UTC time in milliseconds

6.416.2.8 `unsigned long decaf::util::logging::LogRecord::getTreadId () const [inline]`

Gets the Thread Id where this Log was created.

Returns

the source loggers line number

6.416.2.9 `void decaf::util::logging::LogRecord::setLevel (Level value) [inline]`

Set (p. 2729) the Level of this Log Record.

Parameters

value Level Enumeration Value

6.416.2.10 `void decaf::util::logging::LogRecord::setLoggerName (const std::string & loggerName) [inline]`

Sets the Source Logger's Name.

Parameters

loggerName the source loggers name

6.416.2.11 `void decaf::util::logging::LogRecord::setMessage (const std::string & message) [inline]`

Sets the Message to be Logged.

Parameters

message the source loggers message

6.416.2.12 `void decaf::util::logging::LogRecord::setSourceFile (const std::string & sourceFile) [inline]`

Sets the Source Log File Name.

Parameters

sourceFile the source loggers name

6.416.2.13 `void decaf::util::logging::LogRecord::setSourceFunction (const std::string & functionName) [inline]`

Sets the name of the function where this log was logged.

Parameters

functionName the source of the log

6.416.2.14 `void decaf::util::logging::LogRecord::setSourceLine (long sourceLine) [inline]`

Sets the Source Log line number.

Parameters

sourceLine the source logger's line number

6.416.2.15 `void decaf::util::logging::LogRecord::setTimestamp (long timeStamp) [inline]`

Sets the time in mills that this message was logged.

Parameters

timeStamp UTC Time in Milliseconds.

6.416.2.16 void decaf::util::logging::LogRecord::setTreadId (long *threadId*) [inline]

Sets the Thread Id where this Log was created.

Parameters

- threadId* the source logger's line number

The documentation for this class was generated from the following file:

6.417 decaf::util::logging::LogWriter Class Reference

```
#include <src/main/decaf/util/logging/LogWriter.h>
```

Public Member Functions

- **LogWriter** ()
- virtual **~LogWriter** ()
- virtual void **log** (const std::string &file, const int line, const std::string &prefix, const std::string &message)
Writes a message to the output destination.
- virtual void **log** (const std::string &message)
Writes a message to the output destination.

Static Public Member Functions

- static **LogWriter** & **getInstance** ()
Get the singleton instance.
- static void **returnInstance** ()
Returns a Checked out instance of this Writer.
- static void **destroy** ()
*Forcefully Delete the Instance of this **LogWriter** (p. 1932) even if there are outstanding references.*

6.417.1 Constructor & Destructor Documentation

6.417.1.1 `decaf::util::logging::LogWriter::LogWriter ()`

6.417.1.2 `virtual decaf::util::logging::LogWriter::~~LogWriter ()` [virtual]

6.417.2 Member Function Documentation

6.417.2.1 `static void decaf::util::logging::LogWriter::destroy ()` [static]

Forcefully Delete the Instance of this **LogWriter** (p. 1932) even if there are outstanding references.

6.417.2.2 `static LogWriter& decaf::util::logging::LogWriter::getInstance ()`
[static]

Get the singleton instance.

6.417.2.3 `virtual void decaf::util::logging::LogWriter::log (const std::string & message)` [virtual]

Writes a message to the output destination.

Parameters

message

6.417.2.4 `virtual void decaf::util::logging::LogWriter::log (const std::string & file,
const int line, const std::string & prefix, const std::string & message
)` [virtual]

Writes a message to the output destination.

Parameters

file

line

prefix

message

6.417.2.5 `static void decaf::util::logging::LogWriter::returnInstance ()` [static]

Returns a Checked out instance of this Writer.

The documentation for this class was generated from the following file:

6.418 decaf::lang::Long Class Reference

#include <src/main/decaf/lang/Long.h>

Inheritance diagram for decaf::lang::Long:

Public Member Functions

- **Long** (long long value)
- **Long** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Long** ()
- virtual int **compareTo** (const **Long** &l) const
*Compares this **Long** (p. 1934) instance with another.*
- bool **equals** (const **Long** &l) const
- virtual bool **operator==** (const **Long** &l) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Long** &l) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const long long &l) const
*Compares this **Long** (p. 1934) instance with another.*
- bool **equals** (const long long &l) const
- virtual bool **operator==** (const long long &l) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const long long &l) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.

- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)
Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static **Long decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Long** (p. 1934).*
- static long long **highestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static long long **lowestOneBit** (long long value)
Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (long long value)
Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.
- static int **numberOfTrailingZeros** (long long value)
Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.
- static long long **parseLong** (const std::string &value) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal long.
- static long long **parseLong** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Long** (p. 1934) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*
- static long long **reverseBytes** (long long value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.
- static long long **reverse** (long long value)
Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.
- static long long **rotateLeft** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

- static long long **rotateRight** (long long value, int distance)
Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.
- static int **signum** (long long value)
Returns the signum function of the specified value.
- static std::string **toString** (long long value)
Converts the long to a String representation.
- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)
Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (long long value)
Returns a string representation of the long long argument as an unsigned long long in base 8.
- static std::string **toBinaryString** (long long value)
Returns a string representation of the long long argument as an unsigned long long in base 2.
- static **Long** **valueOf** (long long value)
*Returns a **Long** (p. 1934) instance representing the specified int value.*
- static **Long** **valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Long** (p. 1934) object holding the value given by the specified std::string.*
- static **Long** **valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Long** (p. 1934) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 64
The size in bits of the primitive long long type.
- static const long long **MAX_VALUE** = (long long)0x7FFFFFFFFFFFFFFFFLL
The maximum value that the primitive type can hold.
- static const long long **MIN_VALUE** = (long long)0x800000000000000LL
The minimum value that the primitive type can hold.

6.418.1 Constructor & Destructor Documentation

6.418.1.1 `decaf::lang::Long::Long (long long value)`

Parameters

value - the primitive long long to wrap

6.418.1.2 `decaf::lang::Long::Long (const std::string & value) throw (exceptions::NumberFormatException)`

Parameters

value - the long long formatted string to wrap

Exceptions

NumberFormatException

6.418.1.3 `virtual decaf::lang::Long::~~Long () [inline, virtual]`

6.418.2 Member Function Documentation

6.418.2.1 `static int decaf::lang::Long::bitCount (long long value) [static]`

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value - the long long to count

Returns

the number of one-bits in the two's complement binary representation of the specified long long value.

6.418.2.2 `virtual unsigned char decaf::lang::Long::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.418.2.3 `virtual int decaf::lang::Long::compareTo (const long long & l) const [virtual]`

Compares this **Long** (p. 1934) instance with another.

Parameters

l - the **Integer** (p. 1652) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **long long** > (p. 1010).

6.418.2.4 virtual int decaf::lang::Long::compareTo (const Long & *l*) const
[virtual]

Compares this **Long** (p. 1934) instance with another.

Parameters

l - the **Long** (p. 1934) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.418.2.5 static Long decaf::lang::Long::decode (const std::string & *value*)
throw (exceptions::NumberFormatException) [static]

Decodes a String into a **Long** (p. 1934).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInt method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Long** (p. 1934) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.418.2.6 `virtual double decaf::lang::Long::doubleValue () const [inline, virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.418.2.7 `bool decaf::lang::Long::equals (const Long & l) const [inline]`

Parameters

l - the **Long** (p. 1934) object to compare against.

Returns

true if the two **Integer** (p. 1652) Objects have the same value.

6.418.2.8 `bool decaf::lang::Long::equals (const long long & l) const [inline, virtual]`

Parameters

l - the **Long** (p. 1934) object to compare against.

Returns

true if the two **Integer** (p. 1652) Objects have the same value.

Implements **decaf::lang::Comparable< long long >** (p. 1010).

6.418.2.9 `virtual float decaf::lang::Long::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.418.2.10 `static long long decaf::lang::Long::highestOneBit (long long value) [static]`

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.418.2.11 virtual int decaf::lang::Long::intValue () const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.418.2.12 virtual long long decaf::lang::Long::longValue () const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.418.2.13 static long long decaf::lang::Long::lowestOneBit (long long value) [static]

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value - the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.418.2.14 static int decaf::lang::Long::numberOfLeadingZeros (long long value) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

* floor(log2(x)) = 63 - numberOfLeadingZeros(x) * ceil(log2(x)) = 64 - numberOfLeadingZeros(x - 1)

Parameters

value - the long long to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.418.2.15 `static int decaf::lang::Long::numberOfTrailingZeros (long long value)`
[static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value - the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.418.2.16 `virtual bool decaf::lang::Long::operator< (const long long & l) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< long long >` (p. 1011).

6.418.2.17 `virtual bool decaf::lang::Long::operator< (const Long & l) const`
[inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.418.2.18 `virtual bool decaf::lang::Long::operator==(const Long & l) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.418.2.19 `virtual bool decaf::lang::Long::operator==(const long long & l)`
`const` [inline, virtual]

Compares equality between this object and the one passed.

Parameters

l - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< long long >` (p.1011).

6.418.2.20 `static long long decaf::lang::Long::parseLong (const std::string &`
`value) throw (exceptions::NumberFormatException)` [static]

Parses the string argument as a signed decimal long.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseLong(java.lang.String, int)` method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters

value - String to parse

Returns

long long value

Exceptions

NumberFormatException on invalid string value

6.418.2.21 `static long long decaf::lang::Long::parseLong (const std::string &
 value, int radix) throw (exceptions::NumberFormatException)
 [static]`

Returns a **Long** (p. 1934) object holding the value extracted from the specified string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the `parseLong(std::string, int)` method. The result is a **Long** (p. 1934) object that represents the long long value specified by the string.

