::util::AbstractCollection< Pointer< Command > > (p. 123), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 123), decaf::util::StlList< CompositeTask * > (p. 2840), decaf::util::StlList< URI > (p. 2840), decaf::util::StlList< Pointer< DestinationInfo > > (p. 2840), decaf::util::StlList< PrimitiveValueNode > (p. 2840), decaf::util::StlList< Pointer< Command > > (p. 2840), decaf::util::StlList< Pointer< BackupTransport > > (p. 2840), decaf::util::StlSet< transport::TransportListener * > (p. 2869), decaf::util::StlSet< Pointer< Synchronization > > (p. 2869), and decaf::util::StlSet< ActiveMQSession * > (p. 2869).

6.178.3.4 `template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & value) const throw (lang::Exception) [pure virtual]`

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element *e* such that (*o*==null ? *e*==null : *o.equals(e)*).

Parameters

value - value to check for presence in the collection

Returns

true if there is at least one of the elements in the collection

Exceptions

Exception

Implemented in decaf::util::AbstractCollection< E > (p. 124), decaf::util::StlList< E > (p. 2840), decaf::util::StlSet< E > (p. 2869), decaf::util::AbstractCollection< transport::TransportListener * > (p. 124), decaf::util::AbstractCollection< Pointer< Synchronization > > (p. 124), decaf::util::AbstractCollection< CompositeTask * > (p. 124), decaf::util::AbstractCollection< URI > (p. 124), decaf::util::AbstractCollection< ActiveMQSession * > (p. 124), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 124), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 124), decaf::util::AbstractCollection< Pointer< Command > > (p. 124), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 124), decaf::util::StlList< CompositeTask * > (p. 2840), decaf::util::StlList< URI > (p. 2840), decaf::util::StlList< Pointer< DestinationInfo > > (p. 2840), decaf::util::StlList< PrimitiveValueNode > (p. 2840), decaf::util::StlList< Pointer< Command > > (p. 2840), decaf::util::StlList< Pointer< BackupTransport > > (p. 2840), decaf::util::StlSet< transport::TransportListener * > (p. 2869), decaf::util::StlSet< Pointer< Synchronization > > (p. 2869), and decaf::util::StlSet< ActiveMQSession * > (p. 2869).

6.178.3.5 `template<typename E> virtual bool decaf::util::Collection< E >::containsAll (const Collection< E > & collection) const throw (lang::Exception) [pure virtual]`

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection - **Collection** (p. 982) to compare to this one.

Exceptions

Exception

Implemented in **decaf::util::AbstractCollection< E >** (p. 124), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 124), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 124), **decaf::util::AbstractCollection< CompositeTask * >** (p. 124), **decaf::util::AbstractCollection< URI >** (p. 124), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 124), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 124), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 124), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 124), and **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 124).

6.178.3.6 `template<typename E> virtual bool decaf::util::Collection< E >::equals (const Collection< E > & value) const` [pure virtual]

Compares the passed collection to this one, if they contain the same elements, i.e. all their elements are equivalent, then it returns true.

Returns

true if the Collections contain the same elements.

Implemented in **decaf::util::AbstractCollection< E >** (p. 125), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 125), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 125), **decaf::util::AbstractCollection< CompositeTask * >** (p. 125), **decaf::util::AbstractCollection< URI >** (p. 125), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 125), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 125), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 125), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 125), and **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 125).

6.178.3.7 `template<typename E> virtual bool decaf::util::Collection< E >::isEmpty () const` [pure virtual]

Returns

true if this collection contains no elements.

Implemented in **decaf::util::AbstractCollection< E >** (p. 125), **decaf::util::StlList< E >** (p. 2841), **decaf::util::StlSet< E >** (p. 2870), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 125), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 125), **decaf::util::AbstractCollection< CompositeTask * >** (p. 125), **decaf::util::AbstractCollection< URI >** (p. 125), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 125), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 125), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 125), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 125), and **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 125),

decaf::util::StlList< CompositeTask * > (p. 2841), decaf::util::StlList< URI > (p. 2841), decaf::util::StlList< Pointer< DestinationInfo > > (p. 2841), decaf::util::StlList< PrimitiveValueNode > (p. 2841), decaf::util::StlList< Pointer< Command > > (p. 2841), decaf::util::StlList< Pointer< BackupTransport > > (p. 2841), decaf::util::StlSet< transport::TransportListener * > (p. 2870), decaf::util::StlSet< Pointer< Synchronization > > (p. 2870), and decaf::util::StlSet< ActiveMQSession * > (p. 2870).

6.178.3.8 `template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes a single instance of the specified element from the collection.

More formally, removes an element *e* such that (*o*==null ? *e*==null : *o*.equals(*e*)), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value - reference to the element to remove.

Returns

true if the collection was changed

Exceptions

UnsupportedOperationException

IllegalArgumentException

Implemented in decaf::util::AbstractCollection< E > (p. 127), decaf::util::PriorityQueue< E > (p. 2419), decaf::util::StlList< E > (p. 2843), decaf::util::StlSet< E > (p. 2870), decaf::util::AbstractCollection< transport::TransportListener * > (p. 127), decaf::util::AbstractCollection< Pointer< Synchronization > > (p. 127), decaf::util::AbstractCollection< CompositeTask * > (p. 127), decaf::util::AbstractCollection< URI > (p. 127), decaf::util::AbstractCollection< ActiveMQSession * > (p. 127), decaf::util::AbstractCollection< Pointer< DestinationInfo > > (p. 127), decaf::util::AbstractCollection< PrimitiveValueNode > (p. 127), decaf::util::AbstractCollection< Pointer< Command > > (p. 127), decaf::util::AbstractCollection< Pointer< BackupTransport > > (p. 127), decaf::util::StlList< CompositeTask * > (p. 2843), decaf::util::StlList< URI > (p. 2843), decaf::util::StlList< Pointer< DestinationInfo > > (p. 2843), decaf::util::StlList< PrimitiveValueNode > (p. 2843), decaf::util::StlList< Pointer< Command > > (p. 2843), decaf::util::StlList< Pointer< BackupTransport > > (p. 2843), decaf::util::StlSet< transport::TransportListener * > (p. 2870), decaf::util::StlSet< Pointer< Synchronization > > (p. 2870), and decaf::util::StlSet< ActiveMQSession * > (p. 2870).

6.178.3.9 `template<typename E> virtual bool decaf::util::Collection< E >::removeAll (const Collection< E > & collection) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [pure virtual]`

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection - The **Collection** (p. 982) whose elements are to be removed

Returns

true if the collection changed as a result of this call

Exceptions

UnsupportedOperationException

IllegalArgumentException

Implemented in `decaf::util::AbstractCollection< E >` (p. 128), `decaf::util::AbstractSet< E >` (p. 139), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 128), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 128), `decaf::util::AbstractCollection< CompositeTask * >` (p. 128), `decaf::util::AbstractCollection< URI >` (p. 128), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 128), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 128), `decaf::util::AbstractCollection< Primitive-ValueNode >` (p. 128), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 128), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 128), `decaf::util::AbstractSet< transport::TransportListener * >` (p. 139), `decaf::util::AbstractSet< Pointer< Synchronization > >` (p. 139), and `decaf::util::AbstractSet< ActiveMQSession * >` (p. 139).

```
6.178.3.10  template<typename E> virtual bool decaf::util::Collection<
              E >::retainAll ( const Collection< E > & collection )
              throw ( lang::exceptions::UnsupportedOperationException,
                      lang::exceptions::IllegalArgumentException ) [pure virtual]
```

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection - The **Collection** (p. 982) whose elements are to be retained

Returns

true if the collection changed as a result of this call

Exceptions

UnsupportedOperationException

IllegalArgumentException

Implemented in `decaf::util::AbstractCollection< E >` (p. 128), `decaf::util::AbstractCollection< transport::TransportListener * >`

(p. 128), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 128), `decaf::util::AbstractCollection< CompositeTask * >` (p. 128), `decaf::util::AbstractCollection< URI >` (p. 128), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 128), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 128), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 128), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 128), and `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 128).

6.178.3.11 `template<typename E> virtual std::size_t decaf::util::Collection< E >::size () const [pure virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

Implemented in `decaf::util::PriorityQueue< E >` (p. 2420), `decaf::util::StlList< E >` (p. 2844), `decaf::util::StlSet< E >` (p. 2871), `decaf::util::StlList< CompositeTask * >` (p. 2844), `decaf::util::StlList< URI >` (p. 2844), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2844), `decaf::util::StlList< PrimitiveValueNode >` (p. 2844), `decaf::util::StlList< Pointer< Command > >` (p. 2844), `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2844), `decaf::util::StlSet< transport::TransportListener * >` (p. 2871), `decaf::util::StlSet< Pointer< Synchronization > >` (p. 2871), and `decaf::util::StlSet< ActiveMQSession * >` (p. 2871).

Referenced by `decaf::util::AbstractCollection< Pointer< BackupTransport > >::equals()`, `decaf::util::AbstractCollection< Pointer< BackupTransport > >::isEmpty()`, `decaf::util::AbstractSet< ActiveMQSession * >::removeAll()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::toArray()`.

6.178.3.12 `template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray () const [pure virtual]`

Returns an array containing all of the elements in this collection.

If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns

an array of the elements in this collection.

Implemented in `decaf::util::AbstractCollection< E >` (p. 129), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 129), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 129), `decaf::util::AbstractCollection< CompositeTask * >` (p. 129), `decaf::util::AbstractCollection< URI >` (p. 129), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 129), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 129), and `decaf::util::AbstractCollection< PrimitiveValueNode >`

(p. 129), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 129), and `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 129).

6.179.1 Constructor & Destructor Documentation

6.179.1.1 virtual `activemq::commands::Command::~~Command` () [inline, virtual]

6.179.2 Member Function Documentation

6.179.2.1 virtual `int activemq::commands::Command::getCommandId` () const [pure virtual]

Gets the **Command** (p. 991) Id of this **Message** (p. 2018).

Returns

Command (p. 991) Id

Implemented in `activemq::commands::BaseCommand` (p. 599).

6.179.2.2 virtual bool `activemq::commands::Command::isBrokerInfo` () const [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::BrokerInfo` (p. 718).

6.179.2.3 virtual bool `activemq::commands::Command::isConnectionInfo` () const [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::ConnectionInfo` (p. 1132).

6.179.2.4 virtual bool `activemq::commands::Command::isConsumerInfo` () const [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::ConsumerInfo` (p. 1219).

6.179.2.5 virtual bool `activemq::commands::Command::isKeepAliveInfo` () const [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::KeepAliveInfo` (p. 1814).

6.179.2.6 `virtual bool activemq::commands::Command::isMessage () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::Message` (p. 2030).

6.179.2.7 `virtual bool activemq::commands::Command::isMessageAck () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::MessageAck` (p. 2058).

6.179.2.8 `virtual bool activemq::commands::Command::isMessageDispatch () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 600), and `activemq::commands::MessageDispatch` (p. 2087).

6.179.2.9 `virtual bool activemq::commands::Command::isMessageDispatchNotification () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::MessageDispatchNotification` (p. 2118).

6.179.2.10 `virtual bool activemq::commands::Command::isProducerAck () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::ProducerAck` (p. 2422).

6.179.2.11 `virtual bool activemq::commands::Command::isProducerInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::ProducerInfo` (p. 2472).

6.179.2.12 `virtual bool activemq::commands::Command::isRemoveInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::RemoveInfo` (p. 2539).

6.179.2.13 `virtual bool activemq::commands::Command::isRemoveSubscriptionInfo () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::RemoveSubscriptionInfo` (p. 2563).

6.179.2.14 `virtual bool activemq::commands::Command::isResponse () const`
[pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 601), and `activemq::commands::Response` (p. 2613).

6.179.2.15 `virtual bool activemq::commands::Command::isResponseRequired () const` [pure virtual]

Is a **Response** (p. 2611) required for this **Command** (p. 991).

Returns

true if a response is required.

Implemented in `activemq::commands::BaseCommand` (p. 601).

6.179.2.16 `virtual bool activemq::commands::Command::isShutdownInfo () const` [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 602), and `activemq::commands::ShutdownInfo` (p. 2759).

6.179.2.17 `virtual bool activemq::commands::Command::isTransactionInfo () const` [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 602), and `activemq::commands::TransactionInfo` (p. 3039).

6.179.2.18 `virtual bool activemq::commands::Command::isWireFormatInfo () const` [pure virtual]

Implemented in `activemq::commands::BaseCommand` (p. 602), and `activemq::commands::WireFormatInfo` (p. 3159).

6.179.2.19 `virtual void activemq::commands::Command::setCommandId (int id)` [pure virtual]

Sets the **Command** (p. 991) Id of this **Message** (p. 2018).

Parameters

id **Command** (p. 991) Id

Implemented in `activemq::commands::BaseCommand` (p. 602).

6.179.2.20 `virtual void activemq::commands::Command::setResponseRequired (const bool required)` [pure virtual]

Set if this **Message** (p. 2018) requires a **Response** (p. 2611).

Parameters

required true if response is required

Implemented in `activemq::commands::BaseCommand` (p. 602).

6.179.2.21 `virtual std::string activemq::commands::Command::toString () const`
[pure virtual]

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 662).

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 146), `activemq::commands::ActiveMQBytesMessage` (p. 177), `activemq::commands::ActiveMQMapMessage` (p. 284), `activemq::commands::ActiveMQMessage` (p. 307), `activemq::commands::ActiveMQObjectMessage` (p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 432), `activemq::commands::ActiveMQTextMessage` (p. 529), `activemq::commands::BaseCommand` (p. 602), `activemq::commands::BrokerInfo` (p. 719), `activemq::commands::ConnectionControl` (p. 1058), `activemq::commands::ConnectionError` (p. 1082), `activemq::commands::ConnectionInfo` (p. 1133), `activemq::commands::ConsumerControl` (p. 1169), `activemq::commands::ConsumerInfo` (p. 1220), `activemq::commands::ControlCommand` (p. 1245), `activemq::commands::DataArrayResponse` (p. 1270), `activemq::commands::DataResponse` (p. 1309), `activemq::commands::DestinationInfo` (p. 1394), `activemq::commands::ExceptionResponse` (p. 1486), `activemq::commands::FlushCommand` (p. 1575), `activemq::commands::IntegerResponse` (p. 1669), `activemq::commands::KeepAliveInfo` (p. 1815), `activemq::commands::Message` (p. 2033), `activemq::commands::MessageAck` (p. 2059), `activemq::commands::MessageDispatch` (p. 2087), `activemq::commands::MessageDispatchNotification` (p. 2119), `activemq::commands::MessagePull` (p. 2206), `activemq::commands::ProducerAck` (p. 2423), `activemq::commands::ProducerInfo` (p. 2473), `activemq::commands::RemoveInfo` (p. 2539), `activemq::commands::RemoveSubscriptionInfo` (p. 2563), `activemq::commands::ReplayCommand` (p. 2586), `activemq::commands::Response` (p. 2614), `activemq::commands::SessionInfo` (p. 2704), `activemq::commands::ShutdownInfo` (p. 2759), `activemq::commands::TransactionInfo` (p. 3040), and `activemq::commands::WireFormatInfo` (p. 3162).

6.179.2.22 `virtual decaf::lang::Pointer<commands::Command> activemq::commands::Command::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [pure virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implemented in `activemq::commands::BrokerError` (p. 689), `activemq::commands::BrokerInfo` (p. 720), `activemq::commands::ConnectionControl`

(p. 1059), **activemq::commands::ConnectionError** (p. 1083), **activemq::commands::ConnectionInfo** (p. 1133), **activemq::commands::ConsumerControl** (p. 1170), **activemq::commands::ConsumerInfo** (p. 1221), **activemq::commands::ControlCommand** (p. 1246), **activemq::commands::DestinationInfo** (p. 1394), **activemq::commands::FlushCommand** (p. 1575), **activemq::commands::KeepAliveInfo** (p. 1815), **activemq::commands::Message** (p. 2034), **activemq::commands::MessageAck** (p. 2059), **activemq::commands::MessageDispatch** (p. 2088), **activemq::commands::MessageDispatchNotification** (p. 2119), **activemq::commands::MessagePull** (p. 2206), **activemq::commands::ProducerAck** (p. 2423), **activemq::commands::ProducerInfo** (p. 2473), **activemq::commands::RemoveInfo** (p. 2540), **activemq::commands::RemoveSubscriptionInfo** (p. 2563), **activemq::commands::ReplayCommand** (p. 2587), **activemq::commands::Response** (p. 2614), **activemq::commands::SessionInfo** (p. 2704), **activemq::commands::ShutdownInfo** (p. 2759), **activemq::commands::TransactionInfo** (p. 3040), and **activemq::commands::WireFormatInfo** (p. 3162).

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/Command.h`

6.180 activemq::state::CommandVisitor Class Reference

Interface for an Object that can visit the various Command Objects that are sent from and to this client.

```
#include <src/main/activemq/state/CommandVisitor.h>
```

6.180.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client. The Commands themselves implement a `visit` method that is called with an instance of this interface and each one then call the appropriate `processXXX` method.

Since

3.0

6.180.2 Constructor & Destructor Documentation

- 6.180.2.1 `virtual activemq::state::CommandVisitor::~~CommandVisitor ()`
[inline, virtual]

6.180.3 Member Function Documentation

- 6.180.3.1 `virtual decaf::lang::Pointer< commands::Command > activemq::state::CommandVisitor::processBeginTransaction (commands::TransactionInfo * info)` throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1162).

- 6.180.3.2** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processBrokerError
(commands::BrokerError * error) throw (exceptions::ActiveMQException) [pure virtual]`
- 6.180.3.3** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processBrokerInfo (commands::BrokerInfo * info) throw (exceptions::ActiveMQException) [pure virtual]`
- 6.180.3.4** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processCommitTransactionOnePhase
(commands::TransactionInfo * info) throw (exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::ConnectionStateTracker` (p. 1162).

- 6.180.3.5** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processCommitTransactionTwoPhase
(commands::TransactionInfo * info) throw (exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::ConnectionStateTracker` (p. 1162).

- 6.180.3.6** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processConnectionControl
(commands::ConnectionControl * control) throw (exceptions::ActiveMQException) [pure virtual]`
- 6.180.3.7** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processConnectionError
(commands::ConnectionError * error) throw (exceptions::ActiveMQException) [pure virtual]`
- 6.180.3.8** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processConnectionInfo
(commands::ConnectionInfo * info) throw (exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

- 6.180.3.9** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processConsumerControl
(commands::ConsumerControl * control) throw (exceptions::ActiveMQException) [pure virtual]`
- 6.180.3.10** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processConsumerInfo
(commands::ConsumerInfo * info) throw (exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

6.180.3.11 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processControlCommand
(commands::ControlCommand * *command*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.12 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processDestinationInfo
(commands::DestinationInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

6.180.3.13 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processEndTransaction
(commands::TransactionInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

6.180.3.14 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processFlushCommand
(commands::FlushCommand * *command*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.15 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processForgetTransaction
(commands::TransactionInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.16 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processKeepAliveInfo
(commands::KeepAliveInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.17 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processMessage (commands::Message * *send*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

6.180.3.18 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processMessageAck
(commands::MessageAck * *ack*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

- 6.180.3.19** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processMessageDispatch
(commands::MessageDispatch * dispatch) throw (exceptions::ActiveMQException)` [pure virtual]
- 6.180.3.20** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processMessageDispatchNotification
(commands::MessageDispatchNotification * notification) throw (exceptions::ActiveMQException)` [pure virtual]
- 6.180.3.21** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processMessagePull
(commands::MessagePull * pull) throw (exceptions::ActiveMQException)` [pure virtual]
- 6.180.3.22** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processPrepareTransaction
(commands::TransactionInfo * info) throw (exceptions::ActiveMQException)` [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1163).

- 6.180.3.23** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processProducerAck
(commands::ProducerAck * ack) throw (exceptions::ActiveMQException)` [pure virtual]
- 6.180.3.24** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processProducerInfo
(commands::ProducerInfo * info) throw (exceptions::ActiveMQException)` [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

- 6.180.3.25** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRecoverTransactions
(commands::TransactionInfo * info) throw (exceptions::ActiveMQException)` [pure virtual]
- 6.180.3.26** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveConnection (commands::ConnectionId * id) throw (exceptions::ActiveMQException)` [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

- 6.180.3.27** `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveConsumer (commands::ConsumerId * id) throw (exceptions::ActiveMQException)` [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

6.180.3.28 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveDestination
(commands::DestinationInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

6.180.3.29 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveInfo
(commands::RemoveInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::CommandVisitorAdapter` (p. 1007).

6.180.3.30 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveProducer (commands::ProducerId * *id*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

6.180.3.31 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveSession (commands::SessionId * *id*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

6.180.3.32 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRemoveSubscriptionInfo
(commands::RemoveSubscriptionInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.33 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processReplayCommand
(commands::ReplayCommand * *replay*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.34 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processResponse
(commands::Response * *response*) throw (exceptions::ActiveMQException) [pure virtual]

6.180.3.35 virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processRollbackTransaction
(commands::TransactionInfo * *info*) throw (exceptions::ActiveMQException) [pure virtual]

Implemented in `activemq::state::ConnectionStateTracker` (p. 1164).

6.180.3.36 `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processSessionInfo
(commands::SessionInfo * info) throw (
exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::ConnectionStateTracker` (p. 1165).

6.180.3.37 `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processShutdownInfo
(commands::ShutdownInfo * info) throw (
exceptions::ActiveMQException) [pure virtual]`

6.180.3.38 `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processTransactionInfo
(commands::TransactionInfo * info) throw (
exceptions::ActiveMQException) [pure virtual]`

Implemented in `activemq::state::CommandVisitorAdapter` (p. 1008).

6.180.3.39 `virtual decaf::lang::Pointer<commands::Command>
activemq::state::CommandVisitor::processWireFormat
(commands::WireFormatInfo * info) throw (
exceptions::ActiveMQException) [pure virtual]`

The documentation for this class was generated from the following file:

- `src/main/activemq/state/CommandVisitor.h`

6.181 `activemq::state::CommandVisitorAdapter` Class Reference

Default Implementation of a `CommandVisitor` (p. 996) that returns NULL for all calls.

`#include <src/main/activemq/state/CommandVisitorAdapter.h>`

6.182 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

```
#include <src/main/decaf/lang/Comparable.h>
```

Public Member Functions

- virtual **~Comparable** ()
- virtual int **compareTo** (const T &value) const =0
Compares this object with the specified object for order.
- virtual bool **equals** (const T &value) const =0
- virtual bool **operator==** (const T &value) const =0
Compares equality between this object and the one passed.
- virtual bool **operator<** (const T &value) const =0
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.182.1 Detailed Description

```
template<typename T> class decaf::lang::Comparable< T >
```

This interface imposes a total ordering on the objects of each class that implements it. This ordering is referred to as the class's natural ordering, and the class's compareTo method is referred to as its natural comparison method.

6.182.2 Constructor & Destructor Documentation

6.182.2.1 `template<typename T> virtual decaf::lang::Comparable< T
>::~Comparable () [inline, virtual]`

6.182.3 Member Function Documentation

6.182.3.1 `template<typename T> virtual int decaf::lang::Comparable< T
>::compareTo (const T & value) const [pure virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all x and y. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementor must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all z.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the **Comparable** (p.1009) interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Boolean** (p.676), **decaf::lang::Byte** (p.779), **decaf::lang::Character** (p.917), **decaf::lang::Double** (p.1444), **decaf::lang::Float** (p.1547), **decaf::lang::Integer** (p.1656), **decaf::lang::Long** (p.1937), and **decaf::lang::Short** (p.2732).

6.182.3.2 `template<typename T> virtual bool decaf::lang::Comparable< T
>::equals (const T & value) const [pure virtual]`

Returns

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Boolean** (p.676), **decaf::lang::Byte** (p.780), **decaf::lang::Character** (p.918), **decaf::lang::Double** (p.1446), **decaf::lang::Float** (p.1548), **decaf::lang::Integer** (p.1658), **decaf::lang::Long** (p.1939), and **decaf::lang::Short** (p.2733).

6.182.3.3 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & value) const` [pure virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implemented in `decaf::lang::Boolean` (p. 676), `decaf::lang::Byte` (p. 781), `decaf::lang::Character` (p. 920), `decaf::lang::Double` (p. 1448), `decaf::lang::Float` (p. 1551), `decaf::lang::Integer` (p. 1660), `decaf::lang::Long` (p. 1941), and `decaf::lang::Short` (p. 2734).

6.182.3.4 `template<typename T> virtual bool decaf::lang::Comparable< T >::operator== (const T & value) const` [pure virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implemented in `decaf::lang::Boolean` (p. 677), `decaf::lang::Byte` (p. 781), `decaf::lang::Character` (p. 920), `decaf::lang::Double` (p. 1449), `decaf::lang::Float` (p. 1551), `decaf::lang::Integer` (p. 1660), `decaf::lang::Long` (p. 1942), and `decaf::lang::Short` (p. 2735).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Comparable.h`

6.183 `decaf::util::Comparator< T >` Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

```
#include <src/main/decaf/util/Comparator.h>
```

Public Member Functions

- `virtual ~Comparator()`

- virtual bool **operator()** (const T &left, const T &right) const =0

*Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1011) to be passed to an STL **Map** (p. 1970) for use as the sorting criteria.*

- virtual int **compare** (const T &o1, const T &o2) const =0

Compares its two arguments for order.

6.183.1 Detailed Description

template<typename T> class decaf::util::Comparator< T >

A comparison function, which imposes a total ordering on some collection of objects. Comparators can be passed to a sort method (such as Collections.sort) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 1011) c on a set of elements S is said to be consistent with equals if and only if (compare(e1, e2) == 0) has the same boolean value as (e1 == e2) for every e1 and e2 in S.

6.183.2 Constructor & Destructor Documentation

6.183.2.1 template<typename T> virtual decaf::util::Comparator< T >::~~Comparator () [inline, virtual]

6.183.3 Member Function Documentation

6.183.3.1 template<typename T> virtual int decaf::util::Comparator< T >::compare (const T & o1, const T & o2) const [pure virtual]

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that `sgn(compare(x, y)) == -sgn(compare(y, x))` for all x and y. (This implies that `compare(x, y)` must throw an exception if and only if `compare(y, x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `((compare(x, y)>0) && (compare(y, z)>0))` implies `compare(x, z)>0`.

Finally, the implementer must ensure that `compare(x, y)==0` implies that `sgn(compare(x, z))==sgn(compare(y, z))` for all z.

It is generally the case, but not strictly required that `(compare(x, y)==0) == (x == y)`. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

o1 - the first object to be compared

o2 - the second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implemented in **decaf::util::comparators::Less< E >** (p. 1863).

6.183.3.2 `template<typename T> virtual bool decaf::util::Comparator< T
>::operator() (const T & left, const T & right) const` [pure virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1011) to be passed to an STL **Map** (p. 1970) for use as the sorting criteria.

Parameters

left - the Left hand side operand.

right - the Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implemented in **decaf::util::comparators::Less< E >** (p. 1864).

6.186.3.1 `void activemq::threads::CompositeTaskRunner::addTask (
CompositeTask * task)`

Adds a new **CompositeTask** (p. 1016) to the Set of Tasks that this class manages.

Parameters

task - Pointer to a **CompositeTask** (p. 1016) instance.

6.186.3.2 `virtual bool activemq::threads::CompositeTaskRunner::iterate ()
[protected, virtual]`

6.186.3.3 `void activemq::threads::CompositeTaskRunner::removeTask (
CompositeTask * task)`

Removes a **CompositeTask** (p. 1016) that was added previously.

Parameters

task - Pointer to a **CompositeTask** (p. 1016) instance.

6.186.3.4 `virtual void activemq::threads::CompositeTaskRunner::run ()
[protected, virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2642).

6.186.3.5 `virtual void activemq::threads::CompositeTaskRunner::shutdown ()
[virtual]`

Shutdown once the task has finished and the TaskRunner's thread has exited.

6.186.3.6 `virtual void activemq::threads::CompositeTaskRunner::shutdown (
unsigned int timeout) [virtual]`

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout - Time in Milliseconds to wait for the task to stop.

6.186.3.7 virtual void activemq::threads::CompositeTaskRunner::wakeup () [virtual]

Signal the **TaskRunner** (p. 2958) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2956) instance will be run until its iterate method has returned false indicating it is done.

The documentation for this class was generated from the following file:

6.187 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 3066) is a **Transport** (p. 3066) implementation that is composed of several Transports.

```
#include <src/main/activemq/transport/CompositeTransport.h>
```

Inheritance diagram for activemq::transport::CompositeTransport:

Public Member Functions

- virtual ~**CompositeTransport** ()
- virtual void **addURI** (const **List**< **URI** > &uris)=0

*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3066) is a composite of.*

- virtual void **removeURI** (const **List**< **URI** > &uris)=0

*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3066) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3066) should result in that **Transport** (p. 3066) being disposed of.*

6.187.1 Detailed Description

A Composite **Transport** (p. 3066) is a **Transport** (p. 3066) implementation that is composed of several Transports. The composition could be such that only one **Transport** (p. 3066) exists for each URI that is composed or there could be many active Transports working at once.

Since

3.0

6.187.2 Constructor & Destructor Documentation

6.187.2.1 virtual activemq::transport::CompositeTransport::~CompositeTransport () [inline, virtual]

6.187.3 Member Function Documentation

6.187.3.1 virtual void activemq::transport::CompositeTransport::addURI (const List< URI > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3066) is a composite of.

Parameters

uris The new URI set to add to the set this composite maintains.

6.187.3.2 virtual void activemq::transport::CompositeTransport::removeURI (const List< URI > & *uris*) [pure virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3066) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3066) should result in that **Transport** (p. 3066) being disposed of.

Parameters

uris The new URI set to remove to the set this composite maintains.

- src/main/activemq/transport/**CompositeTransport.h**

6.188 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference

Interface for a **Map** (p. 1970) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1970) interface.

#include <src/main/decaf/util/concurrent/ConcurrentMap.h>

Inheritance diagram for decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >:

Public Member Functions

- virtual ~**ConcurrentMap** ()
- virtual bool **putIfAbsent** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)

If the specified key is not already associated with a value, associate it with the given value.

- virtual bool **remove** (const K &key, const V &value)=0
Remove entry for key only if currently mapped to given value.
- virtual bool **replace** (const K &key, const V &oldValue, const V &newValue)=0
Replace entry for key only if currently mapped to given value.
- virtual V **replace** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::NoSuchElementException)
Replace entry for key only if currently mapped to some value.

6.188.1 Detailed Description

template<typename K, typename V, typename COMPARATOR> class decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >

Interface for a **Map** (p.1970) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p.1970) interface.

Since

1.0

6.188.2 Constructor & Destructor Documentation

6.188.2.1 template<typename K, typename V, typename COMPARATOR>
virtual decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
>::~ConcurrentMap () [inline, virtual]

6.188.3 Member Function Documentation

6.188.3.1 template<typename K, typename V, typename COMPARATOR>
virtual bool decaf::util::concurrent::ConcurrentMap< K, V,
COMPARATOR >::putIfAbsent (const K & *key*, const V & *value*)
throw (decaf::lang::exceptions::UnsupportedOperationException) [pure
virtual]

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key The key to map the value to.

value The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

UnsupportedOperationException if the put operation is not supported by this map

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p.1035), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p.1035).

6.188.3.2 template<typename K, typename V, typename COMPARATOR> virtual
bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
>::remove (const K & *key*, const V & *value*) [pure virtual]

Remove entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.

value value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p.1035), decaf::util::concurrent::ConcurrentStlMap<

`Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1035), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1035), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1035), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1035), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1035), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1035).

6.188.3.3 `template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (const K & key, const V & oldValue, const V & newValue)` [pure virtual]

Replace entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns

true if the value was replaced

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1037), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1037).

6.188.3.4 `template<typename K, typename V, typename COMPARATOR> virtual
 V decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR
 >::replace (const K & key, const V & value) throw (
 decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Replace entry for key only if currently mapped to some value.

Acts as

```
if( ( map.containsKey( key ) ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an NoSuchElementException if there was no mapping for key.

Exceptions

NoSuchElementException if there was no previous mapping.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1036), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1036), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1036), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1036), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1036), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1036), and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1036).

Public Member Functions

- **ConcurrentStlMap** ()
Default constructor - does nothing.
- **ConcurrentStlMap** (const **ConcurrentStlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **ConcurrentStlMap** (const **Map**< K, V, COMPARATOR > &source)
Copy constructor - copies the content of the given map into this one.
- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (const **ConcurrentStlMap** &source) const
- virtual bool **equals** (const **Map**< K, V, COMPARATOR > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **ConcurrentStlMap** &source)
- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
Copies the content of the source map into this map.
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions
***UnsupportedOperationException** if this map is unmodifiable.*
- virtual bool **containsKey** (const K &key) const
Indicates whether or this map contains a value for the given key.
Parameters
***key** The key to look up.*
Returns
true if this map contains the value, otherwise false.
- virtual bool **containsValue** (const V &value) const
Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.
Parameters
***value** The Value to look up.*
Returns
true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () const
Returns
*if the **Map** (p. 1970) contains any element or not, TRUE or FALSE*

- virtual std::size_t **size** () const
Returns
The number of elements (key/value pairs) in this map.

- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1970).*
*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*
Parameters
key The search key.
Returns
A reference to the value for the given key.
Exceptions
***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1970).*

- virtual const V & **get** (const K &key) const throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1970).*
*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*
Parameters
key The search key.
Returns
A {const} reference to the value for the given key.
Exceptions
***NoSuchElementException** if the key requests doesn't exist in the **Map** (p. 1970).*

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)
Sets the value for the specified key.
Parameters
key The target key.
value The value to be set.
Exceptions
***UnsupportedOperationException** if this map is unmodifiable.*

- virtual void **putAll** (const ConcurrentStlMap< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual void **putAll** (const Map< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)
*Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.*

Parameters

*other A **Map** (p. 1970) instance whose elements are to all be inserted in this **Map** (p. 1970).*

Exceptions

UnsupportedOperationException *If the implementing class does not support the putAll operation.*

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException *if this key is not in the **Map** (p. 1970).*
UnsupportedOperationException *if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () const

*Returns a **Set** (p. 2729) view of the mappings contained in this map.*

*The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1718), **Set.remove** (p. 127), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

Returns

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns

the entire set of values in this map as a std::vector.

- bool **putIfAbsent** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (const K &key, const V &value)

Remove entry for key only if currently mapped to given value.

- bool **replace** (const K &key, const V &oldValue, const V &newValue)

Replace entry for key only if currently mapped to given value.

- V **replace** (const K &key, const V &value) throw (decaf::lang::exceptions::NoSuchElementException)

Replace entry for key only if currently mapped to some value.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
*Attempts to **Lock** (p.1903) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.189.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >
```

Map (p.1970) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map. This version of **Map** (p.1970) extends the **ConcurrentMap** (p.1020) interface and implements all the methods defined in that interface. Unlike a Java ConcurrentHashMap this implementations synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since

6.189.2 Constructor & Destructor Documentation

6.189.2.1 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::ConcurrentStlMap () [inline]`

Default constructor - does nothing.

6.189.2.2 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::ConcurrentStlMap (const ConcurrentStlMap< K,
V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.189.2.3 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K,
V, COMPARATOR >::ConcurrentStlMap (const Map< K, V,
COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.189.2.4 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::~~ConcurrentStlMap () [inline, virtual]`

6.189.3 Member Function Documentation

6.189.3.1 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARATOR >::clear () throw (
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1972).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()`.

6.189.3.2 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::containsKey (const K & key) const
 [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

key The key to look up.

Returns

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1973).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< Produc-
 erId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals()`,
`decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState
 >, ProducerId::COMPARATOR >::putIfAbsent()`, `decaf::util::concurrent::ConcurrentStlMap<
 Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::remove()`,
 and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState
 >, ProducerId::COMPARATOR >::replace()`.

6.189.3.3 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::containsValue (const V & value) const
 [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this
 manner.

Parameters

value The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1973).

6.189.3.4 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::copy (const ConcurrentStlMap< K, V,
 COMPARATOR > & source) [inline, virtual]`

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< Pro-
 ducerState >, ProducerId::COMPARATOR >::ConcurrentStlMap()`.

6.189.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source) [inline, virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source The source object to copy from.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1974).

6.189.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const [inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source - `Map` (p. 1970) to compare to this one.

Returns

true if the `Map` (p. 1970) passed is equal in value to this one.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1974).

6.189.3.7 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const ConcurrentStlMap< K, V, COMPARATOR > & source) const [inline, virtual]`

6.189.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & key) throw (lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the `Map` (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1975).

6.189.3.9 `template<typename K, typename V, typename
COMPARATOR = std::less<K>> virtual const V&
decaf::util::concurrent::ConcurrentStlMap< K, V,
COMPARATOR >::get (const K & key) const throw (
lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1976).

6.189.3.10 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap<
K, V, COMPARATOR >::isEmpty () const [inline, virtual]`

Returns

if the **Map** (p. 1970) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1977).

6.189.3.11 `template<typename K, typename V, typename
COMPARATOR = std::less<K>> virtual std::vector<K>
decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
>::keySet () const [inline, virtual]`

Returns a **Set** (p. 2729) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1718), **Set.remove** (p. 127), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1977).

6.189.3.12 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p.2932).

6.189.3.13 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p.2930) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p.2933).

6.189.3.14 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p.2930) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p.2934).

6.189.3.15 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::put (const K & key, const V & value
) throw (decaf::lang::exceptions::UnsupportedOperationException)
 [inline, virtual]`

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1978).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace()`.

6.189.3.16 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::putAll (const Map<
 K, V, COMPARATOR > & other) throw (
 decaf::lang::exceptions::UnsupportedOperationException) [inline,
 virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.

Parameters

other A **Map** (p. 1970) instance whose elements are to all be inserted in this **Map** (p. 1970).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1979).

6.189.3.17 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::putAll (const ConcurrentStlMap<
 K, V, COMPARATOR > & other) throw (
 decaf::lang::exceptions::UnsupportedOperationException) [inline,
 virtual]`

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy()`.

6.189.3.18 `template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putIfAbsent (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key The key to map the value to.

value The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

UnsupportedOperationException if the put operation is not supported by this map

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p. 1021).

6.189.3.19 `template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & key, const V & value) [inline, virtual]`

Remove entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == value ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.
value value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 1022).

6.189.3.20 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the **Map** (p. 1970).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1980).

6.189.3.21 `template<typename K, typename V, typename COMPARATOR = std::less<K>> V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & key, const V & value) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Replace entry for key only if currently mapped to some value.

Acts as

```
if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException(...);
};
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.

value value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an `NoSuchElementException` if there was no mapping for key.

Exceptions

NoSuchElementException if there was no previous mapping.

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p. 1024).

6.189.3.22 `template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & key, const V & oldValue, const V & newValue) [inline, virtual]`

Replace entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key key with which the specified value is associated.

oldValue value expected to be associated with the specified key.

newValue value to be associated with the specified key.

Returns

true if the value was replaced

Implements `decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >` (p. 1023).

6.189.3.23 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::size_t decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::size () const [inline, virtual]`

Returns

The number of elements (key/value pairs) in this map.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1981).

6.189.3.24 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::tryLock () throw (
 decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to **Lock** (p.1903) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p.2935).

6.189.3.25 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::unlock () throw (
 decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p.2936).

6.189.3.26 `template<typename K, typename V, typename
 COMPARATOR = std::less<K>> virtual std::vector<V>
 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
 >::values () const [inline, virtual]`

Returns

the entire set of values in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p.1981).

Referenced by `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values()`.

6.189.3.27 `template<typename K, typename V, typename COMPARATOR =
 std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
 K, V, COMPARATOR >::wait (long long millisecs
) throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException,
 decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

```
6.189.3.28  template<typename K, typename V, typename
             COMPARATOR = std::less<K>> virtual void
             decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR
             >::wait (    ) throw ( decaf::lang::exceptions::RuntimeException,
             decaf::lang::exceptions::IllegalMonitorStateException,
             decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

```
6.189.3.29  template<typename K, typename V, typename COMPARATOR =
             std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap<
             K, V, COMPARATOR >::wait ( long long millisecs, int
             nanos ) throw ( decaf::lang::exceptions::RuntimeException,
             decaf::lang::exceptions::IllegalArgumentException,
             decaf::lang::exceptions::IllegalMonitorStateException,
             decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ConcurrentStlMap.h**

6.190 decaf::util::concurrent::locks::Condition Class Reference

Condition (p. 1040) factors out the **Mutex** (p. 2239) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1898) implementations.

6.190.1 Detailed Description

Condition (p. 1040) factors out the **Mutex** (p. 2239) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1898) implementations. Where a **Lock** (p. 1898) replaces the use of synchronized statements, a **Condition** (p. 1040) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs in different threads, it must be protected, so a lock of some form is associated with the condition. The key property that waiting for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 1040) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 1040) instance for a particular **Lock** (p. 1898) instance use its newCondition() method.

As an example, suppose we have a bounded buffer which supports put and take methods. If a take is attempted on an empty buffer, then the thread will block until an item becomes available; if a put is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting put threads and take threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 1040) instances.

```
class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();
```

```
Object* items = new Object[100]; int putptr, takeptr, count;
```

```
public void put( Object* x ) throw( InterruptedException ) { lock->lock(); try { while( count == 100 ) notFull->await() (p. 1042); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->signal() (p. 1046); } catch(...) { lock->unlock(); } }
```

```
public Object take() throw( InterruptedException ) { lock->lock(); try { while(count == 0) notEmpty->await() (p. 1042); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->signal() (p. 1046); return x; } catch(...) { lock->unlock(); } }
```

(The ArrayBlockingQueue class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 1040), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most

application programs as a **Condition** (p. 1040) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.190.2 Constructor & Destructor Documentation

6.190.2.1 `virtual decaf::util::concurrent::locks::Condition::~~Condition ()`
[inline, virtual]

6.190.3 Member Function Documentation

6.190.3.1 `virtual void decaf::util::concurrent::locks::Condition::await () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException)` [pure virtual]

Causes the current thread to wait until it is signaled or interrupted.

The lock associated with this **Condition** (p. 1040) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes the **signal()** (p. 1046) method for this **Condition** (p. 1040) and the current thread happens to be chosen as the thread to be awakened; or * Some other thread invokes the **signalAll()** (p. 1046) method for this **Condition** (p. 1040); or * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting and interruption of thread suspension is supported,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1040) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as `IllegalMonitorStateException`) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1040).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

```
6.190.3.2  virtual bool decaf::util::concurrent::locks::Condition::await
            ( long long time, const TimeUnit & unit )
            throw ( decaf::lang::exceptions::RuntimeException,
                    decaf::lang::exceptions::InterruptedException,
                    decaf::lang::exceptions::IllegalMonitorStateException ) [pure virtual]
```

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

This method is behaviorally equivalent to:

```
awaitNanos(unit.toNanos(time)) > 0
```

Parameters

time - the maximum time to wait

unit - the time unit of the time argument

Returns

false if the waiting time detectably elapsed before return from the method, else true

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1040).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

```

6.190.3.3 virtual long long decaf::util::concurrent::locks::Condition::awaitNanos
( long long nanosTimeout ) throw ( de-
caf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::InterruptedException, de-
caf::lang::exceptions::IllegalMonitorStateException ) [pure
virtual]

```

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

- * Some other thread invokes the **signal()** (p. 1046) method for this **Condition** (p. 1040) and the current thread happens to be chosen as the thread to be awakened; or
- * Some other thread invokes the **signalAll()** (p. 1046) method for this **Condition** (p. 1040); or
- * Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
- * The specified waiting time elapses; or
- * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting and interruption of thread suspension is supported,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied *nanosTimeout* value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

```

synchronized boolean aMethod( long timeout, const TimeUnit& unit ) { long nanosTimeout =
unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTimeout > 0) nanosTimeout
= theCondition->awaitNanos(nanosTimeout); else return false; } // ... }

```

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1040) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as **IllegalMonitorStateException**) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters

nanosTimeout - the maximum time to wait, in nanoseconds

Returns

an estimate of the nanosTimeout value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1040).

InterruptedException if the current thread is interrupted (and interruption of thread suspension is supported)

IllegalMonitorStateException if the caller is not the lock owner.

6.190.3.4 virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Causes the current thread to wait until it is signalled.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes the **signal()** (p. 1046) method for this **Condition** (p. 1040) and the current thread happens to be chosen as the thread to be awakened; or * Some other thread invokes the **signalAll()** (p. 1046) method for this **Condition** (p. 1040); or * A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 1040) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as **IllegalMonitorStateException**) and the implementation must document that fact.

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p. 1040).

IllegalMonitorStateException if the caller is not the lock owner.

6.190.3.5 virtual bool decaf::util::concurrent::locks::Condition::awaitUntil (const Date & *deadline*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

6.190.3.6 virtual void decaf::util::concurrent::locks::Condition::signal () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Wakes up one waiting thread.

If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p.1040).

6.190.3.7 virtual void decaf::util::concurrent::locks::Condition::signalAll () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Wakes up all waiting threads.

If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

Exceptions

RuntimeException if an unexpected error occurs while trying to wait on the **Condition** (p.1040).

#include <src/main/decaf/internal/util/concurrent/ConditionImpl.h>
```

Static Public Member Functions

- static **decaf::util::concurrent::ConditionHandle** * **create** (**decaf::util::concurrent::MutexHandle** *mutex)
Creates the Condition object and attaches it to the given MutexHandle.
- static void **destroy** (**decaf::util::concurrent::ConditionHandle** *handle)
Destroy a previously create Condition instance.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition)
Waits for the condition to be signaled.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition, long long mills, long long nanos)
Waits for the condition to be signaled or for the time specified to ellapse.
- static void **notify** (**decaf::util::concurrent::ConditionHandle** *condition)
Signals one Thread that is waiting on this condition to wake up.
- static void **notifyAll** (**decaf::util::concurrent::ConditionHandle** *condition)
Signals all Threads that is waiting on this condition to wake up.

6.192.1 Member Function Documentation

6.192.1.1 static **decaf::util::concurrent::ConditionHandle***
decaf::internal::util::concurrent::ConditionImpl::create (
decaf::util::concurrent::MutexHandle * *mutex*) [static]

Creates the Condition object and attaches it to the given MutexHandle.

Parameters

mutex the Mutex handle that this Condition is attached to.

Returns

a newly constructed Condition handle that is attached to the given handle.

6.192.1.2 static void **decaf::internal::util::concurrent::ConditionImpl::destroy** (
decaf::util::concurrent::ConditionHandle * *handle*) [static]

Destroy a previously create Condition instance.

Parameters

handle The Condition handle to be destroyed.

6.192.1.3 `static void decaf::internal::util::concurrent::ConditionImpl::notify (decaf::util::concurrent::ConditionHandle * condition) [static]`

Signals one Thread that is waiting on this condition to wake up.

Parameters

condition the handle to the condition to wait on.

6.192.1.4 `static void decaf::internal::util::concurrent::ConditionImpl::notifyAll (decaf::util::concurrent::ConditionHandle * condition) [static]`

Signals all Threads that is waiting on this condition to wake up.

Parameters

condition the handle to the condition to wait on.

6.192.1.5 `static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * condition, long long mills, long long nanos) [static]`

Waits for the condition to be signaled or for the time specified to ellapse.

Parameters

condition the handle to the condition to wait on.

mills the time in milliseconds to wait for the condition to be signaled.

nanos additional time in nanoseconds to wait for the thread to be signaled.

6.192.1.6 `static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * condition) [static]`

Waits for the condition to be signaled.

Parameters

condition the handle to the condition to wait on.

6.193 decaf::net::ConnectException Class Reference

```
#include <src/main/decaf/net/ConnectException.h>
```

Inheritance diagram for decaf::net::ConnectException:

Public Member Functions

- **ConnectException** () throw ()
Default Constructor.
- **ConnectException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **ConnectException** (const **ConnectException** &ex) throw ()
Copy Constructor.
- **ConnectException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ConnectException** (const std::exception *cause) throw ()
Constructor.
- **ConnectException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ConnectException** * **clone** () const
Clones this exception.
- virtual ~**ConnectException** () throw ()

6.193.1 Constructor & Destructor Documentation

6.193.1.1 decaf::net::ConnectException::ConnectException () throw () [inline]

Default Constructor.

6.193.1.2 decaf::net::ConnectException::ConnectException (const Exception &ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.193.1.3 decaf::net::ConnectException::ConnectException (const ConnectException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.193.1.4 `decaf::net::ConnectException::ConnectException (const char * file,
const int lineNumber, const std::exception * cause, const char * msg,
...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.193.1.5 `decaf::net::ConnectException::ConnectException (const std::exception *
cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.193.1.6 `decaf::net::ConnectException::ConnectException (const char * file,
const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.193.1.7 `virtual decaf::net::ConnectException::~~ConnectException () throw ()
[inline, virtual]`

6.193.2 Member Function Documentation

6.193.2.1 `virtual ConnectException* decaf::net::ConnectException::clone ()
const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2794).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ConnectException.h**

6.194 cms::Connection Class Reference

The client's connection to its provider.

```
#include <src/main/cms/Connection.h>
```

Inheritance diagram for cms::Connection:

Public Member Functions

- virtual **~Connection** ()
- virtual void **close** ()=0 throw (CMSEException)
Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).
- virtual const **ConnectionMetaData** * **getMetaData** () const =0 throw (CMSEException)
Gets the metadata for this connection.
- virtual **Session** * **createSession** ()=0 throw (CMSEException)
Creates an AUTO_ACKNOWLEDGE Session (p. 2663).
- virtual **Session** * **createSession** (Session::AcknowledgeMode ackMode)=0 throw (CMSEException)
Creates a new Session (p. 2663) to work for this Connection (p. 1052) using the specified acknowledgment mode.
- virtual std::string **getClientID** () const =0
Get the Client Id for this session.
- virtual **ExceptionListener** * **getExceptionListener** () const =0
Gets the registered Exception Listener for this connection.
- virtual void **setExceptionListener** (ExceptionListener *listener)=0
Sets the registered Exception Listener for this connection.