Parameters

value - String to parse

radix - the base encoding of the string

Returns

long long value

Exceptions

NumberFormatException on invalid string value

6.418.2.22 `static long long decaf::lang::Long::reverse (long long value) [static]`

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters

value - the value whose bits are to be reversed

Returns

the reversed bits long long.

6.418.2.23 `static long long decaf::lang::Long::reverseBytes (long long value)
 [static]`

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters

value - the long long whose bytes we are to reverse

Returns

the reversed long long.

6.418.2.24 static long long decaf::lang::Long::rotateLeft (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value - the long long to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.418.2.25 static long long decaf::lang::Long::rotateRight (long long *value*, int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters

value - the long long to be inspected

distance - the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.418.2.26 virtual short decaf::lang::Long::shortValue () const [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.418.2.27 static int decaf::lang::Long::signum (long long *value*) [static]

Returns the signum function of the specified value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value - the long long to be inspected

Returns

the signum function of the specified long long value.

6.418.2.28 static std::string decaf::lang::Long::toBinaryString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 2.

The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters

value - the long long to be translated to a binary string

Returns

the unsigned long long value as a binary string

6.418.2.29 static std::string decaf::lang::Long::toHexString (long long *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

0123456789abcdef

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters

value - the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.418.2.30 `static std::string decaf::lang::Long::toOctalString (long long value)`
 [static]

Returns a string representation of the long long argument as an unsigned long long in base 8.

The unsigned long long value is the argument plus 2^{32} if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

01234567

Parameters

value - the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.418.2.31 `static std::string decaf::lang::Long::toString (long long value)`
 [static]

Converts the long to a String representation.

Parameters

value The long to convert to a std::string.

Returns

string representation

6.418.2.32 `std::string decaf::lang::Long::toString () const`

Returns

this **Long** (p. 1934) Object as a String Representation

6.418.2.33 `static std::string decaf::lang::Long::toString (long long value, int`
 `radix) [static]`

6.418.2.34 `static Long decaf::lang::Long::valueOf (long long value) [inline,`
 `static]`

Returns a **Long** (p. 1934) instance representing the specified int value.

Parameters

value - the long long to wrap

Returns

the new **Integer** (p. 1652) object wrapping value.

6.418.2.35 `static Long decaf::lang::Long::valueOf (const std::string & value, int radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Long** (p.1934) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the `parseLong(std::string, int)` method. The result is a **Long** (p.1934) object that represents the long long value specified by the string.

Parameters

value - std::string to parse as base (radix)
radix - base of the string to parse.

Returns

new **Long** (p.1934) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid long long.

6.418.2.36 `static Long decaf::lang::Long::valueOf (const std::string & value) throw (exceptions::NumberFormatException) [static]`

Returns a **Long** (p.1934) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the `parseLong(std::string)` method. The result is a **Integer** (p.1652) object that represents the long long value specified by the string.

Parameters

value - std::string to parse as base 10

Returns

new **Long** (p.1934) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal long long.

6.418.3 Field Documentation

6.418.3.1 `const long long decaf::lang::Long::MAX_VALUE = (long long)0x7FFFFFFFFFFFFFFFFFLL [static]`

The maximum value that the primitive type can hold.

6.418.3.2 `const long long decaf::lang::Long::MIN_VALUE = (long long)0x8000000000000000LL [static]`

The minimum value that the primitive type can hold.

6.418.3.3 const int decaf::lang::Long::SIZE = 64 [static]

The size in bits of the primitive long long type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Long.h**

6.419 decaf::internal::nio::LongArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/LongArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::LongArrayBuffer:

Public Member Functions

- **LongArrayBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **IntArrayBuffer** (p. 1634) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **LongArrayBuffer** (long long *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **LongArrayBuffer** (p. 1948) object that wraps the given array.*
- **LongArrayBuffer** (ByteArrayPerspective &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.*
- **LongArrayBuffer** (const LongArrayBuffer &other)
*Create a **LongArrayBuffer** (p. 1948) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.*
- virtual ~**LongArrayBuffer** ()
- virtual long long * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the long long array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual LongBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only long long buffer that shares this buffer's content.
- virtual LongBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.

- virtual LongBuffer * **duplicate** ()
Creates a new long long buffer that shares this buffer's content.
- virtual long long **get** () throw (decaf::nio::BufferUnderflowException)
Relative get method.
- virtual long long **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible long long array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual LongBuffer & **put** (long long value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual LongBuffer & **put** (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual LongBuffer * **slice** () const
Creates a new LongBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteArrayBuffer** (p. 806) as Read-Only.*

6.419.1 Constructor & Destructor Documentation

6.419.1.1 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **IntArrayBuffer** (p. 1634) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

6.419.1.2 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)`

Creates a **LongArrayBuffer** (p.1948) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap

offset - the position that is this buffers start pos.

capacity - size of the array, this is the limit we read and write to.

readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.419.1.3 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)`

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p.843) and start at the given offset.