6.194.1 Detailed Description

The client's connection to its provider. Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 1154) object.
- It supports an optional **ExceptionListener** (p. 1483) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since

1.0

6.194.2 Constructor & Destructor Documentation

6.194.2.1 `virtual cms::Connection::~~Connection () [inline, virtual]`

6.194.3 Member Function Documentation

6.194.3.1 `virtual void cms::Connection::close () throw (CMSException) [pure virtual]`

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

CMSException (p. 960)

Implements **cms::Closeable** (p. 952).

6.194.3.2 `virtual Session* cms::Connection::createSession (Session::AcknowledgeMode ackMode) throw (CMSEException) [pure virtual]`

Creates a new **Session** (p. 2663) to work for this **Connection** (p. 1052) using the specified acknowledgment mode.

Parameters

ackMode the Acknowledgment Mode to use.

Exceptions

CMSEException (p. 960)

6.194.3.3 `virtual Session* cms::Connection::createSession () throw (CMSEException) [pure virtual]`

Creates an AUTO_ACKNOWLEDGE **Session** (p. 2663).

Exceptions

CMSEException (p. 960)

6.194.3.4 `virtual std::string cms::Connection::getClientID () const [pure virtual]`

Get the Client Id for this session.

Returns

Client Id String

6.194.3.5 `virtual ExceptionListener* cms::Connection::getExceptionListener () const [pure virtual]`

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

6.194.3.6 `virtual const ConnectionMetaData* cms::Connection::getMetaData () const throw (CMSEException) [pure virtual]`

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

CMSEException (p. 960) if the provider fails to get the connection metadata for this connection.

See also

ConnectionMetaData (p. 1154)

Since

2.0

6.194.3.7 `virtual void cms::Connection::setExceptionListener (ExceptionListener * listener)` [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters

listener pointer to and ExceptionListener (p. 1483)

The documentation for this class was generated from the following file:

- `src/main/cms/Connection.h`

6.195 activemq::commands::ConnectionControl Class Reference

```
#include <src/main/activemq/commands/ConnectionControl.h>
```

Inheritance diagram for activemq::commands::ConnectionControl:

Public Member Functions

- **ConnectionControl** ()
- virtual **~ConnectionControl** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConnectionControl** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual bool **isClose** () const
- virtual void **setClose** (bool **close**)
- virtual bool **isExit** () const
- virtual void **setExit** (bool **exit**)
- virtual bool **isFaultTolerant** () const
- virtual void **setFaultTolerant** (bool **faultTolerant**)
- virtual bool **isResume** () const
- virtual void **setResume** (bool **resume**)
- virtual bool **isSuspend** () const
- virtual void **setSuspend** (bool **suspend**)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

6.195.1 Constructor & Destructor Documentation

6.195.1.1 `activemq::commands::ConnectionControl::ConnectionControl (const ConnectionControl &)` [inline, protected]

6.195.1.2 `activemq::commands::ConnectionControl::ConnectionControl ()`

6.195.1.3 `virtual activemq::commands::ConnectionControl::~~ConnectionControl ()` [virtual]

6.195.2 Member Function Documentation

6.195.2.1 `virtual ConnectionControl* activemq::commands::ConnectionControl::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.195.2.2 `virtual void activemq::commands::ConnectionControl::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.195.2.3 `virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.195.2.4 `virtual unsigned char activemq::commands::ConnectionControl::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

6.195.2.5 virtual bool activemq::commands::ConnectionControl::isClose () const [virtual]

6.195.2.6 virtual bool activemq::commands::ConnectionControl::isExit () const [virtual]

6.195.2.7 virtual bool activemq::commands::ConnectionControl::isFaultTolerant () const [virtual]

6.195.2.8 virtual bool activemq::commands::ConnectionControl::isResume () const [virtual]

6.195.2.9 virtual bool activemq::commands::ConnectionControl::isSuspend () const [virtual]

6.195.2.10 ConnectionControl& activemq::commands::ConnectionControl::operator= (const ConnectionControl &) [inline, protected]

6.195.2.11 virtual void activemq::commands::ConnectionControl::setClose (bool *close*) [virtual]

6.195.2.12 virtual void activemq::commands::ConnectionControl::setExit (bool *exit*) [virtual]

6.195.2.13 virtual void activemq::commands::ConnectionControl::setFaultTolerant (bool *faultTolerant*) [virtual]

6.195.2.14 virtual void activemq::commands::ConnectionControl::setResume (bool *resume*) [virtual]

6.195.2.15 virtual void activemq::commands::ConnectionControl::setSuspend (bool *suspend*) [virtual]

6.195.2.16 virtual std::string activemq::commands::ConnectionControl::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

```

6.195.2.17 virtual Pointer<Command> activemq::commands::ConnectionControl::visit (
    activemq::state::CommandVisitor * visitor ) throw (
    exceptions::ActiveMQException ) [virtual]

```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.195.3 Field Documentation

- 6.195.3.1** bool **activemq::commands::ConnectionControl::close** [protected]

6.196 activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller Class Reference

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 1059).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ConnectionControlMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller**:

Public Member Functions

- **ConnectionControlMarshaller** ()
- virtual **~ConnectionControlMarshaller** ()
- virtual **commands::DataStructure * createObject** () const

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshall an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.196.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p.1059). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.196.2 Constructor & Destructor Documentation

6.196.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::ConnectionControlMarshaller()` [inline]

6.196.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::~~ConnectionControlMarshaller()` [inline, virtual]

6.196.3 Member Function Documentation

6.196.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.196.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.196.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.196.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.196.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.196.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

```
6.196.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.197.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p.1063). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.197.2 Constructor & Destructor Documentation

6.197.2.1 `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::ConnectionControlMarshaller () [inline]`

6.197.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::~~ConnectionControlMarshaller () [inline, virtual]`

6.197.3 Member Function Documentation

6.197.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.197.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.197.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.197.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.197.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.197.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.197.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ConnectionControlMarshaller.h`

6.198 `activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller` Class Reference

Marshaling code for Open Wire Format for `ConnectionControlMarshaller` (p. 1067).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ConnectionControlMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller`:

Public Member Functions

Write a object instance to data output stream.

6.198.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p.1067). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.198.2 Constructor & Destructor Documentation

6.198.2.1 `activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::ConnectionControlMarshaller () [inline]`

6.198.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::~ConnectionControlMarshaller () [inline, virtual]`

6.198.3 Member Function Documentation

6.198.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.198.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.198.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.198.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.198.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.198.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.198.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.199.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p.1071). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.199.2 Constructor & Destructor Documentation

6.199.2.1 `activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::ConnectionControlMarshaller () [inline]`

6.199.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::~~ConnectionControlMarshaller () [inline, virtual]`

6.199.3 Member Function Documentation

6.199.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.199.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.199.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.199.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.199.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.199.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.199.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

6.200.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p.1075). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.200.2 Constructor & Destructor Documentation

6.200.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::ConnectionControlMarshaller () [inline]`

6.200.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::~~ConnectionControlMarshaller () [inline, virtual]`

6.200.3 Member Function Documentation

6.200.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.200.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.200.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.200.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.200.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.200.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.200.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ConnectionControlMarshaller.h`

6.201 `activemq::commands::ConnectionError` Class Reference

#include <src/main/activemq/commands/ConnectionError.h>
```

Inheritance diagram for `activemq::commands::ConnectionError`:

Public Member Functions

- **ConnectionError** ()
- virtual **~ConnectionError** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ConnectionError * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID _ CONNECTIONERROR** = 16

Protected Member Functions

- **ConnectionError** (const **ConnectionError** &)
- **ConnectionError** & **operator=** (const **ConnectionError** &)

Protected Attributes

- **Pointer**< **BrokerError** > exception
- **Pointer**< **ConnectionId** > connectionId

6.201.1 Constructor & Destructor Documentation

- 6.201.1.1** `activemq::commands::ConnectionError::ConnectionError (const ConnectionError &) [inline, protected]`
- 6.201.1.2** `activemq::commands::ConnectionError::ConnectionError ()`
- 6.201.1.3** `virtual activemq::commands::ConnectionError::~~ConnectionError () [virtual]`

6.201.2 Member Function Documentation

- 6.201.2.1** `virtual ConnectionError* activemq::commands::ConnectionError::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

- 6.201.2.2** `virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

- 6.201.2.3** `virtual bool activemq::commands::ConnectionError::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

- 6.201.2.4 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () const [virtual]`
- 6.201.2.5 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId () [virtual]`
- 6.201.2.6 `virtual unsigned char activemq::commands::ConnectionError::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

- 6.201.2.7 `virtual Pointer<BrokerError>& activemq::commands::ConnectionError::getException () [virtual]`
- 6.201.2.8 `virtual const Pointer<BrokerError>& activemq::commands::ConnectionError::getException () const [virtual]`
- 6.201.2.9 `ConnectionError& activemq::commands::ConnectionError::operator= (const ConnectionError &) [inline, protected]`
- 6.201.2.10 `virtual void activemq::commands::ConnectionError::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`
- 6.201.2.11 `virtual void activemq::commands::ConnectionError::setException (const Pointer< BrokerError > & exception) [virtual]`
- 6.201.2.12 `virtual std::string activemq::commands::ConnectionError::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.201.2.13 `virtual Pointer<Command> activemq::commands::ConnectionError::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 995).

6.201.3 Field Documentation

6.201.3.1 `Pointer<ConnectionId> activemq::commands::ConnectionError::connectionId [protected]`

6.201.3.2 `Pointer<BrokerError> activemq::commands::ConnectionError::exception [protected]`

6.201.3.3 `const unsigned char activemq::commands::ConnectionError::ID _ - CONNECTIONERROR = 16 [static]`

The documentation for this class was generated from the following file:

6.202 activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller Class Reference

Marshaling code for Open Wire Format for `ConnectionErrorMarshaller` (p. 1083).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ConnectionErrorMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller`:

Public Member Functions

- `ConnectionErrorMarshaller ()`
- `virtual ~ConnectionErrorMarshaller ()`
- `virtual commands::DataStructure * createObject () const`

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.202.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p.1083). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.202.2 Constructor & Destructor Documentation

- 6.202.2.1 **activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::ConnectionErrorMarshaller** () [inline]
- 6.202.2.2 **virtual activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller** () [inline, virtual]

6.202.3 Member Function Documentation

- 6.202.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.202.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::getDataStructure () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.202.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 604).

6.202.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.202.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

6.202.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```

6.202.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ConnectionErrorMarshaller.h`

6.203 activemq::wireformat::openwire::marshal::v1::ConnectionErrorMa Class Reference

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p. 1087).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ConnectionErrorMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller**:

Public Member Functions

- **ConnectionErrorMarshaller** ()
- virtual **~ConnectionErrorMarshaller** ()

6.203.2.2 virtual
activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::~~ConnectionErrorMarshaller () [inline, virtual]

6.203.3 Member Function Documentation

6.203.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.203.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.203.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.203.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.203.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

6.203.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

6.203.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

6.204.3 Member Function Documentation

6.204.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.204.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.204.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.204.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.204.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.204.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.204.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

The documentation for this class was generated from the following file:

6.205.3 Member Function Documentation

6.205.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.205.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.205.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.205.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.205.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.205.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.205.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshall an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.206.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p.1099). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.206.2 Constructor & Destructor Documentation

6.206.2.1 activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::ConnectionErrorMarshaller () [inline]

6.206.2.2 virtual activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::~ConnectionErrorMarshaller () [inline, virtual]

6.206.3 Member Function Documentation

6.206.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.206.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.206.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.206.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.206.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

```
6.206.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.206.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionErrorMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ConnectionErrorMarshaller.h`

6.207 cms::ConnectionFactory Class Reference

Defines the interface for a factory that creates connection objects, the **Connection** (p.1052) objects returned implement the CMS **Connection** (p. 1052) interface and hide the CMS Provider specific implementation details behind that interface.

```
#include <src/main/cms/ConnectionFactory.h>
```

Inheritance diagram for cms::ConnectionFactory:

Public Member Functions

- virtual **~ConnectionFactory** ()
- virtual **Connection * createConnection** ()=0 throw (CMSEException)
Creates a connection with the default user identity.
- virtual **cms::Connection * createConnection** (const std::string &username, const std::string &password)=0 throw (cms::CMSEException)
Creates a connection with the default specified identity.
- virtual **cms::Connection * createConnection** (const std::string &username, const std::string &password, const std::string &clientId)=0 throw (cms::CMSEException)
Creates a connection with the specified user identity.

Static Public Member Functions

- static **ConnectionFactory * createCMSConnectionFactory** (const std::string &brokerURI) throw (cms::CMSEException)
Static method that is used to create a provider specific connection factory.

6.207.1 Detailed Description

Defines the interface for a factory that creates connection objects, the **Connection** (p.1052) objects returned implement the CMS **Connection** (p. 1052) interface and hide the CMS Provider specific implementation details behind that interface. A Client creates a new **ConnectionFactory** (p.1103) either directly by instantiating the provider specific implementation of the factory or

by using the static method `createCMSConnectionFactory` which all providers are required to implement.

Since

1.0

6.207.2 Constructor & Destructor Documentation

6.207.2.1 `virtual cms::ConnectionFactory::~~ConnectionFactory () [inline, virtual]`

6.207.3 Member Function Documentation

6.207.3.1 `static ConnectionFactory* cms::ConnectionFactory::createCMSConnectionFactory (const std::string & brokerURI) throw (cms::CMSException) [static]`

Static method that is used to create a provider specific connection factory.

The provider implements this method in their library and returns an instance of a **ConnectionFactory** (p. 1103) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

Parameters

brokerURI The remote address to use to connect to the Provider.

Returns

A pointer to a provider specific implementation of the **ConnectionFactory** (p. 1103) interface, the caller is responsible for deleting this resource.

Exceptions

CMSException (p. 960) if an internal error occurs while creating the **ConnectionFactory** (p. 1103).

6.207.3.2 `virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & username, const std::string & password) throw (cms::CMSException) [pure virtual]`

Creates a connection with the default specified identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2831) method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless `createConnection` will continue to use the default values that were set in the Constructor.

Parameters

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSEException (p. 960) if an internal error occurs while creating the **Connection** (p. 1052).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 213).

6.207.3.3 `virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & username, const std::string & password, const std::string & clientId) throw (cms::CMSEException) [pure virtual]`

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2831) method is explicitly called. The user name and password values passed here do not change the defaults, subsequent calls to the parameterless `createConnection` will continue to use the default values that were set in the Constructor.

Parameters

username The user name used to authenticate with the Provider.

password The password used to authenticate with the Provider.

clientId The Client Id assigned to connection. If the id is the empty string ("") then a random client Id is created for this connection.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSEException (p. 960) if an internal error occurs while creating the **Connection** (p. 1052).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 214).

6.207.3.4 `virtual Connection* cms::ConnectionFactory::createConnection () throw (CMSEException) [pure virtual]`

Creates a connection with the default user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 2831) method is explicitly called.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSException (p. 960) if an internal error occurs while creating the **Connection** (p. 1052).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 213).

[virtual]`

6.208.3 Member Function Documentation

- 6.208.3.1** `virtual ConnectionId* ac-
tivemq::commands::ConnectionId::cloneDataStructure (
) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.208.3.2 `virtual int activemq::commands::ConnectionId::compareTo (const ConnectionId & value) const` [virtual]

6.208.3.3 `virtual void activemq::commands::ConnectionId::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.208.3.4 `virtual bool activemq::commands::ConnectionId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.208.3.5 `virtual bool activemq::commands::ConnectionId::equals (const ConnectionId & value) const` [virtual]

6.208.3.6 `virtual unsigned char activemq::commands::ConnectionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

- 6.208.3.7 `virtual const std::string& activemq::commands::ConnectionId::getValue () const [virtual]`
- 6.208.3.8 `virtual std::string& activemq::commands::ConnectionId::getValue () [virtual]`

- 6.208.3.10 `ConnectionId& activemq::commands::ConnectionId::operator= (const ConnectionId & other)`
- 6.208.3.11 `virtual bool activemq::commands::ConnectionId::operator== (const ConnectionId & value) const [virtual]`
- 6.208.3.12 `virtual void activemq::commands::ConnectionId::setValue (const std::string & value) [virtual]`
- 6.208.3.13 `virtual std::string activemq::commands::ConnectionId::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.208.4 Field Documentation

- 6.208.4.1 `const unsigned char activemq::commands::ConnectionId::ID_ - CONNECTIONID = 120 [static]`

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.208.4.2 `std::string activemq::commands::ConnectionId::value [protected]`

6.209.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p.1109). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.209.2 Constructor & Destructor Documentation

6.209.2.1 `activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::ConnectionIdMarshaller () [inline]`

6.209.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::~~ConnectionIdMarshaller () [inline, virtual]`

6.209.3 Member Function Documentation

6.209.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.209.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.209.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.209.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.209.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.209.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.209.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::ConnectionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.210.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p.1113). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.210.2 Constructor & Destructor Documentation

6.210.2.1 `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.210.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.210.3 Member Function Documentation

6.210.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.210.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.210.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.210.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.210.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.210.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.210.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ConnectionIdMarshaller.h`

6.211 activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 1116).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ConnectionIdMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller**:

Public Member Functions

- **ConnectionIdMarshaller** ()

Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.211.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p.1116). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.211.2 Constructor & Destructor Documentation

6.211.2.1 `activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.211.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.211.3 Member Function Documentation

6.211.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.211.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.211.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.211.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.211.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.211.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.211.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.212.2 Constructor & Destructor Documentation

6.212.2.1 `activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::ConnectionIdMarshaller()` [inline]

6.212.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::~~ConnectionIdMarshaller()` [inline, virtual]

6.212.3 Member Function Documentation

6.212.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.212.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.212.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.212.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.212.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.212.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.212.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::ConnectionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.213.3 Member Function Documentation

6.213.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.213.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.213.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.213.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.213.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.213.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.213.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.214.2 Member Function Documentation

- 6.214.2.1** **virtual ConnectionInfo* activemq::commands::ConnectionInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

- 6.214.2.2** **virtual void activemq::commands::ConnectionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.214.2.3 `virtual bool activemq::commands::ConnectionInfo::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.214.2.4 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath () const` [virtual]

6.214.2.5 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath ()` [virtual]

6.214.2.7 `virtual std::string& activemq::commands::ConnectionInfo::getClientId ()` [virtual]

6.214.2.8 `virtual Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId ()` [virtual]

6.214.2.9 `virtual const Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId () const` [virtual]

6.214.2.10 `virtual unsigned char activemq::commands::ConnectionInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.214.2.11 `virtual const std::string& activemq::commands::ConnectionInfo::getPassword ()`
`const [virtual]`
- 6.214.2.12 `virtual std::string& activemq::commands::ConnectionInfo::getPassword () [virtual]`
- 6.214.2.13 `virtual const std::string& activemq::commands::ConnectionInfo::getUserName ()`
`const [virtual]`
- 6.214.2.14 `virtual std::string& activemq::commands::ConnectionInfo::getUserName () [virtual]`
- 6.214.2.15 `virtual bool activemq::commands::ConnectionInfo::isBrokerMasterConnector ()`
`const [virtual]`
- 6.214.2.16 `virtual bool activemq::commands::ConnectionInfo::isClientMaster ()`
`const [virtual]`
- 6.214.2.17 `virtual bool activemq::commands::ConnectionInfo::isConnectionInfo () const [inline, virtual]`

Returns

an answer of true to the `isConnectionInfo()` (p. 1132) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 600).

- 6.214.2.18 `virtual bool activemq::commands::ConnectionInfo::isManageable ()
const [virtual]`
- 6.214.2.19 `ConnectionInfo& activemq::commands::ConnectionInfo::operator= (
const ConnectionInfo &) [inline, protected]`

const std::string & userName) [virtual]`
- 6.214.2.28 `virtual std::string activemq::commands::ConnectionInfo::toString ()
const [virtual]`

Returns a string containing the information for this **DataSet** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.214.2.29 `virtual Pointer<Command> activemq::commands::ConnectionInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.214.3 Field Documentation

6.215.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.215.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.215.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.215.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.215.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.215.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.215.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

6.216.3 Member Function Documentation

6.216.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.216.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::getDataStructureT
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.216.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.216.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.216.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.216.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.216.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.217.3 Member Function Documentation

6.217.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.217.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::getDataStructureT
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.217.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.217.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.217.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.217.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.217.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

6.218.3 Member Function Documentation

6.218.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.218.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::getDataStructureT
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.218.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.218.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.218.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.218.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.218.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

- **ConnectionInfoMarshaller** ()
- virtual **~ConnectionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.219.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 1150). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.219.2 Constructor & Destructor Documentation

6.219.2.1 `activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::ConnectionInfoM`
`() [inline]`

6.219.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::~~ConnectionInfo`
`() [inline, virtual]`

6.219.3 Member Function Documentation

6.219.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.219.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::getDataStructureT`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.219.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.219.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.219.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.219.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.219.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConnectionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/ConnectionInfoMarshaller.h

6.220 cms::ConnectionMetaData Class Reference

A **ConnectionMetaData** (p. 1154) object provides information describing the **Connection** (p. 1052) object.

```
#include <src/main/cms/ConnectionMetaData.h>
```

Inheritance diagram for cms::ConnectionMetaData:

Public Member Functions

- virtual `~ConnectionMetaData ()`
- virtual `std::string getCMSVersion () const =0 throw (cms::CMSEException)`
Gets the CMS API version.
- virtual `int getCMSMajorVersion () const =0 throw (cms::CMSEException)`
Gets the CMS major version number.
- virtual `int getCMSMinorVersion () const =0 throw (cms::CMSEException)`
Gets the CMS minor version number.
- virtual `std::string getCMSProviderName () const =0 throw (cms::CMSEException)`
Gets the CMS provider name.
- virtual `std::string getProviderVersion () const =0 throw (cms::CMSEException)`
Gets the CMS provider version.
- virtual `int getProviderMajorVersion () const =0 throw (cms::CMSEException)`
Gets the CMS provider major version number.
- virtual `int getProviderMinorVersion () const =0 throw (cms::CMSEException)`
Gets the CMS provider minor version number.
- virtual `std::vector< std::string > getCMSXPropertyNames () const =0 throw (cms::CMSEException)`
Gets an Vector of the CMSX property names.

6.220.1 Detailed Description

A **ConnectionMetaData** (p.1154) object provides information describing the **Connection** (p.1052) object.

Since

1.3

6.220.2 Constructor & Destructor Documentation

- 6.220.2.1** `virtual cms::ConnectionMetaData::~~ConnectionMetaData () [inline, virtual]`

6.220.3 Member Function Documentation

- 6.220.3.1** `virtual int cms::ConnectionMetaData::getCMSMajorVersion () const throw (cms::CMSEException) [pure virtual]`

Gets the CMS major version number.

Returns

the CMS API major version number

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 217).

6.220.3.2 `virtual int cms::ConnectionMetaData::getCMSMinorVersion () const throw (cms::CMSEException) [pure virtual]`

Gets the CMS minor version number.

Returns

the CMS API minor version number

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 218).

6.220.3.3 `virtual std::string cms::ConnectionMetaData::getCMSProviderName () const throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider name.

Returns

the CMS provider name

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 218).

6.220.3.4 `virtual std::string cms::ConnectionMetaData::getCMSVersion () const throw (cms::CMSEException) [pure virtual]`

Gets the CMS API version.

Returns

the CMS API Version in String form.

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 218).

6.220.3.5 `virtual std::vector<std::string>
 cms::ConnectionMetaData::getCMSXPropertyNames ()
 const throw (cms::CMSEException) [pure virtual]`

Gets an Vector of the CMSX property names.

Returns

an Vector of CMSX property names

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 219).

6.220.3.6 `virtual int cms::ConnectionMetaData::getProviderMajorVersion ()
 const throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider major version number.

Returns

the CMS provider major version number

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 219).

6.220.3.7 `virtual int cms::ConnectionMetaData::getProviderMinorVersion ()
 const throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider minor version number.

Returns

the CMS provider minor version number

Exceptions

CMSEException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in `activemq::core::ActiveMQConnectionMetaData` (p. 219).

6.220.3.8 `virtual std::string cms::ConnectionMetaData::getProviderVersion ()
 const throw (cms::CMSEException) [pure virtual]`

Gets the CMS provider version.

Returns

the CMS provider version

Exceptions

CMSException (p. 960) If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 220).

6.223.2 Member Function Documentation

6.223.2.1 **virtual ConsumerControl* activemq::commands::ConsumerControl::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.223.2.2 **virtual void activemq::commands::ConsumerControl::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.223.2.3 `virtual bool activemq::commands::ConsumerControl::equals (const
DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.223.2.4 `virtual const Pointer<ConsumerId>& ac-
tivemq::commands::ConsumerControl::getConsumerId (
) const` [virtual]

6.223.2.5 `virtual Pointer<ConsumerId>& ac-
tivemq::commands::ConsumerControl::getConsumerId (
)` [virtual]

6.223.2.6 `virtual unsigned char ac-
tivemq::commands::ConsumerControl::getDataStructureType () const`
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.223.2.7 `virtual int activemq::commands::ConsumerControl::getPrefetch ()
const [virtual]`
- 6.223.2.8 `virtual bool activemq::commands::ConsumerControl::isClose () const
[virtual]`
- 6.223.2.9 `virtual bool activemq::commands::ConsumerControl::isFlush () const
[virtual]`
- 6.223.2.10 `virtual bool activemq::commands::ConsumerControl::isStart () const
[virtual]`
- 6.223.2.11 `virtual bool activemq::commands::ConsumerControl::isStop () const
[virtual]`
- 6.223.2.12 `ConsumerControl& activemq::commands::ConsumerControl::operator=
(const ConsumerControl &) [inline, protected]`
- 6.223.2.13 `virtual void activemq::commands::ConsumerControl::setClose (bool
close) [virtual]`
- 6.223.2.14 `virtual void activemq::commands::ConsumerControl::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.223.2.15 `virtual void activemq::commands::ConsumerControl::setFlush (bool
flush) [virtual]`
- 6.223.2.16 `virtual void activemq::commands::ConsumerControl::setPrefetch (int
prefetch) [virtual]`
- 6.223.2.17 `virtual void activemq::commands::ConsumerControl::setStart (bool
start) [virtual]`
- 6.223.2.18 `virtual void activemq::commands::ConsumerControl::setStop (bool
stop) [virtual]`
- 6.223.2.19 `virtual std::string activemq::commands::ConsumerControl::toString () const
[virtual]`

Returns a string containing the information for this **DataSet** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.223.2.20 `virtual Pointer<Command> activemq::commands::ConsumerControl::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 995).

6.223.3 Field Documentation

6.223.3.1 `bool activemq::commands::ConsumerControl::close` [protected]

6.223.3.2 `Pointer<ConsumerId> activemq::commands::ConsumerControl::consumerId` [protected]

6.223.3.3 `bool activemq::commands::ConsumerControl::flush` [protected]

6.223.3.4 `const unsigned char activemq::commands::ConsumerControl::ID_CONSUMERCONTROL = 17` [static]

6.223.3.5 `int activemq::commands::ConsumerControl::prefetch` [protected]

6.223.3.6 `bool activemq::commands::ConsumerControl::start` [protected]

6.223.3.7 `bool activemq::commands::ConsumerControl::stop` [protected]

6.224.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p.1170). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.224.2 Constructor & Destructor Documentation

6.224.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::ConsumerControlMarshaller () [inline]`

6.224.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::~~ConsumerControlMarshaller () [inline, virtual]`

6.224.3 Member Function Documentation

6.224.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.224.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.224.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.224.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.224.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.224.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.224.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

6.225.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p.1174). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.225.2 Constructor & Destructor Documentation

6.225.2.1 `activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::ConsumerControlMarshaller () [inline]`

6.225.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::~~ConsumerControlMarshaller () [inline, virtual]`

6.225.3 Member Function Documentation

6.225.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.225.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.225.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.225.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.225.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.225.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.225.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

6.226.2.1 `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::ConsumerControlMarshaller () [inline]`

6.226.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::~~ConsumerControlMarshaller () [inline, virtual]`

6.226.3 Member Function Documentation

6.226.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.226.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.226.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.226.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.226.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.226.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.226.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

6.227.3 Member Function Documentation

6.227.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.227.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.227.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.227.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.227.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.227.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.227.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ConsumerControlMarshaller.h`

6.228 `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller` Class Reference

Marshaling code for Open Wire Format for `ConsumerControlMarshaller` (p. 1186).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ConsumerControlMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller`:

Public Member Functions

- **ConsumerControlMarshaller** ()
- virtual **~ConsumerControlMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.228.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p.1186). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.228.2 Constructor & Destructor Documentation

6.228.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::ConsumerControlMarshaller () [inline]`

6.228.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::~~ConsumerControlMarshaller () [inline, virtual]`

6.228.3 Member Function Documentation

6.228.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.228.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.228.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.228.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.228.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.228.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.228.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConsumerControlMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

Protected Attributes

- std::string **connectionId**
- long long **sessionId**
- long long **value**

6.229.1 Member Typedef Documentation

6.229.1.1 `typedef decaf::lang::PointerComparator<ConsumerId>
activemq::commands::ConsumerId::COMPARATOR`

6.229.2 Constructor & Destructor Documentation

6.229.2.1 `activemq::commands::ConsumerId::ConsumerId ()`

6.229.2.2 `activemq::commands::ConsumerId::ConsumerId (const ConsumerId &
other)`

6.229.2.3 `activemq::commands::ConsumerId::ConsumerId (const SessionId &
sessionId, long long consumerId) [inline]`

References `activemq::commands::SessionId::getConnectionId()`, and `activemq::commands::SessionId::getValue()`.

6.229.2.4 `virtual activemq::commands::ConsumerId::~~ConsumerId () [virtual]`

6.229.3 Member Function Documentation

6.229.3.1 `virtual ConsumerId* activemq::commands::ConsumerId::cloneDataStructure (const) [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.229.3.2 `virtual int activemq::commands::ConsumerId::compareTo (const ConsumerId & value) const [virtual]`

6.229.3.3 `virtual void activemq::commands::ConsumerId::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.229.3.4 `virtual bool activemq::commands::ConsumerId::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.229.3.5 virtual bool activemq::commands::ConsumerId::equals (const ConsumerId & *value*) const [virtual]

6.229.3.6 virtual std::string& activemq::commands::ConsumerId::getConnectionId () [virtual]

6.229.3.7 virtual const std::string& activemq::commands::ConsumerId::getConnectionId () const [virtual]

6.229.3.8 virtual unsigned char activemq::commands::ConsumerId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

- 6.229.3.9 `const Pointer<SessionId>& activemq::commands::ConsumerId::getParentId ()`
`const`
- 6.229.3.10 `virtual long long activemq::commands::ConsumerId::getSessionId ()`
`const` [virtual]
- 6.229.3.11 `virtual long long activemq::commands::ConsumerId::getValue ()`
`const` [virtual]
- 6.229.3.12 `virtual bool activemq::commands::ConsumerId::operator< (const ConsumerId & value) const` [virtual]
- 6.229.3.13 `ConsumerId& activemq::commands::ConsumerId::operator= (const ConsumerId & other)`
- 6.229.3.14 `virtual bool activemq::commands::ConsumerId::operator== (const ConsumerId & value) const` [virtual]
- 6.229.3.15 `virtual void activemq::commands::ConsumerId::setConnectionId (const std::string & connectionId)` [virtual]
- 6.229.3.16 `virtual void activemq::commands::ConsumerId::setSessionId (long long sessionId)` [virtual]
- 6.229.3.17 `virtual void activemq::commands::ConsumerId::setValue (long long value)` [virtual]
- 6.229.3.18 `virtual std::string activemq::commands::ConsumerId::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.229.4 Field Documentation

- 6.229.4.1 `std::string activemq::commands::ConsumerId::connectionId` [protected]
- 6.229.4.2 `const unsigned char activemq::commands::ConsumerId::ID_-CONSUMERID = 122` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.229.4.3 `long long activemq::commands::ConsumerId::sessionId` [protected]
- 6.229.4.4 `long long activemq::commands::ConsumerId::value` [protected]

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.230.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 1195). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.230.2 Constructor & Destructor Documentation

6.230.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::ConsumerIdMarshaller () [inline]`

6.230.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::~~ConsumerIdMarshaller () [inline, virtual]`

6.230.3 Member Function Documentation

6.230.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.230.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.230.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

```
6.230.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

```
6.230.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.230.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.230.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

The documentation for this class was generated from the following file:

6.231.2.1 `activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::ConsumerIdMarshaller () [inline]`

6.231.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::~~ConsumerIdMarshaller () [inline, virtual]`

6.231.3 Member Function Documentation

6.231.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.231.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.231.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.231.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.231.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.231.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.231.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.232.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p.1202). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.232.2 Constructor & Destructor Documentation

6.232.2.1 `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::ConsumerIdMarshaller () [inline]`

6.232.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::~~ConsumerIdMarshaller () [inline, virtual]`

6.232.3 Member Function Documentation

6.232.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.232.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.232.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.232.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.232.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.232.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.232.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

6.233.3 Member Function Documentation

6.233.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.233.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.233.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.233.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.233.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.233.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.233.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.234.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p.1210). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.234.2 Constructor & Destructor Documentation

6.234.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::ConsumerIdMarshaller () [inline]`

6.234.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::~~ConsumerIdMarshaller () [inline, virtual]`

6.234.3 Member Function Documentation

6.234.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.234.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.234.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.234.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.234.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.234.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.234.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConsumerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.235.1 Constructor & Destructor Documentation

6.235.1.1 `activemq::commands::ConsumerInfo::ConsumerInfo (const ConsumerInfo &) [inline, protected]`

6.235.1.2 `activemq::commands::ConsumerInfo::ConsumerInfo ()`

6.235.1.3 `virtual activemq::commands::ConsumerInfo::~~ConsumerInfo () [virtual]`

6.235.2 Member Function Documentation

6.235.2.1 `virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.235.2.2 `virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.235.2.3 `virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

- 6.235.2.4 `virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () const [virtual]`

- 6.235.2.5 `virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate () [virtual]`

tivismq::commands::ConsumerInfo::setNetworkSubscription (bool
networkSubscription) [virtual]
- 6.235.2.42 virtual void activemq::commands::ConsumerInfo::setNoLocal (bool

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

```
6.235.2.51 virtual Pointer<Command> activemq::commands::ConsumerInfo::visit  
    ( activemq::state::CommandVisitor * visitor ) throw (   
    exceptions::ActiveMQException ) [virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.236.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 1223). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.236.2 Constructor & Destructor Documentation

6.236.2.1 `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::ConsumerInfoMarshaller () [inline]`

6.236.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller () [inline, virtual]`

6.236.3 Member Function Documentation

6.236.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.236.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.236.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.236.3.4 virtual void `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.236.3.5 virtual int `activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

6.236.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

6.236.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller () [inline, virtual]`

6.237.3 Member Function Documentation

6.237.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.237.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.237.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.237.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.237.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.237.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.237.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

`tivemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.238.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.238.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.238.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.238.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.239.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller()` [inline, virtual]

6.239.3 Member Function Documentation

6.239.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.239.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.239.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.239.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.239.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.239.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.239.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ConsumerInfoMarshaller.h`

6.240 `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for `ConsumerInfoMarshaller` (p. 1238).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ConsumerInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller`:

Public Member Functions

- **ConsumerInfoMarshaller** ()
- virtual **~ConsumerInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.240.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p.1238). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.240.2 Constructor & Destructor Documentation

6.240.2.1 `activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::ConsumerInfoMarshaller () [inline]`

6.240.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::~~ConsumerInfoMarshaller () [inline, virtual]`

6.240.3 Member Function Documentation

6.240.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.240.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.240.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.240.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.240.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.240.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.240.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ConsumerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ConsumerInfoMarshaller.h`

6.241 activemq::state::ConsumerState Class Reference

```
#include <src/main/activemq/state/ConsumerState.h>
```

Public Member Functions

- **ConsumerState** (const **Pointer**< **ConsumerInfo** > &info)

6.242 activemq::commands::ControlCommand Class Reference

```
#include <src/main/activemq/commands/ControlCommand.h>
```

Inheritance diagram for `activemq::commands::ControlCommand`:

Public Member Functions

- `ControlCommand ()`
- `virtual ~ControlCommand ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual ControlCommand * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- `virtual void copyDataStructure (const DataStructure *src)`
Copy the contents of the passed object into this object's members, overwriting any existing data.
- `virtual std::string toString () const`
Returns a string containing the information for this DataStructure (p. 1372) such as its type and value of its elements.
- `virtual bool equals (const DataStructure *value) const`
Compares the DataStructure (p. 1372) passed in to this one, and returns if they are equivalent.
- `virtual const std::string & getCommand () const`
- `virtual std::string & getCommand ()`

- virtual void **setCommand** (const std::string &command)
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_CONTROLCOMMAND** = 14

Protected Member Functions

- **ControlCommand** (const **ControlCommand** &)
- **ControlCommand & operator=** (const **ControlCommand** &)

Protected Attributes

- std::string **command**

6.242.1 Constructor & Destructor Documentation

6.242.1.1 **activemq::commands::ControlCommand::ControlCommand** (const **ControlCommand** &) [inline, protected]

6.242.1.2 **activemq::commands::ControlCommand::ControlCommand** ()

6.242.1.3 **virtual activemq::commands::ControlCommand::~~ControlCommand** () [virtual]

6.242.2 Member Function Documentation

6.242.2.1 **virtual ControlCommand* activemq::commands::ControlCommand::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.242.2.2 **virtual void activemq::commands::ControlCommand::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.242.2.3 `virtual bool activemq::commands::ControlCommand::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.242.2.4 `virtual std::string& activemq::commands::ControlCommand::getCommand ()` [virtual]

6.242.2.5 `virtual const std::string& activemq::commands::ControlCommand::getCommand () const` [virtual]

6.242.2.6 `virtual unsigned char activemq::commands::ControlCommand::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.242.2.7 `ControlCommand& activemq::commands::ControlCommand::operator= (const ControlCommand &)` [inline, protected]

6.242.2.8 `virtual void activemq::commands::ControlCommand::setCommand (const std::string & command)` [virtual]

6.242.2.9 `virtual std::string activemq::commands::ControlCommand::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 602).

6.242.2.10 `virtual Pointer<Command> activemq::commands::ControlCommand::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 995).

6.242.3 Field Documentation

6.242.3.1 `std::string activemq::commands::ControlCommand::command [protected]`

6.242.3.2 `const unsigned char activemq::commands::ControlCommand::ID _ - CONTROLCOMMAND = 14 [static]`

The documentation for this class was generated from the following file:

6.243.3 Member Function Documentation

6.243.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.243.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.243.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 604).

6.243.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.243.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

6.243.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```

6.243.3.7 virtual void activemq::wireformat::openwire::marshal::v3::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

6.244.3 Member Function Documentation

6.244.3.1 virtual commands::DataStructure* ac-
tivismq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.244.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.244.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.244.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.244.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

6.244.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

6.244.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for `ControlCommandMarshaller` (p. 1254).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ControlCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller`:

Public Member Functions

- `ControlCommandMarshaller ()`
- `virtual ~ControlCommandMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.245.1 Detailed Description

Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 1254). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.245.2 Constructor & Destructor Documentation

6.245.2.1 **activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::ControlComm**
() [inline]

6.245.2.2 **virtual**
activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::~~ControlComm
() [inline, virtual]

6.245.3 Member Function Documentation

6.245.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.245.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::getDataStructur
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.245.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.245.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.245.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

6.245.3.6 virtual void `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightMarshal2`
(`OpenWireFormat` * *wireFormat*, `commands::DataStructure`
* *dataStructure*, `decaf::io::DataOutputStream` * *dataOut*,
`utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

6.245.3.7 virtual void `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller::tightUnmarshal`
(`OpenWireFormat` * *wireFormat*, `commands::DataStructure`
* *dataStructure*, `decaf::io::DataInputStream` * *dataIn*,
`utils::BooleanStream` * *bs*) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

The documentation for this class was generated from the following file:

6.246.3 Member Function Documentation

6.246.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.246.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.246.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.246.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.246.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.246.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.246.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

6.247.3 Member Function Documentation

6.247.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.247.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.247.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.247.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.247.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

```
6.247.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.247.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ControlCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ControlCommandMarshaller.h`

6.248 decaf::util::concurrent::CountDownLatch Class Reference

```
#include <src/main/decaf/util/concurrent/CountDownLatch.h>
```

Public Member Functions

- **CountDownLatch** (int count)
Constructor.
- virtual **~CountDownLatch** ()
- virtual void **await** () throw (lang::Exception)
Waits for the Count to be zero, and then returns.
- virtual bool **await** (unsigned long timeout) throw (lang::Exception)
Waits for the Count to hit zero, or a timeout.
- virtual void **countDown** ()
Counts down the latch, releasing all waiting threads when the count hits zero.
- virtual int **getCount** () const
Gets the current count.

6.248.1 Constructor & Destructor Documentation

6.248.1.1 decaf::util::concurrent::CountDownLatch::CountDownLatch (int count)

Constructor.

Parameters

count - number to count down from.

6.248.1.2 `virtual decaf::util::concurrent::CountDownLatch::~~CountDownLatch () [virtual]`

6.248.2 Member Function Documentation

6.248.2.1 `virtual void decaf::util::concurrent::CountDownLatch::await () throw (lang::Exception) [virtual]`

Waits for the Count to be zero, and then returns.

Exceptions

Exception

6.248.2.2 `virtual bool decaf::util::concurrent::CountDownLatch::await (unsigned long timeOut) throw (lang::Exception) [virtual]`

Waits for the Count to hit zero, or a timeout.

Parameters

timeOut - time in milliseconds to wait.

Returns

true if the wait made it to count zero, otherwise false

6.248.2.3 `virtual void decaf::util::concurrent::CountDownLatch::countDown () [virtual]`

Counts down the latch, releasing all waiting threads when the count hits zero.

6.248.2.4 `virtual int decaf::util::concurrent::CountDownLatch::getCount () const [inline, virtual]`

Gets the current count.

Returns

int count value

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/CountDownLatch.h`

6.249 activemq::commands::DataArrayResponse Class Reference

```
#include <src/main/activemq/commands/DataArrayResponse.h>
```

Inheritance diagram for `activemq::commands::DataArrayResponse`:

Public Member Functions

- **DataArrayResponse** ()
- virtual **~DataArrayResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataArrayResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** () const
- virtual std::vector< **decaf::lang::Pointer**< **DataStructure** > > & **getData** ()
- virtual void **setData** (const std::vector< **decaf::lang::Pointer**< **DataStructure** > > &data)

Static Public Attributes

- static const unsigned char **ID_DATAARRAYRESPONSE** = 33

Protected Member Functions

- **DataArrayResponse** (const **DataArrayResponse** &)
- **DataArrayResponse** & **operator=** (const **DataArrayResponse** &)

Protected Attributes

- std::vector< **decaf::lang::Pointer**< **DataStructure** > > **data**

6.249.1 Constructor & Destructor Documentation

6.249.1.1 `activemq::commands::DataArrayResponse::DataArrayResponse (const DataArrayResponse &) [inline, protected]`

6.249.1.2 `activemq::commands::DataArrayResponse::DataArrayResponse ()`

6.249.1.3 `virtual activemq::commands::DataArrayResponse::~~DataArrayResponse () [virtual]`

6.249.2 Member Function Documentation

6.249.2.1 `virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p.2612).

6.249.2.2 `virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::Response` (p.2612).

6.249.2.3 `virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p.1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p.2613).

- 6.249.2.4** `virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () [virtual]`
- 6.249.2.5** `virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData () const [virtual]`
- 6.249.2.6** `virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Reimplemented from **activemq::commands::Response** (p. 2613).

- 6.249.2.7** `DataArrayResponse& activemq::commands::DataArrayResponse::operator= (const DataArrayResponse &) [inline, protected]`
- 6.249.2.8** `virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & data) [virtual]`
- 6.249.2.9** `virtual std::string activemq::commands::DataArrayResponse::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2614).

6.249.3 Field Documentation

- 6.249.3.1** `std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]`
- 6.249.3.2** `const unsigned char activemq::commands::DataArrayResponse::ID_ - DATAARRAYRESPONSE = 33 [static]`

The documentation for this class was generated from the following file:

6.250.3 Member Function Documentation

6.250.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2625).

6.250.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::getDataStruct
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.250.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.250.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.250.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

```
6.250.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

```
6.250.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2628).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/DataArrayResponseMarshaller.h`

6.251 activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 1275).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/DataArrayResponseMarshaller.h>
```

() [inline, virtual]`

6.251.3 Member Function Documentation

6.251.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.251.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::getDataStruct
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.251.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.251.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2640).

6.251.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2640).

```

6.251.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

```

6.251.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

6.252.3 Member Function Documentation

6.252.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2634).

6.252.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::getDataStruct
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.252.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.252.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.252.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2636).

```
6.252.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2636).

```
6.252.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2637).

6.253.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.253.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::getDataStruct
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.253.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.253.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2631).

6.253.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2631).

```

6.253.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightMarshal2
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2632).

```

6.253.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller::tightUnmarshal
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2632).

6.254.3 Member Function Documentation

6.254.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.254.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::getDataStruct
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.254.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.254.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

6.254.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

```
6.254.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

```
6.254.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/DataArrayResponseMarshaller.h`

6.255 decaf::io::DataInputStream Class Reference

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

```
#include <src/main/decaf/io/DataInputStream.h>
```

Inheritance diagram for decaf::io::DataInputStream:

Public Member Functions

- **DataInputStream** (**InputStream** *inputStream, bool own=false)
*Creates a **DataInputStream** (p. 1291) that uses the specified underlying **InputStream** (p. 1630).*
- virtual ~**DataInputStream** ()
- virtual int **read** () throw (**IOException**)
Reads the next byte of data from this input stream.
- virtual int **read** (std::vector< unsigned char > &buffer) throw (**io::IOException**)
Reads some number of bytes from the contained input stream and stores them into the buffer array b.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (**io::IOException**, **lang::exceptions::NullPointerException**)
Reads up to len bytes of data from the contained input stream into an array of bytes.
- virtual bool **readBoolean** () throw (**io::IOException**, **io::EOFException**)
Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.
- virtual char **readByte** () throw (**io::IOException**, **io::EOFException**)
Reads and returns one input byte.
- virtual unsigned char **readUnsignedByte** () throw (**io::IOException**, **io::EOFException**)
Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.
- virtual char **readChar** () throw (**io::IOException**, **io::EOFException**)
Reads an input char and returns the char value.
- virtual double **readDouble** () throw (**io::IOException**, **io::EOFException**)
Reads eight input bytes and returns a double value.
- virtual float **readFloat** () throw (**io::IOException**, **io::EOFException**)
Reads four input bytes and returns a float value.
- virtual int **readInt** () throw (**io::IOException**, **io::EOFException**)
Reads four input bytes and returns an int value.

- virtual long long **readLong** () throw (io::IOException, io::EOFException)
Reads eight input bytes and returns a long value.
- virtual short **readShort** () throw (io::IOException, io::EOFException)
Reads two input bytes and returns a short value.
- virtual unsigned short **readUnsignedShort** () throw (io::IOException, io::EOFException)
Reads two input bytes and returns an int value in the range 0 through 65535.
- virtual std::string **readString** () throw (io::IOException, io::EOFException)
Reads an null terminated ASCII string to the stream and returns the string to the caller.
- virtual std::string **readUTF** () throw (io::IOException, io::EOFException, io::UTFDataFormatException)
Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.
- virtual void **readFully** (std::vector< unsigned char > &buffer) throw (io::IOException, io::EOFException)
Reads some bytes from an input stream and stores them into the buffer array buffer.
- virtual void **readFully** (unsigned char *buffer, std::size_t offset, std::size_t length) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException)
Reads length bytes from an input stream.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.255.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way. An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 1630) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

```
DataInputStream (p. 1291) os = new DataInputStream (p. 1291)( new InputStream(), true )
```

Since

1.0

6.255.2 Constructor & Destructor Documentation

6.255.2.1 decaf::io::DataInputStream::DataInputStream (*InputStream* * *inputStream*, *bool* *own* = *false*)

Creates a **DataInputStream** (p. 1291) that uses the specified underlying **InputStream** (p. 1630).

Parameters

inputStream the **InputStream** (p. 1630) instance to wrap.

own indicates if this class owns the wrapped string defaults to false.