The capacity and limit of the new **LongArrayBuffer** (p.1948) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p.843) to wrap

offset - the offset into array where the buffer starts

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.419.1.4 `decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const LongArrayBuffer & other)`

Create a **LongArrayBuffer** (p.1948) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p.843) and when changes are made to that data it is reflected in both.

Parameters

other - the **LongArrayBuffer** (p.1948) this one is to mirror.

6.419.1.5 `virtual decaf::internal::nio::LongArrayBuffer::~~LongArrayBuffer ()`
[virtual]

6.419.2 Member Function Documentation

6.419.2.1 `virtual long long* decaf::internal::nio::LongArrayBuffer::array ()`
`throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::LongBuffer` (p. 1958).

6.419.2.2 `virtual std::size_t decaf::internal::nio::LongArrayBuffer::arrayOffset (`
`) throw (decaf::lang::exceptions::UnsupportedOperationException,`
`decaf::nio::ReadOnlyBufferException)` [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements `decaf::nio::LongBuffer` (p. 1959).

6.419.2.3 `virtual LongBuffer* de-`
`caf::internal::nio::LongArrayBuffer::asReadOnlyBuffer (`
`) const` [virtual]

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 1959).

6.419.2.4 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this LongBuffer

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1959).

6.419.2.5 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate () [virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long Buffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1960).

6.419.2.6 `virtual long long decaf::internal::nio::LongArrayBuffer::get () throw (decaf::nio::BufferUnderflowException) [virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements `decaf::nio::LongBuffer` (p. 1962).

6.419.2.7 `virtual long long decaf::internal::nio::LongArrayBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [virtual]`

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the Buffer where the long long is to be read

Returns

the long long that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements `decaf::nio::LongBuffer` (p. 1961).

6.419.2.8 `virtual bool decaf::internal::nio::LongArrayBuffer::hasArray () const [inline, virtual]`

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements `decaf::nio::LongBuffer` (p. 1962).

6.419.2.9 `virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly () const`
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.419.2.10 `virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put`
`(std::size_t index, long long value) throw`
`(lang::exceptions::IndexOutOfBoundsException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::LongBuffer` (p. 1963).

6.419.2.11 `virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put`
`(long long value) throw (decaf::nio::BufferOverflowException,`
`decaf::nio::ReadOnlyBufferException) [virtual]`

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements `decaf::nio::LongBuffer` (p. 1963).

6.419.2.12 `virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool value)` [inline, protected, virtual]

Sets this **ByteBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.419.2.13 `virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice ()`
`const` [virtual]

Creates a new LongBuffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create LongBuffer which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1965).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/LongArrayBuffer.h`

6.420 decaf::nio::LongBuffer Class Reference

This class defines four categories of operations upon long long buffers:

```
#include <src/main/decaf/nio/LongBuffer.h>
```

Inheritance diagram for decaf::nio::LongBuffer:

Public Member Functions

- `virtual ~LongBuffer ()`
- `virtual std::string toString () const`
- `virtual long long * array ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`
Returns the long long array that backs this buffer (optional operation).
- `virtual std::size_t arrayOffset ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **LongBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only long long buffer that shares this buffer's content.
- virtual **LongBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **LongBuffer** * **duplicate** ()=0
Creates a new long long buffer that shares this buffer's content.
- virtual long long **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual long long **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **LongBuffer** & **get** (std::vector< long long > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **LongBuffer** & **get** (long long *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible long long array.
- **LongBuffer** & **put** (**LongBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the long longs remaining in the given source buffer long longo this buffer.
- **LongBuffer** & **put** (const long long *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers long longs long longo this buffer from the given source array.
- **LongBuffer** & **put** (std::vector< long long > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source long longs array long longo this buffer.
- virtual **LongBuffer** & **put** (long long value)=0 throw (BufferOverflowException, ReadOnlyBufferException)
Writes the given long longs long longo this buffer at the current position, and then increments the position.
- virtual **LongBuffer** & **put** (std::size_t index, long long value)=0 throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)
Writes the given long longs long longo this buffer at the given index.