6.255.2.2 virtual decaf::io::DataInputStream::~~DataInputStream () [virtual]

6.255.3 Member Function Documentation

6.255.3.1 virtual int decaf::io::DataInputStream::read () throw (*IOException*) [inline, virtual]

Reads the next byte of data from this input stream.

The value byte is returned as an unsigned char in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown. This method simply performs `in.read()` and returns the result.

Returns

The next byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1532).

References `decaf::io::FilterInputStream::read()`.

6.255.3.2 virtual int decaf::io::DataInputStream::read (*std::vector< unsigned char>* & *buffer*) throw (*io::IOException*) [virtual]

Reads some number of bytes from the contained input stream and stores them into the buffer array *b*.

The number of bytes actually read is returned as an integer. This method blocks until input data is available, end of file is detected, or an exception is thrown.

If the length of *buffer* is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into *buffer*.

The first byte read is stored into element *buffer*[0], the next one into *buffer*[1], and so on. The number of bytes read is, at most, equal to the length of *buffer*. Let *k* be the number of bytes actually read; these bytes will be stored in elements *b*[0] through *b*[*k*-1], leaving elements *buffer*[*k*] through *buffer*[*buffer.length*-1] unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p.1707) is thrown. In particular, an **IOException** (p.1707) is thrown if the input stream has been closed.

The `read(buffer)` method has the same effect as: `read(buffer, 0, b.length)`

Parameters

buffer - byte array to insert read data into

Returns

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions

IOException (p. 1707)

6.255.3.3 `virtual int decaf::io::DataInputStream::read (unsigned char * buffer,
std::size_t offset, std::size_t length) throw (io::IOException,
lang::exceptions::NullPointerException) [virtual]`

Reads up to len bytes of data from the contained input stream into an array of bytes.

An attempt is made to read as many as len bytes, but a smaller number may be read, possibly zero. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If buffer is null, a NullPointerException is thrown.

If off is negative, or len is negative then an IndexOutOfBoundsException is thrown, if off + len is greater than the allocated length of the array, an **IOException** (p.1707) will result depending on the platform and compiler settings.

If len is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into buffer.

The first byte read is stored into element b[off], the next one into buffer[off+1], and so on. The number of bytes read is, at most, equal to len. Let k be the number of bytes actually read; these bytes will be stored in elements buffer[off] through buffer[off+k-1], leaving elements buffer[off+k] through buffer[off+len-1] unaffected.

In every case, elements buffer[0] through buffer[off] and elements buffer[off+len] through buffer[buffer.length-1] are unaffected.

If the first byte cannot be read for any reason other than end of file, then an **IOException** (p.1707) is thrown. In particular, an **IOException** (p.1707) is thrown if the input stream has been closed.

Parameters

buffer - byte array to insert read data into

offset - location in buffer to start writing

length - number of bytes to read

Returns

the total number of bytes read, or -1 if there is no more data because the stream is EOF.

Exceptions

IOException (p. 1707)

NullPointerException if the buffer is null

Reimplemented from **decaf::io::FilterInputStream** (p. 1533).

6.255.3.4 `virtual bool decaf::io::DataInputStream::readBoolean () throw (io::IOException, io::EOFException) [virtual]`

Reads one input byte and returns true if that byte is nonzero, false if that byte is zero.

Returns

the boolean value read.

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.5 `virtual char decaf::io::DataInputStream::readByte () throw (io::IOException, io::EOFException) [virtual]`

Reads and returns one input byte.

The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns

the 8-bit value read.

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.6 `virtual char decaf::io::DataInputStream::readChar () throw (io::IOException, io::EOFException) [virtual]`

Reads an input char and returns the char value.

A ascii char is made up of one bytes. This returns the same result as **readByte**

Returns

the 8 bit char read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.7 virtual double decaf::io::DataInputStream::readDouble () throw (io::IOException, io::EOFException) [virtual]

Reads eight input bytes and returns a double value.

It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double.longBitsToDouble.

Returns

the double value read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.8 virtual float decaf::io::DataInputStream::readFloat () throw (io::IOException, io::EOFException) [virtual]

Reads four input bytes and returns a float value.

It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float.intBitsToFloat.

Returns

the float value read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.9 virtual void decaf::io::DataInputStream::readFully (std::vector< unsigned char > & buffer) throw (io::IOException, io::EOFException) [virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer.

The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs: * buffer.size() bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1474) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1707) other than **EOFException** (p. 1474) is thrown.

If buffer.size() is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters

buffer - vector of char that is read to its size()

Exceptions***IOException*** (p. 1707)***EOFException*** (p. 1474)

6.255.3.10 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer*, std::size_t *offset*, std::size_t *length*) throw (io::IOException, io::EOFException, lang::exceptions::NullPointerException) [virtual]

Reads length bytes from an input stream.

This method blocks until one of the following conditions occurs: * length bytes of input data are available, in which case a normal return is made. * End of file is detected, in which case an **EOFException** (p. 1474) is thrown. * An I/O error occurs, in which case an **IOException** (p. 1707) other than **EOFException** (p. 1474) is thrown.

If buffer is null, a NullPointerException is thrown. If offset is negative, or len is negative, or offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If len is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to len.

Parameters

buffer - byte array to insert read data into

offset - location in buffer to start writing

length - number of bytes to read

Exceptions***IOException*** (p. 1707)***EOFException*** (p. 1474)***NullPointerException*** if the buffer is null

6.255.3.11 virtual int decaf::io::DataInputStream::readInt () throw (io::IOException, io::EOFException) [virtual]

Reads four input bytes and returns an int value.

Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

$$(((a \& 0xff) << 24) | ((b \& 0xff) << 16) | ((c \& 0xff) << 8) | (d \& 0xff))$$
Returns

the int value read

Exceptions***IOException*** (p. 1707)***EOFException*** (p. 1474)

6.255.3.12 virtual long long decaf::io::DataInputStream::readLong () throw (io::IOException, io::EOFException) [virtual]

Reads eight input bytes and returns a long value.

Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is: (((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns

the 64 bit long long read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.13 virtual short decaf::io::DataInputStream::readShort () throw (io::IOException, io::EOFException) [virtual]

Reads two input bytes and returns a short value.

Let a be the first byte read and b be the second byte. The value returned is: (short)((a << 8) | (b & 0xff))

Returns

the 16 bit short value read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.14 virtual std::string decaf::io::DataInputStream::readString () throw (io::IOException, io::EOFException) [virtual]

Reads an null terminated ASCII string to the stream and returns the string to the caller.

Returns

string object containing the string read.

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.15 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte () throw (io::IOException, io::EOFException) [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns

the 8 bit unsigned value read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.16 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort () throw (io::IOException, io::EOFException) [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535.

Let a be the first byte read and b be the second byte. The value returned is: (((a & 0xff) << 8) | (b & 0xff))

Returns

the 16 bit unsigned short read

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

6.255.3.17 virtual std::string decaf::io::DataInputStream::readUTF () throw (io::IOException, io::EOFException, io::UTFDataFormatException) [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

This method reads String value written from a Java **DataOutputStream** (p. 1300) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns

The decoded string read from stream.

Exceptions

IOException (p. 1707)

EOFException (p. 1474)

UTFDataFormatException (p. 3139)

6.255.3.18 `virtual std::size_t decaf::io::DataInputStream::skip
(std::size_t num) throw (io::IOException,
lang::exceptions::UnsupportedOperationException) [virtual]`

Makes an attempt to skip over *n* bytes of data from the input stream, discarding the skipped bytes.

However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. This method never throws an **EOFException** (p.1474). The actual number of bytes skipped is returned.

Parameters

num - number of bytes to skip

Returns

the total number of bytes skipped

Reimplemented from **decaf::io::FilterInputStream** (p.1534).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/DataInputStream.h`

6.256 decaf::io::DataOutputStream Class Reference

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

`#include <src/main/decaf/io/DataOutputStream.h>`

Inheritance diagram for `decaf::io::DataOutputStream`:

Public Member Functions

- **DataOutputStream** (`OutputStream *outputStream`, `bool own=false`)
Creates a new data output stream to write data to the specified underlying output stream.
- `virtual ~DataOutputStream ()`
- `virtual std::size_t size () const`
Returns the current value of the counter written, the number of bytes written to this data output stream so far.
- `virtual void write (unsigned char c) throw (IOException)`
Writes a single byte to the output stream.
- `virtual void write (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)`
Writes an array of bytes to the output stream.

- virtual void **write** (const std::vector< unsigned char > &**buffer**) throw (IOException)
Writes an array of bytes to the output stream.
- virtual void **writeBoolean** (bool value) throw (IOException)
Writes a boolean to the underlying output stream as a 1-byte value.
- virtual void **writeByte** (unsigned char value) throw (IOException)
Writes out a byte to the underlying output stream as a 1-byte value.
- virtual void **writeShort** (short value) throw (IOException)
Writes a short to the underlying output stream as two bytes, high byte first.
- virtual void **writeUnsignedShort** (unsigned short value) throw (IOException)
Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual void **writeChar** (char value) throw (IOException)
Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.
- virtual void **writeInt** (int value) throw (IOException)
Writes an int to the underlying output stream as four bytes, high byte first.
- virtual void **writeLong** (long long value) throw (IOException)
Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.
- virtual void **writeFloat** (float value) throw (IOException)
Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.
- virtual void **writeDouble** (double value) throw (IOException)
Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.
- virtual void **writeBytes** (const std::string &value) throw (IOException)
Writes out the string to the underlying output stream as a sequence of bytes.
- virtual void **writeChars** (const std::string &value) throw (IOException)
Writes a string to the underlying output stream as a sequence of characters.
- virtual void **writeUTF** (const std::string &value) throw (IOException, UTFDataFormatException)
Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

Protected Attributes

- std::size_t **written**
- unsigned char **buffer** [8]

6.256.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way. An application can then use a data input stream to read the data back in.

6.256.2 Constructor & Destructor Documentation

6.256.2.1 `decaf::io::DataOutputStream::DataOutputStream (OutputStream * outputStream, bool own = false)`

Creates a new data output stream to write data to the specified underlying output stream.

Parameters

outputStream a stream to wrap with this one.

own true if this objects owns the stream that it wraps.

6.256.2.2 `virtual decaf::io::DataOutputStream::~~DataOutputStream ()` [virtual]

6.256.3 Member Function Documentation

6.256.3.1 `virtual std::size_t decaf::io::DataOutputStream::size () const` [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far.

If the counter overflows, it will be wrapped to Integer.MAX_VALUE.

Returns

the value of the written field.

6.256.3.2 `virtual void decaf::io::DataOutputStream::write (unsigned char c)` `throw (IOException)` [virtual]

Writes a single byte to the output stream.

If no exception is thrown, the counter written is incremented by 1.

Parameters

c the byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Reimplemented from `decaf::io::FilterOutputStream` (p. 1542).

6.256.3.3 virtual void decaf::io::DataOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1542).

6.256.3.4 virtual void decaf::io::DataOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

the counter written is incremented by len.

Parameters

buffer The array of bytes to write.

offset the position in buffer to start writing from.

len The number of bytes from the buffer to be written.

Exceptions

IOException (p. 1707) thrown if an error occurs.

NullPointerException if buffer is Null

Reimplemented from **decaf::io::FilterOutputStream** (p. 1543).

6.256.3.5 virtual void decaf::io::DataOutputStream::writeBoolean (bool *value*) throw (IOException) [virtual]

Writes a boolean to the underlying output stream as a 1-byte value.

The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters

value the boolean to write.

Exceptions

IOException (p. 1707)

6.256.3.6 `virtual void decaf::io::DataOutputStream::writeByte (unsigned char value) throw (IOException) [virtual]`

Writes out a byte to the underlying output stream as a 1-byte value.

If no exception is thrown, the counter written is incremented by 1.

Parameters

value the unsigned char value to write.

Exceptions

IOException (p. 1707)

6.256.3.7 `virtual void decaf::io::DataOutputStream::writeBytes (const std::string & value) throw (IOException) [virtual]`

Writes out the string to the underlying output stream as a sequence of bytes.

Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.8 `virtual void decaf::io::DataOutputStream::writeChar (char value) throw (IOException) [virtual]`

Writes out a char to the underlying output stream as a one byte value. If no exception is thrown, the counter written is incremented by 1.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.9 `virtual void decaf::io::DataOutputStream::writeChars (const std::string & value) throw (IOException) [virtual]`

Writes a string to the underlying output stream as a sequence of characters.

Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.10 virtual void decaf::io::DataOutputStream::writeDouble (double *value*) throw (IOException) [virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.11 virtual void decaf::io::DataOutputStream::writeFloat (float *value*) throw (IOException) [virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.12 virtual void decaf::io::DataOutputStream::writeInt (int *value*) throw (IOException) [virtual]

Writes an int to the underlying output stream as four bytes, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.13 `virtual void decaf::io::DataOutputStream::writeLong (long long value) throw (IOException)` [virtual]

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.14 `virtual void decaf::io::DataOutputStream::writeShort (short value) throw (IOException)` [virtual]

Writes a short to the underlying output stream as two bytes, high byte first.

If no exception is thrown, the counter written is incremented by 2.

Parameters

value the value to write.

Exceptions

IOException (p. 1707)

6.256.3.15 `virtual void decaf::io::DataOutputStream::writeUnsignedShort (unsigned short value) throw (IOException)` [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

value - unsigned short to write to the stream

Exceptions

IOException (p. 1707)

6.256.3.16 `virtual void decaf::io::DataOutputStream::writeUTF (const std::string & value) throw (IOException, UTFDataFormatException)` [virtual]

Writes out the string to the underlying output stream as a modified UTF-8 encoded sequence of bytes.

The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters

value the value to write.

Exceptions

IOException (p. 1707) - on a write error

UTFDataFormatException (p. 3139) - if encoded size if greater than 65535

6.256.4 Field Documentation

6.256.4.1 unsigned char decaf::io::DataOutputStream::buffer[8] [protected]

6.256.4.2 std::size_t decaf::io::DataOutputStream::written [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**DataOutputStream.h**

6.257 activemq::commands::DataResponse Class Reference

```
#include <src/main/activemq/commands/DataResponse.h>
```

Inheritance diagram for activemq::commands::DataResponse:

Public Member Functions

- **DataResponse** ()
- virtual **~DataResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **DataStructure** > &**getData** () const
- virtual **Pointer**< **DataStructure** > &**getData** ()
- virtual void **setData** (const **Pointer**< **DataStructure** > &data)

Static Public Attributes

- static const unsigned char **ID_DATARESPONSE** = 32

Protected Member Functions

- **DataResponse** (const **DataResponse** &)
- **DataResponse** & **operator=** (const **DataResponse** &)

Protected Attributes

- **Pointer< DataStructure > data**

6.257.1 Constructor & Destructor Documentation

6.257.1.1 **activemq::commands::DataResponse::DataResponse** (const **DataResponse** &) [inline, protected]

6.257.1.2 **activemq::commands::DataResponse::DataResponse** ()

6.257.1.3 **virtual activemq::commands::DataResponse::~~DataResponse** () [virtual]

6.257.2 Member Function Documentation

6.257.2.1 **virtual DataResponse* activemq::commands::DataResponse::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 2612).

6.257.2.2 **virtual void activemq::commands::DataResponse::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 2612).

6.257.2.3 virtual bool activemq::commands::DataResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::Response** (p. 2613).

6.257.2.4 virtual Pointer<DataStructure>& activemq::commands::DataResponse::getData () [virtual]**6.257.2.5 virtual const Pointer<DataStructure>& activemq::commands::DataResponse::getData () const** [virtual]**6.257.2.6 virtual unsigned char activemq::commands::DataResponse::getDataStructureType () const** [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Reimplemented from **activemq::commands::Response** (p. 2613).

6.257.2.7 DataResponse& activemq::commands::DataResponse::operator= (const DataResponse &) [inline, protected]**6.257.2.8 virtual void activemq::commands::DataResponse::setData (const Pointer< DataStructure > & *data*)** [virtual]**6.257.2.9 virtual std::string activemq::commands::DataResponse::toString () const** [virtual]

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2614).

6.257.3 Field Documentation

6.257.3.1 `Pointer<DataStructure> activemq::commands::DataResponse::data`
[protected]

6.257.3.2 `const unsigned char activemq::commands::DataResponse::ID_ -
DATARESPONSE = 32` [static]

The documentation for this class was generated from the following file:

6.258 `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` Class Reference

Marshaling code for Open Wire Format for `DataResponseMarshaller` (p. 1310).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/DataResponseMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller`:

Public Member Functions

- `DataResponseMarshaller ()`
- `virtual ~DataResponseMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.
- `virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`

Un-marshall an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.258.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1310). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.258.2 Constructor & Destructor Documentation

6.258.2.1 **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::DataResponseMar**
() [inline]

6.258.2.2 **virtual**
activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::~~DataResponseM
() [inline, virtual]

6.258.3 Member Function Documentation

6.258.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::createObject
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2625).

6.258.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::getDataStructureTy
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2626).

6.258.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.258.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.258.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2627).

```
6.258.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2627).

```
6.258.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::ResponseMarshaller** (p. 2628).

The documentation for this class was generated from the following file:

activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::~~DataResponseMarshaller () [inline, virtual]

6.259.3 Member Function Documentation

6.259.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2634).

6.259.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2635).

6.259.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.259.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.259.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2636).

```
6.259.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2636).

```
6.259.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2637).

6.260.3 Member Function Documentation

6.260.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2630).

6.260.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2630).

6.260.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.260.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2631).

6.260.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2631).

```
6.260.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2632).

```
6.260.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2632).

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2639).

6.261.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2639).

6.261.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.261.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2640).

6.261.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2640).

```
6.261.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2641).

```
6.261.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2641).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/DataResponseMarshaller.h`

6.262 activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1326).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/DataResponseMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller**:

Public Member Functions

- **DataResponseMarshaller** ()
- virtual **~DataResponseMarshaller** ()

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.262.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 1326). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.262.2 Constructor & Destructor Documentation

6.262.2.1 activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::DataResponseMarshaller () [inline]

6.262.2.2 virtual
activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::~~DataResponseMarshaller () [inline, virtual]

6.262.3 Member Function Documentation

6.262.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2621).

6.262.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2621).

6.262.3.3 virtual void activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.262.3.4 virtual void activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

6.262.3.5 virtual int activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2622).

```
6.262.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2623).

```
6.262.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::DataResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::ResponseMarshaller** (p. 2623).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/DataResponseMarshaller.h`

6.263 activemq::wireformat::openwire::marshal::DataStreamMarshaller Class Reference

Base class for all classes that marshal commands for Openwire.

```
#include <src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::DataStreamMarshaller`:

Public Member Functions

- virtual `~DataStreamMarshaller ()`
- virtual unsigned char `getDataStructureType () const =0`
Gets the DataStructureType that this class marshals/unmarshals.
- virtual `commands::DataStructure * createObject () const =0`
Creates a new instance of the class that this class is a marshaling director for.
- virtual int `tightMarshal (OpenWireFormat *format, commands::DataStructure *command, utils::BooleanStream *bs)=0 throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual void `tightMarshal2 (OpenWireFormat *format, commands::DataStructure *command, decaf::io::DataOutputStream *ds, utils::BooleanStream *bs)=0 throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual void `tightUnmarshal (OpenWireFormat *format, commands::DataStructure *command, decaf::io::DataInputStream *dis, utils::BooleanStream *bs)=0 throw (decaf::io::IOException)`
Tight Un-marshal to the given stream.
- virtual void `looseMarshal (OpenWireFormat *format, commands::DataStructure *command, decaf::io::DataOutputStream *ds)=0 throw (decaf::io::IOException)`
Tight Marshal to the given stream.
- virtual void `looseUnmarshal (OpenWireFormat *format, commands::DataStructure *command, decaf::io::DataInputStream *dis)=0 throw (decaf::io::IOException)`
Loose Un-marshal to the given stream.

6.263.1 Detailed Description

Base class for all classes that marshal commands for Openwire.

6.263.2 Constructor & Destructor Documentation

6.263.2.1 virtual

activemq::wireformat::openwire::marshal::DataStreamMarshaller::~~DataStreamMarshaller
() [inline, virtual]

6.263.3 Member Function Documentation

6.263.3.1 virtual commands::DataStructure* ac-

tivemq::wireformat::openwire::marshal::DataStreamMarshaller::createObject
() const [pure virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 152), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 187), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 290), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 312), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 352), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 388), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 441), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 486), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 510), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 535), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 558), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 699), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 727), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1065), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1088), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1114), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1144), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1180), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1204), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1228), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1255), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1280), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1315), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1408), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1437), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1492), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 1581), `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1675), `activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller` (p. 1735), `activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller` (p. 1752),

6.263.3.2 virtual unsigned char
 activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType
 () const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implemented in activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller
 (p. 152), activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller
 (p. 187), activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller

6.263.3.3 virtual void ac-

```
tivemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal  

( OpenWireFormat * format, commands::DataStructure * command,  

  decaf::io::DataOutputStream * ds ) throw ( decaf::io::IOException )  

[pure virtual]
```

Tight Marshal to the given stream.

Parameters

format - The OpenWireFormat properties

command - the object to Marshal

ds - DataOutputStream to marshal to

Exceptions

IOException if an error occurs.

6.263.3.4 `virtual void ativemq::wireformat::openwire::marshal::DataStreamMarshaller::looseUnmarshal (OpenWireFormat * format, commands::DataStructure * command, decaf::io::DataInputStream * dis) throw (decaf::io::IOException)`
[pure virtual]

Loose Un-marhsal to the given stream.

Parameters

format - The OpenWireFormat properties
command - the object to Un-Marshal
dis - the DataInputStream to Un-Marshal from

Exceptions

IOException if an error occurs.

Implemented in `ativemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 153), `ativemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 188), `ativemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 256), `ativemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 291), `ativemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 313), `ativemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 353), `ativemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 389), `ativemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 442), `ativemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 464), `ativemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 487), `ativemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 511), `ativemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 536), `ativemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 559), `ativemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612), `ativemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 700), `ativemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 728), `ativemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1066), `ativemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1089), `ativemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1115), `ativemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1145), `ativemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1181), `ativemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1205), `ativemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1229), `ativemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1256), `ativemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1281), `ativemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1316), `ativemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1409), `ativemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1438), `ativemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1493), `ativemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 1582), `ativemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1676),

6.263.3.5 `virtual int activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal1 (OpenWireFormat * format, commands::DataStructure * command, utils::BooleanStream * bs) throw (decaf::io::IOException)` [pure virtual]

Tight Marshal to the given stream.

Parameters

format - The OpenWireFormat properties

command - the object to Marshal

bs - boolean stream to marshal to.

Exceptions

IOException if an error occurs.

Implemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v1::ActiveMQDestinationMarshaller` (p. 256), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 291), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 313), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 353), `activemq::wireformat::openwire::marshal::v1::ActiveMQQueueMarshaller` (p. 389), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 442), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempDestinationMarshaller` (p. 464), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempQueueMarshaller` (p. 487), `activemq::wireformat::openwire::marshal::v1::ActiveMQTempTopicMarshaller` (p. 511), `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 536), `activemq::wireformat::openwire::marshal::v1::ActiveMQTopicMarshaller` (p. 560), `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613), `activemq::wireformat::openwire::marshal::v1::BrokerIdMarshaller` (p. 700), `activemq::wireformat::openwire::marshal::v1::BrokerInfoMarshaller` (p. 728), `activemq::wireformat::openwire::marshal::v1::ConnectionControlMarshaller` (p. 1066), `activemq::wireformat::openwire::marshal::v1::ConnectionErrorMarshaller` (p. 1090), `activemq::wireformat::openwire::marshal::v1::ConnectionIdMarshaller` (p. 1115), `activemq::wireformat::openwire::marshal::v1::ConnectionInfoMarshaller` (p. 1145), `activemq::wireformat::openwire::marshal::v1::ConsumerControlMarshaller` (p. 1181), `activemq::wireformat::openwire::marshal::v1::ConsumerIdMarshaller` (p. 1205), `activemq::wireformat::openwire::marshal::v1::ConsumerInfoMarshaller` (p. 1229), `activemq::wireformat::openwire::marshal::v1::ControlCommandMarshaller` (p. 1256), `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1281), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1316), `activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller` (p. 1409), `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller` (p. 1438), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1493), `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` (p. 1582),

6.263.3.6 virtual void ac-

```
tivemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2
( OpenWireFormat * format, commands::DataStructure * command,
  decaf::io::DataOutputStream * ds, utils::BooleanStream * bs ) throw (
  decaf::io::IOException ) [pure virtual]
```

Tight Marshal to the given stream.

Parameters

format - The OpenWireFormat properties

command - the object to Marshal

ds - the DataOutputStream to Marshal to

bs - boolean stream to marshal to.

Exceptions

IOException if an error occurs.

6.263.3.7 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [pure virtual]

Tight Un-marhsal to the given stream.

Parameters

format - The OpenWireFormat properties
command - the object to Un-Marshal
dis - the DataInputStream to Un-Marshal from
bs - boolean stream to unmarshal from.

Exceptions

IOException if an error occurs.

 activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller (p. 2547), ac-
 tivemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller

(p. 2567), `activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller` (p. 2598), `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2632), `activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller` (p. 2685), `activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller` (p. 2720), `activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller` (p. 2779), `activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller` (p. 2922), `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3033), `activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller` (p. 3044), `activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller` (p. 3170), and `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller` (p. 3216).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/DataStreamMarshaller.h`

6.264 `activemq::commands::DataStructure` Class Reference

```
#include <src/main/activemq/commands/DataStructure.h>
```

Inheritance diagram for `activemq::commands::DataStructure`:

Public Member Functions

- virtual `~DataStructure ()`
- virtual unsigned char `getDataStructureType ()` const =0

*Get the **DataStructure** (p. 1372) Type as defined in *CommandTypes.h*.*

- virtual `DataStructure * cloneDataStructure ()` const =0

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void `copyDataStructure (const DataStructure *src)`=0

Copy the contents of the passed object into this objects members, overwriting any existing data.

- virtual std::string `toString ()` const =0

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool `equals (const DataStructure *value)` const =0

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

6.264.1 Constructor & Destructor Documentation

6.264.1.1 virtual `activemq::commands::DataStructure::~~DataStructure ()`
`[inline, virtual]`

6.264.2 Member Function Documentation

6.264.2.1 virtual `DataStructure* activemq::commands::DataStructure::cloneDataStructure ()`
`const [pure virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 143), `activemq::commands::ActiveMQBytesMessage` (p. 170), `activemq::commands::ActiveMQDestination` (p. 242), `activemq::commands::ActiveMQMapMessage` (p. 276), `activemq::commands::ActiveMQMessage` (p. 306), `activemq::commands::ActiveMQObjectMessage` (p. 345), `activemq::commands::ActiveMQStreamMessage` (p. 425), `activemq::commands::ActiveMQTextMessage` (p. 527), `activemq::commands::BooleanExpression` (p. 679), `activemq::commands::BrokerError` (p. 687), `activemq::commands::BrokerInfo` (p. 715), `activemq::commands::ConnectionControl` (p. 1057), `activemq::commands::ConnectionError` (p. 1081), `activemq::commands::ConnectionInfo` (p. 1130), `activemq::commands::ConsumerControl` (p. 1167), `activemq::commands::ConsumerInfo` (p. 1217), `activemq::commands::ControlCommand` (p. 1244), `activemq::commands::DataArrayResponse` (p. 1269), `activemq::commands::DataResponse` (p. 1308), `activemq::commands::DestinationInfo` (p. 1392), `activemq::commands::DiscoveryEvent` (p. 1418), `activemq::commands::ExceptionResponse` (p. 1485), `activemq::commands::FlushCommand` (p. 1574), `activemq::commands::IntegerResponse` (p. 1668), `activemq::commands::JournalQueueAck` (p. 1719), `activemq::commands::JournalTopicAck` (p. 1743), `activemq::commands::JournalTrace` (p. 1767), `activemq::commands::JournalTransaction` (p. 1791), `activemq::commands::KeepAliveInfo` (p. 1813), `activemq::commands::LastPartialCommand` (p. 1841), `activemq::commands::Message` (p. 2023), `activemq::commands::MessageAck` (p. 2056), `activemq::commands::MessageDispatch` (p. 2085), `activemq::commands::MessageDispatchNotification` (p. 2117), `activemq::commands::MessagePull` (p. 2204), `activemq::commands::NetworkBridgeFilter` (p. 2247), `activemq::commands::PartialCommand` (p. 2320), `activemq::commands::ProducerAck` (p. 2421), `activemq::commands::ProducerInfo` (p. 2471), `activemq::commands::RemoveInfo` (p. 2538), `activemq::commands::RemoveSubscriptionInfo` (p. 2561), `activemq::commands::ReplayCommand` (p. 2585), `activemq::commands::Response` (p. 2612), `activemq::commands::SessionInfo` (p. 2703), `activemq::commands::ShutdownInfo` (p. 2758), `activemq::commands::SubscriptionInfo` (p. 2908), `activemq::commands::TransactionInfo` (p. 3038), and `activemq::commands::WireFormatInfo` (p. 3156).

6.264.2.2 virtual void activemq::commands::DataStructure::copyDataStructure (const DataStructure * *src*) [pure virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 143), **activemq::commands::ActiveMQBytesMessage** (p. 170), **activemq::commands::ActiveMQDestination** (p. 243), **activemq::commands::ActiveMQMapMessage** (p. 276), **activemq::commands::ActiveMQMessage** (p. 306), **activemq::commands::ActiveMQObjectMessage** (p. 346), **activemq::commands::ActiveMQStreamMessage** (p. 425), **activemq::commands::ActiveMQTextMessage** (p. 527), **activemq::commands::BaseCommand** (p. 598), **activemq::commands::BrokerError** (p. 687), **activemq::commands::BrokerInfo** (p. 716), **activemq::commands::ConnectionControl** (p. 1057), **activemq::commands::ConnectionError** (p. 1081), **activemq::commands::ConnectionInfo** (p. 1130), **activemq::commands::ConsumerControl** (p. 1167), **activemq::commands::ConsumerInfo** (p. 1217), **activemq::commands::ControlCommand** (p. 1244), **activemq::commands::DataArrayResponse** (p. 1269), **activemq::commands::DataResponse** (p. 1308), **activemq::commands::DestinationInfo** (p. 1392), **activemq::commands::DiscoveryEvent** (p. 1418), **activemq::commands::ExceptionResponse** (p. 1485), **activemq::commands::FlushCommand** (p. 1574), **activemq::commands::IntegerResponse** (p. 1668), **activemq::commands::JournalQueueAck** (p. 1720), **activemq::commands::JournalTopicAck** (p. 1743), **activemq::commands::JournalTrace** (p. 1768), **activemq::commands::JournalTransaction** (p. 1791), **activemq::commands::KeepAliveInfo** (p. 1814), **activemq::commands::LastPartialCommand** (p. 1841), **activemq::commands::Message** (p. 2023), **activemq::commands::MessageAck** (p. 2057), **activemq::commands::MessageDispatch** (p. 2085), **activemq::commands::MessageDispatchNotification** (p. 2117), **activemq::commands::MessagePull** (p. 2204), **activemq::commands::NetworkBridgeFilter** (p. 2248), **activemq::commands::PartialCommand** (p. 2320), **activemq::commands::ProducerAck** (p. 2422), **activemq::commands::ProducerInfo** (p. 2471), **activemq::commands::RemoveInfo** (p. 2538), **activemq::commands::RemoveSubscriptionInfo** (p. 2562), **activemq::commands::ReplayCommand** (p. 2585), **activemq::commands::Response** (p. 2612), **activemq::commands::SessionInfo** (p. 2703), **activemq::commands::ShutdownInfo** (p. 2758), **activemq::commands::SubscriptionInfo** (p. 2909), **activemq::commands::TransactionInfo** (p. 3038), and **activemq::commands::WireFormatInfo** (p. 3156).

6.264.2.3 virtual bool activemq::commands::DataStructure::equals (const DataStructure * *value*) const [pure virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implemented in **activemq::commands::ActiveMQBlobMessage** (p. 144), **activemq::commands::ActiveMQBytesMessage** (p. 171), **activemq::commands::ActiveMQDestination** (p. 243), **activemq::commands::ActiveMQMapMessage** (p. 276), **activemq::commands::ActiveMQMessage** (p. 306), **activemq::commands::ActiveMQMessageTemplate<T>** (p. 331), **activemq::commands::ActiveMQObjectMessage** (p. 346), **activemq::commands::ActiveMQStreamMessage** (p. 426), **activemq::commands::ActiveMQTextMessage** (p. 527), **activemq::commands::BaseCommand** (p. 598), **activemq::commands::BooleanExpression** (p. 680), **activemq::commands::BrokerInfo** (p. 716), **activemq::commands::ConnectionControl** (p. 1057), **activemq::commands::ConnectionError** (p. 1081), **activemq::commands::ConnectionInfo** (p. 1131), **activemq::commands::ConsumerControl** (p. 1168), **activemq::commands::ConsumerInfo** (p. 1217), **activemq::commands::ControlCommand** (p. 1245), **activemq::commands::DataArrayResponse** (p. 1269), **activemq::commands::DataResponse** (p. 1309), **activemq::commands::DestinationInfo** (p. 1392), **activemq::commands::DiscoveryEvent** (p. 1418), **activemq::commands::ExceptionResponse** (p. 1485), **activemq::commands::FlushCommand** (p. 1574), **activemq::commands::IntegerResponse** (p. 1668), **activemq::commands::JournalQueueAck** (p. 1720), **activemq::commands::JournalTopicAck** (p. 1743), **activemq::commands::JournalTrace** (p. 1768), **activemq::commands::JournalTransaction** (p. 1791), **activemq::commands::KeepAliveInfo** (p. 1814), **activemq::commands::LastPartialCommand** (p. 1841), **activemq::commands::Message** (p. 2023), **activemq::commands::MessageAck** (p. 2057), **activemq::commands::MessageDispatch** (p. 2086), **activemq::commands::MessageDispatchNotification** (p. 2117), **activemq::commands::MessagePull** (p. 2204), **activemq::commands::NetworkBridgeFilter** (p. 2248), **activemq::commands::PartialCommand** (p. 2320), **activemq::commands::ProducerAck** (p. 2422), **activemq::commands::ProducerInfo** (p. 2471), **activemq::commands::RemoveInfo** (p. 2538), **activemq::commands::RemoveSubscriptionInfo** (p. 2562), **activemq::commands::ReplayCommand** (p. 2586), **activemq::commands::Response** (p. 2613), **activemq::commands::SessionInfo** (p. 2703), **activemq::commands::ShutdownInfo** (p. 2758), **activemq::commands::SubscriptionInfo** (p. 2909), **activemq::commands::TransactionInfo** (p. 3039), **activemq::commands::WireFormatInfo** (p. 3156), **activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>** (p. 331), **activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>** (p. 331), **activemq::commands::ActiveMQMessageTemplate<cms::Message>** (p. 331), **activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>** (p. 331), **activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>** (p. 331), and **activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>** (p. 331).

6.264.2.4 virtual unsigned char activemq::commands::DataStructure::getDataStructureType () const [pure virtual]

Get the **DataStructure** (p. 1372) Type as defined in **CommandTypes.h**.

Returns

The type of the data structure

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 144), `activemq::commands::ActiveMQBytesMessage` (p. 172), `activemq::commands::ActiveMQDestination` (p. 244), `activemq::commands::ActiveMQMapMessage` (p. 278), `activemq::commands::ActiveMQMessage` (p. 306), `activemq::commands::ActiveMQObjectMessage` (p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 426), `activemq::commands::ActiveMQTextMessage` (p. 528), `activemq::commands::BrokerError` (p. 688), `activemq::commands::BrokerInfo` (p. 717), `activemq::commands::ConnectionControl` (p. 1057), `activemq::commands::ConnectionError` (p. 1082), `activemq::commands::ConnectionInfo` (p. 1131), `activemq::commands::ConsumerControl` (p. 1168), `activemq::commands::ConsumerInfo` (p. 1218), `activemq::commands::ControlCommand` (p. 1245), `activemq::commands::DataArrayResponse` (p. 1270), `activemq::commands::DataResponse` (p. 1309), `activemq::commands::DestinationInfo` (p. 1393), `activemq::commands::DiscoveryEvent` (p. 1419), `activemq::commands::ExceptionResponse` (p. 1486), `activemq::commands::FlushCommand` (p. 1575), `activemq::commands::IntegerResponse` (p. 1669), `activemq::commands::JournalQueueAck` (p. 1720), `activemq::commands::JournalTopicAck` (p. 1744), `activemq::commands::JournalTrace` (p. 1768), `activemq::commands::JournalTransaction` (p. 1792), `activemq::commands::KeepAliveInfo` (p. 1814), `activemq::commands::LastPartialCommand` (p. 1842), `activemq::commands::Message` (p. 2025), `activemq::commands::MessageAck` (p. 2057), `activemq::commands::MessageDispatch` (p. 2086), `activemq::commands::MessageDispatchNotification` (p. 2118), `activemq::commands::MessagePull` (p. 2205), `activemq::commands::NetworkBridgeFilter` (p. 2248), `activemq::commands::PartialCommand` (p. 2321), `activemq::commands::ProducerAck` (p. 2422), `activemq::commands::ProducerInfo` (p. 2472), `activemq::commands::RemoveInfo` (p. 2538), `activemq::commands::RemoveSubscriptionInfo` (p. 2562), `activemq::commands::ReplayCommand` (p. 2586), `activemq::commands::Response` (p. 2613), `activemq::commands::SessionInfo` (p. 2704), `activemq::commands::ShutdownInfo` (p. 2758), `activemq::commands::SubscriptionInfo` (p. 2909), `activemq::commands::TransactionInfo` (p. 3039), and `activemq::commands::WireFormatInfo` (p. 3156).

6.264.2.5 `virtual std::string activemq::commands::DataStructure::toString ()`
`const [pure virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implemented in `activemq::commands::ActiveMQBlobMessage` (p. 146), `activemq::commands::ActiveMQBytesMessage` (p. 177), `activemq::commands::ActiveMQDestination` (p. 248), `activemq::commands::ActiveMQMapMessage` (p. 284), `activemq::commands::ActiveMQMessage` (p. 307), `activemq::commands::ActiveMQObjectMessage`

(p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 432),
`activemq::commands::ActiveMQTextMessage` (p. 529), `ac-`
`tivemq::commands::BaseCommand` (p. 602), `activemq::commands::BaseDataStructure`
(p. 662), `activemq::commands::BooleanExpression` (p. 680), `ac-`

6.265 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

```
#include <src/main/decaf/util/Date.h>
```

Inheritance diagram for `decaf::util::Date`:

Public Member Functions

- **Date** ()
Default constructor - sets time to the current System time, rounded to the nearest millisecond.
- **Date** (long long milliseconds)
Constructs the date with a given time value.

- **Date** (const **Date** &source)
Copy constructor.
- **Date** & **operator=** (const **Date** &value)
*Assigns the value of one **Date** (p. 1377) object to another.*
- virtual ~**Date** ()
- long long **getTime** () const
Gets the underlying time.
- void **setTime** (long long milliseconds)
Sets the underlying time.
- bool **after** (const **Date** &when) const
Determines whether or not this date falls after the specified time.
- bool **before** (const **Date** &when) const
Determines whether or not this date falls before the specified time.
- std::string **toString** () const
*Converts this **Date** (p. 1377) object to a String of the form:*
- virtual int **compareTo** (const **Date** &value) const
Compares this Data object to the one given.
- virtual bool **equals** (const **Date** &value) const
- virtual bool **operator==** (const **Date** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Date** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

6.265.1 Detailed Description

Wrapper class around a time value in milliseconds. This class is comparable to Java's java.util.Date class.

Since

1.0

6.265.2 Constructor & Destructor Documentation

6.265.2.1 decaf::util::Date::Date ()

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

6.265.2.2 decaf::util::Date::Date (long long *milliseconds*)

Constructs the date with a given time value.

Parameters

milliseconds The time in milliseconds;

6.265.2.3 decaf::util::Date::Date (const Date & *source*)

Copy constructor.

Parameters

source The **Date** (p. 1377) instance to copy into this one.

6.265.2.4 virtual decaf::util::Date::~~Date () [virtual]**6.265.3 Member Function Documentation****6.265.3.1 bool decaf::util::Date::after (const Date & *when*) const**

Determines whether or not this date falls after the specified time.

Parameters

when The date to compare

Returns

true if this date falls after when.

6.265.3.2 bool decaf::util::Date::before (const Date & *when*) const

Determines whether or not this date falls before the specified time.

Parameters

when The date to compare

Returns

true if this date falls before when.

6.265.3.3 virtual int decaf::util::Date::compareTo (const Date & *value*) const [virtual]

Compares this Data object to the one given.

Parameters

value The **Date** (p. 1377) value to compare to this one.

Returns

zero if the **Date** (p. 1377) values are equal, a value less than zero if this **Date** value is earlier than argument value, and a value greater than zero if this **Date** (p. 1377) object is later than the argument **Date** (p. 1377) value.

6.265.3.4 `virtual bool decaf::util::Date::equals (const Date & value) const`
[virtual]

Returns

true if this value is considered equal to the passed value.

6.265.3.5 `long long decaf::util::Date::getTime () const`

Gets the underlying time.

Returns

The underlying time value in milliseconds.

6.265.3.6 `virtual bool decaf::util::Date::operator< (const Date & value) const`
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.265.3.7 `Date& decaf::util::Date::operator= (const Date & value)`

Assigns the value of one **Date** (p. 1377) object to another.

Parameters

value The value to be copied into this **Date** (p. 1377) object.

Returns

reference to this object with the newly assigned value.

6.265.3.8 virtual bool decaf::util::Date::operator==(const Date & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.265.3.9 void decaf::util::Date::setTime (long long *milliseconds*)

Sets the underlying time.

Parameters

milliseconds The underlying time value in milliseconds.

6.265.3.10 std::string decaf::util::Date::toString () const

Converts this **Date** (p. 1377) object to a String of the form:

dow mon dd hh:mm:ss zzz yyyy

where:

- dow is the day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
- mon is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec).
- dd is the day of the month (01 through 31), as two decimal digits.
- hh is the hour of the day (00 through 23), as two decimal digits.
- mm is the minute within the hour (00 through 59), as two decimal digits.
- ss is the second within the minute (00 through 61, as two decimal digits.
- zzz is the time zone (and may reflect daylight saving time). Standard time zone abbreviations include those recognized by the method parse. If time zone information is not available, then zzz is empty - that is, it consists of no characters at all.
- yyyy is the year, as four decimal digits.

Returns

the String representation of the **Date** (p. 1377) object.

The documentation for this class was generated from the following file:

6.266 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

```
#include <src/main/decaf/internal/DecafRuntime.h>
```

Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime** ()
Initializes the APR Runtime for a library.
- virtual **~DecafRuntime** ()
Terminates the APR Runtime for a library.
- apr_pool_t * **getGlobalPool** () const
Grants access to the Global APR Pool instance that should be used when creating new threads.

6.266.1 Detailed Description

Handles APR initialization and termination.

6.266.2 Constructor & Destructor Documentation

6.266.2.1 decaf::internal::DecafRuntime::DecafRuntime ()

Initializes the APR Runtime for a library.

6.266.2.2 virtual decaf::internal::DecafRuntime::~~DecafRuntime () [virtual]

Terminates the APR Runtime for a library.

6.266.3 Member Function Documentation

6.266.3.1 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool () const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.267 activemq::threads::DedicatedTaskRunner Class Reference

```
#include <src/main/activemq/threads/DedicatedTaskRunner.h>
```

Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (**Task** *task)
- virtual **~DedicatedTaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()

Shutdown once the task has finished and the TaskRunner's thread has exited.
- virtual void **wakeup** ()

*Signal the **TaskRunner** (p. 2958) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2956) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.267.1 Constructor & Destructor Documentation

6.267.1.1 **activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner** (**Task** * *task*)

6.267.1.2 **virtual activemq::threads::DedicatedTaskRunner::~~DedicatedTaskRunner** () [virtual]

6.267.2 Member Function Documentation

6.267.2.1 **virtual void activemq::threads::DedicatedTaskRunner::run** ()
[protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2642).

6.267.2.2 virtual void activemq::threads::DedicatedTaskRunner::shutdown () [virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

6.267.2.3 virtual void activemq::threads::DedicatedTaskRunner::shutdown (unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout - Time in Milliseconds to wait for the task to stop.

6.267.2.4 virtual void activemq::threads::DedicatedTaskRunner::wakeup () [virtual]

Signal the **TaskRunner** (p. 2958) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2956) instance will be run until its iterate method has returned false indicating it is done.

The documentation for this class was generated from the following file:

6.268 activemq::transport::DefaultTransportListener Class Reference

```
#include <src/main/activemq/transport/DefaultTransportListener.h>
```

Inheritance diagram for activemq::transport::DefaultTransportListener:

Public Member Functions

- virtual **~DefaultTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command AMQCPP_UNUSED)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex AMQCPP_UNUSED)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.

6.268.1 Constructor & Destructor Documentation

6.268.1.1 virtual
activemq::transport::DefaultTransportListener::~~DefaultTransportListener
() [inline, virtual]

6.268.2 Member Function Documentation

6.268.2.1 virtual void activemq::transport::DefaultTransportListener::onCommand
(const Pointer< Command > &command *AMQCPP_UNUSED*)
[inline, virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3066) deletes the command upon receipt.

Parameters

command the received command object.

6.268.2.2 virtual void activemq::transport::DefaultTransportListener::onException
(const decaf::lang::Exception &ex *AMQCPP_UNUSED*) [inline, virtual]

Event handler for an exception from a command transport.

Parameters

ex The exception.

6.268.2.3 virtual void activemq::transport::DefaultTransportListener::transportInterrupted ()
[inline, virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3082).

6.268.2.4 virtual void activemq::transport::DefaultTransportListener::transportResumed ()
[inline, virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3082).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**DefaultTransportListener.h**

6.269 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

```
#include <src/main/decaf/util/concurrent/Delayed.h>
```

Inheritance diagram for decaf::util::concurrent::Delayed:

Public Member Functions

- virtual `~Delayed()`
- virtual long long `getDelay(const TimeUnit &unit)=0`
Returns the remaining delay associated with this object, in the given time unit.

6.269.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay. An implementation of this interface must define a Comparable methods that provides an ordering consistent with its getDelay method.

6.269.2 Constructor & Destructor Documentation

6.269.2.1 virtual decaf::util::concurrent::Delayed::~~Delayed () [inline, virtual]

6.269.3 Member Function Documentation

6.269.3.1 virtual long long decaf::util::concurrent::Delayed::getDelay (const TimeUnit & *unit*) [pure virtual]

Returns the remaining delay associated with this object, in the given time unit.

Parameters

unit The time unit

Returns

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/Delayed.h

6.270 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

```
#include <src/main/cms/DeliveryMode.h>
```

Public Types

- enum **DELIVERY_MODE** { **PERSISTENT** = 0, **NON_PERSISTENT** = 1 }
*Enumeration values for **Message** (p. 2036) Delivery Mode.*

Public Member Functions

- virtual **~DeliveryMode** ()

6.270.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages. When a client sends a **cms::Message** (p. 2036) it can mark the **Message** (p. 2036) as either Persistent or Non-Persistent. If the client feels that the **Message** (p. 2036) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p. 2036) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p. 2036) throughput.

The **DeliveryMode** (p. 1386) covers only the transport of the **Message** (p. 2036) for sending client to its destination and doesn't apply to the receiving **Message** (p. 2036) consumer. The receiving Consumer can drop Message's based on configuration such as memory limits or **Message** (p. 2036) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is **PERSISTENT** and the configuration of the **Message** (p. 2036) consumer allows for it.

Since

1.0

6.270.2 Member Enumeration Documentation

6.270.2.1 enum cms::DeliveryMode::DELIVERY_MODE

Enumeration values for **Message** (p. 2036) Delivery Mode.

Enumerator:

PERSISTENT

NON_PERSISTENT

6.270.3 Constructor & Destructor Documentation

6.270.3.1 virtual cms::DeliveryMode::~~DeliveryMode () [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/cms/**DeliveryMode.h**

6.271 cms::Destination Class Reference

A **Destination** (p. 1387) object encapsulates a provider-specific address.

```
#include <src/main/cms/Destination.h>
```

Inheritance diagram for cms::Destination:

Public Types

- enum **DestinationType** { **TOPIC**, **QUEUE**, **TEMPORARY_TOPIC**, **TEMPORARY_QUEUE** }

Public Member Functions

- virtual **~Destination** ()
- virtual **DestinationType** **getDestinationType** () const =0
*Retrieve the **Destination** (p. 1387) Type for this **Destination** (p. 1387).*
- virtual **cms::Destination * clone** () const =0
Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (const **cms::Destination** &source)=0
*Copies the contents of the given **Destination** (p. 1387) object to this one.*
- virtual const **CMSProperties** & **getCMSProperties** () const =0
Retrieve any properties that might be part of the destination that was specified.

6.271.1 Detailed Description

A **Destination** (p. 1387) object encapsulates a provider-specific address. There is no standard definition of a **Destination** (p. 1387) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 1387) address.

All CMS **Destination** (p. 1387) objects support concurrent use.

Since

1.0

6.271.2 Member Enumeration Documentation

6.271.2.1 enum cms::Destination::DestinationType

Enumerator:

TOPIC
QUEUE
TEMPORARY_TOPIC
TEMPORARY_QUEUE

6.271.3 Constructor & Destructor Documentation

6.271.3.1 virtual cms::Destination::~~Destination () [inline, virtual]

6.271.4 Member Function Documentation

6.271.4.1 virtual cms::Destination* cms::Destination::clone () const [pure virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implemented in **activemq::commands::ActiveMQQueue** (p. 380),
activemq::commands::ActiveMQTempQueue (p. 478), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 502), and **ac-**
tivemq::commands::ActiveMQTopic (p. 551).

6.271.4.2 virtual void cms::Destination::copy (const cms::Destination & *source*)
[pure virtual]

Copies the contents of the given **Destination** (p. 1387) object to this one.

Parameters

source The source **Destination** (p. 1387) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 380),
activemq::commands::ActiveMQTempQueue (p. 479), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 503), and **ac-**
tivemq::commands::ActiveMQTopic (p. 551).

6.271.4.3 virtual const CMSProperties& cms::Destination::getCMSProperties ()
const [pure virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a **CMSProperties** (p. 965) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 381),
activemq::commands::ActiveMQTempQueue (p. 480), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 504), and **ac-**
tivemq::commands::ActiveMQTopic (p. 552).

6.271.4.4 virtual DestinationType cms::Destination::getDestinationType ()
const [pure virtual]

Retrieve the **Destination** (p. 1387) Type for this **Destination** (p. 1387).

Returns

The **Destination** (p.1387) Type

Implemented in **activemq::commands::ActiveMQQueue** (p. 382),
activemq::commands::ActiveMQTempQueue (p. 480), **ac-**
tivemq::commands::ActiveMQTempTopic (p. 504), and **ac-**
tivemq::commands::ActiveMQTopic (p. 552).

The documentation for this class was generated from the following file:

- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual unsigned char **getOperationType** () const
- virtual void **setOperationType** (unsigned char operationType)
- virtual long long **getTimeout** () const
- virtual void **setTimeout** (long long timeout)
- virtual const std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** () const
- virtual std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** ()
- virtual void **setBrokerPath** (const std::vector< **decaf::lang::Pointer**< **BrokerId** > > &brokerPath)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_DESTINATIONINFO** = 8

Protected Member Functions

- **DestinationInfo** (const **DestinationInfo** &)
- **DestinationInfo** & **operator=** (const **DestinationInfo** &)

Protected Attributes

- `Pointer< ConnectionId > connectionId`
- `Pointer< ActiveMQDestination > destination`
- unsigned char `operationType`
- long long `timeout`
- `std::vector< decaf::lang::Pointer< BrokerId > > brokerPath`

6.273.1 Constructor & Destructor Documentation

- 6.273.1.1** `activemq::commands::DestinationInfo::DestinationInfo (const DestinationInfo &)` [inline, protected]
- 6.273.1.2** `activemq::commands::DestinationInfo::DestinationInfo ()`
- 6.273.1.3** `virtual activemq::commands::DestinationInfo::~~DestinationInfo ()` [virtual]

6.273.2 Member Function Documentation

- 6.273.2.1** `virtual DestinationInfo* activemq::commands::DestinationInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

- 6.273.2.2** `virtual void activemq::commands::DestinationInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

- 6.273.2.3** `virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

- 6.273.2.4 **virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath () const**
[virtual]
- 6.273.2.5 **virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath ()** [virtual]
- 6.273.2.6 **virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId ()** [virtual]
- 6.273.2.7 **virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId () const** [virtual]
- 6.273.2.8 **virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType () const**
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.273.2.9 `virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination () const` [virtual]
- 6.273.2.10 `virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination ()` [virtual]
- 6.273.2.11 `virtual unsigned char activemq::commands::DestinationInfo::getOperationType () const` [virtual]
- 6.273.2.12 `virtual long long activemq::commands::DestinationInfo::getTimeout () const` [virtual]
- 6.273.2.13 `DestinationInfo& activemq::commands::DestinationInfo::operator= (const DestinationInfo &)` [inline, protected]
- 6.273.2.14 `virtual void activemq::commands::DestinationInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath)` [virtual]
- 6.273.2.15 `virtual void activemq::commands::DestinationInfo::setConnectionId (const Pointer< ConnectionId > & connectionId)` [virtual]
- 6.273.2.16 `virtual void activemq::commands::DestinationInfo::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.273.2.17 `virtual void activemq::commands::DestinationInfo::setOperationType (unsigned char operationType)` [virtual]
- 6.273.2.18 `virtual void activemq::commands::DestinationInfo::setTimeout (long long timeout)` [virtual]
- 6.273.2.19 `virtual std::string activemq::commands::DestinationInfo::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 602).

- 6.273.2.20 `virtual Pointer<Command> activemq::commands::DestinationInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.273.3 Field Documentation

6.274.2 Constructor & Destructor Documentation

6.274.2.1 activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::DestinationInfoMarshaller () [inline]

6.274.2.2 virtual activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::~~DestinationInfoMarshaller () [inline, virtual]

6.274.3 Member Function Documentation

6.274.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.274.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.274.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 631).

6.274.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

```
6.274.3.5 virtual int ac-
      tivemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal1
      ( OpenWireFormat * wireFormat, commands::DataStructure
        * dataStructure, utils::BooleanStream * bs ) throw (
        decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

```
6.274.3.6 virtual void ac-
      tivemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightMarshal2
      ( OpenWireFormat * wireFormat, commands::DataStructure
        * dataStructure, decaf::io::DataOutputStream * dataOut,
        utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

6.274.3.7 virtual void activemq::wireformat::openwire::marshal::v2::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.275.3.3 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 604).

6.275.3.4 virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.275.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

6.275.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

6.275.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/DestinationInfoMarshaller.h`

6.276 activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 1403).

```

Public Member Functions

- **DestinationInfoMarshaller** ()
- virtual **~DestinationInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.276.1 Detailed Description

Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p.1403). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.276.2 Constructor & Destructor Documentation

6.276.2.1 **activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::DestinationInfoMarshaller** () [inline]

6.276.2.2 **virtual**
activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::~~DestinationInfoMarshaller () [inline, virtual]

6.276.3 Member Function Documentation

6.276.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.276.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.276.3.3 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.276.3.4 virtual void activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.276.3.5 virtual int activemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.276.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.276.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::~~DestinationInfoMarshaller () [inline, virtual]

6.277.3 Member Function Documentation

6.277.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.277.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.277.3.3 virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.277.3.4 virtual void activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.277.3.5 virtual int activemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.277.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.277.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

6.278.3 Member Function Documentation

6.278.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.278.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.278.3.3 virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.278.3.4 virtual void activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.278.3.5 virtual int activemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

```
6.278.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.278.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::DestinationInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/DestinationInfoMarshaller.h`

6.279 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

```
#include <src/main/activemq/cmsutil/DestinationResolver.h>
```

Inheritance diagram for `activemq::cmsutil::DestinationResolver`:

Public Member Functions

- virtual `~DestinationResolver()`
- virtual void **init** (`ResourceLifecycleManager *mgr`)=0
Initializes this destination resolver for use.
- virtual void **destroy** ()=0
Destroys any allocated resources.
- virtual `cms::Destination * resolveDestinationName (cms::Session *session, const std::string &destName, bool pubSubDomain)=0` throw (`cms::CMSException`)
Resolves the given name to a destination.

6.279.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.279.2 Constructor & Destructor Documentation

- 6.279.2.1** virtual `activemq::cmsutil::DestinationResolver::~DestinationResolver()` [`inline`, `virtual`]

6.279.3 Member Function Documentation

- 6.279.3.1** virtual void `activemq::cmsutil::DestinationResolver::destroy()` [`pure virtual`]

Destroys any allocated resources.

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1472).

6.279.3.2 `virtual void activemq::cmsutil::DestinationResolver::init (ResourceLifecycleManager * mgr) [pure virtual]`

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls `destroy()` (p. 1415)).

Parameters

mgr the resource lifecycle manager.

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1472).

6.279.3.3 `virtual cms::Destination* activemq::cmsutil::DestinationResolver::resolveDestinationName (cms::Session * session, const std::string & destName, bool pubSubDomain) throw (cms::CMSException) [pure virtual]`

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

cms::CMSException (p. 960) if resolution failed.

Implemented in `activemq::cmsutil::DynamicDestinationResolver` (p. 1472).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/DestinationResolver.h`

6.280 activemq::commands::DiscoveryEvent Class Reference

```
#include <src/main/activemq/commands/DiscoveryEvent.h>
```

Inheritance diagram for `activemq::commands::DiscoveryEvent`:

Public Member Functions

- **DiscoveryEvent** ()
- virtual **~DiscoveryEvent** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DiscoveryEvent * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getServiceName** () const
- virtual std::string & **getServiceName** ()
- virtual void **setServiceName** (const std::string &serviceName)
- virtual const std::string & **getBrokerName** () const
- virtual std::string & **getBrokerName** ()
- virtual void **setBrokerName** (const std::string &brokerName)

Static Public Attributes

- static const unsigned char **ID_DISCOVERYEVENT** = 40

Protected Member Functions

- **DiscoveryEvent** (const **DiscoveryEvent** &)
- **DiscoveryEvent** & **operator=** (const **DiscoveryEvent** &)

Protected Attributes

- std::string **serviceName**
- std::string **brokerName**

6.280.1 Constructor & Destructor Documentation

6.280.1.1 `activemq::commands::DiscoveryEvent::DiscoveryEvent (const
DiscoveryEvent &) [inline, protected]`

6.280.1.2 `activemq::commands::DiscoveryEvent::DiscoveryEvent ()`

6.280.1.3 `virtual activemq::commands::DiscoveryEvent::~~DiscoveryEvent ()
[virtual]`

6.280.2 Member Function Documentation

6.280.2.1 `virtual DiscoveryEvent* ac-
tivemq::commands::DiscoveryEvent::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.280.2.2 `virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

6.280.2.3 `virtual bool activemq::commands::DiscoveryEvent::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

- 6.280.2.4 `virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName () const [virtual]`
- 6.280.2.5 `virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName () [virtual]`
- 6.280.2.6 `virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

- 6.280.2.7 `virtual std::string& activemq::commands::DiscoveryEvent::getServiceName () [virtual]`
- 6.280.2.8 `virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName () const [virtual]`
- 6.280.2.9 `DiscoveryEvent& activemq::commands::DiscoveryEvent::operator= (const DiscoveryEvent &) [inline, protected]`
- 6.280.2.10 `virtual void activemq::commands::DiscoveryEvent::setBrokerName (const std::string & brokerName) [virtual]`
- 6.280.2.11 `virtual void activemq::commands::DiscoveryEvent::setServiceName (const std::string & serviceName) [virtual]`
- 6.280.2.12 `virtual std::string activemq::commands::DiscoveryEvent::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 662).

6.280.3 Field Documentation

- 6.280.3.1 `std::string activemq::commands::DiscoveryEvent::brokerName`
[protected]
- 6.280.3.2 `const unsigned char activemq::commands::DiscoveryEvent::ID _ - DISCOVERYEVENT = 40` [static]
- 6.280.3.3 `std::string activemq::commands::DiscoveryEvent::serviceName`
[protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/DiscoveryEvent.h`

6.281 `activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller` Class Reference

Marshaling code for Open Wire Format for `DiscoveryEventMarshaller` (p. 1420).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/DiscoveryEventMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller`:

Public Member Functions

- `DiscoveryEventMarshaller ()`
- `virtual ~DiscoveryEventMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.281.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1420). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.281.2 Constructor & Destructor Documentation

6.281.2.1 `activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::DiscoveryEventMarshaller()` [inline]

6.281.2.2 `virtual activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller()` [inline, virtual]

6.281.3 Member Function Documentation

6.281.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.281.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.281.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.281.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.281.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.281.3.6 virtual void **activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightMarshal2** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.281.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::DiscoveryEventMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.282.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p.1424). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.282.2 Constructor & Destructor Documentation

6.282.2.1 `activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::DiscoveryEventMarshaller ()` [inline]

6.282.2.2 `virtual activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller ()` [inline, virtual]

6.282.3 Member Function Documentation

6.282.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1331).

6.282.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1336).

6.282.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

```
6.282.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

```
6.282.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.282.3.6 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.282.3.7 virtual void activemq::wireformat::openwire::marshal::v3::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.283.3 Member Function Documentation

6.283.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.283.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.283.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.283.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.283.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.283.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.283.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.284.2.2 `virtual activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller () [inline, virtual]`

6.284.3 Member Function Documentation

6.284.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.284.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.284.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.284.3.4 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.284.3.5 virtual int activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.284.3.6 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.284.3.7 virtual void activemq::wireformat::openwire::marshal::v5::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.285.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 1435). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.285.2 Constructor & Destructor Documentation

6.285.2.1 `activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::DiscoveryEventMarshaller()` [inline]

6.285.2.2 `virtual activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::~~DiscoveryEventMarshaller()` [inline, virtual]

6.285.3 Member Function Documentation

6.285.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.285.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.285.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.285.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.285.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.285.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.285.3.7 virtual void activemq::wireformat::openwire::marshal::v1::DiscoveryEventMarshaller::tightUnmarshal
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/DiscoveryEventMarshaller.h`

6.286 activemq::core::DispatchData Class Reference

Simple POCO that contains the information necessary to route a message to a specified consumer.

```
#include <src/main/activemq/core/DispatchData.h>
```

Public Member Functions

- **DispatchData** ()
- **DispatchData** (const **decaf::lang::Pointer**< **commands::ConsumerId** > &consumer,
const **decaf::lang::Pointer**< **commands::Message** > &message)
- const **decaf::lang::Pointer**< **commands::ConsumerId** > & **getConsumerId** ()
- const **decaf::lang::Pointer**< **commands::Message** > & **getMessage** ()

6.286.1 Detailed Description

Simple POCO that contains the information necessary to route a message to a specified consumer.

6.286.2 Constructor & Destructor Documentation

6.286.2.1 `activemq::core::DispatchData::DispatchData ()` [inline]

6.286.2.2 `activemq::core::DispatchData::DispatchData (const decaf::lang::Pointer< commands::ConsumerId > & consumer, const decaf::lang::Pointer< commands::Message > & message)` [inline]

6.286.3 Member Function Documentation

6.286.3.1 `const decaf::lang::Pointer<commands::ConsumerId>& activemq::core::DispatchData::getConsumerId ()` [inline]

6.286.3.2 `const decaf::lang::Pointer<commands::Message>& activemq::core::DispatchData::getMessage ()` [inline]

The documentation for this class was generated from the following file:

- `src/main/activemq/core/DispatchData.h`

6.287 activemq::core::Dispatcher Class Reference

Interface for an object responsible for dispatching messages to consumers.

```
#include <src/main/activemq/core/Dispatcher.h>
```

Inheritance diagram for `activemq::core::Dispatcher`:

Public Member Functions

- virtual `~Dispatcher ()`
- virtual void `dispatch (const Pointer< MessageDispatch > &message)=0`

Dispatches a message to a particular consumer.

6.287.1 Detailed Description

Interface for an object responsible for dispatching messages to consumers.

6.287.2 Constructor & Destructor Documentation

6.287.2.1 virtual `activemq::core::Dispatcher::~~Dispatcher ()` [inline, virtual]

6.287.3 Member Function Documentation

6.287.3.1 virtual void `activemq::core::Dispatcher::dispatch (const Pointer< MessageDispatch > & message)` [pure virtual]

Dispatches a message to a particular consumer.

Parameters

message - the message to be dispatched.

Implemented in `activemq::core::ActiveMQConsumer` (p. 234), and `activemq::core::ActiveMQSession` (p. 413).

The documentation for this class was generated from the following file:

- `src/main/activemq/core/Dispatcher.h`

6.288 decaf::lang::Double Class Reference

```
#include <src/main/decaf/lang/Double.h>
```

Inheritance diagram for `decaf::lang::Double`:

Public Member Functions

- **Double** (double value)
- **Double** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual **~Double** ()
- virtual int **compareTo** (const **Double** &d) const
*Compares this **Double** (p. 1441) instance with another.*
- bool **equals** (const **Double** &d) const
- virtual bool **operator==** (const **Double** &d) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Double** &d) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const double &d) const
*Compares this **Double** (p. 1441) instance with another.*
- bool **equals** (const double &d) const
- virtual bool **operator==** (const double &d) const

Compares equality between this object and the one passed.

- virtual bool **operator<** (const double &d) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.
- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (double d1, double d2)
Compares the two specified double values.
- static long long **doubleToLongBits** (double value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.
- static long long **doubleToRawLongBits** (double value)
Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.
- static bool **isInfinite** (double value)
- static bool **isNaN** (double value)
- static double **longBitsToDouble** (long long bits)
Returns the double value corresponding to a given bit representation.
- static double **parseDouble** (const std::string value) throw (exceptions::NumberFormatException)
*Returns a new double initialized to the value represented by the specified string, as performed by the `valueOf` method of class **Double** (p. 1441).*

- static std::string **toHexString** (double value)
Returns a hexadecimal string representation of the double argument.
- static std::string **toString** (double value)
Returns a string representation of the double argument.
- static **Double** **valueOf** (double value)
*Returns a **Double** (p. 1441) instance representing the specified double value.*
- static **Double** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Double** (p. 1441) instance that wraps a primitive double which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 64
The size in bits of the primitive int type.
- static const double **MAX_VALUE**
The maximum value that the primitive type can hold.
- static const double **MIN_VALUE**
The minimum value that the primitive type can hold.
- static const double **NaN**
*Constant for the Not a **Number** (p. 2282) Value.*
- static const double **POSITIVE_INFINITY**
Constant for Positive Infinity.
- static const double **NEGATIVE_INFINITY**
Constant for Negative Infinitiy.

6.288.1 Constructor & Destructor Documentation

6.288.1.1 decaf::lang::Double::Double (double value)

Parameters

value - the primitive type to wrap

6.288.1.2 decaf::lang::Double::Double (const std::string & value) throw (exceptions::NumberFormatException)

Parameters

value - the string to convert to a primitive type to wrap

6.288.1.3 `virtual decaf::lang::Double::~~Double () [inline, virtual]`

6.288.2 Member Function Documentation

6.288.2.1 `virtual unsigned char decaf::lang::Double::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

6.288.2.2 `static int decaf::lang::Double::compare (double d1, double d2) [static]`

Compares the two specified double values.

The sign of the integer value returned is the same as that of the integer that would be returned by the call: `new Double(d1).compareTo(new Double(d2))`

Parameters

d1 - the first double to compare

d2 - the second double to compare

Returns

the value 0 if *d1* is numerically equal to *d2*; a value less than 0 if *d1* is numerically less than *d2*; and a value greater than 0 if *d1* is numerically greater than *d2*.

6.288.2.3 `virtual int decaf::lang::Double::compareTo (const double & d) const [virtual]`

Compares this **Double** (p. 1441) instance with another.

Parameters

d - the **Double** (p. 1441) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements `decaf::lang::Comparable< double >` (p. 1010).

6.288.2.4 `virtual int decaf::lang::Double::compareTo (const Double & d) const [virtual]`

Compares this **Double** (p. 1441) instance with another.

Parameters

d - the **Double** (p. 1441) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.288.2.5 static long long decaf::lang::Double::doubleToLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.

Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToLongBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters

value - double to be converted

Returns

the long long bits that make up the double

6.288.2.6 static long long decaf::lang::Double::doubleToRawLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

Bit 63 (the bit that is selected by the mask 0x8000000000000000LL) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000LL. If the argument is negative infinity, the result is 0xfff0000000000000LL. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the doubleToLongBits method, doubleToRawLongBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToRawLongBits.

Parameters

value - double to be converted

Returns

the long long bits that make up the double

6.288.2.7 `virtual double decaf::lang::Double::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.288.2.8 `bool decaf::lang::Double::equals (const Double & d) const [inline]`

Parameters

d - the **Double** (p. 1441) object to compare against.

Returns

true if the two **Double** (p. 1441) Objects have the same value.

6.288.2.9 `bool decaf::lang::Double::equals (const double & d) const [inline, virtual]`

Parameters

d - the **Double** (p. 1441) object to compare against.

Returns

true if the two **Double** (p. 1441) Objects have the same value.

Implements **decaf::lang::Comparable< double >** (p. 1010).

6.288.2.10 `virtual float decaf::lang::Double::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.288.2.11 `virtual int decaf::lang::Double::intValue () const` [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.288.2.12 `bool decaf::lang::Double::isInfinite () const`

Returns

true if the double is equal to positive infinity.

6.288.2.13 `static bool decaf::lang::Double::isInfinite (double value)` [static]

Parameters

value - The double to check.

Returns

true if the double is equal to infinity.

6.288.2.14 `bool decaf::lang::Double::isNaN () const`

Returns

true if the double is equal to NaN.

6.288.2.15 `static bool decaf::lang::Double::isNaN (double value)` [static]

Parameters

value - The double to check.

Returns

true if the double is equal to NaN.

6.288.2.16 `static double decaf::lang::Double::longBitsToDouble (long long bits)`
[static]

Returns the double value corresponding to a given bit representation.

The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xfffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 1445) method.

Parameters

bits - the long long bits to convert to double

Returns

the double converted from the bits

6.288.2.17 `virtual long long decaf::lang::Double::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.288.2.18 `virtual bool decaf::lang::Double::operator< (const Double & d) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

d - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.288.2.19 `virtual bool decaf::lang::Double::operator< (const double & d) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

d - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< double >` (p.1011).

6.288.2.20 `virtual bool decaf::lang::Double::operator==(const Double & d)
const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

d - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.288.2.21 `virtual bool decaf::lang::Double::operator==(const double & d)
const [inline, virtual]`

Compares equality between this object and the one passed.

Parameters

d - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< double >` (p.1011).

6.288.2.22 `static double decaf::lang::Double::parseDouble (const std::string value
) throw (exceptions::NumberFormatException) [static]`

Returns a new double initialized to the value represented by the specified string, as performed by the `valueOf` method of class **Double** (p.1441).

Parameters

value - The string to parse to an double

Returns

a double parsed from the passed string

Exceptions

NumberFormatException

6.288.2.23 `virtual short decaf::lang::Double::shortValue () const [inline,
virtual]`

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

6.288.2.24 `static std::string decaf::lang::Double::toHexString (double value)` `[static]`

Returns a hexadecimal string representation of the double argument.

All characters mentioned below are ASCII characters.

* If the argument is NaN, the result is the string "NaN". * Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p.1664) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters

value - The double to convert to a string

Returns

the Hex formatted double string.

6.288.2.25 `std::string decaf::lang::Double::toString () const`

Returns

this **Double** (p.1441) Object as a String Representation

6.288.2.26 `static std::string decaf::lang::Double::toString (double value)` `[static]`

Returns a string representation of the double argument.

All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10⁻³ but less than 10⁷, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m

is less than 10^{-3} or greater than or equal to 10^7 , then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that $10^n \leq m < 10^{n+1}$; then let a be the mathematically exact quotient of m and 10^n so that $1 \leq a < 10$. The magnitude is then represented as the integer part of a , as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a , followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1665).

Parameters

value - The double to convert to a string

Returns

the formatted double string.

6.288.2.27 static Double decaf::lang::Double::valueOf (double value) [static]

Returns a **Double** (p. 1441) instance representing the specified double value.

Parameters

value - double to wrap

Returns

new **Double** (p. 1441) instance wrapping the primitive value

6.288.2.28 static Double decaf::lang::Double::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]

Returns a **Double** (p. 1441) instance that wraps a primitive double which is parsed from the string value passed.

Parameters

value - the string to parse

Returns

a new **Double** (p. 1441) instance wrapping the double parsed from value

Exceptions

NumberFormatException on error.

6.288.3 Field Documentation

6.288.3.1 const double decaf::lang::Double::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.288.3.2 const double decaf::lang::Double::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.288.3.3 `const double decaf::lang::Double::NaN` [static]

Constant for the Not a **N**umber (p. 2282) Value.

6.288.3.4 `const double decaf::lang::Double::NEGATIVE_INFINITY` [static]

Constant for Negative Infinitiy.

6.288.3.5 `const double decaf::lang::Double::POSITIVE_INFINITY` [static]

Constant for Positive Infinity.

6.288.3.6 `const int decaf::lang::Double::SIZE = 64` [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Double.h`

6.289 `decaf::internal::nio::DoubleArrayBuffer` Class Reference

```
#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h>
```

Inheritance diagram for `decaf::internal::nio::DoubleArrayBuffer`:

Public Member Functions

- **DoubleArrayBuffer** (`std::size_t` capacity, `bool` readOnly=false)
*Creates a **DoubleArrayBuffer** (p. 1452) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **DoubleArrayBuffer** (`double *array`, `std::size_t` offset, `std::size_t` capacity, `bool` readOnly=false) throw (`decaf::lang::exceptions::NullPointerException`)
*Creates a **DoubleArrayBuffer** (p. 1452) object that wraps the given array.*
- **DoubleArrayBuffer** (**ByteArrayPerspective** &array, `std::size_t` offset, `std::size_t` length, `bool` readOnly=false) throw (`decaf::lang::exceptions::IndexOutOfBoundsException`)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.*
- **DoubleArrayBuffer** (`const DoubleArrayBuffer &other`)
*Create a **DoubleArrayBuffer** (p. 1452) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.*

- virtual `~DoubleArrayBuffer ()`
- virtual `double * array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)`
Returns the double array that backs this buffer (optional operation).
- virtual `std::size_t arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)`
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual `DoubleBuffer * asReadOnlyBuffer () const`
Creates a new, read-only double buffer that shares this buffer's content.
- virtual `DoubleBuffer & compact () throw (decaf::nio::ReadOnlyBufferException)`
Compacts this buffer.
- virtual `DoubleBuffer * duplicate ()`
Creates a new double buffer that shares this buffer's content.
- virtual `double get () throw (decaf::nio::BufferUnderflowException)`
Relative get method.
- virtual `double get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
Absolute get method.
- virtual `bool hasArray () const`
Tells whether or not this buffer is backed by an accessible double array.
- virtual `bool isReadOnly () const`
Tells whether or not this buffer is read-only.
- virtual `DoubleBuffer & put (double value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)`
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual `DoubleBuffer & put (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)`
Writes the given doubles into this buffer at the given index.
- virtual `DoubleBuffer * slice () const`
Creates a new DoubleBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual `void setReadOnly (bool value)`
*Sets this **ByteArrayBuffer** (p. 806) as Read-Only.*

6.289.1 Constructor & Destructor Documentation

6.289.1.1 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (std::size_t capacity, bool readOnly = false)`

Creates a **DoubleArrayBuffer** (p.1452) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.289.1.2 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (double * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)`

Creates a **DoubleArrayBuffer** (p.1452) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.289.1.3 `decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t length, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p.843) and start at the given offset.

The capacity and limit of the new **DoubleArrayBuffer** (p.1452) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p.843) to wrap

offset - the offset into array where the buffer starts

length - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.289.1.4 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const DoubleArrayBuffer & *other*)

Create a **DoubleArrayBuffer** (p. 1452) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.

Parameters

other - the **DoubleArrayBuffer** (p. 1452) this one is to mirror.

6.289.1.5 virtual decaf::internal::nio::DoubleArrayBuffer::~~DoubleArrayBuffer () [virtual]

6.289.2 Member Function Documentation

6.289.2.1 virtual double* decaf::internal::nio::DoubleArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1462).

6.289.2.2 virtual std::size_t decaf::internal::nio::DoubleArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 1463).

6.289.2.3 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implements **decaf::nio::DoubleBuffer** (p. 1463).

6.289.2.4 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 746) is copied to index zero, the byte at index `p + 1` is copied to index one, and so forth until the byte at index `limit()` (p. 745) - 1 is copied to index `n = limit()` (p. 745) - 1 - `p`. The buffer's position is then set to `n+1` and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer**

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1464).

6.289.2.5 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate () [virtual]`

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double Buffer which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1464).

6.289.2.6 virtual double decaf::internal::nio::DoubleArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements **decaf::nio::DoubleBuffer** (p. 1466).

6.289.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the Buffer where the double is to be read

Returns

the double that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements **decaf::nio::DoubleBuffer** (p. 1465).

6.289.2.8 virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray () const [inline, virtual]

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 1466).

6.289.2.9 `virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly ()`
`const [inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.289.2.10 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put`
`(std::size_t index, double value) throw`
`(lang::exceptions::IndexOutOfBoundsException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1468).

6.289.2.11 `virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put`
`(double value) throw (decaf::nio::BufferOverflowException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::DoubleBuffer** (p. 1467).

6.289.2.12 `virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool value)` [inline, protected, virtual]

Sets this **ByteBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.289.2.13 `virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice () const` [virtual]

Creates a new **DoubleBuffer** whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 1469).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/DoubleArrayBuffer.h`

6.290 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:

```
#include <src/main/decaf/nio/DoubleBuffer.h>
```

Inheritance diagram for **decaf::nio::DoubleBuffer**:

Public Member Functions

- virtual **~DoubleBuffer** ()
- virtual std::string **toString** () const
- virtual double * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the double array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **DoubleBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only double buffer that shares this buffer's content.
- virtual **DoubleBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **DoubleBuffer** * **duplicate** ()=0
Creates a new double buffer that shares this buffer's content.
- virtual double **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual double **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **DoubleBuffer** & **get** (std::vector< double > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **DoubleBuffer** & **get** (double *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible double array.
- **DoubleBuffer** & **put** (**DoubleBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the doubles remaining in the given source buffer into this buffer.
- **DoubleBuffer** & **put** (const double *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers doubles into this buffer from the given source array.
- **DoubleBuffer** & **put** (std::vector< double > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source doubles array into this buffer.

- virtual **DoubleBuffer** & **put** (double value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual **DoubleBuffer** & **put** (std::size_t index, double value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual **DoubleBuffer** * **slice** () const =0
*Creates a new **DoubleBuffer** (p. 1459) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **DoubleBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **DoubleBuffer** &value) const
- virtual bool **operator==** (const **DoubleBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **DoubleBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **DoubleBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **DoubleBuffer** * **wrap** (double *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **DoubleBuffer** (p. 1459).*
- static **DoubleBuffer** * **wrap** (std::vector< double > &buffer)
*Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1459).*

Protected Member Functions

- **DoubleBuffer** (std::size_t capacity)
*Creates a **DoubleBuffer** (p. 1459) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.290.1 Detailed Description

This class defines four categories of operations upon double buffers: o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer

contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.290.2 Constructor & Destructor Documentation

6.290.2.1 `decaf::nio::DoubleBuffer::DoubleBuffer (std::size_t capacity)` [protected]

Creates a **DoubleBuffer** (p.1459) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size and limit of the **Buffer** (p.741) in doubles

6.290.2.2 `virtual decaf::nio::DoubleBuffer::~~DoubleBuffer ()` [inline, virtual]

6.290.3 Member Function Documentation

6.290.3.1 `static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (std::size_t capacity)` [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Double buffer in doubles

Returns

the **DoubleBuffer** (p.1459) that was allocated, caller owns.

6.290.3.2 `virtual double* decaf::nio::DoubleBuffer::array ()` throw (`decaf::lang::exceptions::UnsupportedOperationException`, `ReadOnlyBufferException`) [pure virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1455).

6.290.3.3 virtual std::size_t decaf::nio::DoubleBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1455).

6.290.3.4 virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer ()
const [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1456).

6.290.3.5 **virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact () throw (ReadOnlyBufferException)** [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer** (p. 1459)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1456).

6.290.3.6 **virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & value) const** [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.290.3.7 **virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate ()** [pure virtual]

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1456).

6.290.3.8 virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & *value*) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.290.3.9 DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > *buffer*) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length doubles remaining in this buffer

6.290.3.10 virtual double decaf::nio::DoubleBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the double is to be read

Returns

the double that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1457).

6.290.3.11 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method.

This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies `length` doubles from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer - pointer to an allocated buffer to fill
offset - position in the buffer to start filling
length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than `length` doubles remaining in this buffer
NullPointerException if the passed buffer is null.

6.290.3.12 `virtual double decaf::nio::DoubleBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1457).

6.290.3.13 `virtual bool decaf::nio::DoubleBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1457).

6.290.3.14 `virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.290.3.15 `virtual bool decaf::nio::DoubleBuffer::operator== (const DoubleBuffer & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.290.3.16 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (double value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::DoubleArrayBuffer` (p. 1458).

6.290.3.17 `virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (std::size_t index, double value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1458).

6.290.3.18 `DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)`

This method transfers doubles into this buffer from the given source array.

If there are more doubles to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no doubles are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer- The array from which doubles are to be read
offset- The offset within the array of the first double to be read;
length - The number of doubles to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.290.3.19 DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source doubles array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size()

Parameters

buffer - The buffer whose contents are copied to this **DoubleBuffer** (p.1459)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.290.3.20 DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the doubles remaining in the given source buffer into this buffer.

If there are more doubles remaining in the source buffer than in this buffer, that is, if src.remaining() > remaining() (p.746), then no doubles are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies n = src.remaining() doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src - the buffer to take doubles from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining doubles in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.290.3.21 virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice () const [pure virtual]

Creates a new **DoubleBuffer** (p.1459) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** (p. 1459) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 1459).

6.290.3.22 `virtual std::string decaf::nio::DoubleBuffer::toString () const`
[virtual]

Returns

a `std::string` describing this object

6.290.3.23 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double
* array, std::size_t offset, std::size_t length) throw (`
`lang::exceptions::NullPointerException)` [static]

Wraps the passed buffer with a new **DoubleBuffer** (p. 1459).

The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be `array.length`, its position will be `offset`, its limit will be `offset + length`, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **DoubleBuffer** (p. 1459) that is backed by buffer, caller owns.

6.290.3.24 `static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector<`
`double > & buffer)` [static]

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 1459).

The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns

- a new **DoubleBuffer** (p. 1459) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**DoubleBuffer.h**

6.291 decaf::lang::DYNAMIC_CAST_TOKEN Struct Reference

```
#include <src/main/decaf/lang/Pointer.h>
```

The documentation for this struct was generated from the following file:

- src/main/decaf/lang/**Pointer.h**

6.292 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a **Destination**.

```
#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h>
```

Inheritance diagram for `activemq::cmsutil::DynamicDestinationResolver`:

Data Structures

- class **SessionResolver**

Manages maps of names to topics and queues for a single session.

Public Member Functions

- virtual **~DynamicDestinationResolver** ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)

Initializes this destination resolver for use.

- virtual void **destroy** ()

Destroys any allocated resources.

- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, const std::string &destName, bool pubSubDomain) throw (cms::CMSException)

Resolves the given name to a destination.

6.292.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.292.2 Constructor & Destructor Documentation

6.292.2.1 `virtual`
`activemq::cmsutil::DynamicDestinationResolver::~DynamicDestinationResolver`
`()` [virtual]

6.292.3 Member Function Documentation

6.292.3.1 `virtual void` `activemq::cmsutil::DynamicDestinationResolver::destroy` (
`)` [virtual]

Destroys any allocated resources.

Implements `activemq::cmsutil::DestinationResolver` (p. 1415).

6.292.3.2 `virtual void` `activemq::cmsutil::DynamicDestinationResolver::init` (
`ResourceLifecycleManager * mgr`) [inline, virtual]

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls `destroy()` (p. 1472)).

Parameters

mgr the resource lifecycle manager.

Implements `activemq::cmsutil::DestinationResolver` (p. 1416).

6.292.3.3 `virtual cms::Destination*` `activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName`
`(cms::Session * session, const std::string & destName, bool`
`pubSubDomain) throw (cms::CMSException)` [virtual]

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

session the session for which to retrieve resolve the destination.

destName the name to be resolved.

pubSubDomain If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

cms::CMSException (p. 960) if resolution failed.

Implements **activemq::cmsutil::DestinationResolver** (p. 1416).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/DynamicDestinationResolver.h`

6.293 decaf::util::Map< K, V, COMPARATOR >::Entry Class Reference

```
#include <src/main/decaf/util/Map.h>
```

Public Member Functions

6.294 decaf::io::EOFException Class Reference

```
#include <src/main/decaf/io/EOFException.h>
```

Inheritance diagram for decaf::io::EOFException:

Public Member Functions

- **EOFException** () throw ()
Default Constructor.
- **EOFException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **EOFException** (const EOFException &ex) throw ()
Copy Constructor.
- **EOFException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **EOFException** (const std::exception *cause) throw ()
Constructor.
- **EOFException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **EOFException** * clone () const
Clones this exception.
- virtual ~**EOFException** () throw ()

6.294.1 Constructor & Destructor Documentation

6.294.1.1 decaf::io::EOFException::EOFException () throw () [inline]

Default Constructor.

6.294.1.2 decaf::io::EOFException::EOFException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.294.1.3 decaf::io::EOFException::EOFException (const EOFException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.294.1.4 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.294.1.5 decaf::io::EOFException::EOFException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.294.1.6 decaf::io::EOFException::EOFException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.294.1.7 `virtual decaf::io::EOFException::~~EOFException () throw () [inline, virtual]`

6.294.2 Member Function Documentation

6.294.2.1 `virtual EOFException* decaf::io::EOFException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from `decaf::io::IOException` (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/EOFException.h`

6.295 decaf::lang::Exception Class Reference

```
#include <src/main/decaf/lang/Exception.h>
```

Inheritance diagram for `decaf::lang::Exception`:

Public Member Functions

- **Exception** () throw ()
Default Constructor.
- **Exception** (const **Exception** &ex) throw ()
Copy Constructor.
- **Exception** (const std::exception *cause) throw ()
Constructor.
- **Exception** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **Exception** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **~Exception** () throw ()
- virtual std::string **getMessage** () const
Gets the message for this exception.

- virtual const std::exception * **getCause** () const
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (const std::exception *cause)
Initializes the contained cause exception with the one given.
- virtual const char * **what** () const throw ()
Implement method from std::exception.
- virtual void **setMessage** (const char *msg,...)
Sets the cause for this exception.
- virtual void **setMark** (const char *file, const int lineNumber)
Adds a file/line number to the stack trace.
- virtual **Exception** * **clone** () const
Clones this exception.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () const
Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) const
Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () const
Gets the stack trace as one contiguous string.
- virtual **Exception** & **operator=** (const **Exception** &ex)
Assignment operator.

Protected Member Functions

- virtual void **setStackTrace** (const std::vector< std::pair< std::string, int > > &trace)
- virtual void **buildMessage** (const char *format, va_list &args)

Protected Attributes

- std::string **message**
The cause of this exception.
- std::exception * **cause**

The **Exception** (p. 1476) that caused this one to be thrown.

- `std::vector< std::pair< std::string, int > > stackTrace`

The stack trace.

6.295.1 Constructor & Destructor Documentation

6.295.1.1 `decaf::lang::Exception::Exception () throw ()`

Default Constructor.

Referenced by `decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException()`,
`decaf::util::concurrent::CancellationException::CancellationException()`,
`decaf::util::concurrent::ExecutionException::ExecutionException()`,
`cafe::net::HttpRetryException::HttpRetryException()`, `decaf::net::MalformedURLException::MalformedURLException()`,
`decaf::net::ProtocolException::ProtocolException()`, `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException()`,
`decaf::net::SocketTimeoutException::SocketTimeoutException()`,
`cafe::util::concurrent::TimeoutException::TimeoutException()`,
`cafe::net::UnknownHostException::UnknownHostException()`, and
`cafe::net::UnknownServiceException::UnknownServiceException()`.

6.295.1.2 `decaf::lang::Exception::Exception (const Exception & ex) throw ()`

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) instance to copy.

6.295.1.3 `decaf::lang::Exception::Exception (const std::exception * cause) throw ()`

Constructor.

Parameters

cause Pointer (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.295.1.4 `decaf::lang::Exception::Exception (const char * file, const int lineNumber, const char * msg, ...) throw ()`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.295.1.5 `decaf::lang::Exception::Exception (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.295.1.6 `virtual decaf::lang::Exception::~~Exception () throw () [virtual]`

6.295.2 Member Function Documentation

6.295.2.1 `virtual void decaf::lang::Exception::buildMessage (const char * format, va_list & vargs) [protected, virtual]`

Referenced by `decaf::lang::exceptions::NumberFormatException::NumberFormatException()`.

6.295.2.2 `virtual Exception* decaf::lang::Exception::clone () const [virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p.1476) object

Implements **decaf::lang::Throwable** (p.2984).

Reimplemented in **activemq::exceptions::ActiveMQException** (p.271), **activemq::exceptions::BrokerException** (p.691), **decaf::io::EOFException** (p.1476), **decaf::io::InterruptedIOException** (p.1695), **decaf::io::IOException** (p.1709), **decaf::io::UnsupportedEncodingException** (p.3092), **decaf::io::UTFDataFormatException** (p.3141), **decaf::lang::exceptions::ClassCastException** (p.950), **decaf::lang::exceptions::IllegalArgumentException** (p.1615), **decaf::lang::exceptions::IllegalMonitorStateException** (p.1618), **decaf::lang::exceptions::IllegalStateException** (p.1620), **decaf::lang::exceptions::IllegalThreadStateException** (p.1624), **decaf::lang::exceptions::IndexOutOfBoundsException** (p.1629), **decaf::lang::exceptions::InterruptedException** (p.1693), **decaf::lang::exceptions::InvalidStateException** (p.1706), **decaf::lang::exceptions::NoSuchElementException** (p.2276), **decaf::lang::exceptions::NullPointerException** (p.2281), **decaf::lang::exceptions::NumberFormatException** (p.2286),

decaf::lang::exceptions::RuntimeException (p. 2646), **decaf::lang::exceptions::UnsupportedOperationException** (p. 3096),
decaf::net::BindException (p. 665), **decaf::net::ConnectException** (p. 1051), **decaf::net::HttpRetryException** (p. 1613), **decaf::net::MalformedURLException** (p. 1970),
decaf::net::NoRouteToHostException (p. 2271), **decaf::net::PortUnreachableException** (p. 2370), **decaf::net::ProtocolException** (p. 2506), **decaf::net::SocketException** (p. 2794),
decaf::net::SocketTimeoutException (p. 2811), **decaf::net::UnknownHostException** (p. 3087), **decaf::net::UnknownServiceException** (p. 3089),
decaf::net::URISyntaxException (p. 3125), **decaf::nio::BufferOverflowException** (p. 773), **decaf::nio::BufferUnderflowException** (p. 776),
decaf::nio::InvalidMarkException (p. 1703), **decaf::nio::ReadOnlyBufferException** (p. 2522), **decaf::util::concurrent::BrokenBarrierException** (p. 685),
decaf::util::concurrent::CancellationException (p. 900), **decaf::util::concurrent::ExecutionException** (p. 1509),
decaf::util::concurrent::RejectedExecutionException (p. 2535), and **decaf::util::concurrent::TimeoutException** (p. 2989).

6.295.2.3 `virtual const std::exception* decaf::lang::Exception::getCause () const`
`[inline, virtual]`

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p. 2985).

6.295.2.4 `virtual std::string decaf::lang::Exception::getMessage () const`
`[inline, virtual]`

Gets the message for this exception.

Returns

Text formatted error message

Implements **decaf::lang::Throwable** (p. 2985).

6.295.2.5 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace () const` `[virtual]`

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns

the stack trace.

Implements **decaf::lang::Throwable** (p. 2985).

6.295.2.6 `virtual std::string decaf::lang::Exception::getStackTraceString () const [virtual]`

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implements **decaf::lang::Throwable** (p. 2986).

6.295.2.7 `virtual void decaf::lang::Exception::initCause (const std::exception * cause) [virtual]`

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

cause The exception that was the cause of this one.

Implements **decaf::lang::Throwable** (p. 2986).

6.295.2.8 `virtual Exception& decaf::lang::Exception::operator= (const Exception & ex) [virtual]`

Assignment operator.

Parameters

ex const reference to another **Exception** (p. 1476)

6.295.2.9 `virtual void decaf::lang::Exception::printStackTrace () const [virtual]`

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 2986).

6.295.2.10 `virtual void decaf::lang::Exception::printStackTrace (std::ostream & stream) const [virtual]`

Prints the stack trace to the given output stream.

Parameters

stream the target output stream.

Implements **decaf::lang::Throwable** (p. 2986).

6.295.2.11 `virtual void decaf::lang::Exception::setMark (const char * file, const int lineNumber)` [virtual]

Adds a file/line number to the stack trace.

Parameters

file The name of the file calling this method (use `__FILE__`).

lineNumber The line number in the calling file (use `__LINE__`).

Implements **decaf::lang::Throwable** (p. 2986).

Referenced by `activemq::exceptions::BrokerException::BrokerException()`, and `decaf::lang::exceptions::NumberFormatException::NumberFormatException()`.

6.295.2.12 `virtual void decaf::lang::Exception::setMessage (const char * msg, ...)` [virtual]

Sets the cause for this exception.

Parameters

msg the format string for the msg.

... params to format into the string

Referenced by `activemq::exceptions::BrokerException::BrokerException()`.

6.295.2.13 `virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & trace)` [protected, virtual]

6.295.2.14 `virtual const char* decaf::lang::Exception::what () const throw ()` [inline, virtual]

Implement method from `std::exception`.

Returns

the `const char*` of `getMessage()` (p. 1480).

6.295.3 Field Documentation

6.295.3.1 `std::exception* decaf::lang::Exception::cause` [protected]

The **Exception** (p. 1476) that caused this one to be thrown.

6.295.3.2 `std::string decaf::lang::Exception::message` [protected]

The cause of this exception.

6.295.3.3 std::vector< std::pair< std::string, int> > decaf::lang::Exception::stackTrace [protected]

The stack trace.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Exception.h**

6.296 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p. 1483) that is registered with the `Connection` (p. 1052).

```
#include <src/main/cms/ExceptionListener.h>
```

Public Member Functions

- virtual `~ExceptionListener ()`
- virtual void `onException (const cms::CMSException &ex)=0`
Called when an exception occurs.

6.296.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an `ExceptionListener` (p. 1483) that is registered with the `Connection` (p. 1052). An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since

1.0

6.296.2 Constructor & Destructor Documentation

- 6.296.2.1** virtual `cms::ExceptionListener::~ExceptionListener ()` [inline, virtual]

6.296.3 Member Function Documentation

- 6.296.3.1** virtual void `cms::ExceptionListener::onException (const cms::CMSException & ex)` [pure virtual]

Called when an exception occurs.

Once notified of an exception the caller should no longer use the resource that generated the exception.

Parameters

ex Exception Object that occurred.

The documentation for this class was generated from the following file:

- `src/main/cms/ExceptionListener.h`

6.297 activemq::commands::ExceptionResponse Class Reference

```
#include <src/main/activemq/commands/ExceptionResponse.h>
```

Inheritance diagram for `activemq::commands::ExceptionResponse`:

Public Member Functions

- **ExceptionResponse** ()
- virtual **~ExceptionResponse** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ExceptionResponse * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **BrokerError** > & **getException** () const
- virtual **Pointer**< **BrokerError** > & **getException** ()
- virtual void **setException** (const **Pointer**< **BrokerError** > &exception)

Static Public Attributes

- static const unsigned char **ID_EXCEPTIONRESPONSE** = 31

Protected Member Functions

- **ExceptionResponse** (const **ExceptionResponse** &)
- **ExceptionResponse** & **operator=** (const **ExceptionResponse** &)

Protected Attributes

- `Pointer< BrokerError > exception`

6.297.1 Constructor & Destructor Documentation

6.297.1.1 `activemq::commands::ExceptionResponse::ExceptionResponse (const ExceptionResponse &) [inline, protected]`

6.297.1.2 `activemq::commands::ExceptionResponse::ExceptionResponse ()`

6.297.1.3 `virtual activemq::commands::ExceptionResponse::~~ExceptionResponse () [virtual]`

6.297.2 Member Function Documentation

6.297.2.1 `virtual ExceptionResponse* activemq::commands::ExceptionResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p.2612).

6.297.2.2 `virtual void activemq::commands::ExceptionResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::Response` (p.2612).

6.297.2.3 `virtual bool activemq::commands::ExceptionResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p.1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::Response` (p.2613).

6.297.2.4 `virtual unsigned char activemq::commands::ExceptionResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Reimplemented from **activemq::commands::Response** (p. 2613).

6.297.2.5 `virtual Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () [virtual]`

6.297.2.6 `virtual const Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException () const [virtual]`

6.297.2.7 `ExceptionResponse& activemq::commands::ExceptionResponse::operator= (const ExceptionResponse &) [inline, protected]`

6.297.2.8 `virtual void activemq::commands::ExceptionResponse::setException (const Pointer< BrokerError > & exception) [virtual]`

6.297.2.9 `virtual std::string activemq::commands::ExceptionResponse::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 2614).

6.297.3 Field Documentation

6.297.3.1 `Pointer<BrokerError> activemq::commands::ExceptionResponse::exception [protected]`

6.297.3.2 `const unsigned char activemq::commands::ExceptionResponse::ID _ - EXCEPTIONRESPONSE = 31 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/ExceptionResponse.h`

6.298 activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 1487).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ExceptionResponseMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller:

Public Member Functions

- **ExceptionResponseMarshaller** ()
- virtual **~ExceptionResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.298.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p.1487). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.298.2 Constructor & Destructor Documentation

6.298.2.1 `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::ExceptionRe`
`() [inline]`

6.298.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::~~ExceptionR`
`() [inline, virtual]`

6.298.3 Member Function Documentation

6.298.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.298.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.298.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.298.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

6.298.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

```

6.298.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

```

6.298.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ExceptionResponseMarshaller.h`

6.299 `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` Class Reference

Marshaling code for Open Wire Format for `ExceptionResponseMarshaller` (p. 1491).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/ExceptionResponseMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller`:

Public Member Functions

- `ExceptionResponseMarshaller ()`
- `virtual ~ExceptionResponseMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.
- `virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`
Write a object instance to data output stream.

6.299.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p.1491). NOTE! This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.299.2 Constructor & Destructor Documentation

6.299.2.1 `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::ExceptionRe`
`() [inline]`

6.299.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::~~ExceptionR`
`() [inline, virtual]`

6.299.3 Member Function Documentation

6.299.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2634).

6.299.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.299.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.299.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.299.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2636).