- virtual **LongBuffer** * **slice** () const =0
*Creates a new **LongBuffer** (p. 1955) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **LongBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **LongBuffer** &value) const
- virtual bool **operator==** (const **LongBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **LongBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **LongBuffer** * **allocate** (std::size_t capacity)
Allocates a new Double buffer.
- static **LongBuffer** * **wrap** (long long *array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException)
*Wraps the passed buffer with a new **LongBuffer** (p. 1955).*
- static **LongBuffer** * **wrap** (std::vector< long long > &buffer)
*Wraps the passed STL long long Vector in a **LongBuffer** (p. 1955).*

Protected Member Functions

- **LongBuffer** (std::size_t capacity)
*Creates a **LongBuffer** (p. 1955) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.420.1 Detailed Description

This class defines four categories of operations upon long long buffers: o Absolute and relative get and put methods that read and write single long longs; o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array; and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.420.2 Constructor & Destructor Documentation

6.420.2.1 decaf::nio::LongBuffer::LongBuffer (std::size_t *capacity*) [protected]

Creates a **LongBuffer** (p. 1955) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size and limit of the **Buffer** (p. 741) in doubles

6.420.2.2 virtual decaf::nio::LongBuffer::~~LongBuffer () [inline, virtual]

6.420.3 Member Function Documentation

6.420.3.1 static LongBuffer* decaf::nio::LongBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Double buffer in long longs

Returns

the **LongBuffer** (p. 1955) that was allocated, caller owns.

6.420.3.2 virtual long long* decaf::nio::LongBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1951).

6.420.3.3 `virtual std::size_t decaf::nio::LongBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long along the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1951).

6.420.3.4 `virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer () const
[pure virtual]`

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1951).

6.420.3.5 `virtual LongBuffer& decaf::nio::LongBuffer::compact () throw (
ReadOnlyBufferException) [pure virtual]`

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 746) is copied to index zero, the byte at index `p + 1` is copied to index one, and so forth until the byte at index `limit()` (p. 745) - 1 is copied to index `n = limit()` (p. 745) - 1 - `p`. The buffer's position is then set to `n+1` and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **LongBuffer** (p. 1955)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1952).

6.420.3.6 virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & value) const [virtual]

Compares this object with the specified object for order.

Returns a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative long longeger, zero, or a positive long longeger as this object is less than, equal to, or greater than the specified object.

6.420.3.7 virtual LongBuffer* decaf::nio::LongBuffer::duplicate () [pure virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1952).

6.420.3.8 virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & value) const [virtual]**Returns**

true if this value is considered equal to the passed value.

6.420.3.9 LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > *buffer*) throw (BufferUnderflowException)

Relative bulk get method.

This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length long longs remaining in this buffer

6.420.3.10 virtual long long decaf::nio::LongBuffer::get (std::size_t *index*) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the long long is to be read

Returns

the long long that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1953).

6.420.3.11 LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferUnderflowException, lang::exceptions::NullPointerException)

Relative bulk get method.

This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies length long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer - long longer to an allocated buffer to fill
offset - position in the buffer to start filling
length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length long longs remaining in this buffer
NullPointerException longerException if the passed buffer is null.

6.420.3.12 `virtual long long decaf::nio::LongBuffer::get () throw (BufferUnderflowException) [pure virtual]`

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::LongArrayBuffer** (p.1953).

6.420.3.13 `virtual bool decaf::nio::LongBuffer::hasArray () const [pure virtual]`

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p.1953).

6.420.3.14 `virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.420.3.15 `virtual bool decaf::nio::LongBuffer::operator==(const LongBuffer & value) const` [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.420.3.16 `virtual LongBuffer& decaf::nio::LongBuffer::put (long long value) throw (BufferOverflowException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value - the long longs value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::LongArrayBuffer` (p.1954).

6.420.3.17 `virtual LongBuffer& decaf::nio::LongBuffer::put (std::size_t index, long long value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException)` [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data

value - the long longs to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1954).

6.420.3.18 **LongBuffer& decaf::nio::LongBuffer::put (const long long * *buffer*, std::size_t *offset*, std::size_t *length*) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)**

This method transfers long longs long longo this buffer from the given source array.

If there are more long longs to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no long longs are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `length` bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by `length`.

Parameters

buffer- The array from which long longs are to be read

offset- The offset within the array of the first long long to be read;

length - The number of long longs to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.420.3.19 **LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > & *buffer*) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source long longs array long longo this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters

buffer - The buffer whose contents are copied to this **LongBuffer** (p. 1955)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.420.3.20 `LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & src
) throw (BufferOverflowException, ReadOnlyBufferException,
lang::exceptions::IllegalArgumentException)`

This method transfers the long longs remaining in the given source buffer long longo this buffer.

If there are more long longs remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 746), then no long longs are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `n = src.remaining()` long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src - the buffer to take long longs from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining long longs in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.420.3.21 `virtual LongBuffer* decaf::nio::LongBuffer::slice () const [pure
virtual]`

Creates a new **LongBuffer** (p. 1955) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **LongBuffer** (p. 1955) which the caller owns.

Implemented in `decaf::internal::nio::LongArrayBuffer` (p. 1955).

6.420.3.22 virtual std::string decaf::nio::LongBuffer::toString () const [virtual]**Returns**

a std::string describing this object

6.420.3.23 static LongBuffer* decaf::nio::LongBuffer::wrap (long long
* *array*, std::size_t *offset*, std::size_t *length*) throw (
lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **LongBuffer** (p. 1955).

The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **LongBuffer** (p. 1955) that is backed by buffer, caller owns.

6.420.3.24 static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long
> & *buffer*) [static]

Wraps the passed STL long long Vector in a **LongBuffer** (p. 1955).

The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **LongBuffer** (p. 1955) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

6.421 activemq::util::LongSequenceGenerator Class Reference

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

```
#include <src/main/activemq/util/LongSequenceGenerator.h>
```

Public Member Functions

- **LongSequenceGenerator** ()
- virtual **~LongSequenceGenerator** ()
- long long **getNextSequenceId** ()
- long long **getLastSequenceId** ()

6.421.1 Detailed Description

This class is used to generate a sequence of long long values that are incremented each time a new value is requested. This class is thread safe so the ids can be requested in different threads safely.

6.421.2 Constructor & Destructor Documentation

6.421.2.1 **activemq::util::LongSequenceGenerator::LongSequenceGenerator** ()

6.421.2.2 **virtual**
activemq::util::LongSequenceGenerator::~~LongSequenceGenerator ()
[inline, virtual]

6.421.3 Member Function Documentation

6.421.3.1 **long long activemq::util::LongSequenceGenerator::getLastSequenceId** ()

Returns

the last id that was generated.

6.421.3.2 **long long activemq::util::LongSequenceGenerator::getNextSequenceId** ()

Returns

the next id in the sequence.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/LongSequenceGenerator.h`

6.422 decaf::net::MalformedURLException Class Reference

```
#include <src/main/decaf/net/MalformedURLException.h>
```

Inheritance diagram for decaf::net::MalformedURLException:

Public Member Functions

- **MalformedURLException** () throw ()
Default Constructor.
- **MalformedURLException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **MalformedURLException** (const **MalformedURLException** &ex) throw ()
Copy Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **MalformedURLException** (const std::exception *cause) throw ()
Constructor.
- **MalformedURLException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **MalformedURLException** * clone () const
Clones this exception.
- virtual ~**MalformedURLException** () throw ()

6.422.1 Constructor & Destructor Documentation

6.422.1.1 decaf::net::MalformedURLException::MalformedURLException () throw () [inline]

Default Constructor.

6.422.1.2 decaf::net::MalformedURLException::MalformedURLException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.422.1.3 `decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.422.1.4 `decaf::net::MalformedURLException::MalformedURLException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.422.1.5 `decaf::net::MalformedURLException::MalformedURLException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.422.1.6 `decaf::net::MalformedURLException::MalformedURLException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.422.1.7 virtual decaf::net::MalformedURLException::~~MalformedURLException
() throw () [inline, virtual]

6.422.2 Member Function Documentation

6.422.2.1 virtual MalformedURLException* decaf::net::MalformedURLException::clone () const
[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1709).

The documentation for this class was generated from the following file:

- src/main/decaf/net/MalformedURLException.h

6.423 decaf::util::Map< K, V, COMPARATOR > Class Template Reference

Map (p. 1970) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

```
#include <src/main/decaf/util/Map.h>
```

Inheritance diagram for decaf::util::Map< K, V, COMPARATOR >:

Data Structures

- class **Entry**

Public Member Functions

- **Map** ()
Default constructor - does nothing.
- virtual ~**Map** ()
- virtual bool **equals** (const **Map** &source) const =0
Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (const **Map** &source)=0
Copies the content of the source map into this map.

- virtual void **clear** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
- virtual bool **containsKey** (const K &key) const =0
Indicates whether or this map contains a value for the given key.
- virtual bool **containsValue** (const V &value) const =0
Indicates whether or this map contains a value for the given value, i.e.
- virtual bool **isEmpty** () const =0
- virtual std::size_t **size** () const =0
- virtual V & **get** (const K &key)=0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1970).*
- virtual const V & **get** (const K &key) const =0 throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1970).*
- virtual void **put** (const K &key, const V &value)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
Sets the value for the specified key.
- virtual void **putAll** (const Map< K, V, COMPARATOR > &other)=0 throw (decaf::lang::exceptions::UnsupportedOperationException)
*Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.*
- virtual V **remove** (const K &key)=0 throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)
Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.
- virtual std::vector< K > **keySet** () const =0
*Returns a **Set** (p. 2729) view of the mappings contained in this map.*
- virtual std::vector< V > **values** () const =0