```

6.299.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2636).

```

6.299.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2637).

6.300.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2625).

6.300.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.300.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.300.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.300.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

```

6.300.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

```

6.300.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2628).

6.301.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.301.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.301.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2639).

6.301.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2640).

6.301.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2640).

```

6.301.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

```

6.301.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.302.1 Detailed Description

Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p.1503). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.302.2 Constructor & Destructor Documentation

6.302.2.1 `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::ExceptionRe`
`() [inline]`

6.302.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::~~ExceptionR`
`() [inline, virtual]`

6.302.3 Member Function Documentation

6.302.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.302.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.302.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.302.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2631).

6.302.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2631).

```

6.302.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2632).

```

6.302.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2632).

6.303 decaf::util::concurrent::ExecutionException Class Reference

```
#include <src/main/decaf/util/concurrent/ExecutionException.h>
```

Inheritance diagram for decaf::util::concurrent::ExecutionException:

Public Member Functions

- **ExecutionException** () throw ()
Default Constructor.
- **ExecutionException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **ExecutionException** (const **ExecutionException** &ex) throw ()
Copy Constructor.
- **ExecutionException** (const std::exception *cause) throw ()
Constructor.
- **ExecutionException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **ExecutionException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ExecutionException** * clone () const
Clones this exception.
- virtual ~**ExecutionException** () throw ()

6.303.1 Constructor & Destructor Documentation

6.303.1.1 decaf::util::concurrent::ExecutionException::ExecutionException () throw () [inline]

Default Constructor.

6.303.1.2 decaf::util::concurrent::ExecutionException::ExecutionException (const decaf::lang::Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex - An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.303.1.3 `decaf::util::concurrent::ExecutionException::ExecutionException (const ExecutionException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex - The Exception to copy in this new instance.

References `decaf::lang::Exception::Exception()`.

6.303.1.4 `decaf::util::concurrent::ExecutionException::ExecutionException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.303.1.5 `decaf::util::concurrent::ExecutionException::ExecutionException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

msg - The message to report

... - The list of primitives that are formatted into the message

6.303.1.6 `decaf::util::concurrent::ExecutionException::ExecutionException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file - The file name where exception occurs

lineNumber - The line number where the exception occurred.

cause - The exception that was the cause for this one to be thrown.

msg - The message to report

... - list of primitives that are formatted into the message

6.303.1.7 virtual decaf::util::concurrent::ExecutionException::~~ExecutionException () throw () [inline, virtual]

6.303.2 Member Function Documentation

6.303.2.1 virtual ExecutionException* decaf::util::concurrent::ExecutionException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ExecutionException.h**

6.304 decaf::util::concurrent::Executor Class Reference

An object that executes submitted **decaf.lang Runnable** (p. 2642) tasks.

```
#include <src/main/decaf/util/concurrent/Executor.h>
```

Inheritance diagram for decaf::util::concurrent::Executor:

Public Member Functions

- virtual ~**Executor** ()
- virtual void **execute** (Runnable *command)=0 throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException)

Executes the given command at some time in the future.

6.304.1 Detailed Description

An object that executes submitted **decaf.lang Runnable** (p. 2642) tasks. This interface provides a way of decoupling task submission from the mechanics of how each task will be run, including details of thread use, scheduling, etc. An **Executor** (p. 1509) is normally used instead of explicitly creating threads. For example, rather than invoking `new Thread(new RunnableTask()).start()` for each of a set of tasks, you might use:

```
Executor (p. 1509) executor = anExecutor;
```

```

executor->execute( new RunnableTask1() );
executor->execute( new RunnableTask2() );
...

```

However, the `Executor` (p.1509) interface does not strictly require that execution be asynchronous. In the simplest case, an executor can run the submitted task immediately in the caller's thread:

```

class DirectExecutor : public Executor (p.1509) {
public:

    void execute( Runnable* r ) (p.1510) {
        r->run();
    }

}

```

More typically, tasks are executed in some thread other than the caller's thread. The executor below spawns a new thread for each task.

```

class ThreadPerTaskExecutor : public Executor (p.1509) {
public:
    std::vector<Thread*gt; threads;

    void execute( Runnable* r ) (p.1510) {
        threads.push_back( new Thread( r ) );
        threads.rbegin()->start();
    }

}

```

The `Executor` (p.1509) implementations provided in this package implement **decaf.util.concurrent.ExecutorService** (p.1511), which is a more extensive interface. The **decaf.util.concurrent.ThreadPoolExecutor** (p.??) class provides an extensible thread pool implementation. The **decaf.util.concurrent.Executor** (p.??) class provides convenient factory methods for these Executors.

Since

1.0

6.304.2 Constructor & Destructor Documentation

6.304.2.1 `virtual decaf::util::concurrent::Executor::~~Executor () [inline, virtual]`

6.304.3 Member Function Documentation

6.304.3.1 `virtual void decaf::util::concurrent::Executor::execute (Runnable * command) throw (decaf::util::concurrent::RejectedExecutionException, decaf::lang::exceptions::NullPointerException) [pure virtual]`

Executes the given command at some time in the future.

The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the **Executor** (p. 1509) implementation.

Parameters

command the runnable task

Exceptions

RejectedExecutionException (p. 2533) if this task cannot be accepted for execution.

NullPointerException if command is null

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Executor.h**

6.305 decaf::util::concurrent::ExecutorService Class Reference

An **Executor** (p. 1509) that provides methods to manage termination and methods that can produce a **Future** (p. 1597) for tracking progress of one or more asynchronous tasks.

```
#include <src/main/decaf/util/concurrent/ExecutorService.h>
```

Inheritance diagram for decaf::util::concurrent::ExecutorService:

Public Member Functions

- virtual **~ExecutorService** ()
- bool **awaitTermination** (long long timeout, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::InterruptedException)
Blocks until all tasks have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

6.305.1 Detailed Description

An **Executor** (p. 1509) that provides methods to manage termination and methods that can produce a **Future** (p. 1597) for tracking progress of one or more asynchronous tasks. An **ExecutorService** (p. 1511) can be shut down, which will cause it to reject new tasks. Two different methods are provided for shutting down an **ExecutorService** (p. 1511). The shutdown() method will allow previously submitted tasks to execute before terminating, while the shutdownNow() method prevents waiting tasks from starting and attempts to stop currently executing tasks. Upon termination, an executor has no tasks actively executing, no tasks awaiting execution, and no new tasks can be submitted. An unused **ExecutorService** (p. 1511) should be shut down to allow reclamation of its resources.

Method submit extends base method **Executor.execute** (p. 1510)(decaf.lang.**Runnable** (p. 2642)) by creating and returning a **Future** (p. 1597) that can be used to cancel execution

and/or wait for completion. Methods `invokeAny` and `invokeAll` perform the most commonly useful forms of bulk execution, executing a collection of tasks and then waiting for at least one, or all, to complete. (Class `ExecutorCompletionService` can be used to write customized variants of these methods.)

The `Executors` class provides factory methods for the executor services provided in this package.

1.0

6.305.2 Constructor & Destructor Documentation

6.305.2.1 `virtual decaf::util::concurrent::ExecutorService::~~ExecutorService ()`
[inline, virtual]

6.305.3 Member Function Documentation

6.305.3.1 `bool decaf::util::concurrent::ExecutorService::awaitTermination`
(`long long timeout`, `const TimeUnit & unit`) `throw (`
`decaf::lang::exceptions::InterruptedException)` [pure virtual]

Blocks until all tasks have completed execution after a shutdown request, or the timeout occurs, or the current thread is interrupted, whichever happens first.

Parameters

timeout The amount of time to wait before timing out the Wait operation.

unit The Units that comprise the timeout value.

Returns

true if the executor terminated before the given timeout value elapsed.

Exceptions

InterruptedException - if interrupted while waiting.

6.306 activemq::transport::failover::FailoverTransport Class Reference

```
#include <src/main/activemq/transport/failover/FailoverTransport.h>
```

Inheritance diagram for `activemq::transport::failover::FailoverTransport`:

Public Member Functions

- **FailoverTransport** ()
- virtual **~FailoverTransport** ()
- void **reconnect** ()
*Indicates that the **Transport** (p. 3066) needs to reconnect to another URI in its list.*
- void **add** (const std::string &uri)
Adds a New URI to the List of URIs this transport can Connect to.
- virtual void **addURI** (const List< URI > &uris)
*Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3066) is a composite of.*
- virtual void **removeURI** (const List< URI > &uris)
*Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3066) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3066) should result in that **Transport** (p. 3066) being disposed of.*
- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **stop** () throw (decaf::io::IOException)
*Stop the **Transport** (p. 3066).*
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual void **oneway** (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual Pointer< Response > **request** (const Pointer< Command > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given command to the broker and then waits for the response.
- virtual Pointer< Response > **request** (const Pointer< Command > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given command to the broker and then waits for the response.
- virtual void **setWireFormat** (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED)
Sets the WireFormat instance to use.
- virtual void **setTransportListener** (TransportListener *listener)
Sets the observer of asynchronous events from this transport.
- virtual TransportListener * **getTransportListener** () const
Gets the observer of asynchronous exceptions from this transport.

activemq::transport::failover::FailoverTransport::~~FailoverTransport ()
 [virtual]

6.306.2 Member Function Documentation

6.306.2.1 **void** **activemq::transport::failover::FailoverTransport::add** (const
 std::string & *uri*)

Adds a New URI to the List of URIs this transport can Connect to.

Parameters

uri A String version of a URI to add to the URIs to failover to.

6.306.2.2 **virtual void** **activemq::transport::failover::FailoverTransport::addURI** (const List< URI > & *uris*) [virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 3066) is a composite of.

Parameters

uris The new URIs to add to the set this composite maintains.

6.306.2.3 `virtual void activemq::transport::failover::FailoverTransport::close ()
throw (decaf::io::IOException) [virtual]`

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

6.306.2.4 `long long activemq::transport::failover::FailoverTransport::getBackOffMultiplier ()
const [inline]`

6.306.2.5 `int activemq::transport::failover::FailoverTransport::getBackupPoolSize ()
const [inline]`

6.306.2.6 `long long activemq::transport::failover::FailoverTransport::getInitialReconnectDelay ()
const [inline]`

6.306.2.7 `int activemq::transport::failover::FailoverTransport::getMaxCacheSize ()
const [inline]`

6.306.2.8 `int activemq::transport::failover::FailoverTransport::getMaxReconnectAttempts ()
const [inline]`

6.306.2.9 `long long activemq::transport::failover::FailoverTransport::getMaxReconnectDelay ()
const [inline]`

6.306.2.10 `long long activemq::transport::failover::FailoverTransport::getReconnectDelay ()
const [inline]`

6.306.2.11 `virtual std::string activemq::transport::failover::FailoverTransport::getRemoteAddress ()
const [virtual]`

Returns

the remote address for this connection

6.306.2.12 `long long activemq::transport::failover::FailoverTransport::getTimeout ()
const [inline]`

6.306.2.13 `virtual TransportListener* activemq::transport::failover::FailoverTransport::getTransportListener ()
const [virtual]`

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

6.306.2.14 `void activemq::transport::failover::FailoverTransport::handleTransportFailure (const decaf::lang::Exception & error) throw (decaf::lang::Exception) [protected]`

Called when this class' **TransportListener** (p. 3080) is notified of a Failure.

Parameters

error - The CMS Exception that was thrown.

Exceptions

Exception if an error occurs.

6.306.2.15 `bool activemq::transport::failover::FailoverTransport::isBackup () const [inline]`

6.306.2.16 `virtual bool activemq::transport::failover::FailoverTransport::isClosed () const [inline, virtual]`

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

6.306.2.17 `virtual bool activemq::transport::failover::FailoverTransport::isConnected () const [inline, virtual]`

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

6.306.2.18 `virtual bool activemq::transport::failover::FailoverTransport::isFaultTolerant () const [inline, virtual]`

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

6.306.2.19 `bool activemq::transport::failover::FailoverTransport::isInitialized ()`
`const [inline]`

Returns true if the **Transport** (p. 3066) has been initialized by a BrokerInfo command.

Returns

true if the **Transport** (p. 3066) has been initialized by a BrokerInfo command.

6.306.2.20 `virtual bool activemq::transport::failover::FailoverTransport::isPending () const [virtual]`

Returns

true if there is a need for the iterate method to be called by this classes task runner.

Implements **activemq::threads::CompositeTask** (p. 1016).

6.306.2.21 `bool activemq::transport::failover::FailoverTransport::isRandomize ()`
`const [inline]`

6.306.2.22 `bool activemq::transport::failover::FailoverTransport::isTrackMessages () const [inline]`

6.306.2.23 `bool activemq::transport::failover::FailoverTransport::isUseExponentialBackOff () const [inline]`

6.306.2.24 `virtual bool activemq::transport::failover::FailoverTransport::iterate () [virtual]`

Performs the actual Reconnect operation for the **FailoverTransport** (p. 1512), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.

Returns

false to indicate a connection, true to indicate it needs to try again.

Implements **activemq::threads::Task** (p. 2956).

6.306.2.25 `virtual Transport* activemq::transport::failover::FailoverTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

References `activemq::transport::Transport::narrow()`.

6.306.2.26 `virtual void activemq::transport::failover::FailoverTransport::oneway
(const Pointer< Command > & command
) throw (decaf::io::IOException, de-
caf::lang::exceptions::UnsupportedOperationException)
[virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

6.306.2.27 `void activemq::transport::failover::FailoverTransport::reconnect ()`

Indicates that the **Transport** (p. 3066) needs to reconnect to another URI in its list.

6.306.2.28 `virtual void activemq::transport::failover::FailoverTransport::reconnect
(const decaf::net::URI & uri) throw (decaf::io::IOException)
[virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.306.2.29 `virtual void activemq::transport::failover::FailoverTransport::removeURI
(const List< URI > & uris) [virtual]`

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 3066) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 3066) should result in that **Transport** (p. 3066) being disposed of.

Parameters

uris The new URIs to remove to the set this composite maintains.

6.306.2.30 `virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command the command to be sent.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

6.306.2.31 `virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command - The command to be sent.

timeout - The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

6.306.2.32 `void activemq::transport::failover::FailoverTransport::restoreTransport (const Pointer< Transport > & transport) throw (decaf::io::IOException) [protected]`

Given a **Transport** (p. 3066) restore the state of the Client's connection to the Broker using the data accumulated in the State Tracker.

Parameters

transport The new **Transport** (p. 3066) connected to the Broker.

Exceptions

IOException if an errors occurs while restoring the old state.

- 6.306.2.33** void activemq::transport::failover::FailoverTransport::setBackOffMultiplier (long long *value*) [inline]
- 6.306.2.34** void activemq::transport::failover::FailoverTransport::setBackup (bool *value*) [inline]
- 6.306.2.35** void activemq::transport::failover::FailoverTransport::setBackupPoolSize (int *value*) [inline]
- 6.306.2.36** void activemq::transport::failover::FailoverTransport::setInitialized (bool *value*) [inline]

Sets the initialized state of this **Transport** (p. 3066) to true.

Parameters

value - true if this **Transport** (p. 3066) has been initialized.

- 6.306.2.37** void activemq::transport::failover::FailoverTransport::setInitialReconnectDelay (long long *value*) [inline]
- 6.306.2.38** void activemq::transport::failover::FailoverTransport::setMaxCacheSize (int *value*) [inline]
- 6.306.2.39** void activemq::transport::failover::FailoverTransport::setMaxReconnectAttempts (int *value*) [inline]
- 6.306.2.40** void activemq::transport::failover::FailoverTransport::setMaxReconnectDelay (long long *value*) [inline]
- 6.306.2.41** void activemq::transport::failover::FailoverTransport::setRandomize (bool *value*) [inline]
- 6.306.2.42** void activemq::transport::failover::FailoverTransport::setReconnectDelay (long long *value*) [inline]
- 6.306.2.43** void activemq::transport::failover::FailoverTransport::setTimeout (long long *value*) [inline]
- 6.306.2.44** void activemq::transport::failover::FailoverTransport::setTrackMessages (bool *value*) [inline]
- 6.306.2.45** virtual void activemq::transport::failover::FailoverTransport::setTransportListener (TransportListener * *listener*) [virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener the listener of transport events.

6.306.2.46 `void activemq::transport::failover::FailoverTransport::setUseExponentialBackOff (bool value) [inline]`

6.306.2.47 `virtual void activemq::transport::failover::FailoverTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.306.2.48 `virtual void activemq::transport::failover::FailoverTransport::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException if an error occurs or if this transport has already been closed.

6.306.2.49 `virtual void activemq::transport::failover::FailoverTransport::stop () throw (decaf::io::IOException) [virtual]`

Stop the **Transport** (p. 3066).

Exceptions

IOException if an error occurs while stopping the **Transport** (p. 3066).

6.306.3 Friends And Related Function Documentation

6.306.3.1 `friend class FailoverTransportListener [friend]`

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/FailoverTransport.h`

6.307 activemq::transport::failover::FailoverTransportFactory Class Reference

Creates an instance of a **FailoverTransport** (p.1512).

```
#include <src/main/activemq/transport/failover/FailoverTransportFactory.h>
```

6.307.1 Detailed Description

Creates an instance of a **FailoverTransport** (p.1512).

Since

3.0

6.307.2 Constructor & Destructor Documentation

6.307.2.1 `virtual
activemq::transport::failover::FailoverTransportFactory::~FailoverTransportFactory
() [inline, virtual]`

6.307.3 Member Function Documentation

6.307.3.1 `virtual Pointer<Transport> ac-
tivemq::transport::failover::FailoverTransportFactory::create (const
decaf::net::URI & location) throw (exceptions::ActiveMQException)
[virtual]`

Creates a fully configured **Transport** (p.3066) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements `activemq::transport::TransportFactory` (p.3072).

6.307.3.2 `virtual Pointer<Transport> ac-
tivemq::transport::failover::FailoverTransportFactory::createComposite
(const decaf::net::URI & location) throw (exceptions::ActiveMQException) [virtual]`

Creates a slimed down **Transport** (p.3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements `activemq::transport::TransportFactory` (p.3072).

6.307.3.3 `virtual Pointer<Transport> ac-
tivemq::transport::failover::FailoverTransportFactory::doCreateComposite
(const decaf::net::URI & location, const decaf::util::Properties &
properties) throw (exceptions::ActiveMQException) [protected,
virtual]`

Creates a slimed down **Transport** (p.3066) instance which can be used in composite transport instances.

Parameters

- location* - URI location to connect to.
- properties* - Properties to apply to the transport.

Returns

Pointer to a new **FailoverTransport** (p. 1512) instance.

Exceptions

- ActiveMQException* if an error occurs

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransportFactory.h**

6.308 activemq::transport::failover::FailoverTransportListener Class Reference

Utility class used by the **Transport** (p. 3066) to perform the work of responding to events from the active **Transport** (p. 3066).

```
#include <src/main/activemq/transport/failover/FailoverTransportListener.h>
```

Inheritance diagram for activemq::transport::failover::FailoverTransportListener:

Public Member Functions

- **FailoverTransportListener** (**FailoverTransport** *parent)
- virtual **~FailoverTransportListener** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.

6.308.1 Detailed Description

Utility class used by the **Transport** (p. 3066) to perform the work of responding to events from the active **Transport** (p. 3066).

Since

3.0

6.308.2 Constructor & Destructor Documentation

6.308.2.1 `activemq::transport::failover::FailoverTransportListener::FailoverTransportListener (FailoverTransport * parent)`

6.308.2.2 `virtual
activemq::transport::failover::FailoverTransportListener::~~FailoverTransportListener
() [virtual]`

6.308.3 Member Function Documentation

6.308.3.1 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::onCommand (
const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3066) deletes the command upon receipt.

Parameters

command the received command object.

Implements `activemq::transport::TransportListener` (p. 3081).

6.308.3.2 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::onException (
const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

ex The exception.

Implements `activemq::transport::TransportListener` (p. 3082).

6.308.3.3 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::transportInterrupted
() [virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implements `activemq::transport::TransportListener` (p. 3082).

6.308.3.4 `virtual void ac-
tivemq::transport::failover::FailoverTransportListener::transportResumed
() [virtual]`

The transport has resumed after an interruption.

Implements `activemq::transport::TransportListener` (p. 3082).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/FailoverTransportListener.h`

6.309 decaf::util::logging::Filter Class Reference

A **Filter** (p. 1527) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

```
#include <src/main/decaf/util/logging/Filter.h>
```

Public Member Functions

- virtual `~Filter ()`
- virtual `bool isLoggable (const LogRecord &record) const =0`

Check if a given log record should be published.

6.309.1 Detailed Description

A **Filter** (p.1527) can be used to provide fine grain control over what is logged, beyond the control provided by log levels. Each **Logger** (p.1908) and each **Handler** (p.1604) can have a filter associated with it. The **Logger** (p.1908) or **Handler** (p.1604) will call the `isLoggable` method to check if a given **LogRecord** (p.1928) should be published. If `isLoggable` returns false, the **LogRecord** (p.1928) will be discarded.

6.309.2 Constructor & Destructor Documentation

6.309.2.1 virtual `decaf::util::logging::Filter::~Filter ()` [inline, virtual]

6.309.3 Member Function Documentation

6.309.3.1 virtual `bool decaf::util::logging::Filter::isLoggable (const LogRecord &
record) const` [pure virtual]

Check if a given log record should be published.

Parameters

record the **LogRecord** (p.1928) to check.

Returns

true if the record is loggable.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/Filter.h`

6.310 decaf::io::FilterInputStream Class Reference

A **FilterInputStream** (p.1528) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

```
#include <src/main/decaf/io/FilterInputStream.h>
```

Inheritance diagram for decaf::io::FilterInputStream:

Public Member Functions

- **FilterInputStream** (**InputStream** *inputStream, bool own=false)
*Constructor to create a wrapped **InputStream** (p. 1630).*
- virtual ~**FilterInputStream** ()
- virtual std::size_t **available** () const throw (**IOException**)
Returns the number of bytes that can be read from this input stream without blocking.
- virtual int **read** () throw (**IOException**)
Reads the next byte of data from this input stream.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (**IOException**, lang::exceptions::NullPointerException)
Reads up to len bytes of data from this input stream into an array of bytes.
- virtual void **close** () throw (io::IOException)
*Close the Stream, the **FilterOutputStream** (p. 1536) simply calls the close method of the underlying stream.*
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (**IOException**)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual bool **isClosed** () const

Protected Attributes

- **InputStream * inputStream**
- **util::concurrent::Mutex mutex**
- bool **own**
- volatile bool **closed**

6.310.1 Detailed Description

A **FilterInputStream** (p. 1528) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality. The class **FilterInputStream** (p. 1528) itself simply overrides all methods of **InputStream** (p. 1630) with versions that pass all requests to the contained input stream. Subclasses of **FilterInputStream** (p. 1528) may further override some of these methods and may also provide additional methods and fields.

6.310.2 Constructor & Destructor Documentation

6.310.2.1 `decaf::io::FilterInputStream::FilterInputStream (InputStream * inputStream, bool own = false)` [inline]

Constructor to create a wrapped **InputStream** (p.1630).

Parameters

inputStream the stream to wrap and filter

own indicates if we own the stream object, defaults to false

6.310.2.2 `virtual decaf::io::FilterInputStream::~FilterInputStream ()` [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.310.3 Member Function Documentation

6.310.3.1 `virtual std::size_t decaf::io::FilterInputStream::available () const`
`throw (IOException)` [inline, virtual]

Returns the number of bytes that can be read from this input stream without blocking.

This method simply performs in.available() and returns the result.

Returns

the number of bytes available without blocking.

Implements **decaf::io::InputStream** (p.1631).

Reimplemented in **decaf::io::BufferedInputStream** (p.749).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.2 `virtual void decaf::io::FilterInputStream::close ()` `throw (io::IOException)` [inline, virtual]

Close the Stream, the **FilterOutputStream** (p.1536) simply calls the close method of the underlying stream.

Exceptions

Exception

Reimplemented in **decaf::io::BufferedInputStream** (p.749).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.3 `virtual bool decaf::io::FilterInputStream::isClosed () const` [inline, protected, virtual]

Returns

true if this stream has been closed.

6.310.3.4 `virtual void decaf::io::FilterInputStream::lock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2932).

6.310.3.5 `virtual void decaf::io::FilterInputStream::mark (int readLimit)` [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters

readLimit The max bytes read before marked position is invalid.

Implements `decaf::io::InputStream` (p. 1631).

Reimplemented in `decaf::io::BufferedInputStream` (p. 750).

References `DECAF_CATCHALL_NOTHROW`.

6.310.3.6 `virtual bool decaf::io::FilterInputStream::markSupported () const` [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns

true if this stream instance supports marks

Implements `decaf::io::InputStream` (p. 1631).

Reimplemented in `decaf::io::BufferedInputStream` (p. 750).

References `DECAF_CATCHALL_NOTHROW`.

6.310.3.7 `virtual void decaf::io::FilterInputStream::notify ()
 throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [inline,
 virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

6.310.3.8 `virtual void decaf::io::FilterInputStream::notifyAll ()
 throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [inline,
 virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.310.3.9 `virtual int decaf::io::FilterInputStream::read () throw (IOException)
 [inline, virtual]`

Reads the next byte of data from this input stream.

The value byte is returned as an unsigned char in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown. This method simply performs `in.read()` and returns the result.

Returns

The next byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1632).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1918), **decaf::io::BufferedInputStream** (p. 751), and **decaf::io::DataInputStream** (p. 1293).

References **DECAF_CATCH_RETHROW**, and **DECAF_CATCHALL_THROW**.

Referenced by **decaf::io::DataInputStream::read()**.

6.310.3.10 **virtual int decaf::io::FilterInputStream::read (unsigned char * *buffer*, std::size_t *offset*, std::size_t *bufferSize*) throw (IOException, lang::exceptions::NullPointerException) [inline, virtual]**

Reads up to len bytes of data from this input stream into an array of bytes.

This method blocks until some input is available. This method simply performs **in.read(b, len)** and returns the result.

Parameters

buffer (out) the target buffer.

offset the position to start reading in the passed buffer.

bufferSize the size of the output buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException (p. 1707) thrown if an error occurs.

NullPointerException

Implements **decaf::io::InputStream** (p. 1632).

Reimplemented in **activemq::io::LoggingInputStream** (p. 1918), **decaf::io::BufferedInputStream** (p. 750), and **decaf::io::DataInputStream** (p. 1294).

References **DECAF_CATCH_RETHROW**, and **DECAF_CATCHALL_THROW**.

6.310.3.11 **virtual void decaf::io::FilterInputStream::reset () throw (IOException) [inline, virtual]**

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method **markSupported** returns true, then: * If the method **mark** has not been called since the stream was created, or the number of bytes read from the stream since **mark** was last called is larger than the argument to **mark** at that last call, then an **IOException** (p. 1707) might be thrown. * If such an **IOException** (p. 1707) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to **mark** (or since the start of the file, if **mark** has not been called) will be resupplied to subsequent callers of the **read** method, followed by any bytes that otherwise would have been the next input data as of the time of the call to **reset**. If the method **markSupported** returns false, then: * The call to **reset** may throw an **IOException** (p. 1707). * If an **IOException** (p. 1707) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the **read** method depend on the particular type of the input stream.

Exceptions***IOException*** (p. 1707)Implements **decaf::io::InputStream** (p. 1633).Reimplemented in **decaf::io::BufferedInputStream** (p. 751).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.12 `virtual std::size_t decaf::io::FilterInputStream::skip
 (std::size_t num) throw (io::IOException,
 lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If n is negative, no bytes are skipped.

The skip method of **InputStream** (p. 1630) creates a byte array and then repeatedly reads into it until n bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters*num* - the number of bytes to skip**Returns**

total butes skipped

Exceptions***IOException*** (p. 1707) if an error occursImplements **decaf::io::InputStream** (p. 1633).Reimplemented in **decaf::io::BufferedInputStream** (p. 751), and **decaf::io::DataInputStream** (p. 1300).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.310.3.13 `virtual bool decaf::io::FilterInputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions***RuntimeException*** if an error occurs while locking the object.Implements **decaf::util::concurrent::Synchronizable** (p. 2935).

6.310.3.14 virtual void decaf::io::FilterInputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2936).

6.310.3.15 virtual void decaf::io::FilterInputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements decaf::util::concurrent::Synchronizable (p. 2940).

6.310.3.16 virtual void decaf::io::FilterInputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2938).

```
6.310.3.17 virtual void decaf::io::FilterInputStream::wait (    )
            throw ( decaf::lang::exceptions::RuntimeException,
                    decaf::lang::exceptions::IllegalMonitorStateException,
                    decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.310.4 Field Documentation

The documentation for this class was generated from the following file:

- `src/main/decaf/io/FilterInputStream.h`

6.311 decaf::io::FilterOutputStream Class Reference

This class is the superclass of all classes that filter output streams.

```
#include <src/main/decaf/io/FilterOutputStream.h>
```

Inheritance diagram for `decaf::io::FilterOutputStream`:

Public Member Functions

- **FilterOutputStream** (**OutputStream** *outputStream, bool own=false)
Constructor, creates a wrapped output stream.
- virtual ~**FilterOutputStream** ()
- virtual void **write** (unsigned char c) throw (**IOException**)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (**IOException**)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset DECAF_UNUSED, std::size_t len) throw (**IOException**, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** () throw (**IOException**)
Flushes any pending writes in this output stream.
- virtual void **close** () throw (io::IOException)
Close the Stream.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.311.1 Detailed Description

This class is the superclass of all classes that filter output streams. These streams sit on top of an already existing output stream (the underlying output stream) which it uses as its basic sink of data, but possibly transforming the data along the way or providing additional functionality.

The class **FilterOutputStream** (p. 1536) itself simply overrides all methods of **OutputStream** (p. 2316) with versions that pass all requests to the underlying output stream. Subclasses of **FilterOutputStream** (p. 1536) may further override some of these methods as well as provide additional methods and fields.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 1630) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataOutputStream (p. 1300) `os = new DataOutputStream (p. 1300)(new OutputStream(), true)`

6.311.2 Constructor & Destructor Documentation

6.311.2.1 decaf::io::FilterOutputStream::FilterOutputStream (**OutputStream** * *outputStream*, bool *own* = *false*) [inline]

Constructor, creates a wrapped output stream.

Parameters

outputStream the **OutputStream** (p. 2316) to wrap

own If true, this object will control the lifetime of the output stream that it encapsulates.

6.311.2.2 virtual decaf::io::FilterOutputStream::~~FilterOutputStream () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.311.3 Member Function Documentation

6.311.3.1 virtual void decaf::io::FilterOutputStream::close () throw (io::IOException) [inline, virtual]

Close the Stream.

The close method of **FilterOutputStream** (p.1536) calls its flush method, and then calls the close method of its underlying output stream, it then destroys the output stream if it is the owner.

Exceptions

IOException

Reimplemented in **decaf::io::BufferedOutputStream** (p. 753).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.2 virtual void decaf::io::FilterOutputStream::flush () throw (IOException) [inline, virtual]

Flushes any pending writes in this output stream.

The flush method of **FilterOutputStream** (p.1536) calls the flush method of its underlying output stream

Exceptions

IOException (p. 1707)

Implements **decaf::io::OutputStream** (p. 2317).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 753).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.3 virtual bool decaf::io::FilterOutputStream::isClosed () const [inline, protected, virtual]

Returns

true if this stream has been closed.

6.311.3.4 virtual void decaf::io::FilterOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2932).

6.311.3.5 `virtual void decaf::io::FilterOutputStream::notify ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

6.311.3.6 `virtual void decaf::io::FilterOutputStream::notifyAll
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.311.3.7 `virtual bool decaf::io::FilterOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2935).

6.311.3.8 `virtual void decaf::io::FilterOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.311.3.9 `virtual void decaf::io::FilterOutputStream::wait ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.311.3.10 `virtual void decaf::io::FilterOutputStream::wait (long long
millisecs) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2938).

6.311.3.11 `virtual void decaf::io::FilterOutputStream::wait (long long millisecs,
int nanos) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

6.311.3.12 `virtual void decaf::io::FilterOutputStream::write (const std::vector< unsigned char > & buffer) throw (IOException) [inline, virtual]`

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2317).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 754), and **decaf::io::DataOutputStream** (p. 1303).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.311.3.13 `virtual void decaf::io::FilterOutputStream::write (unsigned char c) throw (IOException) [inline, virtual]`

Writes a single byte to the output stream.

The write method of **FilterOutputStream** (p. 1536) calls the write method of its underlying output stream, that is, it performs out.write(b).

Parameters

c the byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2318).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1919), **decaf::io::BufferedOutputStream** (p. 754), and **decaf::io::DataOutputStream** (p. 1302).

References **DECAF_CATCH_RETHROW**, and **DECAF_CATCHALL_THROW**.

6.311.3.14 `virtual void decaf::io::FilterOutputStream::write (const unsigned char * buffer, std::size_t offset DECAF_UNUSED, std::size_t len) throw (IOException, lang::exceptions::NullPointerException)`
[inline, virtual]

Writes an array of bytes to the output stream.

The write method of **FilterOutputStream** (p. 1536) calls the write method of one argument on each byte to output.

Parameters

buffer The array of bytes to write.

offset, the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions

IOException (p. 1707) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 2317).

Reimplemented in **activemq::io::LoggingOutputStream** (p. 1920), **decaf::io::BufferedOutputStream** (p. 754), and **decaf::io::DataOutputStream** (p. 1303).

References **DECAF_CATCH_RETHROW**, and **DECAF_CATCHALL_THROW**.

6.311.4 Field Documentation

6.311.4.1 `volatile bool decaf::io::FilterOutputStream::closed` [protected]

6.311.4.2 `util::concurrent::Mutex decaf::io::FilterOutputStream::mutex`
[protected]

6.311.4.3 `OutputStream* decaf::io::FilterOutputStream::outputStream`
[protected]

6.311.4.4 `bool decaf::io::FilterOutputStream::own` [protected]

The documentation for this class was generated from the following file:

Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const

Answers the int value which the receiver represents.

- virtual long long **longValue** () const

Answers the long value which the receiver represents.

- bool **isInfinite** () const
- bool **isNaN** () const

Static Public Member Functions

- static int **compare** (float f1, float f2)

Compares the two specified double values.

- static int **floatToIntBits** (float value)

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.

- static int **floatToRawIntBits** (float value)

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.

- static float **intBitsToFloat** (int bits)

Returns the float value corresponding to a given bit representation.

- static bool **isInfinite** (float value)

- static bool **isNaN** (float value)

- static float **parseFloat** (const std::string &value) throw (exceptions::NumberFormatException)

*Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1544).*

- static std::string **toHexString** (float value)

Returns a hexadecimal string representation of the float argument.

- static std::string **toString** (float value)

Returns a string representation of the float argument.

- static **Float** **valueOf** (float value)

*Returns a **Float** (p. 1544) instance representing the specified float value.*

- static **Float** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)

*Returns a **Float** (p. 1544) instance that wraps a primitive float which is parsed from the string value passed.*

Static Public Attributes

- static const int **SIZE** = 32
The size in bits of the primitive int type.
- static const float **MAX_VALUE**
The maximum value that the primitive type can hold.
- static const float **MIN_VALUE**
The minimum value that the primitive type can hold.
- static const float **NaN**
*Constant for the Not a **Number** (p. 2282) Value.*
- static const float **POSITIVE_INFINITY**
Constant for Positive Infinity.
- static const float **NEGATIVE_INFINITY**
Constant for Negative Infinity.

6.312.1 Constructor & Destructor Documentation

6.312.1.1 `decaf::lang::Float::Float (float value)`

Parameters

value - the primitive type to wrap

6.312.1.2 `decaf::lang::Float::Float (double value)`

Parameters

value - the primitive type to wrap

6.312.1.3 `decaf::lang::Float::Float (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

value - the string to convert to a primitive type to wrap

6.312.1.4 `virtual decaf::lang::Float::~~Float () [inline, virtual]`

6.312.2 Member Function Documentation

6.312.2.1 `virtual unsigned char decaf::lang::Float::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

6.312.2.2 static int decaf::lang::Float::compare (float *f1*, float *f2*) [static]

Compares the two specified double values.

The sign of the integer value returned is the same as that of the integer that would be returned by the call: `Float(f1).compareTo(Float(f2))`

Parameters

f1 - the first double to compare

f2 - the second double to compare

Returns

the value 0 if *d1* is numerically equal to *f2*; a value less than 0 if *f1* is numerically less than *f2*; and a value greater than 0 if *f1* is numerically greater than *f2*.

6.312.2.3 virtual int decaf::lang::Float::compareTo (const float & *f*) const [virtual]

Compares this **Float** (p. 1544) instance with another.

Parameters

f - the **Float** (p. 1544) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< float > (p. 1010).

6.312.2.4 virtual int decaf::lang::Float::compareTo (const Float & *f*) const [virtual]

Compares this **Float** (p. 1544) instance with another.

Parameters

f - the **Float** (p. 1544) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.312.2.5 `virtual double decaf::lang::Float::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.312.2.6 `bool decaf::lang::Float::equals (const Float & f) const [inline]`

Parameters

f - the **Float** (p.1544) object to compare against.

Returns

true if the two **Float** (p.1544) Objects have the same value.

6.312.2.7 `bool decaf::lang::Float::equals (const float & f) const [inline, virtual]`

Parameters

f - the **Float** (p.1544) object to compare against.

Returns

true if the two **Float** (p.1544) Objects have the same value.

Implements **decaf::lang::Comparable**< **float** > (p.1010).

6.312.2.8 `static int decaf::lang::Float::floatToIntBits (float value) [static]`

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.

Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is 0x7fc00000.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p.1549) method, will produce a floating-point value the same as the argument to floatToIntBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters

value - the float to convert to int bits

Returns

the int that holds the float's value

6.312.2.9 static int decaf::lang::Float::floatToRawIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.

Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is the integer representing the actual NaN value. Unlike the floatToIntBits method, intToRawIntBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1549) method, will produce a floating-point value the same as the argument to floatToRawIntBits.

Parameters

value The float to convert to a raw int.

Returns

the raw int value of the float

6.312.2.10 virtual float decaf::lang::Float::floatValue () const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.312.2.11 static float decaf::lang::Float::intBitsToFloat (int *bits*) [static]

Returns the float value corresponding to a given bit representation.

The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "single format" bit layout.

If the argument is 0x7f800000, the result is positive infinity. If the argument is 0xff800000, the result is negative infinity. If the argument is any value in the range 0x7f800001 through 0x7fffffff or in the range 0xff800001 through 0xffffffff, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Float::floatToRawIntBits** (p. 1549) method.

Parameters

bits - the bits of the float encoded as a float

Returns

a new float created from the int bits.

6.312.2.12 `virtual int decaf::lang::Float::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.312.2.13 `bool decaf::lang::Float::isInfinite () const`

Returns

true if the float is equal to positive infinity.

6.312.2.14 `static bool decaf::lang::Float::isInfinite (float value) [static]`

Parameters

value - The float to check.

Returns

true if the float is equal to infinity.

6.312.2.15 `bool decaf::lang::Float::isNaN () const`

Returns

true if the float is equal to NaN.

6.312.2.16 `static bool decaf::lang::Float::isNaN (float value) [static]`

Parameters

value - The float to check.

Returns

true if the float is equal to NaN.

6.312.2.17 `virtual long long decaf::lang::Float::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.312.2.18 `virtual bool decaf::lang::Float::operator< (const float & f) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

f - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< float >` (p.1011).

6.312.2.19 `virtual bool decaf::lang::Float::operator< (const Float & f) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

f - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.312.2.20 `virtual bool decaf::lang::Float::operator== (const Float & f) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

f - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.312.2.21 `virtual bool decaf::lang::Float::operator== (const float & f) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

f - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **float** > (p. 1011).

6.312.2.22 **static float decaf::lang::Float::parseFloat (const std::string & value)
 throw (exceptions::NumberFormatException) [static]**

Returns a new float initialized to the value represented by the specified string, as performed by the **valueOf** method of class **Float** (p. 1544).

Parameters

value - the string to parse

Returns

a float parsed from the string

Exceptions

NumberFormatException

6.312.2.23 **virtual short decaf::lang::Float::shortValue () const [inline,
 virtual]**

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

6.312.2.24 **static std::string decaf::lang::Float::toHexString (float value)
 [static]**

Returns a hexadecimal string representation of the float argument.

All characters mentioned below are ASCII characters.

* If the argument is NaN, the result is the string "NaN". * Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a float value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1664) on the exponent value. o If m is a float value

with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters

value - The float to convert to a string

Returns

the Hex formatted float string.

6.312.2.25 std::string decaf::lang::Float::toString () const

Returns

this **Float** (p. 1544) Object as a String Representation

6.312.2.26 static std::string decaf::lang::Float::toString (float value) [static]

Returns a string representation of the float argument.

All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10⁻³ but less than 10⁷, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10⁻³ or greater than or equal to 10⁷, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10ⁿ ≤ m < 10ⁿ⁺¹; then let a be the mathematically exact quotient of m and 10ⁿ so that 1 ≤ a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1665).

Parameters

value - The float to convert to a string

Returns

the formatted float string.

6.312.2.27 static Float decaf::lang::Float::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]

Returns a **Float** (p. 1544) instance that wraps a primitive float which is parsed from the string value passed.

Parameters

value - the string to parse

Returns

a new **Float** (p. 1544) instance wrapping the float parsed from value

Exceptions

NumberFormatException on error.

6.312.2.28 `static Float decaf::lang::Float::valueOf (float value) [static]`

Returns a **Float** (p. 1544) instance representing the specified float value.

Parameters

value - float to wrap

Returns

new **Float** (p. 1544) instance wrapping the primitive value

6.312.3 Field Documentation

6.312.3.1 `const float decaf::lang::Float::MAX_VALUE [static]`

The maximum value that the primitive type can hold.

6.312.3.2 `const float decaf::lang::Float::MIN_VALUE [static]`

The minimum value that the primitive type can hold.

6.312.3.3 `const float decaf::lang::Float::NaN [static]`

Constant for the Not a **Number** (p. 2282) Value.

6.312.3.4 `const float decaf::lang::Float::NEGATIVE_INFINITY [static]`

Constant for Negative Infinity.

6.312.3.5 `const float decaf::lang::Float::POSITIVE_INFINITY [static]`

Constant for Positive Infinity.

6.312.3.6 `const int decaf::lang::Float::SIZE = 32 [static]`

The size in bits of the primitive int type.

Relative get method.
- virtual float **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)

Absolute get method.

- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible float array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual FloatBuffer & **put** (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual FloatBuffer & **put** (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual FloatBuffer * **slice** () const
Creates a new FloatBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteBuffer** (p. 806) as Read-Only.*

6.313.1 Constructor & Destructor Documentation

6.313.1.1 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **FloatArrayBuffer** (p. 1555) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.313.1.2 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (float * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **FloatArrayBuffer** (p. 1555) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap
offset - the position that is this buffers start pos.
capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.313.1.3 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.

The capacity and limit of the new **FloatArrayBuffer** (p. 1555) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p. 843) to wrap
offset - the offset into array where the buffer starts
capacity - the length of the array we are wrapping or limit.
readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.313.1.4 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const FloatArrayBuffer & other)

Create a **FloatArrayBuffer** (p. 1555) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.

Parameters

other - the **FloatArrayBuffer** (p. 1555) this one is to mirror.

6.313.1.5 virtual decaf::internal::nio::FloatArrayBuffer::~FloatArrayBuffer () [virtual]

6.313.2 Member Function Documentation

6.313.2.1 virtual float* decaf::internal::nio::FloatArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the float array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1565).

6.313.2.2 `virtual std::size_t decaf::internal::nio::FloatArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1565).

6.313.2.3 `virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::asReadOnlyBuffer () const [virtual]`

Creates a new, read-only float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only float buffer which the caller then owns.

Implements **decaf::nio::FloatBuffer** (p. 1565).

**6.313.2.4 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::compact ()
throw (decaf::nio::ReadOnlyBufferException) [virtual]**

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this FloatBuffer

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1566).

**6.313.2.5 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::duplicate ()
[virtual]**

Creates a new float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new float Buffer which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1567).

6.313.2.6 virtual float decaf::internal::nio::FloatArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the float at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements **decaf::nio::FloatBuffer** (p. 1568).

6.313.2.7 `virtual float decaf::internal::nio::FloatArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
[virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the Buffer where the float is to be read

Returns

the float that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements `decaf::nio::FloatBuffer` (p.1567).

6.313.2.8 `virtual bool decaf::internal::nio::FloatArrayBuffer::hasArray () const`
[inline, virtual]

Tells whether or not this buffer is backed by an accessible float array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements `decaf::nio::FloatBuffer` (p.1569).

6.313.2.9 `virtual bool decaf::internal::nio::FloatArrayBuffer::isReadOnly () const` [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.313.2.10 `virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)` [virtual]

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p.1570).

6.313.2.11 `virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (float value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p.1569).

6.313.2.12 `virtual void decaf::internal::nio::FloatArrayBuffer::setReadOnly (bool value) [inline, protected, virtual]`

Sets this **ByteBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.313.2.13 `virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::slice () const [virtual]`

Creates a new **FloatBuffer** whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create FloatBuffer which the caller owns.

Implements **decaf::nio::FloatBuffer** (p.1572).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/FloatArrayBuffer.h`

6.314 decaf::nio::FloatBuffer Class Reference

This class defines four categories of operations upon float buffers:

```
#include <src/main/decaf/nio/FloatBuffer.h>
```

Inheritance diagram for decaf::nio::FloatBuffer:

Public Member Functions

- virtual **~FloatBuffer** ()
- virtual `std::string toString` () const
- virtual `float * array` ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the float array that backs this buffer (optional operation).
- virtual `std::size_t arrayOffset` ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **FloatBuffer * asReadOnlyBuffer** () const =0
Creates a new, read-only float buffer that shares this buffer's content.
- virtual **FloatBuffer & compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **FloatBuffer * duplicate** ()=0
Creates a new float buffer that shares this buffer's content.
- virtual `float get` ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual `float get` (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **FloatBuffer & get** (std::vector< float > buffer) throw (BufferUnderflowException)
Relative bulk get method.

- **FloatBuffer** & **get** (float *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible float array.
- **FloatBuffer** & **put** (**FloatBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the floats remaining in the given source buffer into this buffer.
- **FloatBuffer** & **put** (const float *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers floats into this buffer from the given source array.
- **FloatBuffer** & **put** (std::vector< float > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source floats array into this buffer.
- virtual **FloatBuffer** & **put** (float value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given floats into this buffer at the current position, and then increments the position.
- virtual **FloatBuffer** & **put** (std::size_t index, float value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given floats into this buffer at the given index.
- virtual **FloatBuffer** * **slice** () const =0
*Creates a new **FloatBuffer** (p.1562) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **FloatBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **FloatBuffer** &value) const
- virtual bool **operator==** (const **FloatBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **FloatBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **FloatBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **FloatBuffer** * **wrap** (float *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)

*Wraps the passed buffer with a new **FloatBuffer** (p. 1562).*

- static **FloatBuffer** * **wrap** (std::vector< float > &buffer)

*Wraps the passed STL float Vector in a **FloatBuffer** (p. 1562).*

Protected Member Functions

- **FloatBuffer** (std::size_t capacity)

*Creates a **FloatBuffer** (p. 1562) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.314.1 Detailed Description

This class defines four categories of operations upon float buffers: o Absolute and relative get and put methods that read and write single floats; o Relative bulk get methods that transfer contiguous sequences of floats from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of floats from a float array or some other float buffer into this buffer o Methods for compacting, duplicating, and slicing a float buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing float array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.314.2 Constructor & Destructor Documentation

6.314.2.1 decaf::nio::FloatBuffer::FloatBuffer (std::size_t capacity) [protected]

Creates a **FloatBuffer** (p. 1562) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size and limit of the **Buffer** (p. 741) in doubles

6.314.2.2 virtual decaf::nio::FloatBuffer::~~FloatBuffer () [inline, virtual]

6.314.3 Member Function Documentation

6.314.3.1 static FloatBuffer* decaf::nio::FloatBuffer::allocate (std::size_t capacity) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Double buffer in floats

Returns

the **FloatBuffer** (p. 1562) that was allocated, caller owns.

6.314.3.2 `virtual float* decaf::nio::FloatBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the float array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1557).

6.314.3.3 `virtual std::size_t decaf::nio::FloatBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1558).

6.314.3.4 **virtual FloatBuffer* decaf::nio::FloatBuffer::asReadOnlyBuffer () const** [pure virtual]

Creates a new, read-only float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only float buffer which the caller then owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1558).

6.314.3.5 **virtual FloatBuffer& decaf::nio::FloatBuffer::compact () throw (** **ReadOnlyBufferException)** [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **FloatBuffer** (p. 1562)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1559).

6.314.3.6 **virtual int decaf::nio::FloatBuffer::compareTo (const FloatBuffer &** **value) const** [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.314.3.7 virtual FloatBuffer* decaf::nio::FloatBuffer::duplicate () [pure virtual]

Creates a new float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new float **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1559).

6.314.3.8 virtual bool decaf::nio::FloatBuffer::equals (const FloatBuffer & value) const [virtual]
Returns

true if this value is considered equal to the passed value.

6.314.3.9 FloatBuffer& decaf::nio::FloatBuffer::get (std::vector< float > buffer) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length floats remaining in this buffer

6.314.3.10 virtual float decaf::nio::FloatBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the float is to be read

Returns

the float that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1560).

6.314.3.11 **FloatBuffer& decaf::nio::FloatBuffer::get (float * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)**

Relative bulk get method.

This method transfers floats from this buffer into the given destination array. If there are fewer floats remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies `length` floats from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than `length` floats remaining in this buffer

NullPointerException if the passed buffer is null.

6.314.3.12 **virtual float decaf::nio::FloatBuffer::get () throw (BufferUnderflowException) [pure virtual]**

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the float at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1559).

6.314.3.13 virtual bool decaf::nio::FloatBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible float array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1560).

6.314.3.14 virtual bool decaf::nio::FloatBuffer::operator< (const FloatBuffer & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.314.3.15 virtual bool decaf::nio::FloatBuffer::operator== (const FloatBuffer & value) const [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.314.3.16 `virtual FloatBuffer& decaf::nio::FloatBuffer::put (float value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters

value - the floats value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::FloatArrayBuffer` (p. 1561).

6.314.3.17 `virtual FloatBuffer& decaf::nio::FloatBuffer::put (std::size_t index, float value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given floats into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the floats to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::FloatArrayBuffer` (p. 1560).

6.314.3.18 `FloatBuffer& decaf::nio::FloatBuffer::put (const float * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)`

This method transfers floats into this buffer from the given source array.

If there are more floats to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no floats are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

- buffer*- The array from which floats are to be read
- offset*- The offset within the array of the first float to be read;
- length* - The number of floats to be read from the given array

Returns

a reference to this buffer

Exceptions

- BufferOverflowException* (p. 771) - If there is insufficient space in this buffer
- ReadOnlyBufferException* (p. 2520) - If this buffer is read-only
- NullPointerException* if the passed buffer is null.

6.314.3.19 FloatBuffer& decaf::nio::FloatBuffer::put (std::vector< float > & buffer) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source floats array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters

- buffer* - The buffer whose contents are copied to this **FloatBuffer** (p. 1562)

Returns

a reference to this buffer

Exceptions

- BufferOverflowException* (p. 771) - If there is insufficient space in this buffer
- ReadOnlyBufferException* (p. 2520) - If this buffer is read-only

6.314.3.20 FloatBuffer& decaf::nio::FloatBuffer::put (FloatBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the floats remaining in the given source buffer into this buffer.

If there are more floats remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 746), then no floats are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `n = src.remaining()` floats from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src - the buffer to take floats from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining floats in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.314.3.21 `virtual FloatBuffer* decaf::nio::FloatBuffer::slice () const [pure virtual]`

Creates a new **FloatBuffer** (p. 1562) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **FloatBuffer** (p. 1562) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1561).

6.314.3.22 `virtual std::string decaf::nio::FloatBuffer::toString () const [virtual]`

Returns

a std::string describing this object

6.314.3.23 `static FloatBuffer* decaf::nio::FloatBuffer::wrap (float * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]`

Wraps the passed buffer with a new **FloatBuffer** (p. 1562).

The new buffer will be backed by the given float array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **FloatBuffer** (p. 1562) that is backed by buffer, caller owns.

6.314.3.24 `static FloatBuffer* decaf::nio::FloatBuffer::wrap (std::vector< float > & buffer) [static]`

Wraps the passed STL float Vector in a **FloatBuffer** (p. 1562).

The new buffer will be backed by the given float array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **FloatBuffer** (p. 1562) that is backed by buffer, caller owns.

6.315 activemq::commands::FlushCommand Class Reference

```
#include <src/main/activemq/commands/FlushCommand.h>
```

Inheritance diagram for activemq::commands::FlushCommand:

Public Member Functions

- **FlushCommand** ()
- virtual **~FlushCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **FlushCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataSet** *value) const

*Compares the **DataSet** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_FLUSHCOMMAND** = 15

Protected Member Functions

- **FlushCommand** (const **FlushCommand** &)
- **FlushCommand** & **operator=** (const **FlushCommand** &)

6.315.1 Constructor & Destructor Documentation

6.315.1.1 **activemq::commands::FlushCommand::FlushCommand** (const **FlushCommand** &) [inline, protected]

6.315.1.2 **activemq::commands::FlushCommand::FlushCommand** ()

6.315.1.3 virtual **activemq::commands::FlushCommand::~~FlushCommand** () [virtual]

6.315.2 Member Function Documentation

6.315.2.1 virtual **FlushCommand*** **activemq::commands::FlushCommand::cloneDataSet** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataSet** (p. 1373).

6.315.2.2 virtual void activemq::commands::FlushCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.315.2.3 virtual bool activemq::commands::FlushCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.315.2.4 virtual unsigned char activemq::commands::FlushCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.315.2.5 FlushCommand& activemq::commands::FlushCommand::operator= (const FlushCommand &) [inline, protected]**6.315.2.6 virtual std::string activemq::commands::FlushCommand::toString () const [virtual]**

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.315.2.7 `virtual Pointer<Command> activemq::commands::FlushCommand::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.315.3 Field Documentation

6.315.3.1 `const unsigned char activemq::commands::FlushCommand::ID - FLUSHCOMMAND = 15` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/FlushCommand.h`

6.316 activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1576).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/FlushCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller`:

Public Member Functions

- **FlushCommandMarshaller** ()
- virtual **~FlushCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.316.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p.1576). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.316.2 Constructor & Destructor Documentation

6.316.2.1 activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::FlushCommandMarshaller () [inline]

6.316.2.2 virtual activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::~~FlushCommandMarshaller () [inline, virtual]

6.316.3 Member Function Documentation

6.316.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.316.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.316.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.316.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.316.3.5 virtual int activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.316.3.6 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

6.316.3.7 virtual void activemq::wireformat::openwire::marshal::v2::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/FlushCommandMarshaller.h`

6.317 `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller` Class Reference

Marshaling code for Open Wire Format for `FlushCommandMarshaller` (p. 1579).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/FlushCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller`:

Public Member Functions

6.317.3 Member Function Documentation

6.317.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.317.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.317.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.317.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.317.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.317.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.317.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.318.2.2 virtual activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::~~FlushCommandMarshaller () [inline, virtual]

6.318.3 Member Function Documentation

6.318.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.318.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.318.3.3 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.318.3.4 virtual void activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.318.3.5 virtual int activemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

```
6.318.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

```
6.318.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

6.319.3 Member Function Documentation

6.319.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.319.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.319.3.3 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.319.3.4 virtual void activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.319.3.5 virtual int activemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

```
6.319.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.319.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.320.3 Member Function Documentation

6.320.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.320.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.320.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.320.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.320.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.320.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.320.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::FlushCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/FlushCommandMarshaller.h`

6.321 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1595) provides support for formatting LogRecords.

```
#include <src/main/decaf/util/logging/Formatter.h>
```

Inheritance diagram for `decaf::util::logging::Formatter`:

Public Member Functions

- virtual **~Formatter** ()
- virtual `std::string format (const LogRecord &record) const =0`
Format the given log record and return the formatted string.
- virtual `std::string formatMessage (const LogRecord &record) const =0`
Format the message string from a log record.
- virtual `std::string getHead (const Handler *handler)=0`
Return the header string for a set of formatted records.
- virtual `std::string getTail (const Handler *handler)=0`
Return the tail string for a set of formatted records.

6.321.1 Detailed Description

A **Formatter** (p. 1595) provides support for formatting LogRecords. Typically each logging **Handler** (p. 1604) will have a **Formatter** (p. 1595) associated with it. The **Formatter** (p. 1595) takes a **LogRecord** (p. 1928) and converts it to a string.

Some formatters (such as the XMLFormatter) need to wrap head and tail strings around a set of formatted records. The `getHeader` and `getTail` methods can be used to obtain these strings.

6.321.2 Constructor & Destructor Documentation

6.321.2.1 virtual decaf::util::logging::Formatter::~~Formatter () [inline, virtual]

6.321.3 Member Function Documentation

6.321.3.1 virtual std::string decaf::util::logging::Formatter::format (const LogRecord & *record*) const [pure virtual]

Format the given log record and return the formatted string.

Parameters

record The Log Record to Format

Returns

the formatted record.

Implemented in **decaf::util::logging::SimpleFormatter** (p.2783).

6.321.3.2 virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & *record*) const [pure virtual]

Format the message string from a log record.

Parameters

record The Log Record to Format

Returns

the formatted message

Implemented in **decaf::util::logging::SimpleFormatter** (p.2783).

6.321.3.3 virtual std::string decaf::util::logging::Formatter::getHead (const Handler * *handler*) [pure virtual]

Return the header string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler the target handler, can be null

Returns

the head string

Implemented in **decaf::util::logging::SimpleFormatter** (p.2783).

6.321.3.4 virtual std::string decaf::util::logging::Formatter::getTail (const Handler * *handler*) [pure virtual]

Return the tail string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler the target handler, can be null

Returns

the tail string

Implemented in **decaf::util::logging::SimpleFormatter** (p. 2783).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Formatter.h**

6.322 decaf::util::concurrent::Future< V > Class Template Reference

A **Future** (p. 1597) represents the result of an asynchronous computation.

```
#include <src/main/decaf/util/concurrent/Future.h>
```

Public Member Functions

- virtual ~**Future** ()
- bool **cancel** (bool mayInterruptIfRunning)=0
Attempts to cancel execution of this task.
- bool **isCancelled** () const =0
Returns true if this task was canceled before it completed normally.
- bool **isDone** () const =0
Returns true if this task completed.
- V **get** ()=0 throw (CancellationException, InterruptedException, ExecutionException)
Waits if necessary for the computation to complete, and then retrieves its result.
- V **get** (long long timeout, **TimeUnit** unit)=0 throw (InterruptedException, ExecutionException, TimeoutException)
Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.322.1 Detailed Description

`template<typename V> class decaf::util::concurrent::Future< V >`

A **Future** (p. 1597) represents the result of an asynchronous computation. Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method `get` when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the `cancel` method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p. 1597) for the sake of cancellability but not provide a usable result, you can declare types of the form `Future<void*>` and return null as a result of the underlying task.

6.322.2 Constructor & Destructor Documentation

6.322.2.1 `template<typename V > virtual decaf::util::concurrent::Future< V >::~~Future () [inline, virtual]`

6.322.3 Member Function Documentation

6.322.3.1 `template<typename V > bool decaf::util::concurrent::Future< V >::cancel (bool mayInterruptIfRunning) [pure virtual]`

Attempts to cancel execution of this task.

This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when `cancel` is called, this task should never run. If the task has already started, then the `mayInterruptIfRunning` parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to `isDone()` (p. 1600) will always return true. Subsequent calls to `isCancelled()` (p. 1600) will always return true if this method returned true.

Parameters

mayInterruptIfRunning - true if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns

false if the task could not be canceled, typically because it has already completed normally; true otherwise

6.322.3.2 `template<typename V > V decaf::util::concurrent::Future< V >::get (long long timeout, TimeUnit unit) throw (InterruptedException, ExecutionException, TimeoutException) [pure virtual]`

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters

timeout - the maximum time to wait

unit - the time unit of the timeout argument

Returns

the computed result

Exceptions

CancellationException (p. 898) - if the computation was canceled
ExecutionException (p. 1507) - if the computation threw an exception
InterruptedException - if the current thread was interrupted while waiting
TimeoutException (p. 2987) - if the wait timed out

6.322.3.3 `template<typename V > V decaf::util::concurrent::Future< V
 >::get () throw (CancellationException, InterruptedException,
 ExecutionException) [pure virtual]`

Waits if necessary for the computation to complete, and then retrieves its result.

Returns

the computed result.

Exceptions

CancellationException (p. 898) - if the computation was canceled
ExecutionException (p. 1507) - if the computation threw an exception
InterruptedException - if the current thread was interrupted while waiting

6.322.3.4 `template<typename V > bool decaf::util::concurrent::Future< V
 >::isCancelled () const [pure virtual]`

Returns true if this task was canceled before it completed normally.

Returns

true if this task was canceled before it completed

6.322.3.5 `template<typename V > bool decaf::util::concurrent::Future< V
 >::isDone () const [pure virtual]`

Returns true if this task completed.

Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns

true if this task completed

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/Future.h`

6.323 activemq::transport::correlator::FutureResponse Class Reference

A container that holds a response object.

```
#include <src/main/activemq/transport/correlator/FutureResponse.h>
```

Public Member Functions

- **FutureResponse** ()
- virtual **~FutureResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** () const
Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** ()
- virtual const **Pointer**< **Response** > & **getResponse** (unsigned int timeout) const
Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** (unsigned int timeout)
- virtual void **setResponse** (const **Pointer**< **Response** > &response)
Setter for the response property.

6.323.1 Detailed Description

A container that holds a response object. Callers of the `getResponse` method will block until a response has been receive unless they call the `getRepsonse` that takes a timeout.

6.323.2 Constructor & Destructor Documentation

6.323.2.1 **activemq::transport::correlator::FutureResponse::FutureResponse** ()
[inline]

6.323.2.2 **virtual**
activemq::transport::correlator::FutureResponse::~~FutureResponse ()
[inline, virtual]

6.323.3 Member Function Documentation

6.323.3.1 **virtual const Pointer**<**Response**>& **activemq::transport::correlator::FutureResponse::getResponse** () const
[inline, virtual]

Getters for the response property.

Infinite Wait.

Returns

the response object for the request

- 6.323.3.2** `virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse ()`
[inline, virtual]
- 6.323.3.3** `virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout)` [inline, virtual]
- 6.323.3.4** `virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int timeout) const` [inline, virtual]

Getters for the response property.

Timed Wait.

Parameters

timeout - time to wait in milliseconds

Returns

the response object for the request

- 6.323.3.5** `virtual void activemq::transport::correlator::FutureResponse::setResponse (const Pointer< Response > & response)` [inline, virtual]

Setter for the response property.

Parameters

response the response object for the request.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/correlator/FutureResponse.h`

6.324 decaf::security::GeneralSecurityException Class Reference

```
#include <src/main/decaf/security/GeneralSecurityException.h>
```

Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- `GeneralSecurityException () throw ()`
Default Constructor.

- **GeneralSecurityException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **GeneralSecurityException** (const **GeneralSecurityException** &ex) throw ()
Copy Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (const std::exception *cause) throw ()
Constructor.
- **GeneralSecurityException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * clone () const
Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.324.1 Constructor & Destructor Documentation

6.324.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException () throw () [inline]

Default Constructor.

6.324.1.2 decaf::security::GeneralSecurityException::GeneralSecurityException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.324.1.3 decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.324.1.4 `decaf::security::GeneralSecurityException::GeneralSecurityException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.324.1.5 `decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.324.1.6 `decaf::security::GeneralSecurityException::GeneralSecurityException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs
lineNumber line number where the exception occurred.

6.324.1.7 `virtual decaf::security::GeneralSecurityException::~GeneralSecurityException () throw () [inline, virtual]`

6.324.2 Member Function Documentation

6.324.2.1 `virtual GeneralSecurityException* decaf::security::GeneralSecurityException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented in **decaf::security::cert::CertificateEncodingException** (p. 906), **decaf::security::cert::CertificateException** (p. 908), **decaf::security::cert::CertificateExpiredException** (p. 910), **decaf::security::cert::CertificateNotYetValidException** (p. 912), **decaf::security::cert::CertificateParsingException** (p. 914), **decaf::security::InvalidKeyException** (p. 1700), **decaf::security::KeyException** (p. 1839), **decaf::security::NoSuchAlgorithmExceptionException** (p. 2274), **decaf::security::NoSuchProviderException** (p. 2279), and **decaf::security::SignatureException** (p. 2781).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/GeneralSecurityException.h`

6.325 decaf::util::logging::Handler Class Reference

A **Handler** (p. 1604) object takes log messages from a **Logger** (p. 1908) and exports them.

`#include <src/main/decaf/util/logging/Handler.h>`

Inheritance diagram for `decaf::util::logging::Handler`:

Public Member Functions

- virtual `~Handler()`
- virtual void `flush()`=0
Flush the Handler's output, clears any buffers.
- virtual void `publish(const LogRecord &record)`=0
*Publish the Log Record to this **Handler** (p. 1604).*
- virtual void `isLoggable(const LogRecord &record)`=0
*Check if this **Handler** (p. 1604) would actually log a given **LogRecord** (p. 1928).*
- virtual void `setFilter(const Filter *filter)`=0
*Sets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.*
- virtual const `Filter * getFilter()`=0
*Gets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.*
- virtual void `setLevel(Level value)`=0
*Set (p. 2729) the log level specifying which message levels will be logged by this **Handler** (p. 1604).*

- virtual **Level** **getLevel** ()=0
*Get the log level specifying which message levels will be logged by this **Handler** (p. 1604).*
- virtual void **setFormatter** (const **Formatter** *formatter)=0
*Sets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).*
- virtual const **Formatter** * **getFormatter** ()=0
*Gets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).*

6.325.1 Detailed Description

A **Handler** (p.1604) object takes log messages from a **Logger** (p.1908) and exports them. It might for example, write them to a console or write them to a file, or send them to a network logging service, or forward them to an OS log, or whatever.

A **Handler** (p.1604) can be disabled by doing a **setLevel**(**Level.OFF**) and can be re-enabled by doing a **setLevel** with an appropriate level.

Handler (p. 1604) classes typically use **LogManager** (p.1923) properties to set default values for the Handler's **Filter** (p.1527), **Formatter** (p.1595), and **Level**. See the specific documentation for each concrete **Handler** (p.1604) class.

6.325.2 Constructor & Destructor Documentation

6.325.2.1 virtual **decaf::util::logging::Handler::~~Handler** () [inline, virtual]

6.325.3 Member Function Documentation

6.325.3.1 virtual void **decaf::util::logging::Handler::flush** () [pure virtual]

Flush the Handler's output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p.2890).

6.325.3.2 virtual const **Filter*** **decaf::util::logging::Handler::getFilter** () [pure virtual]

Gets the **Filter** (p.1527) that this **Handler** (p.1604) uses to filter Log Records.

Returns

Filter (p.1527) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p.2890).

6.325.3.3 virtual const **Formatter*** **decaf::util::logging::Handler::getFormatter** () [pure virtual]

Gets the **Formatter** (p.1595) used by this **Handler** (p.1604).

Returns

Filter (p. 1527) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2890).

6.325.3.4 virtual Level decaf::util::logging::Handler::getLevel () [pure virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1604).

Returns

Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 2890).

6.325.3.5 virtual void decaf::util::logging::Handler::isLoggable (const LogRecord & record) [pure virtual]

Check if this **Handler** (p. 1604) would actually log a given **LogRecord** (p. 1928).

This method checks if the **LogRecord** (p. 1928) has an appropriate Level and whether it satisfies any **Filter** (p. 1527). It also may make other **Handler** (p. 1604) specific checks that might prevent a handler from logging the **LogRecord** (p. 1928).

Parameters

record LogRecord (p. 1928) to check

Implemented in **decaf::util::logging::StreamHandler** (p. 2891).

6.325.3.6 virtual void decaf::util::logging::Handler::publish (const LogRecord & record) [pure virtual]

Publish the Log Record to this **Handler** (p. 1604).

Parameters

record The Log Record to Publish

Implemented in **decaf::util::logging::StreamHandler** (p. 2891).

6.325.3.7 virtual void decaf::util::logging::Handler::setFilter (const Filter * filter) [pure virtual]

Sets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.

For each call of publish the **Handler** (p. 1604) will call this **Filter** (p. 1527) (if it is non-null) to check if the **LogRecord** (p. 1928) should be published or discarded.

Parameters

filter Filter (p. 1527) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2891).

6.325.3.8 virtual void decaf::util::logging::Handler::setFormatter (const Formatter * *formatter*) [pure virtual]

Sets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).

Some Handlers may not use Formatters, in which case the **Formatter** (p. 1595) will be remembered, but not used.

Parameters

formatter Filter (p. 1527) derived instance

Implemented in **decaf::util::logging::StreamHandler** (p. 2891).

6.325.3.9 virtual void decaf::util::logging::Handler::setLevel (Level *value*) [pure virtual]

Set (p. 2729) the log level specifying which message levels will be logged by this **Handler** (p. 1604).

The intention is to allow developers to turn on voluminous logging, but to limit the messages that are sent to certain Handlers.

Parameters

value Level enumeration value

Implemented in **decaf::util::logging::StreamHandler** (p. 2892).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Handler.h**

6.326 decaf::internal::util::HexStringParser Class Reference

```
#include <src/main/decaf/internal/util/HexStringParser.h>
```

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)
Create a new HexParser.
- virtual ~**HexStringParser** ()
- long long **parse** (const std::string &hexString)
Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Static Public Member Functions

- static double **parseDouble** (const std::string &hexString)
- static float **parseFloat** (const std::string &hexString)

6.326.1 Constructor & Destructor Documentation

6.326.1.1 decaf::internal::util::HexStringParser::HexStringParser (int *exponentWidth*, int *mantissaWidth*)

Create a new HexParser.

Parameters

exponentWidth - Width of the exponent for the type to parse

mantissaWidth - Width of the mantissa for the type to parse

6.326.1.2 virtual decaf::internal::util::HexStringParser::~~HexStringParser () [inline, virtual]

6.326.2 Member Function Documentation

6.326.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string & *hexString*)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or double as needed.

Parameters

hexString - string to parse

Returns

the bits parsed from the string

6.326.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.326.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/HexStringParser.h

6.327 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1609) class maps hexadecimal strings to the value of an index into the table, i.e.

```
#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>
```

Public Member Functions

- **HexTable** ()
- virtual **~HexTable** ()
- virtual const std::string & **operator[]** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

- virtual const std::string & **operator[]** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual std::size_t **size** () const

Returns the max size of this Table.

6.327.1 Detailed Description

The **HexTable** (p. 1609) class maps hexadecimal strings to the value of an index into the table, i.e. the class will return "FF" for the index 255 in the table.

6.327.2 Constructor & Destructor Documentation

6.327.2.1 activemq::wireformat::openwire::utils::HexTable::HexTable ()

6.327.2.2 virtual activemq::wireformat::openwire::utils::HexTable::~~HexTable ()
[inline, virtual]

6.327.3 Member Function Documentation

6.327.3.1 virtual const std::string&
activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t
index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters

index The index of the value in the table to fetch.

Returns

string containing the hex value if the index

Exceptions

IndexOutOfBoundsException

6.327.3.2 `virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

6.327.3.3 `virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size () const [inline, virtual]`

Returns the max size of this Table.

Returns

an integer size value

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/utils/HexTable.h`

6.328 decaf::net::HttpRetryException Class Reference

```
#include <src/main/decaf/net/HttpRetryException.h>
```

Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

- **HttpRetryException** () throw ()
Default Constructor.
- **HttpRetryException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **HttpRetryException** (const **HttpRetryException** &ex) throw ()
Copy Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **HttpRetryException** (const std::exception *cause) throw ()
Constructor.
- **HttpRetryException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **HttpRetryException** * **clone** () const
Clones this exception.
- virtual ~**HttpRetryException** () throw ()

6.328.1 Constructor & Destructor Documentation

6.328.1.1 `decaf::net::HttpRetryException::HttpRetryException () throw ()` [inline]

Default Constructor.

6.328.1.2 `decaf::net::HttpRetryException::HttpRetryException (const Exception & ex) throw ()` [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.328.1.3 `decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & ex) throw ()` [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.328.1.4 `decaf::net::HttpRetryException::HttpRetryException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.328.1.5 `decaf::net::HttpRetryException::HttpRetryException (const std::exception * cause) throw ()` [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.328.1.6 `decaf::net::HttpRetryException::HttpRetryException (const char * file,
const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.328.1.7 `virtual decaf::net::HttpRetryException::~~HttpRetryException ()
throw () [inline, virtual]`

6.328.2 Member Function Documentation

6.328.2.1 `virtual HttpRetryException* decaf::net::HttpRetryException::clone ()
const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/HttpRetryException.h`

6.329 decaf::lang::exceptions::IllegalArgumentException Class Reference

```
#include <src/main/decaf/lang/exceptions/IllegalArgumentException.h>
```

Inheritance diagram for `decaf::lang::exceptions::IllegalArgumentException`:

Public Member Functions

- `IllegalArgumentException () throw ()`
Default Constructor.

- **IllegalArgumentException** (const **Exception** &ex) throw ()

Constructor - Initializes the file name and line number where this message occurred.
- virtual **IllegalArgumentException** * clone () const
Clones this exception.
- virtual ~**IllegalArgumentException** () throw ()

6.329.1 Constructor & Destructor Documentation

6.329.1.1 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException () throw () [inline]

Default Constructor.

6.329.1.2 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.329.1.3 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const IllegalArgumentException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.329.1.4 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

***cause* Pointer** (p.2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.329.1.5 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.329.1.6 decaf::lang::exceptions::IllegalArgumentException::IllegalArgumentException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.329.1.7 virtual decaf::lang::exceptions::IllegalArgumentException::~IllegalArgumentException () throw () [inline, virtual]

6.329.2 Member Function Documentation

6.329.2.1 virtual IllegalArgumentException* decaf::lang::exceptions::IllegalArgumentException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IllegalArgumentException.h`

6.330 decaf::lang::exceptions::IllegalMonitorStateException Class Reference

6.330.1 Constructor & Destructor Documentation

6.330.1.1 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
() throw () [inline]

Default Constructor.

6.330.1.2 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
(const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.330.1.3 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
(const IllegalMonitorStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.330.1.4 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...)
throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.330.1.5 decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException
(const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.330.1.6 `decaf::lang::exceptions::IllegalMonitorStateException::IllegalMonitorStateException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.330.1.7 `virtual decaf::lang::exceptions::IllegalMonitorStateException::~~IllegalMonitorStateException () throw () [inline, virtual]`

6.330.2 Member Function Documentation

6.330.2.1 `virtual IllegalMonitorStateException* decaf::lang::exceptions::IllegalMonitorStateException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from `decaf::lang::Exception` (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IllegalMonitorStateException.h`

6.331 decaf::lang::exceptions::IllegalStateException Class Reference

6.331.1 Constructor & Destructor Documentation

6.331.1.1 decaf::lang::exceptions::IllegalStateException::IllegalStateException ()
throw () [inline]

Default Constructor.

6.331.1.2 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.331.1.3 decaf::lang::exceptions::IllegalStateException::IllegalStateException (const **IllegalStateException** & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.331.1.4 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.331.1.5 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.331.1.6 `decaf::lang::exceptions::IllegalStateException::IllegalStateException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.331.1.7 `virtual decaf::lang::exceptions::IllegalStateException::~~IllegalStateException () throw () [inline, virtual]`

6.331.2 Member Function Documentation

6.331.2.1 `virtual IllegalStateException* decaf::lang::exceptions::IllegalStateException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

Reimplemented in **decaf::nio::InvalidMarkException** (p. 1703).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IllegalStateException.h`

6.332 cms::IllegalStateException Class Reference

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

```
#include <src/main/cms/IllegalStateException.h>
```

Inheritance diagram for cms::IllegalStateException:

Public Member Functions

- **IllegalStateException** () throw ()
- **IllegalStateException** (const **IllegalStateException** &ex) throw ()
- **IllegalStateException** (const std::string &message, const std::exception *cause) throw ()

- `IllegalThreadStateException (const char *file, const int lineNumber, const char *msg,...)
throw ()`
Constructor - Initializes the file name and line number where this message occurred.
- `IllegalThreadStateException (const char *file, const int lineNumber, const std::exception
*cause, const char *msg,...) throw ()`
Constructor - Initializes the file name and line number where this message occurred.
- `IllegalThreadStateException (const std::exception *cause) throw ()`

Constructor.

- virtual **IllegalThreadStateException** * **clone** () const
Clones this exception.
- virtual ~**IllegalThreadStateException** () throw ()

6.333.1 Constructor & Destructor Documentation

6.333.1.1 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException () throw () [inline]

Default Constructor.

6.333.1.2 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.333.1.3 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const IllegalThreadStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.333.1.4 decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.333.1.5 `decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.333.1.6 `decaf::lang::exceptions::IllegalThreadStateException::IllegalThreadStateException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.333.1.7 `virtual decaf::lang::exceptions::IllegalThreadStateException::~~IllegalThreadStateException () throw () [inline, virtual]`

6.333.2 Member Function Documentation

6.333.2.1 `virtual IllegalThreadStateException* decaf::lang::exceptions::IllegalThreadStateException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IllegalThreadStateException.h`

6.334 activemq::transport::inactivity::InactivityMonitor Class Reference

```
#include <src/main/activemq/transport/inactivity/InactivityMonitor.h>
```

Inheritance diagram for activemq::transport::inactivity::InactivityMonitor:

Public Member Functions

- **InactivityMonitor** (const **Pointer**< **Transport** > &next, const **Pointer**< **wireformat::WireFormat** > &wireFormat)

- 6.334.1.2** `activemq::transport::inactivity::InactivityMonitor::InactivityMonitor (const Pointer< Transport > & next, const decaf::util::Properties & properties, const Pointer< wireformat::WireFormat > & wireFormat)`
- 6.334.1.3** `virtual
activemq::transport::inactivity::InactivityMonitor::~~InactivityMonitor () [virtual]`

6.334.2 Member Function Documentation

- 6.334.2.1** `virtual void activemq::transport::inactivity::InactivityMonitor::close ()
throw (decaf::io::IOException) [virtual]`

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if an error occurs while closing the **Transport** (p. 3066).

Reimplemented from **activemq::transport::TransportFilter** (p. 3075).

- 6.334.2.2** `long long ac-
tivemq::transport::inactivity::InactivityMonitor::getInitialDelayTime () const`
- 6.334.2.3** `long long ac-
tivemq::transport::inactivity::InactivityMonitor::getReadCheckTime () const`
- 6.334.2.4** `long long ac-
tivemq::transport::inactivity::InactivityMonitor::getWriteCheckTime () const`

tivemq::transport::inactivity::InactivityMonitor::isKeepAliveResponseRequired () const`
- 6.334.2.6** `virtual void ac-
tivemq::transport::inactivity::InactivityMonitor::onCommand (const
Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters

command - the received command object.

Reimplemented from `activemq::transport::TransportFilter` (p. 3077).

6.334.2.7 `virtual void activemq::transport::inactivity::InactivityMonitor::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3077).

6.334.2.8 `virtual void activemq::transport::inactivity::InactivityMonitor::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

ex The exception to handle.

Reimplemented from `activemq::transport::TransportFilter` (p. 3078).

- 6.334.2.9 `void activemq::transport::inactivity::InactivityMonitor::setInitialDelayTime (long long value) const`
- 6.334.2.10 `void activemq::transport::inactivity::InactivityMonitor::setKeepAliveResponseRequired (bool value)`
- 6.334.2.11 `void activemq::transport::inactivity::InactivityMonitor::setReadCheckTime (long long value)`
- 6.334.2.12 `void activemq::transport::inactivity::InactivityMonitor::setWriteCheckTime (long long value)`

6.334.3 Friends And Related Function Documentation

Constructor - Initializes the file name and line number where this message occurred.
- **IndexOutOfBoundsException** (const std::exception *cause) throw ()
Constructor.
- virtual **IndexOutOfBoundsException** * clone () const
Clones this exception.
- virtual ~**IndexOutOfBoundsException** () throw ()

6.335.1 Constructor & Destructor Documentation

6.335.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException () throw () [inline]

Default Constructor.

6.335.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.335.1.3 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.335.1.4 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.335.1.5 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException`
(`const char * file`, `const int lineNumber`, `const std::exception * cause`, `const char * msg`, ...) `throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.335.1.6 `decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException`
(`const std::exception * cause`) `throw ()` [inline]

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.335.1.7 `virtual`
`decaf::lang::exceptions::IndexOutOfBoundsException::~~IndexOutOfBoundsException`
() `throw ()` [inline, virtual]

6.335.2 Member Function Documentation

6.335.2.1 `virtual IndexOutOfBoundsException* decaf::lang::exceptions::IndexOutOfBoundsException::clone` () `const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/IndexOutOfBoundsException.h`

6.336 decaf::io::InputStream Class Reference

Base interface for an input stream.

```
#include <src/main/decaf/io/InputStream.h>
```

Inheritance diagram for decaf::io::InputStream:

Public Member Functions

- virtual **~InputStream** ()
- virtual void **mark** (int readLimit)=0
Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** ()=0 throw (IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const =0
Determines if this input stream supports the mark and reset methods.
- virtual std::size_t **available** () const =0 throw (IOException)
Indicates the number of bytes available.
- virtual int **read** ()=0 throw (IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize)=0 throw (IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual std::size_t **skip** (std::size_t num)=0 throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.

6.336.1 Detailed Description

Base interface for an input stream.

6.336.2 Constructor & Destructor Documentation

6.336.2.1 `virtual decaf::io::InputStream::~~InputStream () [inline, virtual]`

6.336.3 Member Function Documentation

6.336.3.1 `virtual std::size_t decaf::io::InputStream::available () const throw (IOException) [pure virtual]`

Indicates the number of bytes available.

Returns

the number of bytes available on this input stream.

Exceptions

IOException (p. 1707) if an error occurs.

Implemented in `decaf::internal::io::StandardInputStream` (p. 2820), `decaf::io::BlockingByteArrayInputStream` (p. 668), `decaf::io::BufferedInputStream` (p. 749), `decaf::io::ByteArrayInputStream` (p. 830), `decaf::io::FilterInputStream` (p. 1530), and `decaf::net::SocketInputStream` (p. 2798).

6.336.3.2 `virtual void decaf::io::InputStream::mark (int readLimit) [pure virtual]`

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters

readLimit - max bytes read before marked position is invalid.

Implemented in `decaf::internal::io::StandardInputStream` (p. 2820), `decaf::io::BlockingByteArrayInputStream` (p. 669), `decaf::io::BufferedInputStream` (p. 750), `decaf::io::ByteArrayInputStream` (p. 831), `decaf::io::FilterInputStream` (p. 1531), and `decaf::net::SocketInputStream` (p. 2799).

6.336.3.3 `virtual bool decaf::io::InputStream::markSupported () const [pure virtual]`

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns

true if this stream instance supports marks

Implemented in `decaf::internal::io::StandardInputStream` (p. 2821), `decaf::io::BlockingByteArrayInputStream` (p. 669), `decaf::io::BufferedInputStream` (p. 750), `decaf::io::ByteArrayInputStream` (p. 831), `decaf::io::FilterInputStream` (p. 1531), and `decaf::net::SocketInputStream` (p. 2799).

6.336.3.4 `virtual int decaf::io::InputStream::read () throw (IOException)` [pure virtual]

Reads a single byte from the buffer.

The value byte is returned as an int in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown.

Returns

The next byte or -1 if the end of stream is reached.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implemented in `activemq::io::LoggingInputStream` (p. 1918), `decaf::internal::io::StandardInputStream` (p. 2821), `decaf::io::BlockingByteArrayInputStream` (p. 670), `decaf::io::BufferedInputStream` (p. 751), `decaf::io::ByteArrayInputStream` (p. 832), `decaf::io::DataInputStream` (p. 1293), `decaf::io::FilterInputStream` (p. 1532), and `decaf::net::SocketInputStream` (p. 2800).

6.336.3.5 `virtual int decaf::io::InputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (IOException, lang::exceptions::NullPointerException)` [pure virtual]

Reads an array of bytes from the buffer.

Blocks until the requested number of bytes are available.

Parameters

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException (p. 1707) thrown if an error occurs.

NullPointerException if buffer is null

Implemented in `activemq::io::LoggingInputStream` (p. 1918), `decaf::internal::io::StandardInputStream` (p. 2822), `decaf::io::BlockingByteArrayInputStream` (p. 670), `decaf::io::BufferedInputStream` (p. 750), `decaf::io::ByteArrayInputStream` (p. 832), `decaf::io::DataInputStream` (p. 1294), `decaf::io::FilterInputStream` (p. 1533), and `decaf::net::SocketInputStream` (p. 2800).

6.336.3.6 `virtual void decaf::io::InputStream::reset () throw (IOException)` [pure virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method `markSupported` returns true, then: * If the method `mark` has not been called since the stream was created, or the number of bytes read from the stream since `mark` was last called is larger than the argument to `mark` at that last call, then an **IOException** (p. 1707) might be thrown. * If such an **IOException** (p. 1707) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to `mark` (or since the start of the file, if `mark` has not been called) will be resupplied to subsequent callers of the `read` method, followed by any bytes that otherwise would have been the next input data as of the time of the call to `reset`. If the method `markSupported` returns false, then: * The call to `reset` may throw an **IOException** (p. 1707). * If an **IOException** (p. 1707) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the `read` method depend on the particular type of the input stream.

Exceptions

IOException (p. 1707)

Implemented in `decaf::internal::io::StandardInputStream` (p. 2822), `decaf::io::BlockingByteArrayInputStream` (p. 671), `decaf::io::BufferedInputStream` (p. 751), `decaf::io::ByteArrayInputStream` (p. 833), `decaf::io::FilterInputStream` (p. 1533), and `decaf::net::SocketInputStream` (p. 2801).

6.336.3.7 `virtual std::size_t decaf::io::InputStream::skip (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)` [pure virtual]

Skips over and discards `n` bytes of data from this input stream.

The `skip` method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before `n` bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If `n` is negative, no bytes are skipped.

The `skip` method of **InputStream** (p. 1630) creates a byte array and then repeatedly reads into it until `n` bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num - the number of bytes to skip

Returns

total bytes skipped

Exceptions

IOException (p. 1707) if an error occurs

Implemented in `decaf::internal::io::StandardInputStream` (p. 2823), `decaf::io::BlockingByteArrayInputStream` (p. 671), `decaf::io::BufferedInputStream`

(p. 751), `decaf::io::ByteArrayInputStream` (p. 833), `decaf::io::DataInputStream` (p. 1300), `decaf::io::FilterInputStream` (p. 1534), and `decaf::net::SocketInputStream` (p. 2801).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/InputStream.h`

6.337 decaf::internal::nio::IntArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/IntArrayBuffer.h>
```

Inheritance diagram for `decaf::internal::nio::IntArrayBuffer`:

Public Member Functions

- **IntArrayBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **IntArrayBuffer** (p. 1634) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **IntArrayBuffer** (int *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **IntArrayBuffer** (p. 1634) object that wraps the given array.*
- **IntArrayBuffer** (ByteArrayPerspective &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.*
- **IntArrayBuffer** (const IntArrayBuffer &other)
*Create a **IntArrayBuffer** (p. 1634) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.*
- virtual ~**IntArrayBuffer** ()
- virtual int * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the int array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual IntBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only int buffer that shares this buffer's content.
- virtual IntBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.

- virtual `IntBuffer * duplicate ()`
Creates a new int buffer that shares this buffer's content.
- virtual `int get () throw (decaf::nio::BufferUnderflowException)`
Relative get method.
- virtual `int get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)`
Absolute get method.
- virtual `bool hasArray () const`
Tells whether or not this buffer is backed by an accessible int array.
- virtual `bool isReadOnly () const`
Tells whether or not this buffer is read-only.
- virtual `IntBuffer & put (int value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)`
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual `IntBuffer & put (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)`
Writes the given doubles into this buffer at the given index.
- virtual `IntBuffer * slice () const`
Creates a new IntBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual `void setReadOnly (bool value)`
*Sets this **ByteArrayBuffer** (p. 806) as Read-Only.*

6.337.1 Constructor & Destructor Documentation

6.337.1.1 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (std::size_t capacity, bool readOnly = false)`

Creates a **IntArrayBuffer** (p. 1634) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.337.1.2 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * array,
std::size_t offset, std::size_t capacity, bool readOnly = false)
throw (decaf::lang::exceptions::NullPointerException)`

Creates a **IntArrayBuffer** (p. 1634) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.337.1.3 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (
ByteArrayPerspective & array, std::size_t offset,
std::size_t capacity, bool readOnly = false) throw (
decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.

The capacity and limit of the new **IntArrayBuffer** (p. 1634) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p. 843) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.337.1.4 `decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const
IntArrayBuffer & other)`

Create a **IntArrayBuffer** (p. 1634) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.

Parameters

other - the **IntArrayBuffer** (p. 1634) this one is to mirror.

6.337.1.5 `virtual decaf::internal::nio::IntArrayBuffer::~~IntArrayBuffer ()`
[virtual]

6.337.2 Member Function Documentation

6.337.2.1 `virtual int* decaf::internal::nio::IntArrayBuffer::array ()`
`throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::IntBuffer` (p. 1644).

6.337.2.2 `virtual std::size_t decaf::internal::nio::IntArrayBuffer::arrayOffset (`
`) throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::IntBuffer` (p. 1645).

6.337.2.3 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer`
`() const` [virtual]

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow

the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1645).

6.337.2.4 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this IntBuffer

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1645).

6.337.2.5 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate () [virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int Buffer which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1646).

6.337.2.6 `virtual int decaf::internal::nio::IntArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements `decaf::nio::IntBuffer` (p. 1648).

6.337.2.7 `virtual int decaf::internal::nio::IntArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the Buffer where the int is to be read

Returns

the int that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements `decaf::nio::IntBuffer` (p. 1647).

6.337.2.8 `virtual bool decaf::internal::nio::IntArrayBuffer::hasArray () const [inline, virtual]`

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements `decaf::nio::IntBuffer` (p. 1648).

6.337.2.9 `virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly () const [inline, virtual]`

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.337.2.10 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put
(std::size_t index, int value) throw (
lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1649).

6.337.2.11 `virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put
(int value) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::IntBuffer** (p. 1649).

6.337.2.12 `virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool
value) [inline, protected, virtual]`

Sets this **ByteArrayBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.337.2.13 `virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice () const` [virtual]

Creates a new `IntBuffer` whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create `IntBuffer` which the caller owns.

Implements `decaf::nio::IntBuffer` (p. 1651).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/IntArrayBuffer.h`

6.338 `decaf::nio::IntBuffer` Class Reference

This class defines four categories of operations upon int buffers:

```
#include <src/main/decaf/nio/IntBuffer.h>
```

Inheritance diagram for `decaf::nio::IntBuffer`:

Public Member Functions

- `virtual ~IntBuffer ()`
- `virtual std::string toString () const`
- `virtual int * array ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the int array that backs this buffer (optional operation).
- `virtual std::size_t arrayOffset ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- `virtual IntBuffer * asReadOnlyBuffer () const =0`
Creates a new, read-only int buffer that shares this buffer's content.
- `virtual IntBuffer & compact ()=0 throw (ReadOnlyBufferException)`
Compacts this buffer.
- `virtual IntBuffer * duplicate ()=0`

Creates a new int buffer that shares this buffer's content.

- virtual int **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual int **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **IntBuffer** & **get** (std::vector< int > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **IntBuffer** & **get** (int *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible int array.
- **IntBuffer** & **put** (**IntBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the ints remaining in the given source buffer into this buffer.
- **IntBuffer** & **put** (const int *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers ints into this buffer from the given source array.
- **IntBuffer** & **put** (std::vector< int > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source ints array into this buffer.
- virtual **IntBuffer** & **put** (int value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given ints into this buffer at the current position, and then increments the position.
- virtual **IntBuffer** & **put** (std::size_t index, int value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given ints into this buffer at the given index.
- virtual **IntBuffer** * **slice** () const =0
*Creates a new **IntBuffer** (p. 1641) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **IntBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **IntBuffer** &value) const
- virtual bool **operator==** (const **IntBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **IntBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **IntBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **IntBuffer** * **wrap** (int *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **IntBuffer** (p. 1641).*

*Wraps the passed STL int Vector in a **IntBuffer** (p. 1641).*

Protected Member Functions

- **IntBuffer** (std::size_t capacity)
*Creates a **IntBuffer** (p. 1641) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.338.1 Detailed Description

This class defines four categories of operations upon int buffers: o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.338.2 Constructor & Destructor Documentation

6.338.2.1 decaf::nio::IntBuffer::IntBuffer (std::size_t *capacity*) [protected]

Creates a **IntBuffer** (p. 1641) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size and limit of the **Buffer** (p. 741) in doubles

6.338.2.2 virtual decaf::nio::IntBuffer::~~IntBuffer () [inline, virtual]

6.338.3 Member Function Documentation

6.338.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (std::size_t *capacity*)
[static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Double buffer in ints

Returns

the **IntBuffer** (p. 1641) that was allocated, caller owns.

6.338.3.2 virtual int* decaf::nio::IntBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1637).

6.338.3.3 virtual std::size_t decaf::nio::IntBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1637).

6.338.3.4 `virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer () const`
[pure virtual]

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1638).

6.338.3.5 `virtual IntBuffer& decaf::nio::IntBuffer::compact () throw (`
`ReadOnlyBufferException)` [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **IntBuffer** (p. 1641)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1638).

6.338.3.6 `virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & value)`
`const` [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.338.3.7 virtual IntBuffer* decaf::nio::IntBuffer::duplicate () [pure virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1638).

6.338.3.8 virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & value) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.338.3.9 IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > buffer) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length ints remaining in this buffer

6.338.3.10 `virtual int decaf::nio::IntBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the int is to be read

Returns

the int that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1639).

6.338.3.11 `IntBuffer& decaf::nio::IntBuffer::get (int * buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)`

Relative bulk get method.

This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies `length` ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer - pointer to an allocated buffer to fill

offset - position in the buffer to start filling

length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than `length` ints remaining in this buffer

NullPointerException if the passed buffer is null.

6.338.3.12 `virtual int decaf::nio::IntBuffer::get () throw (BufferUnderflowException)` [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1639).

6.338.3.13 virtual bool decaf::nio::IntBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1639).

6.338.3.14 virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & value) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.338.3.15 virtual bool decaf::nio::IntBuffer::operator== (const IntBuffer & value) const [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.338.3.16 `virtual IntBuffer& decaf::nio::IntBuffer::put (int value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes the given ints into this buffer at the current position, and then increments the position.

Parameters

value - the ints value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1640).

6.338.3.17 `virtual IntBuffer& decaf::nio::IntBuffer::put (std::size_t index, int value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes the given ints into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the ints to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::IntArrayBuffer` (p. 1640).

6.338.3.18 `IntBuffer& decaf::nio::IntBuffer::put (const int * buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)`

This method transfers ints into this buffer from the given source array.

If there are more ints to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no ints are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array into this buffer, starting at the given `offset` in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer- The array from which ints are to be read
offset- The offset within the array of the first int to be read;
length - The number of ints to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer
ReadOnlyBufferException (p. 2520) - If this buffer is read-only
NullPointerException if the passed buffer is null.

6.338.3.19 IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)

This method transfers the entire content of the given source ints array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size())

Parameters

buffer - The buffer whose contents are copied to this **IntBuffer** (p. 1641)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer
ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.338.3.20 IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & *src*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)

This method transfers the ints remaining in the given source buffer into this buffer.

If there are more ints remaining in the source buffer than in this buffer, that is, if src.remaining() > remaining() (p. 746), then no ints are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies n = src.remaining() ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src - the buffer to take ints from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining ints in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.338.3.21 virtual IntBuffer* decaf::nio::IntBuffer::slice () const [pure virtual]

Creates a new **IntBuffer** (p. 1641) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **IntBuffer** (p. 1641) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1641).

6.338.3.22 virtual std::string decaf::nio::IntBuffer::toString () const [virtual]**Returns**

a std::string describing this object

6.338.3.23 static IntBuffer* decaf::nio::IntBuffer::wrap (int * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **IntBuffer** (p. 1641).

The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **IntBuffer** (p. 1641) that is backed by buffer, caller owns.

6.338.3.24 static **IntBuffer*** decaf::nio::IntBuffer::wrap (**std::vector< int > &buffer**) [static]

Wraps the passed STL int Vector in a **IntBuffer** (p. 1641).

The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be `buffer.size()`, its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling `vector.resize(N)`.

Returns

a new **IntBuffer** (p. 1641) that is backed by `buffer`, caller owns.