6.423.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::Map< K, V, COMPARATOR >
```

Map (p. 1970) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

6.423.2 Constructor & Destructor Documentation

6.423.2.1 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> decaf::util::Map< K, V, COMPARATOR >::Map ()
[inline]`

Default constructor - does nothing.

6.423.2.2 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual decaf::util::Map< K, V, COMPARATOR >::~~Map
() [inline, virtual]`

6.423.3 Member Function Documentation

6.423.3.1 `template<typename K, typename V, typename
COMPARATOR = std::less<K>> virtual void decaf::util::Map<
K, V, COMPARATOR >::clear () throw (
decaf::lang::exceptions::UnsupportedOperationException) [pure
virtual]`

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1029), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2850), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1029), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1029), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1029), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1029), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1029), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1029), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2850), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2850), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2850), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2850), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2850), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2850).

6.423.3.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsKey (const K & key) const [pure virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

key The key to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p.1030), `decaf::util::StlMap< K, V, COMPARATOR >` (p.2850), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p.1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p.1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p.1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p.1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p.1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p.1030), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p.2850), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p.2850), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p.2850), `decaf::util::StlMap< std::string, cms::Queue * >` (p.2850), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p.2850), `decaf::util::StlMap< std::string, CachedConsumer * >` (p.2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p.2850), `decaf::util::StlMap< std::string, TransportFactory * >` (p.2850), `decaf::util::StlMap< int, Pointer< Command > >` (p.2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p.2850), `decaf::util::StlMap< std::string, CachedProducer * >` (p.2850), and `decaf::util::StlMap< std::string, cms::Topic * >` (p.2850).

6.423.3.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsValue (const V & value) const [pure virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1030), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2850), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1030), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1030), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2850), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2850), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2850), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2850), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2850), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2850), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2850), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2850).

6.423.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source)` [pure virtual]

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source The source object to copy from.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1031), and `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2851).

6.423.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const` [pure virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source - `Map` (p. 1970) to compare to this one.

Returns

true if the **Map** (p. 1970) passed is equal in value to this one.

Implemented in **decaf::util::concurrent::ConcurrentStlMap**< **K**, **V**, **COMPARATOR** > (p. 1031), and **decaf::util::StlMap**< **K**, **V**, **COMPARATOR** > (p. 2851).

6.423.3.6 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual V& decaf::util::Map< K, V, COMPARATOR >::get
(const K & key) throw (lang::exceptions::NoSuchElementException)
[pure virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** is thrown.

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implemented in **decaf::util::concurrent::ConcurrentStlMap**< **K**, **V**, **COMPARATOR** > (p. 1031), **decaf::util::StlMap**< **K**, **V**, **COMPARATOR** > (p. 2851), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **TransactionId** >, **Pointer**< **TransactionState** >, **TransactionId::COMPARATOR** > (p. 1031), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **MessageId** >, **Pointer**< **Message** >, **MessageId::COMPARATOR** > (p. 1031), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConnectionId** >, **Pointer**< **ConnectionState** >, **ConnectionId::COMPARATOR** > (p. 1031), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ConsumerId** >, **Pointer**< **ConsumerState** >, **ConsumerId::COMPARATOR** > (p. 1031), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **SessionId** >, **Pointer**< **SessionState** >, **SessionId::COMPARATOR** > (p. 1031), **decaf::util::concurrent::ConcurrentStlMap**< **Pointer**< **ProducerId** >, **Pointer**< **ProducerState** >, **ProducerId::COMPARATOR** > (p. 1031), **decaf::util::StlMap**< **cms::Session** *, **SessionResolver** * > (p. 2851), **decaf::util::StlMap**< **std::string**, **WireFormatFactory** * > (p. 2851), **decaf::util::StlMap**< **std::string**, **PrimitiveValueNode** > (p. 2851), **decaf::util::StlMap**< **std::string**, **cms::Queue** * > (p. 2851), **decaf::util::StlMap**< **Pointer**< **commands::ProducerId** >, **ActiveMQProducer** *, **commands::ProducerId::COMPARATOR** > (p. 2851), **decaf::util::StlMap**< **std::string**, **CachedConsumer** * > (p. 2851), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **ActiveMQConsumer** *, **commands::ConsumerId::COMPARATOR** > (p. 2851), **decaf::util::StlMap**< **std::string**, **TransportFactory** * > (p. 2851), **decaf::util::StlMap**< **int**, **Pointer**< **Command** > > (p. 2851), **decaf::util::StlMap**< **Pointer**< **commands::ConsumerId** >, **Dispatcher** *, **commands::ConsumerId::COMPARATOR** > (p. 2851), **decaf::util::StlMap**< **std::string**, **CachedProducer** * > (p. 2851), and **decaf::util::StlMap**< **std::string**, **cms::Topic** * > (p. 2851).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`, and `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals()`.

6.423.3.7 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual const V& decaf::util::Map< K, V,
COMPARATOR >::get (const K & key) const throw (
lang::exceptions::NoSuchElementException) [pure virtual]`

Gets the value mapped to the specified key in the **Map** (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1032), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2852), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1032), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2852), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2852), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2852), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2852), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2852), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2852).

6.423.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::isEmpty () const [pure virtual]`

Returns

if the **Map** (p. 1970) contains any element or not, TRUE or FALSE

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1032), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2852), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1032), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1032), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2852), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2852), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2852), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2852), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2852), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2852), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2852), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2852).

6.423.3.9 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::Map< K, V, COMPARATOR >::keySet () const [pure virtual]`

Returns a **Set** (p. 2729) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1718), **Set.remove** (p. 127), **removeAll**, **retainAll** and **clear** operations. It does not support the **add** or **addAll** operations.

Returns

the entire set of keys in this map as a `std::vector`.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1032), `decaf::util::StlMap< K, V, COMPARATOR >`

(p. 2852), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 1032), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1032), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1032), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1032), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1032), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1032), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2852), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2852), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2852), decaf::util::StlMap< std::string, cms::Queue * > (p. 2852), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2852), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2852), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2852), decaf::util::StlMap< std::string, TransportFactory * > (p. 2852), decaf::util::StlMap< int, Pointer< Command > > (p. 2852), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2852), decaf::util::StlMap< std::string, CachedProducer * > (p. 2852), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2852).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals().