The documentation for this class was generated from the following file:

- `src/main/decaf/nio/IntBuffer.h`

6.339 decaf::lang::Integer Class Reference

```
#include <src/main/decaf/lang/Integer.h>
```

Inheritance diagram for `decaf::lang::Integer`:

Public Member Functions

- **Integer** (int value)
- **Integer** (const **std::string** &value) throw (**exceptions::NumberFormatException**)

*Decodes a String into a **Integer** (p. 1652).*
- static int **reverseBytes** (int value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.
- static int **reverse** (int value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.
- static int **parseInt** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed int in the radix specified by the second argument.
- static int **parseInt** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal int.
- static **Integer valueOf** (int value)
*Returns a **Integer** (p. 1652) instance representing the specified int value.*

- static **Integer** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1652) object holding the value given by the specified std::string.*
- static **Integer** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Integer** (p. 1652) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*
- static int **bitCount** (int value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static std::string **toString** (int value)
Converts the int to a String representation.
- static std::string **toString** (int value, int radix)
Returns a string representation of the first argument in the radix specified by the second argument.
- static std::string **toHexString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 8.
- static std::string **toBinaryString** (int value)
Returns a string representation of the integer argument as an unsigned integer in base 2.
- static int **highestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static int **lowestOneBit** (int value)
Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (int value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.
- static int **numberOfTrailingZeros** (int value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.
- static int **rotateLeft** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.
- static int **rotateRight** (int value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

- static int **signum** (int value)
Returns the signum function of the specified int value.

Static Public Attributes

- static const int **SIZE** = 32
The size in bits of the primitive int type.
- static const int **MAX_VALUE** = (int)0x7FFFFFFF
The maximum value that the primitive type can hold.
- static const int **MIN_VALUE** = (int)0x80000000
The minimum value that the primitive type can hold.

6.339.1 Constructor & Destructor Documentation

6.339.1.1 decaf::lang::Integer::Integer (int value)

Parameters

value The primitive value to wrap in an Integer (p. 1652) instance.

6.339.1.2 decaf::lang::Integer::Integer (const std::string & value) throw (exceptions::NumberFormatException)

Parameters

value The base 10 encoded string to decode to an Integer (p. 1652) and wrap.

Exceptions

NumberFormatException

6.339.1.3 virtual decaf::lang::Integer::~~Integer () [inline, virtual]

6.339.2 Member Function Documentation

6.339.2.1 static int decaf::lang::Integer::bitCount (int value) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value - the int to count

Returns

the number of one-bits in the two's complement binary representation of the specified int value.

6.339.2.2 `virtual unsigned char decaf::lang::Integer::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.339.2.3 `virtual int decaf::lang::Integer::compareTo (const int & i) const [virtual]`

Compares this **Integer** (p.1652) instance with another.

Parameters

i - the **Integer** (p.1652) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable< int >** (p.1010).

6.339.2.4 `virtual int decaf::lang::Integer::compareTo (const Integer & i) const [virtual]`

Compares this **Integer** (p.1652) instance with another.

Parameters

i - the **Integer** (p.1652) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.339.2.5 `static Integer decaf::lang::Integer::decode (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Decodes a String into a **Integer** (p.1652).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the `Integer.parseInt` method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a `NumberFormatException` will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Integer** (p. 1652) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.339.2.6 `virtual double decaf::lang::Integer::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.339.2.7 `bool decaf::lang::Integer::equals (const Integer & i) const [inline]`

Parameters

i - the **Integer** (p. 1652) object to compare against.

Returns

true if the two **Integer** (p. 1652) Objects have the same value.

6.339.2.8 `bool decaf::lang::Integer::equals (const int & i) const [inline, virtual]`

Parameters

i - the **Integer** (p. 1652) object to compare against.

Returns

true if the two **Integer** (p. 1652) Objects have the same value.

Implements `decaf::lang::Comparable< int >` (p. 1010).

6.339.2.9 `virtual float decaf::lang::Integer::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.339.2.10 `static int decaf::lang::Integer::highestOneBit (int value) [static]`

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the int to be inspected

Returns

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.339.2.11 `virtual int decaf::lang::Integer::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.339.2.12 `virtual long long decaf::lang::Integer::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.339.2.13 `static int decaf::lang::Integer::lowestOneBit (int value) [static]`

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the int to be inspected

Returns

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.339.2.14 `static int decaf::lang::Integer::numberOfLeadingZeros (int value)`
[static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

$\ast \text{floor}(\log_2(x)) = 31 - \text{numberOfLeadingZeros}(x)$ $\ast \text{ceil}(\log_2(x)) = 32 - \text{numberOfLeadingZeros}(x - 1)$

Parameters

value - the int to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.339.2.15 `static int decaf::lang::Integer::numberOfTrailingZeros (int value)`
[static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value - the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.339.2.16 `virtual bool decaf::lang::Integer::operator< (const int & i) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **int** > (p.1011).

6.339.2.17 **virtual bool decaf::lang::Integer::operator< (const Integer & i) const**
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.339.2.18 **virtual bool decaf::lang::Integer::operator== (const Integer & i) const**
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.339.2.19 **virtual bool decaf::lang::Integer::operator== (const int & i) const**
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

i - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **int** > (p.1011).

6.339.2.20 `static int decaf::lang::Integer::parseInt (const std::string & s, int radix) throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed int in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 917) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs:

- * The first argument is null or is a string of length zero.
- * The radix is either smaller than **Character.MIN_RADIX** (p. 921) or larger than **Character.MAX_RADIX** (p. 921).
- * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1.
- * The value represented by the string is not a value of type int.

Parameters

s - the String containing the int representation to be parsed

radix - the radix to be used while parsing s

Returns

the int represented by the string argument in the specified radix.

Exceptions

NumberFormatException - If String does not contain a parsable int.

6.339.2.21 `static int decaf::lang::Integer::parseInt (const std::string & s) throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal int.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseInt(const std::string, int)` method.

Parameters

s - String to convert to a int

Returns

the converted int value

Exceptions

NumberFormatException if the string is not a int.

6.339.2.22 `static int decaf::lang::Integer::reverse (int value) [static]`

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters

value - the value whose bits are to be reversed

Returns

the reversed bits int.

6.339.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters

value - the int whose bytes we are to reverse

Returns

the reversed int.

6.339.2.24 static int decaf::lang::Integer::rotateLeft (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value - the int to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.339.2.25 static int decaf::lang::Integer::rotateRight (int *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters

value - the int to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.339.2.26 `virtual short decaf::lang::Integer::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.339.2.27 `static int decaf::lang::Integer::signum (int value) [static]`

Returns the signum function of the specified int value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value - the int to be inspected

Returns

the signum function of the specified int value.

6.339.2.28 `static std::string decaf::lang::Integer::toBinaryString (int value) [static]`

Returns a string representation of the integer argument as an unsigned integer in base 2.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters

value - the int to be translated to a binary string

Returns

the unsigned int value as a binary string

6.339.2.29 `static std::string decaf::lang::Integer::toHexString (int value)`
 [static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the `toUpperCase()` method may be called on the result:

Parameters

value - the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.339.2.30 `static std::string decaf::lang::Integer::toOctalString (int value)`
 [static]

Returns a string representation of the integer argument as an unsigned integer in base 8.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters

value - the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.339.2.31 `std::string decaf::lang::Integer::toString () const`**Returns**

this Integer (p. 1652) Object as a String Representation

6.339.2.32 `static std::string decaf::lang::Integer::toString (int value, int radix)`
 [static]

Returns a string representation of the first argument in the radix specified by the second argument.

If the radix is smaller than **Character.MIN_RADIX** (p.921) or larger than **Character.MAX_RADIX** (p.921), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters

value - the int to convert to a string
radix - the radix to format the string in

Returns

an int formatted to the string value of the radix given.

6.339.2.33 static std::string decaf::lang::Integer::toString (int *value*) [static]

Converts the int to a String representation.

Parameters

value The int to convert to a std::string instance.

Returns

string representation

6.339.2.34 static Integer decaf::lang::Integer::valueOf (const std::string & *value*, int *radix*) throw (exceptions::NumberFormatException) [static]

Returns a **Integer** (p.1652) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the parseInt(std::string, int) method. The result is a **Integer** (p.1652) object that represents the int value specified by the string.

Parameters

value - std::string to parse as base (radix)
radix - base of the string to parse.

Returns

new **Integer** (p.1652) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid int.

6.339.2.35 `static Integer decaf::lang::Integer::valueOf (int value) [inline, static]`

Returns a **Integer** (p.1652) instance representing the specified int value.

Parameters

value - the int to wrap

Returns

the new **Integer** (p.1652) object wrapping value.

6.339.2.36 `static Integer decaf::lang::Integer::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Integer** (p.1652) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the `parseInt(std::string)` method. The result is a **Integer** (p.1652) object that represents the int value specified by the string.

Parameters

value - std::string to parse as base 10

Returns

new **Integer** (p.1652) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal int.

6.339.3 Field Documentation

6.339.3.1 `const int decaf::lang::Integer::MAX_VALUE = (int)0x7FFFFFFF [static]`

The maximum value that the primitive type can hold.

6.339.3.2 `const int decaf::lang::Integer::MIN_VALUE = (int)0x80000000 [static]`

The minimum value that the primitive type can hold.

6.339.3.3 `const int decaf::lang::Integer::SIZE = 32 [static]`

The size in bits of the primitive int type.

6.340.1 Constructor & Destructor Documentation

6.340.1.1 `activemq::commands::IntegerResponse::IntegerResponse (const IntegerResponse &) [inline, protected]`

6.340.1.2 `activemq::commands::IntegerResponse::IntegerResponse ()`

6.340.1.3 `virtual activemq::commands::IntegerResponse::~~IntegerResponse () [virtual]`

6.340.2 Member Function Documentation

6.340.2.1 `virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::Response` (p.2612).

6.340.2.2 `virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::Response` (p.2612).

6.340.2.3 `virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p.1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::Response` (p.2613).

6.340.2.4 `virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Reimplemented from **activemq::commands::Response** (p. 2613).

6.340.2.5 `virtual int activemq::commands::IntegerResponse::getResult () const`
[virtual]

6.340.2.6 `IntegerResponse& activemq::commands::IntegerResponse::operator= (`

Write a object instance to data output stream.

6.341.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p.1669). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.341.2 Constructor & Destructor Documentation

6.341.2.1 `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::IntegerResponseMarshaller() [inline]`

6.341.2.2 `virtual activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::~~IntegerResponseMarshaller() [inline, virtual]`

6.341.3 Member Function Documentation

6.341.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.341.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.341.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2621).

6.341.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

6.341.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2622).

6.341.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

6.341.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::ResponseMarshaller` (p. 2623).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/IntegerResponseMarshaller.h`

6.342 `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` Class Reference

6.342.2.2 `virtual activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::~~IntegerResponseMarshaller() [inline, virtual]`

6.342.3 Member Function Documentation

6.342.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2634).

6.342.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaller.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2635).

6.342.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2635).

6.342.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2635).

6.342.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::ResponseMarshaller** (p. 2636).

6.342.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2636).

6.342.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller` (p. 2637).

6.343.3 Member Function Documentation

6.343.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2625).

6.343.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.343.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.343.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2626).

6.343.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

6.343.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2627).

6.343.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::ResponseMarshaller` (p. 2628).

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2640).

6.344.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller** (p. 2640).

6.344.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

6.344.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::ResponseMarshaller` (p. 2641).

6.345.2.1 `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::IntegerResponseMarshaller() [inline]`

6.345.2.2 `virtual activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::~~IntegerResponseMarshaller() [inline, virtual]`

6.345.3 Member Function Documentation

6.345.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::createObject() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.345.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaller.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::ResponseMarshaller` (p. 2630).

6.345.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2630).

6.345.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2631).

6.345.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2631).

```

6.345.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightMarshal2
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2632).

```

6.345.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller::tightUnmarshal
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::ResponseMarshaller** (p. 2632).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**IntegerResponseMarshaller.h**

6.346 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 2227).

```
#include <src/main/activemq/transport/mock/InternalCommandListener.h>
```

Inheritance diagram for `activemq::transport::mock::InternalCommandListener`:

Public Member Functions

- **InternalCommandListener** ()
- virtual **~InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (const **Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual void **onCommand** (const **Pointer**< **Command** > &command)

Event handler for the receipt of a command.

- void **run** ()

6.346.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 2227). This class processes all outbound commands and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 2614) and getting a set of Commands to send back into the **MockTransport** (p. 2227) as incoming Commands and Responses.

6.346.2 Constructor & Destructor Documentation

6.346.2.1 `activemq::transport::mock::InternalCommandListener::InternalCommandListener ()`

6.346.2.2 `virtual
activemq::transport::mock::InternalCommandListener::~~InternalCommandListener
() [virtual]`

6.346.3 Member Function Documentation

6.346.3.1 `virtual void ac-
tivemq::transport::mock::InternalCommandListener::onCommand (
const Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3066) deletes the command upon receipt.

Parameters

command the received command object.

Implements **activemq::transport::TransportListener** (p. 3081).

6.346.3.2 void activemq::transport::mock::InternalCommandListener::run ()

6.346.3.3 void activemq::transport::mock::InternalCommandListener::setResponseBuilder (const Pointer< ResponseBuilder > & *responseBuilder*) [inline]

6.346.3.4 void activemq::transport::mock::InternalCommandListener::setTransport (MockTransport * *transport*) [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**InternalCommandListener.h**

6.347 decaf::lang::exceptions::InterruptedException Class Reference

```
#include <src/main/decaf/lang/exceptions/InterruptedException.h>
```

Inheritance diagram for decaf::lang::exceptions::InterruptedException:

Public Member Functions

- **InterruptedException** () throw ()
Default Constructor.
- **InterruptedException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1476).*
- **InterruptedException** (const **InterruptedException** &ex) throw ()
Copy Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const std::exception ***cause**, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (const std::exception ***cause**) throw ()
Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **InterruptedException** * **clone** () const
Clones this exception.
- virtual ~**InterruptedException** () throw ()

6.347.1 Constructor & Destructor Documentation

6.347.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException () throw () [inline]

Default Constructor.

6.347.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.347.1.3 decaf::lang::exceptions::InterruptedException::InterruptedException (const InterruptedException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.347.1.4 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.347.1.5 decaf::lang::exceptions::InterruptedException::InterruptedException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.347.1.6 `decaf::lang::exceptions::InterruptedException::InterruptedException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.347.1.7 `virtual decaf::lang::exceptions::InterruptedException::~~InterruptedException () throw () [inline, virtual]`

6.347.2 Member Function Documentation

6.347.2.1 `virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/InterruptedException.h`

6.348 decaf::io::InterruptedException Class Reference

```
#include <src/main/decaf/io/InterruptedException.h>
```

Inheritance diagram for `decaf::io::InterruptedException`:

Default Constructor.

- **InterruptedException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **InterruptedException** (const InterruptedException &ex) throw ()
Copy Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (const std::exception *cause) throw ()
Constructor.
- **InterruptedException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **InterruptedException * clone** () const
Clones this exception.
- virtual **~InterruptedException** () throw ()

6.348.1 Constructor & Destructor Documentation

6.348.1.1 decaf::io::InterruptedException::InterruptedException () throw () [inline]

Default Constructor.

6.348.1.2 decaf::io::InterruptedException::InterruptedException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.348.1.3 decaf::io::InterruptedException::InterruptedException (const InterruptedException & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.348.1.4 `decaf::io::InterruptedIOException::InterruptedIOException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.348.1.5 `decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.348.1.6 `decaf::io::InterruptedIOException::InterruptedIOException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.348.1.7 `virtual decaf::io::InterruptedIOException::~~InterruptedIOException () throw () [inline, virtual]`

6.348.2 Member Function Documentation

6.348.2.1 `virtual InterruptedIOException* decaf::io::InterruptedIOException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1709).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 2811).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InterruptedIOException.h**

6.349 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

```
#include <src/main/cms/InvalidClientIdException.h>
```

Inheritance diagram for cms::InvalidClientIdException:

Public Member Functions

Constructor.
- **InvalidKeyException** (const char *file, const int lineNumber, const char *msg,...) throw
()
Constructor - Initializes the file name and line number where this message occurred.

- virtual **InvalidKeyException** * **clone** () const
Clones this exception.
- virtual ~**InvalidKeyException** () throw ()

6.351.1 Constructor & Destructor Documentation

6.351.1.1 decaf::security::InvalidKeyException::InvalidKeyException () throw () [inline]

Default Constructor.

6.351.1.2 decaf::security::InvalidKeyException::InvalidKeyException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.351.1.3 decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.351.1.4 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.351.1.5 `decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.351.1.6 `decaf::security::InvalidKeyException::InvalidKeyException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.351.1.7 `virtual decaf::security::InvalidKeyException::~~InvalidKeyException () throw () [inline, virtual]`

6.351.2 Member Function Documentation

6.351.2.1 `virtual InvalidKeyException* decaf::security::InvalidKeyException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::KeyException` (p. 1839).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/InvalidKeyException.h`

6.352 decaf::nio::InvalidMarkException Class Reference

```
#include <src/main/decaf/nio/InvalidMarkException.h>

Clones this exception.
- virtual ~**InvalidStateException** () throw ()

6.354.1 Constructor & Destructor Documentation

6.354.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException () throw () [inline]

Default Constructor.

6.354.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.354.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.354.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.354.1.5 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

***cause* Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.354.1.6 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.354.1.7 virtual decaf::lang::exceptions::InvalidStateException::~~InvalidStateException () throw () [inline, virtual]

6.354.2 Member Function Documentation

6.354.2.1 virtual InvalidStateException* decaf::lang::exceptions::InvalidStateException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

6.355.1 Constructor & Destructor Documentation

6.355.1.1 decaf::io::IOException::IOException () throw () [inline]

Default Constructor.

6.355.1.2 decaf::io::IOException::IOException (const lang::Exception & ex) throw () [inline]

Copy Constructor.

Parameters

ex the exception to copy

6.355.1.3 `decaf::io::IOException::IOException (const IOException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.355.1.4 `decaf::io::IOException::IOException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.355.1.5 `decaf::io::IOException::IOException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.355.1.6 `decaf::io::IOException::IOException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.355.1.7 `virtual decaf::io::IOException::~~IOException () throw () [inline, virtual]`

6.355.2 Member Function Documentation

6.355.2.1 `virtual IOException* decaf::io::IOException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this instance.

Reimplemented from `decaf::lang::Exception` (p. 1479).

Reimplemented in `decaf::io::EOFException` (p. 1476), `decaf::io::InterruptedIOException` (p. 1695), `decaf::io::UnsupportedEncodingException` (p. 3092), `decaf::io::UTFDataFormatException` (p. 3141), `decaf::net::BindException` (p. 665), `decaf::net::ConnectException` (p. 1051), `decaf::net::HttpRetryException` (p. 1613), `decaf::net::MalformedURLException` (p. 1970), `decaf::net::NoRouteToHostException` (p. 2271), `decaf::net::PortUnreachableException` (p. 2370), `decaf::net::ProtocolException` (p. 2506), `decaf::net::SocketException` (p. 2794), `decaf::net::SocketTimeoutException` (p. 2811), `decaf::net::UnknownHostException` (p. 3087), and `decaf::net::UnknownServiceException` (p. 3089).

6.356 activemq::transport::IOTransport Class Reference

Implementation of the **Transport** (p. 3066) interface that performs marshaling of commands to IO streams.

```
#include <src/main/activemq/transport/IOTransport.h>
```

Inheritance diagram for `activemq::transport::IOTransport`:

Public Member Functions

- **IOTransport** ()
Default Constructor.
- **IOTransport** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
*Create an instance of this **Transport** (p. 3066) and assign its **WireFormat** instance at creation time.*
- virtual **~IOTransport** ()

- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Not supported by this class - throws an exception.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Not supported by this class - throws an exception.
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
Sets the WireFormat instance to use.
- virtual void **setTransportListener** (**TransportListener** *listener)
Sets the observer of asynchronous exceptions from this transport.
- virtual **TransportListener** * **getTransportListener** () const
Gets the observer of asynchronous exceptions from this transport.
- virtual void **setInputStream** (decaf::io::DataInputStream *is)
Sets the input stream for in-coming commands.
- virtual void **setOutputStream** (decaf::io::DataOutputStream *os)
Sets the output stream for out-going commands.
- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **stop** () throw (decaf::io::IOException)
*Stops the **Transport** (p. 3066), terminating any threads and stopping all read and write operations.*
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual void **run** ()
Runs the polling thread.
- virtual **Transport** * **narrow** (const std::type_info &typeId)
*Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () const
*Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const

Is the **Transport** (p. 3066) Connected to its Broker.

- virtual bool **isClosed** () const

Has the **Transport** (p. 3066) been shutdown and no longer usable.

- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri AMQCPP_UNUSED) throw (**decaf::io::IOException**)
reconnect to another location

6.356.1 Detailed Description

Implementation of the **Transport** (p. 3066) interface that performs marshaling of commands to IO streams. This class does not implement the request method, it only handles oneway messages. A thread polls on the input stream for in-coming commands. When a command is received, the command listener is notified. The polling thread is not started until the start method is called. The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.356.2 Constructor & Destructor Documentation

6.356.2.1 **activemq::transport::IOTransport::IOTransport** ()

Default Constructor.

6.356.2.2 **activemq::transport::IOTransport::IOTransport** (const **Pointer**< **wireformat::WireFormat** > & *wireFormat*)

Create an instance of this **Transport** (p. 3066) and assign its **WireFormat** instance at creation time.

Parameters

wireFormat Data encoder / decoder to use when reading and writing.

6.356.2.3 **virtual activemq::transport::IOTransport::~~IOTransport** () [virtual]

6.356.3 Member Function Documentation

6.356.3.1 **virtual void activemq::transport::IOTransport::close** () throw (**decaf::io::IOException**) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

6.356.3.2 `virtual std::string activemq::transport::IOTransport::getRemoteAddress () const [inline, virtual]`

Returns

the remote address for this connection

6.356.3.3 `virtual TransportListener* activemq::transport::IOTransport::getTransportListener () const [inline, virtual]`

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

6.356.3.4 `virtual bool activemq::transport::IOTransport::isClosed () const [inline, virtual]`

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

6.356.3.5 `virtual bool activemq::transport::IOTransport::isConnected () const [inline, virtual]`

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

6.356.3.6 `virtual bool activemq::transport::IOTransport::isFaultTolerant () const [inline, virtual]`

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

6.356.3.7 `virtual Transport* activemq::transport::IOTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

6.356.3.8 `virtual void activemq::transport::IOTransport::oneway (const
Pointer< Command > & command) throw (decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

6.356.3.9 `virtual void activemq::transport::IOTransport::reconnect (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.356.3.10 `virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command to be sent.

Returns

the response to the command sent.

Exceptions

UnsupportedOperationException.

6.356.3.11 `virtual Pointer<Response> activemq::transport::IOTransport::request
 (const Pointer< Command > & command, unsigned
 int timeout) throw (decaf::io::IOException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command to be sent.

timeout the time to wait for a response.

Returns

the response to the command sent.

Exceptions

UnsupportedOperationException.

6.356.3.12 `virtual void activemq::transport::IOTransport::run () [virtual]`

Runs the polling thread.

Implements **decaf::lang::Runnable** (p. 2642).

6.356.3.13 `virtual void activemq::transport::IOTransport::setInputStream (
 decaf::io::DataInputStream * is) [inline, virtual]`

Sets the input stream for in-coming commands.

Parameters

is The input stream.

6.356.3.14 `virtual void activemq::transport::IOTransport::setOutputStream (
 decaf::io::DataOutputStream * os) [inline, virtual]`

Sets the output stream for out-going commands.

Parameters

os The output stream.

6.356.3.15 `virtual void activemq::transport::IOTransport::setTransportListener (
 TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

6.356.3.16 `virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.356.3.17 `virtual void activemq::transport::IOTransport::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

CMSEException if an error occurs or if this transport has already been closed.

6.356.3.18 `virtual void activemq::transport::IOTransport::stop () throw (decaf::io::IOException) [virtual]`

Stops the **Transport** (p. 3066), terminating any threads and stopping all read and write operations.

Exceptions

IOException if an error occurs while stopping the **Transport** (p. 3066).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/IOTransport.h`

6.357 decaf::lang::Iterable< E > Class Template Reference

Implementing this interface allows an object to be cast to an **Iterable** (p. 1715) type for generic collections API calls.

```
#include <src/main/decaf/lang/Iterable.h>
```

Inheritance diagram for `decaf::lang::Iterable< E >`:

Public Member Functions

- `virtual ~Iterable ()`
- `virtual decaf::util::Iterator< E > * iterator ()=0`
- `virtual decaf::util::Iterator< E > * iterator () const =0`

6.357.1 Detailed Description

template<typename E> class decaf::lang::Iterable< E >

Implementing this interface allows an object to be cast to an **Iterable** (p. 1715) type for generic collections API calls.

6.357.2 Constructor & Destructor Documentation

6.357.2.1 **template<typename E> virtual decaf::lang::Iterable< E >::~~Iterable ()** [inline, virtual]

6.357.3 Member Function Documentation

6.357.3.1 **template<typename E> virtual decaf::util::Iterator<E>***
decaf::lang::Iterable< E >::iterator () [pure virtual]

Returns

an iterator over a set of elements of type T.

Referenced by decaf::util::AbstractCollection< Pointer< BackupTransport > >::clear(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::contains(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::copy(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::operator=(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::remove(), decaf::util::AbstractSet< ActiveMQSession * >::removeAll(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::removeAll(), decaf::util::AbstractCollection< Pointer< BackupTransport > >::retainAll(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::toArray().

6.357.3.2 **template<typename E> virtual decaf::util::Iterator<E>***
decaf::lang::Iterable< E >::iterator () const [pure virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/Iterable.h

6.358 decaf::util::Iterator< T > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

#include <src/main/decaf/util/Iterator.h>

Inheritance diagram for decaf::util::Iterator< T >:

Public Member Functions

- virtual ~Iterator ()

- virtual T **next** ()=0 throw (lang::exceptions::NoSuchElementException)
Returns the next element in the iteration.
- virtual bool **hasNext** () const =0
Returns true if the iteration has more elements.
- virtual void **remove** ()=0 throw (lang::exceptions::IllegalStateException, lang::exceptions::UnsupportedOperationException)
Removes from the underlying collection the last element returned by the iterator (optional operation).

6.358.1 Detailed Description

template<typename T> class decaf::util::Iterator< T >

Defines an object that can be used to iterate over the elements of a collection. The iterator provides a way to access and remove elements with well defined semantics.

6.358.2 Constructor & Destructor Documentation

6.358.2.1 **template<typename T> virtual decaf::util::Iterator< T >::~~Iterator ()**
[inline, virtual]

6.358.3 Member Function Documentation

6.358.3.1 **template<typename T> virtual bool decaf::util::Iterator< T >::hasNext () const** [pure virtual]

Returns true if the iteration has more elements.

Returns false if the next call to next would result in an NoSuchElementException to be thrown.

6.358.3.2 **template<typename T> virtual T decaf::util::Iterator< T >::next ()**
throw (lang::exceptions::NoSuchElementException) [pure virtual]

Returns the next element in the iteration.

Calling this method repeatedly until the **hasNext()** (p.1717) method returns false will return each element in the underlying collection exactly once.

Returns

next element in the iteration of elements

Exceptions

NoSuchElementException - iteration has no more elements.

6.358.3.3 `template<typename T> virtual void decaf::util::Iterator< T
>::remove () throw (lang::exceptions::IllegalStateException,
lang::exceptions::UnsupportedOperationException) [pure virtual]`

Removes from the underlying collection the last element returned by the iterator (optional operation).

This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions

UnsupportedOperationException - if the remove operation is not supported by this **Iterator** (p. 1716).

IllegalStateException - if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Iterator.h`

6.359 activemq::commands::JournalQueueAck Class Reference

6.359.1 Constructor & Destructor Documentation

6.359.1.1 **activemq::commands::JournalQueueAck::JournalQueueAck** (const **JournalQueueAck** &) [inline, protected]

6.359.1.2 **activemq::commands::JournalQueueAck::JournalQueueAck** ()

6.359.1.3 **virtual activemq::commands::JournalQueueAck::~~JournalQueueAck** () [virtual]

6.359.2 Member Function Documentation

6.359.2.1 **virtual JournalQueueAck* activemq::commands::JournalQueueAck::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.359.2.2 `virtual void activemq::commands::JournalQueueAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

6.359.2.3 `virtual bool activemq::commands::JournalQueueAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

6.359.2.4 `virtual unsigned char activemq::commands::JournalQueueAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new `DataStructure` (p. 1372) type copy.

Implements `activemq::commands::DataStructure` (p. 1375).

- 6.359.2.5 `virtual Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination ()`

- 6.359.2.12 `virtual std::string activemq::commands::JournalQueueAck::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.662).

6.359.3 Field Documentation

Public Member Functions

- **JournalQueueAckMarshaller** ()
- virtual **~JournalQueueAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.360.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1722). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.360.2 Constructor & Destructor Documentation

6.360.2.1 `activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.360.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.360.3 Member Function Documentation

6.360.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.360.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.360.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.360.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::looseUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure** *
dataStructure, **decaf::io::DataInputStream** * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.360.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal1**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **utils::BooleanStream** * *bs*) throw (
decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.360.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.360.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.361.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p.1725). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.361.2 Constructor & Destructor Documentation

6.361.2.1 `activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.361.2.2 `virtual activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.361.3 Member Function Documentation

6.361.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.361.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.361.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.361.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.361.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.361.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.361.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/JournalQueueAckMarshaller.h`

6.362.2.1 `activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::JournalQueueAckMarshaller () [inline]`

6.362.2.2 `virtual activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::~~JournalQueueAckMarshaller () [inline, virtual]`

6.362.3 Member Function Documentation

6.362.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.362.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.362.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.362.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.362.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.362.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.362.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.363.3 Member Function Documentation

6.363.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.363.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.363.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.363.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.363.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.363.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.363.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::JournalQueueAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.364.3 Member Function Documentation

6.364.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.364.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.364.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.364.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.364.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.364.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.364.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.365.2 Member Function Documentation

- 6.365.2.1** `virtual JournalTopicAck* activemq::commands::JournalTopicAck::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

- 6.365.2.2** `virtual void activemq::commands::JournalTopicAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

- 6.365.2.3** `virtual bool activemq::commands::JournalTopicAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

6.365.2.4 `virtual const std::string& activemq::commands::JournalTopicAck::getClientId () const [virtual]`

6.365.2.5 `virtual std::string& activemq::commands::JournalTopicAck::getClientId () [virtual]`

6.365.2.6 `virtual unsigned char activemq::commands::JournalTopicAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSetructure** (p. 1372) type copy.

Implements **activemq::commands::DataSetructure** (p. 1375).

- 6.365.2.7 `virtual Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination ()` [virtual]
- 6.365.2.8 `virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination () const` [virtual]
- 6.365.2.9 `virtual const Pointer<MessageId>& activemq::commands::JournalTopicAck::getMessageId () const` [virtual]
- 6.365.2.10 `virtual Pointer<MessageId>& activemq::commands::JournalTopicAck::getMessageId ()` [virtual]
- 6.365.2.11 `virtual long long activemq::commands::JournalTopicAck::getMessageSequenceId () const` [virtual]
- 6.365.2.12 `virtual std::string& activemq::commands::JournalTopicAck::getSubscriptionName ()` [virtual]
- 6.365.2.13 `virtual const std::string& activemq::commands::JournalTopicAck::getSubscriptionName () const` [virtual]
- 6.365.2.14 `virtual const Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId () const` [virtual]
- 6.365.2.15 `virtual Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId ()` [virtual]
- 6.365.2.16 `JournalTopicAck& activemq::commands::JournalTopicAck::operator= (const JournalTopicAck &)` [inline, protected]
- 6.365.2.17 `virtual void activemq::commands::JournalTopicAck::setClientId (const std::string & clientId)` [virtual]
- 6.365.2.18 `virtual void activemq::commands::JournalTopicAck::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.365.2.19 `virtual void activemq::commands::JournalTopicAck::setMessageId (const Pointer< MessageId > & messageId)` [virtual]
- 6.365.2.20 `virtual void activemq::commands::JournalTopicAck::setMessageSequenceId (long long messageSequenceId)` [virtual]
- 6.365.2.21 `virtual void activemq::commands::JournalTopicAck::setSubscriptionName (const std::string & subscriptionName)` [virtual]
-
- 6.365.2.22 `virtual void activemq::commands::JournalTopicAck::setTransactionId (const Pointer< TransactionId > & transactionId)` [virtual]
- 6.365.2.23 `virtual std::string activemq::commands::JournalTopicAck::toString () const` [virtual]

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p. 662).

6.365.3 Field Documentation

- 6.365.3.1** `std::string activemq::commands::JournalTopicAck::clientId` [protected]
- 6.365.3.2** `Pointer<ActiveMQDestination> activemq::commands::JournalTopicAck::destination` [protected]

Marshaling code for Open Wire Format for `JournalTopicAckMarshaller` (p. 1746).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTopicAckMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller`:

Public Member Functions

- `JournalTopicAckMarshaller ()`
- `virtual ~JournalTopicAckMarshaller ()`
- `virtual commands::DataStructure * createObject () const`

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.366.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.1746). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.366.2 Constructor & Destructor Documentation

6.366.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::JournalTopicAckMarshaller () [inline]`

6.366.2.2 `virtual
activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller () [inline, virtual]`

6.366.3 Member Function Documentation

6.366.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.366.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.366.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.366.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.366.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.366.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.366.3.7 virtual void activemq::wireformat::openwire::marshal::v2::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.367.3 Member Function Documentation

6.367.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.367.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.367.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.367.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.367.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.367.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.367.3.7 virtual void ac-
 tivemq::wireformat::openwire::marshal::v1::JournalTopicAckMarshaller::tightUnmarshal
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, decaf::io::DataInputStream * *dataIn*,
 utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.368.3 Member Function Documentation

6.368.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.368.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.368.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.368.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.368.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.368.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.368.3.7 virtual void activemq::wireformat::openwire::marshal::v3::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller () [inline, virtual]`

6.369.3 Member Function Documentation

6.369.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.369.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.369.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.369.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.369.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.369.3.6 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.369.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::JournalTopicAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/JournalTopicAckMarshaller.h

6.370 activemq::wireformat::openwire::marshal::v5::JournalTopicAckMa Class Reference

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p. 1762).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/JournalTopicAckMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller**:

Public Member Functions

- **JournalTopicAckMarshaller** ()
- virtual **~JournalTopicAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.370.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p.1762). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.370.2 Constructor & Destructor Documentation

6.370.2.1 `activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::JournalTopicAckMarshaller()` [inline]

6.370.2.2 `virtual activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::~~JournalTopicAckMarshaller()` [inline, virtual]

6.370.3 Member Function Documentation

6.370.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.370.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.370.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.370.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.370.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.370.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.370.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::JournalTopicAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**JournalTopicAckMarshaller.h**

6.371 activemq::commands::JournalTrace Class Reference

```
#include <src/main/activemq/commands/JournalTrace.h>
```

Inheritance diagram for activemq::commands::JournalTrace:

Public Member Functions

- **JournalTrace** ()
- virtual **~JournalTrace** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **JournalTrace** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getMessage** () const
- virtual std::string & **getMessage** ()
- virtual void **setMessage** (const std::string &message)

Static Public Attributes

- static const unsigned char **ID_JOURNALTRACE** = 53

Protected Member Functions

- **JournalTrace** (const **JournalTrace** &)
- **JournalTrace** & **operator=** (const **JournalTrace** &)

Protected Attributes

- std::string **message**

6.371.1 Constructor & Destructor Documentation

- 6.371.1.1 **activemq::commands::JournalTrace::JournalTrace** (const **JournalTrace** &) [inline, protected]
- 6.371.1.2 **activemq::commands::JournalTrace::JournalTrace** ()
- 6.371.1.3 **virtual activemq::commands::JournalTrace::~~JournalTrace** () [virtual]

6.371.2 Member Function Documentation

- 6.371.2.1 **virtual JournalTrace* activemq::commands::JournalTrace::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.371.2.2 virtual void activemq::commands::JournalTrace::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1374).

6.371.2.3 virtual bool activemq::commands::JournalTrace::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1374).

6.371.2.4 virtual unsigned char activemq::commands::JournalTrace::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.371.2.5 `virtual std::string& activemq::commands::JournalTrace::getMessage ()`
[virtual]
- 6.371.2.6 `virtual const std::string& activemq::commands::JournalTrace::getMessage`
`() const` [virtual]
- 6.371.2.7 `JournalTrace& activemq::commands::JournalTrace::operator= (const`
`JournalTrace &)` [inline, protected]
- 6.371.2.8 `virtual void activemq::commands::JournalTrace::setMessage (const`
`std::string & message)` [virtual]
- 6.371.2.9 `virtual std::string activemq::commands::JournalTrace::toString ()`
`const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.662).

6.371.3 Field Documentation

- 6.371.3.1 `const unsigned char activemq::commands::JournalTrace::ID_ -`
`JOURNALTRACE = 53` [static]
- 6.371.3.2 `std::string activemq::commands::JournalTrace::message` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/JournalTrace.h`

6.372 `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller` Class Reference

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.1769).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTraceMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller`:

Public Member Functions

- `JournalTraceMarshaller ()`
- `virtual ~JournalTraceMarshaller ()`
- `virtual commands::DataStructure * createObject () const`

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.372.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.1769). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.372.2 Constructor & Destructor Documentation

6.372.2.1 `activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::JournalTraceMarshaller () [inline]`

6.372.2.2 `virtual activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.372.3 Member Function Documentation

6.372.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.372.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.372.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.372.3.4 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.372.3.5 virtual int activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.372.3.6 virtual void activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.372.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::JournalTraceMarshaller::tightUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

6.373.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.1773). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.373.2 Constructor & Destructor Documentation

6.373.2.1 `activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::JournalTraceMarshaller () [inline]`

6.373.2.2 `virtual activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.373.3 Member Function Documentation

6.373.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.373.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.373.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.373.3.4 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.373.3.5 virtual int activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.373.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.373.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::JournalTraceMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.374.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.374.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.374.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.374.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.374.3.6 virtual void activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.374.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::JournalTraceMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/JournalTraceMarshaller.h`

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.375.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.1781). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.375.2 Constructor & Destructor Documentation

6.375.2.1 `activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::JournalTraceMarshaller () [inline]`

6.375.2.2 `virtual activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.375.3 Member Function Documentation

6.375.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.375.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.375.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.375.3.4 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.375.3.5 virtual int activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.375.3.6 virtual void activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.375.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::JournalTraceMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

Write a object instance to data output stream.

6.376.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p.1785). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.376.2 Constructor & Destructor Documentation

6.376.2.1 `activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::JournalTraceMarshaller () [inline]`

6.376.2.2 `virtual activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::~~JournalTraceMarshaller () [inline, virtual]`

6.376.3 Member Function Documentation

6.376.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.376.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.376.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.376.3.4 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.376.3.5 virtual int activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.376.3.6 virtual void activemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

```
6.376.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::JournalTraceMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.377.1 Constructor & Destructor Documentation

6.377.1.1 `activemq::commands::JournalTransaction::JournalTransaction (const JournalTransaction &) [inline, protected]`

6.377.1.2 `activemq::commands::JournalTransaction::JournalTransaction ()`

6.377.1.3 `virtual activemq::commands::JournalTransaction::~~JournalTransaction () [virtual]`

6.377.2 Member Function Documentation

6.377.2.1 `virtual JournalTransaction* activemq::commands::JournalTransaction::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.377.2.2 `virtual void activemq::commands::JournalTransaction::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

6.377.2.3 `virtual bool activemq::commands::JournalTransaction::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

6.377.2.4 virtual unsigned char activemq::commands::JournalTransaction::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

6.377.2.5 virtual Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () [virtual]

6.377.2.6 virtual const Pointer<TransactionId>& activemq::commands::JournalTransaction::getTransactionId () const [virtual]

6.377.2.7 virtual unsigned char activemq::commands::JournalTransaction::getType () const [virtual]

6.377.2.8 virtual bool activemq::commands::JournalTransaction::getWasPrepared () const [virtual]

6.377.2.9 JournalTransaction& activemq::commands::JournalTransaction::operator= (const JournalTransaction &) [inline, protected]

6.377.2.10 virtual void activemq::commands::JournalTransaction::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.377.2.11 virtual void activemq::commands::JournalTransaction::setType (unsigned char *type*) [virtual]

6.377.2.12 virtual void activemq::commands::JournalTransaction::setWasPrepared (bool *wasPrepared*) [virtual]

6.377.2.13 virtual std::string activemq::commands::JournalTransaction::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataSet** (p. 662).

6.377.3 Field Documentation

- 6.377.3.1 `const unsigned char activemq::commands::JournalTransaction::ID _JOURNALTRANSACTION = 54` [static]

6.378 `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller` Class Reference

Marshaling code for Open Wire Format for `JournalTransactionMarshaller` (p. 1793).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/JournalTransactionMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller`:

Public Member Functions

- `JournalTransactionMarshaller ()`
- `virtual ~JournalTransactionMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.378.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.1793). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.378.2 Constructor & Destructor Documentation

6.378.2.1 **activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::JournalTrans**
 () [inline]

6.378.2.2 **virtual**
activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::~~JournalTrans
 () [inline, virtual]

6.378.3 Member Function Documentation

6.378.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::createObject
 () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.378.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::getDataStructu
 () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.378.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.378.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.378.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.378.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.378.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/JournalTransactionMarshaller.h`

#include <src/main/activemq/wireformat/openwire/marshal/v3/JournalTransactionMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller`:

Public Member Functions

- **JournalTransactionMarshaller** ()
- virtual **~JournalTransactionMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.379.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.1797). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.379.2 Constructor & Destructor Documentation

6.379.2.1 activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::JournalTransactionMarshaller () [inline]

6.379.2.2 virtual
activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::~~JournalTransactionMarshaller () [inline, virtual]

6.379.3 Member Function Documentation

6.379.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.379.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.379.3.3 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.379.3.4 virtual void activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.379.3.5 virtual int activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.379.3.6 virtual void **activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.379.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::JournalTransactionMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.380.1 Detailed Description

Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p.1801). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.380.2 Constructor & Destructor Documentation

6.380.2.1 `activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::JournalTrans`
`()` [inline]

6.380.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::~~JournalTran`
`()` [inline, virtual]

6.380.3 Member Function Documentation

6.380.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::createObject`
`() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1331).

6.380.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::getDataStructur`
`() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1336).

6.380.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

```
6.380.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::looseUnmarsha
l ( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

```
6.380.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightMarshall
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.380.3.6 virtual void activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.380.3.7 virtual void activemq::wireformat::openwire::marshal::v4::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.381.3 Member Function Documentation

6.381.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.381.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::getDataStructu`
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.381.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseMarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.381.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.381.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.381.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.381.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::JournalTransactionMarshaller::tightUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.382.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.382.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::getDataStructu`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.382.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.382.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.382.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.382.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.382.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::JournalTransactionMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

6.383 activemq::commands::KeepAliveInfo Class Reference

```
#include <src/main/activemq/commands/KeepAliveInfo.h>
```

Inheritance diagram for **activemq::commands::KeepAliveInfo**:

Public Member Functions

- **KeepAliveInfo** ()
- virtual **~KeepAliveInfo** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **KeepAliveInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual bool **isKeepAliveInfo** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_KEEPAVAILABLEINFO** = 10

Protected Member Functions

6.383.2 Member Function Documentation

- 6.383.2.1 **virtual KeepAliveInfo*** **activemq::commands::KeepAliveInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.383.2.2 virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.383.2.3 virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.383.2.4 virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.383.2.5 virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo () const [inline, virtual]**Returns**

an answer of true to the **isKeepAliveInfo()** (p. 1814) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 600).

6.383.2.6 `KeepAliveInfo& activemq::commands::KeepAliveInfo::operator= (const KeepAliveInfo &) [inline, protected]`

6.383.2.7 `virtual std::string activemq::commands::KeepAliveInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 602).

6.383.2.8 `virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.995).

6.383.3 Field Documentation

6.383.3.1 `const unsigned char activemq::commands::KeepAliveInfo::ID _ - KEEPALIVEINFO = 10 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/KeepAliveInfo.h`

6.384 activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p.1815).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/KeepAliveInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller`:

`() [inline]`

6.384.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::~~KeepAliveInfoM`
`() [inline, virtual]`

6.384.3 Member Function Documentation

6.384.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.384.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::getDataStructureTy`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.384.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.384.3.4 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.384.3.5 virtual int activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.384.3.6 virtual void activemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.384.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/KeepAliveInfoMarshaller.h`

6.385 `activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for `KeepAliveInfoMarshaller` (p. 1819).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/KeepAliveInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller`:

Public Member Functions

activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::~~KeepAliveInfoM
() [inline, virtual]`

6.385.3 Member Function Documentation

6.385.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.385.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::getDataStructureTy
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.385.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.385.3.4 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.385.3.5 virtual int activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.385.3.6 virtual void activemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.385.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

6.386.3 Member Function Documentation

6.386.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.386.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::getDataStructureTy
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.386.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.386.3.4 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.386.3.5 virtual int activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.386.3.6 virtual void activemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.386.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

6.387.3 Member Function Documentation

6.387.3.1 `virtual commands::DataStructure* ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::createObject
() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.387.3.2 `virtual unsigned char ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::getDataStructureTy
() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.387.3.3 `virtual void ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseMarshal
(OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut) throw (
decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.387.3.4 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.387.3.5 virtual int activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.387.3.6 virtual void activemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.387.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/KeepAliveInfoMarshaller.h`

6.388 `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for `KeepAliveInfoMarshaller` (p. 1831).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/KeepAliveInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller`:

Public Member Functions

- **KeepAliveInfoMarshaller** ()
- virtual **~KeepAliveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.388.1 Detailed Description

Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p.1831). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.388.2 Constructor & Destructor Documentation

6.388.2.1 `activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::KeepAliveInfoMar`
`() [inline]`

6.388.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::~~KeepAliveInfoM`
`() [inline, virtual]`

6.388.3 Member Function Documentation

6.388.3.1 `virtual commands::DataStructure* ac-`
`tivemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::createObject`
`() const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.388.3.2 `virtual unsigned char ac-`
`tivemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::getDataStructureTy`
`() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.388.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseMarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.388.3.4 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.388.3.5 virtual int activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.388.3.6 virtual void activemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.388.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::KeepAliveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/KeepAliveInfoMarshaller.h`

6.389 decaf::security::Key Class Reference

The **Key** (p. 1835) interface is the top-level interface for all keys.

```
#include <src/main/decaf/security/Key.h>
```

Inheritance diagram for `decaf::security::Key`:

Public Member Functions

- virtual `~Key ()`
- virtual `std::string getAlgorithm () const =0`

Returns the standard algorithm name for this key.

- virtual void `getEncoded (std::vector< unsigned char > &output) const =0`

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

- virtual `std::string getFormat () const =0`

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.389.1 Detailed Description

The **Key** (p.1835) interface is the top-level interface for all keys. It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the `getAlgorithm` method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 `SubjectPublicKeyInfo` or PKCS#8), and is returned using the `getEncoded` method. Note: The syntax of the ASN.1 type `SubjectPublicKeyInfo` is defined as follows:

```
SubjectPublicKeyInfo ::= SEQUENCE {
    algorithm AlgorithmIdentifier,
    subjectPublicKey BIT STRING }
AlgorithmIdentifier ::= SEQUENCE {
    algorithm OBJECT IDENTIFIER,
    parameters ANY DEFINED BY algorithm OPTIONAL }
```

For more information, see RFC 2459: Internet X.509 Public **Key** (p.1835) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the `getFormat` method.

6.389.2 Constructor & Destructor Documentation

6.389.2.1 `virtual decaf::security::Key::~~Key () [inline, virtual]`

6.389.3 Member Function Documentation

6.389.3.1 `virtual std::string decaf::security::Key::getAlgorithm () const [pure virtual]`

Returns the standard algorithm name for this key.

For example, "DSA" would indicate that this key is a DSA key.

Returns

the name of the algorithm associated with this key.

6.389.3.2 `virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & output) const [pure virtual]`

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters

output Receives the encoded key, or nothing if the key does not support encoding.

6.389.3.3 `virtual std::string decaf::security::Key::getFormat () const [pure virtual]`

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is SubjectPublicKeyInfo, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is PrivateKeyInfo, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns

the primary encoding format of the key.

The documentation for this class was generated from the following file:

- `src/main/decaf/security/Key.h`

6.390 decaf::security::KeyException Class Reference

```
#include <src/main/decaf/security/KeyException.h>
```

Inheritance diagram for decaf::security::KeyException:

Public Member Functions

- **KeyException** () throw ()
Default Constructor.
- **KeyException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **KeyException** (const **KeyException** &ex) throw ()
Copy Constructor.
- **KeyException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **KeyException** (const std::exception *cause) throw ()
Constructor.
- **KeyException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **KeyException** * **clone** () const
Clones this exception.
- virtual ~**KeyException** () throw ()

6.390.1 Constructor & Destructor Documentation

6.390.1.1 decaf::security::KeyException::KeyException () throw () [inline]

Default Constructor.

6.390.1.2 decaf::security::KeyException::KeyException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.390.1.3 decaf::security::KeyException::KeyException (const KeyException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.390.1.4 `decaf::security::KeyException::KeyException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.390.1.5 `decaf::security::KeyException::KeyException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.390.1.6 `decaf::security::KeyException::KeyException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.390.1.7 `virtual decaf::security::KeyException::~~KeyException () throw () [inline, virtual]`

6.390.2 Member Function Documentation

6.390.2.1 `virtual KeyException* decaf::security::KeyException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1604).

Reimplemented in **decaf::security::InvalidKeyException** (p. 1700).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/KeyException.h`

6.391 activemq::commands::LastPartialCommand Class Reference

```
#include <src/main/activemq/commands/LastPartialCommand.h>
```

Inheritance diagram for `activemq::commands::LastPartialCommand`:

Public Member Functions

- **LastPartialCommand** ()
- virtual **~LastPartialCommand** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **LastPartialCommand * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

Static Public Attributes

- static const unsigned char **ID_LASTPARTIALCOMMAND** = 61

Protected Member Functions

- **LastPartialCommand** (const **LastPartialCommand** &)
- **LastPartialCommand** & **operator=** (const **LastPartialCommand** &)

6.391.1 Constructor & Destructor Documentation

- 6.391.1.1** `activemq::commands::LastPartialCommand::LastPartialCommand (const LastPartialCommand &) [inline, protected]`
- 6.391.1.2** `activemq::commands::LastPartialCommand::LastPartialCommand ()`
- 6.391.1.3** `virtual
activemq::commands::LastPartialCommand::~~LastPartialCommand ()
[virtual]`

6.391.2 Member Function Documentation

- 6.391.2.1** `virtual LastPartialCommand* ac-
tivemq::commands::LastPartialCommand::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from `activemq::commands::PartialCommand` (p. 2320).

- 6.391.2.2** `virtual void ac-
tivemq::commands::LastPartialCommand::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::PartialCommand` (p. 2320).

- 6.391.2.3** `virtual bool activemq::commands::LastPartialCommand::equals (const
DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::PartialCommand` (p. 2320).

6.391.2.4 `virtual unsigned char activemq::commands::LastPartialCommand::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaller share.

Returns

new **DataSet** (p. 1372) type copy.

Reimplemented from **activemq::commands::PartialCommand** (p. 2321).

6.391.2.5 `LastPartialCommand& activemq::commands::LastPartialCommand::operator= (const LastPartialCommand &) [inline, protected]`

6.391.2.6 `virtual std::string activemq::commands::LastPartialCommand::toString () const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::PartialCommand** (p. 2321).

6.391.3 Field Documentation

6.391.3.1 `const unsigned char activemq::commands::LastPartialCommand::ID__LASTPARTIALCOMMAND = 61 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/LastPartialCommand.h`

6.392 activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1842).

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.392.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p.1842).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.392.2 Constructor & Destructor Documentation

6.392.2.1 `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` `[inline]`

6.392.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::~LastPartialCommandMarshaller()` `[inline, virtual]`

6.392.3 Member Function Documentation

6.392.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::createObject()` `const` `[virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2323).

6.392.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::getDataStructureType()` `const` `[virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2323).

6.392.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` `[virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2324).

6.392.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2324).

6.392.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller` (p. 2325).

6.392.3.6 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2325).

6.392.3.7 virtual void activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller** (p. 2326).

The documentation for this class was generated from the following file:

6.393.2.1 `activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::LastPartialCommandMarshaller()` [inline]

6.393.2.2 `virtual activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::~~LastPartialCommandMarshaller()` [inline, virtual]

6.393.3 Member Function Documentation

6.393.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2336).

6.393.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2336).

6.393.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2336).

6.393.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2337).

6.393.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller` (p. 2337).

6.393.3.6 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2338).

6.393.3.7 virtual void activemq::wireformat::openwire::marshal::v1::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::PartialCommandMarshaller** (p. 2338).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v1/**LastPartialCommandMarshaller.h**

6.394.2.2 `virtual activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::~~LastPartialCommandMarshaller()` [inline, virtual]

6.394.3 Member Function Documentation

6.394.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2327).

6.394.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2328).

6.394.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2328).

6.394.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2328).

6.394.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller` (p. 2329).

6.394.3.6 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2329).

6.394.3.7 virtual void activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller** (p. 2330).

6.395.3 Member Function Documentation

6.395.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::createObject(const)` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2332).

6.395.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2332).

6.395.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2332).

6.395.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2333).

6.395.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller` (p. 2333).

6.395.3.6 virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller** (p. 2334).

6.395.3.7 virtual void activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

6.396.3 Member Function Documentation

6.396.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2340).

6.396.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2340).

6.396.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2341).

6.396.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2341).

6.396.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller` (p. 2341).

6.396.3.6 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2342).

6.396.3.7 virtual void activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller** (p. 2342).

- virtual int **compare** (const E &o1, const E &o2) const
Compares its two arguments for order.

6.397.1 Detailed Description

```
template<typename E> class decaf::util::comparators::Less< E >
```

Simple **Less** (p. 1862) **Comparator** (p. 1011) that compares to elements to determine if the first is less than the second. This can be used in **Collection** (p. 982) classes to sort elements according to their natural ordering. By design the Comparator's compare function return more information about comparison than the STL binary function's boolean compare operator. In this case the compare method will return

Since

1.0

6.397.2 Constructor & Destructor Documentation

6.397.2.1 template<typename E > decaf::util::comparators::Less< E >::Less ()
 [inline]

6.397.2.2 template<typename E > virtual decaf::util::comparators::Less< E
 >::~~Less () [inline, virtual]

6.397.3 Member Function Documentation

6.397.3.1 template<typename E > virtual int decaf::util::comparators::Less< E
 >::compare (const E & o1, const E & o2) const [inline, virtual]

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that `sgn(compare(x, y)) == -sgn(compare(y, x))` for all x and y. (This implies that `compare(x, y)` must throw an exception if and only if `compare(y, x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `((compare(x, y)>0) && (compare(y, z)>0))` implies `compare(x, z)>0`.

Finally, the implementor must ensure that `compare(x, y)==0` implies that `sgn(compare(x, z))==sgn(compare(y, z))` for all `z`.

It is generally the case, but not strictly required that `(compare(x, y)==0) == (x == y)`. Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

- o1* - the first object to be compared
- o2* - the second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implements `decaf::util::Comparator< E >` (p. 1012).

6.397.3.2 `template<typename E> virtual bool decaf::util::comparators::Less< E >::operator() (const E & left, const E & right) const` [`inline`, `virtual`]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 1011) to be passed to an STL **Map** (p. 1970) for use as the sorting criteria.

Parameters

- left* - the Left hand side operand.
- right* - the Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implements `decaf::util::Comparator< E >` (p. 1013).

The documentation for this class was generated from the following file:

- virtual std::size_t **indexOf** (const E &value)=0 throw (**decaf::lang::exceptions::NoSuchElementException**)

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::size_t **lastIndexOf** (const E &value)=0 throw (**decaf::lang::exceptions::NoSuchElementException**)

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual E **get** (std::size_t index) const =0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Gets the element contained at position passed.

- virtual E **set** (std::size_t index, const E &element)=0 throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Replaces the element at the specified position in this list with the specified element.

- virtual void **add** (std::size_t index, const E &element)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Inserts the specified element at the specified position in this list.

- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

- virtual E **remove** (std::size_t index)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Removes the element at the specified position in this list.

6.399.1 Detailed Description

```
template<typename E> class decaf::util::List< E >
```

An ordered collection (also known as a sequence). The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements *e1* and *e2* such that *e1.equals(e2)*, and they typically allow multiple null elements if they allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.399.2 Constructor & Destructor Documentation

6.399.2.1 `template<typename E> virtual decaf::util::List< E >::~~List ()`
`[inline, virtual]`

6.399.3 Member Function Documentation

6.399.3.1 `template<typename E> virtual void decaf::util::List< E >::add (std::size_t index, const E & element) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p.2839), `decaf::util::StlList< CompositeTask * >` (p.2839), `decaf::util::StlList< URI >` (p.2839), `decaf::util::StlList< Pointer< DestinationInfo > >` (p.2839), `decaf::util::StlList< PrimitiveValueNode >` (p.2839), `decaf::util::StlList< Pointer< Command > >` (p.2839), and `decaf::util::StlList< Pointer< BackupTransport > >` (p.2839).

6.399.3.2 `template<typename E> virtual bool decaf::util::List< E >::addAll (std::size_t index, const Collection< E > & source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index The index at which to insert the first element from the specified collection

source The **Collection** (p.982) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in `decaf::util::StlList< E >` (p. 2839), `decaf::util::StlList< CompositeTask * >` (p. 2839), `decaf::util::StlList< URI >` (p. 2839), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2839), `decaf::util::StlList< PrimitiveValueNode >` (p. 2839), `decaf::util::StlList< Pointer< Command > >` (p. 2839), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2839).

6.399.3.3 `template<typename E> virtual E decaf::util::List< E >::get (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

Implemented in `decaf::util::StlList< E >` (p. 2841), `decaf::util::StlList< CompositeTask * >` (p. 2841), `decaf::util::StlList< URI >` (p. 2841), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2841), `decaf::util::StlList< PrimitiveValueNode >` (p. 2841), `decaf::util::StlList< Pointer< Command > >` (p. 2841), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2841).

6.399.3.4 `template<typename E> virtual std::size_t decaf::util::List< E >::indexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException)` [pure virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

Implemented in `decaf::util::StlList< E >` (p. 2841), `decaf::util::StlList< CompositeTask * >` (p. 2841), `decaf::util::StlList< URI >` (p. 2841), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2841), `decaf::util::StlList< PrimitiveValueNode >` (p. 2841), `decaf::util::StlList< Pointer< Command > >` (p. 2841), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2841).

6.399.3.5 `template<typename E> virtual size_t decaf::util::List< E >::lastIndexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index *i* such that `get(i) == value` or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NoSuchElementException if *value* is not in the list

Implemented in `decaf::util::StlList< E >` (p. 2842), `decaf::util::StlList< CompositeTask * >` (p. 2842), `decaf::util::StlList< URI >` (p. 2842), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2842), `decaf::util::StlList< PrimitiveValueNode >` (p. 2842), `decaf::util::StlList< Pointer< Command > >` (p. 2842), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2842).

6.399.3.6 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () [pure virtual]`

Returns

a list iterator over the elements in this list (in proper sequence).

Implemented in `decaf::util::StlList< E >` (p. 2843), `decaf::util::StlList< CompositeTask * >` (p. 2843), `decaf::util::StlList< URI >` (p. 2843), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2843), `decaf::util::StlList< PrimitiveValueNode >` (p. 2843), `decaf::util::StlList< Pointer< Command > >` (p. 2843), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2843).

6.399.3.7 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Implemented in `decaf::util::StlList< E >` (p. 2843), `decaf::util::StlList< CompositeTask * >` (p. 2843), `decaf::util::StlList< URI >` (p. 2843), `decaf::util::StlList< Pointer< DestinationInfo > >` (p. 2843), `decaf::util::StlList< PrimitiveValueNode >` (p. 2843), `decaf::util::StlList< Pointer< Command > >` (p. 2843), and `decaf::util::StlList< Pointer< BackupTransport > >` (p. 2843).

6.399.3.8 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator () const [pure virtual]`

Implemented in `decaf::util::StlList< E >` (p. 2843), `decaf::util::StlList< CompositeTask * >` (p. 2843), `decaf::util::StlList< URI >` (p. 2843), `decaf::util::StlList< Pointer<`

DestinationInfo > > (p. 2843), **decaf::util::StlList< PrimitiveValueNode >** (p. 2843), **decaf::util::StlList< Pointer< Command > >** (p. 2843), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2843).

6.399.3.9 `template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Parameters

index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException if the index is out of range (`index < 0 || index > size()` (p. 990))

Implemented in **decaf::util::StlList< E >** (p. 2842), **decaf::util::StlList< CompositeTask * >** (p. 2842), **decaf::util::StlList< URI >** (p. 2842), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2842), **decaf::util::StlList< PrimitiveValueNode >** (p. 2842), **decaf::util::StlList< Pointer< Command > >** (p. 2842), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2842).

6.399.3.10 `template<typename E> virtual E decaf::util::List< E >::remove (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)` [pure virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index - the index of the element to be removed

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implemented in **decaf::util::StlList< E >** (p. 2843), **decaf::util::StlList< CompositeTask * >** (p. 2843), **decaf::util::StlList< URI >** (p. 2843), **decaf::util::StlList< Pointer<**

DestinationInfo > > (p. 2843), **decaf::util::StlList< PrimitiveValueNode >** (p. 2843), **decaf::util::StlList< Pointer< Command > >** (p. 2843), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2843).

```
6.399.3.11  template<typename E> virtual E decaf::util::List< E >::set
              ( std::size_t index, const E & element ) throw (
                decaf::lang::exceptions::IndexOutOfBoundsException ) [pure virtual]
```

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

Implemented in **decaf::util::StlList< E >** (p. 2844), **decaf::util::StlList< CompositeTask * >** (p. 2844), **decaf::util::StlList< URI >** (p. 2844), **decaf::util::StlList< Pointer< DestinationInfo > >** (p. 2844), **decaf::util::StlList< PrimitiveValueNode >** (p. 2844), **decaf::util::StlList< Pointer< Command > >** (p. 2844), and **decaf::util::StlList< Pointer< BackupTransport > >** (p. 2844).

6.400 decaf::util::ListIterator< E > Class Template Reference

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

```
#include <src/main/decaf/util/ListIterator.h>
```

Inheritance diagram for **decaf::util::ListIterator< E >**:

Public Member Functions

- virtual **~ListIterator** ()
- virtual void **add** (const E &e)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into the list (optional operation).

- virtual void **set** (const E &e)=0 throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)
Replaces the last element returned by next or previous with the specified element (optional operation).
- virtual bool **hasPrevious** () const =0
Returns true if this list iterator has more elements when traversing the list in the reverse direction.
- virtual E **previous** ()=0
Returns the previous element in the list.
- virtual int **nextIndex** () const =0
Returns the index of the element that would be returned by a subsequent call to next.
- virtual int **previousIndex** () const =0
Returns the index of the element that would be returned by a subsequent call to previous.

6.400.1 Detailed Description

`template<typename E> class decaf::util::ListIterator< E >`

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list. Note that the **remove()** (p. 1718) and **set(Object)** methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to **next()** (p. 1717) or **previous()** (p. 1873).

6.400.2 Constructor & Destructor Documentation

6.400.2.1 `template<typename E > virtual decaf::util::ListIterator< E >::~ListIterator () [inline, virtual]`

6.400.3 Member Function Documentation

6.400.3.1 `template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & e) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Inserts the specified element into the list (optional operation).

The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters

e - the element to insert.

Exceptions

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

6.400.3.2 `template<typename E> virtual bool decaf::util::ListIterator< E >::hasPrevious () const [pure virtual]`

Returns true if this list iterator has more elements when traversing the list in the reverse direction.

(In other words, returns true if previous would return an element rather than throwing an exception.)

Returns

true if the list iterator has more elements when traversing the list in the reverse direction.

6.400.3.3 `template<typename E> virtual int decaf::util::ListIterator< E >::nextIndex () const [pure virtual]`

Returns the index of the element that would be returned by a subsequent call to next.

(Returns list size if the list iterator is at the end of the list.)

Returns

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

6.400.3.4 `template<typename E> virtual E decaf::util::ListIterator< E >::previous () [pure virtual]`

Returns the previous element in the list.

This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns

the previous element in the list.

Exceptions

NoSuchElementException - if the iteration has no previous element.

6.400.3.5 `template<typename E> virtual int decaf::util::ListIterator< E >::previousIndex () const [pure virtual]`

Returns the index of the element that would be returned by a subsequent call to previous.

(Returns -1 if the list iterator is at the beginning of the list.)

Returns

the index of the element that would be returned by a subsequent call to `previous`, or -1 if list iterator is at beginning of list.

6.400.3.6 `template<typename E > virtual void decaf::util::ListIterator<E >::set (const E & e) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException) [pure virtual]`

Replaces the last element returned by `next` or `previous` with the specified element (optional operation).

This call can be made only if neither `ListIterator.remove` (p.1718) nor `ListIterator.add` (p.1872) have been called after the last call to `next` or `previous`.

Parameters

`e` - the element with which to replace the last element returned by `next` or `previous`.

Exceptions

UnsupportedOperationException - if the add method is not supported by this list iterator.

IllegalArgumentException - if some aspect of this element prevents it from being added to this list.

IllegalStateException - if neither `next` nor `previous` have been called, or `remove` or `add` have been called after the last call to `next` or `previous`.

6.401 activemq::commands::LocalTransactionId Class Reference

```
#include <src/main/activemq/commands/LocalTransactionId.h>
```

Inheritance diagram for `activemq::commands::LocalTransactionId`:

Public Types

- `typedef decaf::lang::PointerComparator< LocalTransactionId > COMPARATOR`

Public Member Functions

- `LocalTransactionId ()`
- `LocalTransactionId (const LocalTransactionId &other)`

- virtual `~LocalTransactionId ()`

- virtual unsigned char `getDataStructureType ()` const

Get the unique identifier that this object and its own Marshaler share.

- virtual `LocalTransactionId * cloneDataStructure ()` const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void `copyDataStructure (const DataStructure *src)`

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string `toString ()` const

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool `equals (const DataStructure *value)` const

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual long long `getValue ()` const

- virtual void `setValue (long long value)`

- virtual const `Pointer< ConnectionId > &getConnectionId ()` const

- virtual `Pointer< ConnectionId > &getConnectionId ()`

- virtual void `setConnectionId (const Pointer< ConnectionId > &connectionId)`

- virtual int `compareTo (const LocalTransactionId &value)` const

- virtual bool `equals (const LocalTransactionId &value)` const

- virtual bool `operator== (const LocalTransactionId &value)` const

- virtual bool `operator< (const LocalTransactionId &value)` const

- `LocalTransactionId & operator= (const LocalTransactionId &other)`

Static Public Attributes

- static const unsigned char `ID_LOCALTRANSACTIONID = 111`

Protected Attributes

- long long `value`
- `Pointer< ConnectionId > connectionId`

6.401.1 Member Typedef Documentation

6.401.1.1 `typedef decaf::lang::PointerComparator<LocalTransactionId>
activemq::commands::LocalTransactionId::COMPARATOR`

6.401.2 Constructor & Destructor Documentation

6.401.2.1 `activemq::commands::LocalTransactionId::LocalTransactionId ()`

6.401.2.2 `activemq::commands::LocalTransactionId::LocalTransactionId (const
LocalTransactionId & other)`

6.401.2.3 `virtual activemq::commands::LocalTransactionId::~~LocalTransactionId ()
[virtual]`

6.401.3 Member Function Documentation

6.401.3.1 `virtual LocalTransactionId* ac-
tivemq::commands::LocalTransactionId::cloneDataStructure () const
[virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.401.3.2 `virtual int activemq::commands::LocalTransactionId::compareTo (const
LocalTransactionId & value) const [virtual]`

6.401.3.3 `virtual void activemq::commands::LocalTransactionId::copyDataStructure
(const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.401.3.4 `virtual bool activemq::commands::LocalTransactionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.401.3.5 `virtual bool activemq::commands::LocalTransactionId::equals (const LocalTransactionId & value) const [virtual]`

6.401.3.6 `virtual const Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () const [virtual]`

6.401.3.7 `virtual Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId () [virtual]`

6.401.3.8 `virtual unsigned char activemq::commands::LocalTransactionId::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

6.401.3.9 `virtual long long activemq::commands::LocalTransactionId::getValue () const [virtual]`

6.401.3.10 `virtual bool activemq::commands::LocalTransactionId::operator< (const LocalTransactionId & value) const [virtual]`

6.401.3.11 `LocalTransactionId& activemq::commands::LocalTransactionId::operator= (const LocalTransactionId & other)`

6.401.3.12 `virtual bool activemq::commands::LocalTransactionId::operator== (const LocalTransactionId & value) const [virtual]`

6.401.3.13 `virtual void activemq::commands::LocalTransactionId::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`

6.401.3.14 `virtual void activemq::commands::LocalTransactionId::setValue (long long value) [virtual]`

6.401.3.15 `virtual std::string activemq::commands::LocalTransactionId::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.401.4 Field Documentation

- 6.401.4.1 `Pointer<ConnectionId> activemq::commands::LocalTransactionId::connectionId`
[protected]

6.402 activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1878).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/LocalTransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller`:

Public Member Functions

- **LocalTransactionIdMarshaller** ()
- virtual `~LocalTransactionIdMarshaller` ()
- virtual `commands::DataStructure * createObject ()` const
Creates a new instance of this marshalable type.
- virtual unsigned char `getDataStructureType ()` const
Get the Data Structure Type that identifies this Marshaler.
- virtual void `tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- virtual int `tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- virtual void `tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.402.1 Detailed Description

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p.1878). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.402.2 Constructor & Destructor Documentation

6.402.2.1 activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller () [inline]

6.402.2.2 virtual activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::~~LocalTransactionIdMarshaller () [inline, virtual]

6.402.3 Member Function Documentation

6.402.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.402.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.402.3.3 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3020).

6.402.3.4 virtual void activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3020).

6.402.3.5 virtual int activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3021).

```
6.402.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3021).

```
6.402.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3022).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/LocalTransactionIdMarshaller.h`

6.403 activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1882).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/LocalTransactionIdMarshaller.h>
```

6.403.3 Member Function Documentation

6.403.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.403.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.403.3.3 virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3034).

6.403.3.4 virtual void activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3035).

6.403.3.5 virtual int activemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3035).

```
6.403.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3036).

```
6.403.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3036).

6.404.2.1 `activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller () [inline]`

6.404.2.2 `virtual activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::~LocalTransactionIdMarshaller () [inline, virtual]`

6.404.3 Member Function Documentation

6.404.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.404.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.404.3.3 virtual void activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3027).

6.404.3.4 virtual void activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3027).

6.404.3.5 virtual int activemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3028).

```
6.404.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller` (p. 3028).

```
6.404.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException*** if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3029).

The documentation for this class was generated from the following file:

6.405.3 Member Function Documentation

6.405.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.405.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.405.3.3 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3023).

6.405.3.4 virtual void activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3024).

6.405.3.5 virtual int activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3024).

```
6.405.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3025).

```
6.405.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3025).

6.406.3 Member Function Documentation

6.406.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.406.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.406.3.3 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3031).

6.406.3.4 virtual void activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3031).

6.406.3.5 virtual int activemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3032).

```
6.406.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3032).

```
6.406.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::LocalTransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3033).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**LocalTransactionIdMarshaller.h**

6.407 decaf::util::concurrent::locks::Lock Class Reference

Lock (p. 1898) implementations provide more extensive locking operations than can be obtained using synchronized statements.

```
#include <src/main/decaf/util/concurrent/locks/Lock.h>
```

Inheritance diagram for decaf::util::concurrent::locks::Lock:

Public Member Functions

- virtual **~Lock** ()
- virtual void **lock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock.
- virtual void **lockInterruptibly** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock only if it is free at the time of invocation.
- virtual bool **tryLock** (long long time, const **TimeUnit** &unit)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Releases the lock.
- virtual **Condition** * **newCondition** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)
*Returns a new **Condition** (p. 1040) instance that is bound to this **Lock** (p. 1898) instance.*

6.407.1 Detailed Description

Lock (p. 1898) implementations provide more extensive locking operations than can be obtained using synchronized statements. They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 1040) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some locks may allow concurrent access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 2522).

While the scoping mechanism for synchronized statements makes it much easier to program with monitor locks, and helps avoid many common programming errors involving locks, there are occasions where you need to work with locks in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock** (p. 1898) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple locks to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of locks that occurs with synchronized statements. In most cases, the following idiom should be used:

```
Lock (p. 1898) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }
```

When locking and unlocking occur in different scopes, care must be taken to ensure that all code that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 1898) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock()** (p. 1902)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly()** (p. 1900)), and an attempt to acquire the lock that can timeout (**tryLock(long, TimeUnit)**).

Note that **Lock** (p. 1898) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 1898) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.407.2 Constructor & Destructor Documentation

6.407.2.1 `virtual decaf::util::concurrent::locks::Lock::~~Lock () [inline, virtual]`

6.407.3 Member Function Documentation

6.407.3.1 `virtual void decaf::util::concurrent::locks::Lock::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]`

Acquires the lock.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p.1898) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1898) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p.2529).

6.407.3.2 `virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [pure virtual]`

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p.1898) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1898) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2530).

6.407.3.3 **virtual Condition* decaf::util::concurrent::locks::Lock::newCondition**
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::UnsupportedOperationException) [pure
 virtual]

Returns a new **Condition** (p. 1040) instance that is bound to this **Lock** (p. 1898) instance.

Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()** (p. 1042) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p. 1040) instance depends on the **Lock** (p. 1898) implementation and must be documented by that implementation.

Returns

A new **Condition** (p. 1040) instance for this **Lock** (p. 1898) instance the caller must delete the returned **Condition** (p. 1040) object when done with it.

Exceptions

RuntimeException if an error occurs while creating the **Condition** (p. 1040).

UnsupportedOperationException if this **Lock** (p. 1898) implementation does not support conditions

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2530).

6.407.3.4 **virtual bool decaf::util::concurrent::locks::Lock::tryLock**
(long long time, const TimeUnit & unit)
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::InterruptedException) [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.

If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or * The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p.1898) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p.1898) implementation.

Parameters

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p.2531).

6.407.3.5 virtual bool decaf::util::concurrent::locks::Lock::tryLock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Acquires the lock only if it is free at the time of invocation.

Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

```
Lock (p.1898) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) { lock.unlock(); } } else { // perform alternative actions }
```

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2532).

6.407.3.6 virtual void decaf::util::concurrent::locks::Lock::unlock
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Releases the lock.

Implementation Considerations

A **Lock** (p. 1898) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 1898) implementation.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

IllegalMonitorStateException if the current thread is not the owner of the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 2533).

6.409 decaf::util::concurrent::locks::LockSupport Class Reference

Basic thread blocking primitives for creating locks and other synchronization classes.

```
#include <src/main/decaf/util/concurrent/locks/LockSupport.h>
```

Public Member Functions

- ~LockSupport ()

Static Public Member Functions

- static void **unpark** (decaf::lang::Thread *thread) throw ()
Makes available the permit for the given thread, if it was not already available.
- static void **park** () throw ()
Disables the current thread for thread scheduling purposes unless the permit is available.
- static void **parkNanos** (long long nanos) throw ()
Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.
- static void **parkUntil** (long long deadline) throw ()
Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

6.409.1 Detailed Description

Basic thread blocking primitives for creating locks and other synchronization classes. This class associates, with each thread that uses it, a permit (in the sense of the **Semaphore** (p.2651) class). A call to park will return immediately if the permit is available, consuming it in the process; otherwise it may block. A call to unpark makes the permit available, if it was not already available. (Unlike with Semaphores though, permits do not accumulate. There is at most one.)

Methods park and unpark provide efficient means of blocking and unblocking threads. Races between one thread invoking park and another thread trying to unpark it will preserve liveness, due to the permit. Additionally, park will return if the caller's thread was interrupted, and timeout versions are supported. The park method may also return at any other time, for "no reason", so

in general must be invoked within a loop that rechecks conditions upon return. In this sense park serves as an optimization of a "busy wait" that does not waste as much time spinning, but must be paired with an unpark to be effective.

These methods are designed to be used as tools for creating higher-level synchronization utilities, and are not in themselves useful for most concurrency control applications. The park method is designed for use only in constructions of the form:

```
while (!canProceed()) { ... LockSupport.park(this); }
```

where neither canProceed nor any other actions prior to the call to park entail locking or blocking. Because only one permit is associated with each thread, any intermediary uses of park could interfere with its intended effects.

Sample Usage. Here is a sketch of a first-in-first-out non-reentrant lock class:

```
class FIFOMutex { private:
    AtomicBoolean locked; ConcurrentLinkedQueue<Thread*> waiters;
public:
    void lock() {
        bool wasInterrupted = false; Thread* current = Thread::currentThread(); waiters.add( current );
        // Block while not first in queue or cannot acquire lock while( waiters.peek() != current ||
        !locked.compareAndSet( false, true ) ) {
            LockSupport.park(this); if( Thread::interrupted() ) // ignore interrupts while waiting wasInter-
            rupted = true; }
        waiters.remove(); if( wasInterrupted ) // reassert interrupt status on exit current.interrupt(); }
    void unlock() { locked.set( false ); LockSupport.unpark (p.1907)( waiters.peek() ); } };
```

Since

1.0

6.409.2 Constructor & Destructor Documentation

6.409.2.1 decaf::util::concurrent::locks::LockSupport::~~LockSupport ()

6.409.3 Member Function Documentation

6.409.3.1 static void decaf::util::concurrent::locks::LockSupport::park () throw () [static]

Disables the current thread for thread scheduling purposes unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes unpark with the current thread as the target; or
- * Some other thread interrupts the current thread; or
- * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread upon return.

6.409.3.2 `static void decaf::util::concurrent::locks::LockSupport::parkNanos (long long nanos) throw () [static]`

Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes `unpark` with the current thread as the target; or * Some other thread interrupts the current thread; or * The specified waiting time elapses; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the elapsed time upon return.

Parameters

nanos the maximum number of nanoseconds to wait

6.409.3.3 `static void decaf::util::concurrent::locks::LockSupport::parkUntil (long long deadline) throw () [static]`

Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

* Some other thread invokes `unpark` with the current thread as the target; or * Some other thread interrupts the current thread; or * The specified deadline passes; or * The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the current time upon return.

Parameters

deadline the absolute time, in milliseconds from the Epoch, to wait until

6.409.3.4 `static void decaf::util::concurrent::locks::LockSupport::unpark (decaf::lang::Thread * thread) throw () [static]`

Makes available the permit for the given thread, if it was not already available.

If the thread was blocked on `park` then it will unblock. Otherwise, its next call to `park` is guaranteed not to block. This operation is not guaranteed to have any effect at all if the given thread has not been started.

Parameters

thread the thread to unport, or NULL in which case the method has no effect.

The documentation for this class was generated from the following file:

Log a message, with the list of params that is formatted into the message string.

- virtual void **log** (**Level** level, const std::string &file, const int line, const std::string &message, **lang::Exception** &ex)

Log a message, with associated Throwable information.

Static Public Member Functions

- static **Logger** * **getAnonymousLogger** ()

Creates an anonymous logger.

- static **Logger** * **getLogger** (const std::string &name)

Find or create a logger for a named subsystem.

6.410.1 Constructor & Destructor Documentation

6.410.1.1 decaf::util::logging::Logger::Logger (const std::string & *name*, Logger * *parent*)

Creates a new instance of the **Logger** (p. 1908) with the given name and assign it the given parent logger.

The logger will be initially configured with a null Level and with useParentHandlers true.

Parameters

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as java.net or javax.swing. It may be null for anonymous Loggers.

parent logger that is this one's parent

6.410.1.2 virtual decaf::util::logging::Logger::~~Logger () [virtual]

6.410.2 Member Function Documentation

6.410.2.1 virtual void decaf::util::logging::Logger::addHandler (Handler * *handler*) throw (lang::exceptions::IllegalArgumentException) [virtual]

Add a log **Handler** (p. 1604) to receive logging messages.

By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p. 1908) is configured with a set of Handlers that essentially act as default handlers for all loggers.

Parameters

handler A Logging **Handler** (p. 1604)

Exceptions

IllegalArgumentException

6.410.2.2 virtual void decaf::util::logging::Logger::debug (const std::string & *file*, const int *line*, const std::string *functionName*, const std::string & *message*) [virtual]

Log a Debug Level Log.

If the logger is currently enabled for the DEBUG message level then the given message is forwarded to all the registered output **Handler** (p. 1604) objects.

Parameters

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

6.410.2.3 `virtual void decaf::util::logging::Logger::entry (const std::string & blockName, const std::string & file, const int line) [virtual]`

Logs an Block Enter message.

This is a convenience method that is used to tag a block enter, a log record with the class name function name and the string Entering is logged at the DEBUG log level.

Parameters

blockName source block name

file source file name

line source line name

6.410.2.4 `virtual void decaf::util::logging::Logger::error (const std::string & file, const int line, const std::string fnctionName, const std::string & message) [virtual]`

Log a error Level Log.

If the logger is currently enabled for the error message level then the given message is forwarded to all the registered output **Handler** (p.1604) objects.

Parameters

file the file name where the log was generated

line the line number where the log was generated

fnctionName name of the function that logged this

message the message to log

6.410.2.5 `virtual void decaf::util::logging::Logger::exit (const std::string & blockName, const std::string & file, const int line) [virtual]`

Logs an Block Exit message.

This is a convenience method that is used to tag a block exit, a log record with the class name function name and the string Exiting is logged at the DEBUG log level.

Parameters

blockName source block name

file source file name

line source line name

6.410.2.6 `virtual void decaf::util::logging::Logger::fatal (const std::string & file, const int line, const std::string functionName, const std::string & message) [virtual]`

Log a fatal Level Log.

If the logger is currently enabled for the fatal message level then the given message is forwarded to all the registered output **Handler** (p.1604) objects.

Parameters

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

6.410.2.7 `static Logger* decaf::util::logging::Logger::getAnonymousLogger ()`
[static]

Creates an anonymous logger.

The newly created **Logger** (p. 1908) is not registered in the **LogManager** (p. 1923) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns

Newly created anonymous logger

6.410.2.8 `virtual const Filter* decaf::util::logging::Logger::getFilter () const`
[inline, virtual]

Gets the **Filter** (p. 1527) object that this class is using.

Returns

the **Filter** (p. 1527) in use, can be null

6.410.2.9 `virtual Level decaf::util::logging::Logger::getLevel () const` [inline, virtual]

Get the log Level that has been specified for this **Logger** (p. 1908).

The result may be the Null level, which means that this logger's effective level will be inherited from its parent.

Returns

the level that is currently set

6.410.2.10 `static Logger* decaf::util::logging::Logger::getLogger (const std::string & name)` [static]

Find or create a logger for a named subsystem.

If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 1923) and it will be configured to also send logging output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 1923) global namespace.

Parameters

name - A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as `cms` or `activemq.core.ActiveMQConnection` (p. 202)

Returns

a suitable logger.

6.410.2.11 `virtual const std::string& decaf::util::logging::Logger::getName ()`
`const [inline, virtual]`

Gets the name of this **Logger** (p. 1908).

Returns

logger name

6.410.2.12 `virtual bool decaf::util::logging::Logger::getUseParentHandlers ()`
`const [inline, virtual]`

Discover whether or not this logger is sending its output to its parent logger.

Returns

true if using Parent Handlers

6.410.2.13 `virtual void decaf::util::logging::Logger::info (const std::string & file,`
`const int line, const std::string functionName, const std::string &`
`message) [virtual]`

Log a info Level Log.

If the logger is currently enabled for the info message level then the given message is forwarded to all the registered output **Handler** (p. 1604) objects.

Parameters

file the file name where the log was generated
line the line number where the log was generated
functionName name of the function that logged this
message the message to log

6.410.2.14 `virtual bool decaf::util::logging::Logger::isLoggable (Level level)`
`const [virtual]`

Log a Throw Message.

If the logger is currently enabled for the Throwing message level then the given message is forwarded to all the registered output **Handler** (p. 1604) objects.

Parameters

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log virtual void throwing(const std::string& file, const int line, const std::string functionName, const std::string& message); Check if a message of the given level would actually be logged by this logger. This check is based on the Loggers effective level, which may be inherited from its parent.

level - a message logging level

Returns

true if the given message level is currently being logged.

6.410.2.15 virtual void decaf::util::logging::Logger::log (Level *level*, const std::string & *message*) [virtual]

Log a message, with no arguments.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p.1604) objects

Parameters

level the Level to log at

message the message to log

6.410.2.16 virtual void decaf::util::logging::Logger::log (LogRecord & *record*) [virtual]

Log a **LogRecord** (p.1928).

All the other logging methods in this class call through this method to actually perform any logging. Subclasses can override this single method to capture all log activity.

Parameters

record - the **LogRecord** (p.1928) to be published

6.410.2.17 virtual void decaf::util::logging::Logger::log (Level *level*, const std::string & *file*, const int *line*, const std::string & *message*, ...) [virtual]

Log a message, with the list of params that is formatted into the message string.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p.1604) objects

Parameters

level the Level to log at

file the message to log

line the line in the file

... variable length argument to format the message string.

6.410.2.18 `virtual void decaf::util::logging::Logger::log (Level level, const std::string & file, const int line, const std::string & message, lang::Exception & ex)` [virtual]

Log a message, with associated Throwable information.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 1928) which is forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 1928) thrown property, rather than the **LogRecord** (p. 1928) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 1928) message property.

Parameters

level the Level to log at.

file File that the message was logged in.

line the line number where the message was logged at.

message the message to log.

ex the Exception to log

6.410.2.19 `virtual void decaf::util::logging::Logger::removeHandler (Handler * handler)` [virtual]

Removes the specified **Handler** (p. 1604) and destroys it.

Returns silently if the given **Handler** (p. 1604) is not found.

Parameters

handler The **Handler** (p. 1604) to remove

6.410.2.20 `virtual void decaf::util::logging::Logger::setFilter (Filter * filter)` [virtual]

Gets a vector containing all the handlers that this class has been assigned to use.

Returns

a list of handlers that are used by this logger **Set** (p. 2729) a filter to control output on this **Logger** (p. 1908).

After passing the initial "level" check, the **Logger** (p. 1908) will call this **Filter** (p. 1527) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters

filter to use, can be null

6.410.2.21 `virtual void decaf::util::logging::Logger::setLevel (Level level)`
`[inline, virtual]`

Set (p. 2729) the log level specifying which message levels will be logged by this logger.

Message levels lower than this value will be discarded. The level value `Level.OFF` can be used to turn off logging.

If the new level is the Null Level, it means that this node should inherit its level from its nearest ancestor with a specific (non-null) level value.

Parameters

level new Level value

6.410.2.22 `virtual void decaf::util::logging::Logger::setUseParentHandlers (bool value)`
`[inline, virtual]`

pecify whether or not this logger should send its output to it's parent **Logger** (p. 1908).

This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters

value True is output is to be written to the parent

6.410.2.23 `virtual void decaf::util::logging::Logger::warn (const std::string & file,
const int line, const std::string functionName, const std::string &
message)` `[virtual]`

Log a warn Level Log.

If the logger is currently enabled for the warn message level then the given message is forwarded to all the registered output **Handler** (p. 1604) objects.

Parameters

file the file name where the log was generated

line the line number where the log was generated

functionName name of the function that logged this

message the message to log

```
#include <src/main/activemq/io/LoggingInputStream.h>
```

Inheritance diagram for `activemq::io::LoggingInputStream`:

Public Member Functions

- **LoggingInputStream** (`decaf::io::InputStream *inputStream`, `bool own=false`)
Creates a DataInputStream that uses the specified underlying InputStream.
- virtual **~LoggingInputStream** ()
- virtual `int read ()` throw (`decaf::io::IOException`)
Reads a single byte from the buffer.
- virtual `int read (unsigned char *buffer, std::size_t offset, std::size_t bufferSize)` throw (`decaf::io::IOException`, `decaf::lang::exceptions::NullPointerException`)
Reads an array of bytes from the buffer.

6.412.1 Constructor & Destructor Documentation

6.412.1.1 **activemq::io::LoggingInputStream::LoggingInputStream** (
`decaf::io::InputStream * inputStream`, `bool own = false`)

Creates a DataInputStream that uses the specified underlying InputStream.

Parameters

inputStream the InputStream instance to wrap.

own indicates if this class owns the wrapped string defaults to false.

6.412.1.2 virtual `activemq::io::LoggingInputStream::~~LoggingInputStream ()`
[virtual]

6.412.2 Member Function Documentation

6.412.2.1 virtual `int activemq::io::LoggingInputStream::read ()` throw (`decaf::io::IOException`) [virtual]

Reads a single byte from the buffer.

Blocks until data is available.

Returns

The next byte.

Exceptions

IOException thrown if an error occurs.

Reimplemented from `decaf::io::FilterInputStream` (p.1532).

6.412.2.2 virtual `int activemq::io::LoggingInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize)` throw (`decaf::io::IOException`, `decaf::lang::exceptions::NullPointerException`) [virtual]

Reads an array of bytes from the buffer.

Blocks until the requested number of bytes are available.

Parameters

buffer (out) the target buffer.

offset the position in the buffer to start at

bufferSize the size of the output buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException thrown if an error occurs.

NullPointerException if buffer is null

Reimplemented from `decaf::io::FilterInputStream` (p.1533).

6.413 activemq::io::LoggingOutputStream Class Reference

OutputStream filter that just logs the data being written.

```
#include <src/main/activemq/io/LoggingOutputStream.h>
```

Inheritance diagram for activemq::io::LoggingOutputStream:

Public Member Functions

- **LoggingOutputStream** (OutputStream *next, bool **own**=false)
Constructor.
- virtual **~LoggingOutputStream** ()
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.

6.413.1 Detailed Description

OutputStream filter that just logs the data being written.

6.413.2 Constructor & Destructor Documentation

6.413.2.1 activemq::io::LoggingOutputStream::LoggingOutputStream (OutputStream * next, bool own = false)

Constructor.

Parameters

- next** The OutputStream to wrap an write logs to.
- own** If true, this object will control the lifetime of the output stream that it encapsulates.

6.413.2.2 virtual activemq::io::LoggingOutputStream::~~LoggingOutputStream () [virtual]

6.413.3 Member Function Documentation

6.413.3.1 virtual void activemq::io::LoggingOutputStream::write (unsigned char c) throw (decaf::io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException thrown if an error occurs.

Reimplemented from `decaf::io::FilterOutputStream` (p. 1542).

6.413.3.2 `virtual void activemq::io::LoggingOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)`
[virtual]

Writes an array of bytes to the output stream.

Parameters

buffer The array of bytes to write.

offset the position in the buffer to start at

len The number of bytes from the buffer to be written.

Exceptions

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Reimplemented from `decaf::io::FilterOutputStream` (p. 1543).

The documentation for this class was generated from the following file:

- `src/main/activemq/io/LoggingOutputStream.h`

6.414 activemq::transport::logging::LoggingTransport Class Reference

A transport filter that logs commands as they are sent/received.

```
#include <src/main/activemq/transport/logging/LoggingTransport.h>
```

Inheritance diagram for `activemq::transport::logging::LoggingTransport`:

Public Member Functions

- `LoggingTransport (const Pointer< Transport > &next)`
Constructor.
- `virtual ~LoggingTransport ()`
- `virtual void onCommand (const Pointer< Command > &command)`

Event handler for the receipt of a command.

- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Sends a one-way command.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported by this class - throws an exception.

- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

Not supported by this class - throws an exception.

6.414.1 Detailed Description

A transport filter that logs commands as they are sent/received.

6.414.2 Constructor & Destructor Documentation

6.414.2.1 activemq::transport::logging::LoggingTransport::LoggingTransport (const **Pointer**< **Transport** > & *next*)

Constructor.

Parameters

next - the next **Transport** (p. 3066) in the chain

6.414.2.2 virtual activemq::transport::logging::LoggingTransport::~~LoggingTransport () [inline, virtual]

6.414.3 Member Function Documentation

6.414.3.1 virtual void activemq::transport::logging::LoggingTransport::onCommand (const **Pointer**< **Command** > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters

command - the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 3077).

6.414.3.2 `virtual void activemq::transport::logging::LoggingTransport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from `activemq::transport::TransportFilter` (p. 3077).

6.414.3.3 `virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

Exceptions

UnsupportedOperationException.

Reimplemented from `activemq::transport::TransportFilter` (p. 3079).

6.414.3.4 `virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

timeout the time to wait for a response.

Exceptions

UnsupportedOperationException.

Reimplemented from `activemq::transport::TransportFilter` (p. 3078).

6.415.1 Detailed Description

There is a single global **LogManager** (p.1923) object that is used to maintain a set of shared state about Loggers and log services. This **LogManager** (p.1923) object:

* Manages a hierarchical namespace of **Logger** (p.1908) objects. All named Loggers are stored in this namespace. * Manages a set of logging control properties. These are simple key-value pairs that can be used by Handlers and other logging objects to configure themselves.

The global **LogManager** (p.1923) object can be retrieved using `LogManager.getLogManager()`. The **LogManager** (p.1923) object is created during class initialization and cannot subsequently be changed.

TODO By default, the **LogManager** (p.1923) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default logging configuration for all uses of that JRE.

In addition, the **LogManager** (p.1923) uses two optional system properties that allow more control over reading the initial configuration:

* "decaf.logger.config.class" * "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to `JNI_CreateJavaVM`.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use `readConfiguration(InputStream)` to define properties in the **LogManager** (p.1923).

If "java.util.logging.config.class" property is not set, then the "java.util.logging.config.file" system property can be used to specify a properties file (in `java.util.Properties` format). The initial logging configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p.1923) will read its initial configuration from a properties file "lib/logging.properties" in the JRE directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ***TODO***

The global logging properties may include:

* A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p.1908) (the **Logger** (p.1908) named ""). Each class name must be for a **Handler** (p.1604) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.handlers".

This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1604) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used. * A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the logging message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1604) needs to be configured for this logger otherwise no logging messages are delivered. * A property "config". This property is intended to allow arbitrary configuration code to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary code to update the logging configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and "a.b2" are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 1923) object are multi-thread safe.

6.415.2 Constructor & Destructor Documentation

6.415.2.1 `virtual decaf::util::logging::LogManager::~~LogManager () [virtual]`

6.415.2.2 `decaf::util::logging::LogManager::LogManager () [inline, protected]`

Constructor, hidden to protect against direct instantiation.

6.415.2.3 `decaf::util::logging::LogManager::LogManager (const LogManager & manager) [protected]`

Copy Constructo.

Parameters

manager the Manager to copy

6.415.3 Member Function Documentation

6.415.3.1 `virtual void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * listener) [virtual]`

Adds a change listener for **LogManager** (p. 1923) **Properties** (p. 2494), adding the same instance of a change event listener does nothing.

Parameters

listener a PropertyChangeListener

6.415.3.2 static void decaf::util::logging::LogManager::destroy () [static]

Forcefully Delete the Instance of this **LogManager** (p.1923) even if there are outstanding references.

6.415.3.3 static LogManager* decaf::util::logging::LogManager::getInstance () [static]

Get the singleton instance.

Returns

Pointer to an instance of the Log Manager

6.415.3.4 virtual Logger* decaf::util::logging::LogManager::getLogger (const std::string & name) [virtual]

Retrieves or creates a new **Logger** (p.1908) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters

name The name of the **Logger** (p.1908).

6.415.3.5 virtual int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & names) [virtual]

Gets a list of known **Logger** (p.1908) Names from this Manager.

Parameters

names STL Vector to hold string logger names

Returns

names count of how many loggers were inserted

6.415.3.6 virtual const util::Properties& decaf::util::logging::LogManager::getProperties () const [inline, virtual]

Gets a reference to the Logging **Properties** (p.2494) used by this logger.

Returns

The **Logger** (p.1908) **Properties** (p.2494) Pointer

6.415.3.7 `virtual std::string decaf::util::logging::LogManager::getProperty (const std::string & name)` [inline, virtual]

Gets the value of a named property of this **LogManager** (p. 1923).

Parameters

name of the Property to retrieve

Returns

the value of the property

References decaf::util::Properties::getProperty().

6.415.3.8 `void decaf::util::logging::LogManager::operator= (const LogManager & manager)` [protected]

Assignment operator.

Parameters

manager the manager to assign from

6.415.3.9 `virtual void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * listener)` [virtual]

Removes a properties change listener from the **LogManager** (p. 1923).

Parameters

listener a PropertyChangeListener

6.415.3.10 `static void decaf::util::logging::LogManager::returnInstance ()` [static]

Returns a Checked out instance of this Manager.

6.415.3.11 `virtual void decaf::util::logging::LogManager::setProperties (const util::Properties & properties)` [virtual]

Sets the **Properties** (p. 2494) this **LogManager** (p. 1923) should use to configure its loggers. Once set a properties change event is fired.

Parameters

properties Pointer to read the configuration from

6.416.1.2 **virtual decaf::util::logging::LogRecord::~~LogRecord** () [inline, virtual]

6.416.2 Member Function Documentation

6.416.2.1 **Level decaf::util::logging::LogRecord::getLevel** () const [inline]

Get Level of this log record.

Returns

Level enumeration value.

6.416.2.2 **const std::string& decaf::util::logging::LogRecord::getLoggerName** () const [inline]

Gets the Source Logger's Name.

Returns

the source loggers name

6.416.2.3 **const std::string& decaf::util::logging::LogRecord::getMessage** () const [inline]

Gets the Message to be Logged.

Returns

the source logger's message

Referenced by decaf::util::logging::SimpleFormatter::formatMessage().

6.416.2.4 **const std::string& decaf::util::logging::LogRecord::getSourceFile** () const [inline]

Gets the Source Log File name.

Returns

the source loggers name

6.416.2.5 `const std::string& decaf::util::logging::LogRecord::getSourceFunction () const [inline]`

Gets the name of the function where this log was logged.

Returns

the source logger's message

6.416.2.6 `unsigned long decaf::util::logging::LogRecord::getSourceLine () const [inline]`

Gets the Source Log line number.

Returns

the source loggers line number

6.416.2.7 `unsigned long decaf::util::logging::LogRecord::getTimestamp () const [inline]`

Gets the time in mills that this message was logged.

Returns