```
6.423.3.10 template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR
>::put ( const K & key, const V & value ) throw (
decaf::lang::exceptions::UnsupportedOperationException ) [pure
virtual]
```

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1034), decaf::util::StlMap< K, V, COMPARATOR > (p. 2854), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR

> (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1034), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2854), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2854), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2854), decaf::util::StlMap< std::string, cms::Queue * > (p. 2854), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2854), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, TransportFactory * > (p. 2854), decaf::util::StlMap< int, Pointer< Command > > (p. 2854), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, CachedProducer * > (p. 2854), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2854).

6.423.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) throw (decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.

Parameters

other A **Map** (p. 1970) instance whose elements are to all be inserted in this **Map** (p. 1970).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1034), decaf::util::StlMap< K, V, COMPARATOR > (p. 2854), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1034), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1034), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2854), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2854), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2854), decaf::util::StlMap< std::string, cms::Queue * > (p. 2854),

decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2854), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, TransportFactory * > (p. 2854), decaf::util::StlMap< int, Pointer< Command > > (p. 2854), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2854), decaf::util::StlMap< std::string, CachedProducer * > (p. 2854), and decaf::util::StlMap< std::string, cms::Topic * > (p. 2854).

6.423.3.12 template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual V decaf::util::Map< K, V,
COMPARATOR >::remove (const K & *key*) throw
(decaf::lang::exceptions::NoSuchElementException,
decaf::lang::exceptions::UnsupportedOperationException) [pure
virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the Map (p. 1970).

UnsupportedOperationException if this map is unmodifiable.

Implemented in decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > (p. 1036), decaf::util::StlMap< K, V, COMPARATOR > (p. 2855), decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR > (p. 1036), decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR > (p. 1036), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR > (p. 1036), decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR > (p. 1036), decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1036), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1036), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2855), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2855), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2855), decaf::util::StlMap< std::string, cms::Queue * > (p. 2855), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2855), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2855), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2855),

`decaf::util::StlMap< std::string, TransportFactory * >` (p. 2855), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2855), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2855), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2855), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2855).

6.423.3.13 `template<typename K, typename V, typename COMPARATOR`
`= std::less<K>> virtual std::size_t decaf::util::Map< K, V,`
`COMPARATOR >::size () const [pure virtual]`

Returns

The number of elements (key/value pairs) in this map.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1037), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2855), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1037), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1037), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2855), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2855), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2855), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2855), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2855), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2855), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2855), `decaf::util::StlMap< std::string, TransportFactory * >` (p. 2855), `decaf::util::StlMap< int, Pointer< Command > >` (p. 2855), `decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >` (p. 2855), `decaf::util::StlMap< std::string, CachedProducer * >` (p. 2855), and `decaf::util::StlMap< std::string, cms::Topic * >` (p. 2855).

6.423.3.14 `template<typename K, typename V, typename COMPARATOR`
`= std::less<K>> virtual std::vector<V> decaf::util::Map< K, V,`
`COMPARATOR >::values () const [pure virtual]`

Returns

the entire set of values in this map as a `std::vector`.

Implemented in `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1038), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2856), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR`

6.424 cms::MapMessage Class Reference

A **MapMessage** (p.1982) object is used to send a set of name-value pairs.

```
#include <src/main/cms/MapMessage.h>
```

Inheritance diagram for cms::MapMessage:

Public Member Functions

- virtual **~MapMessage** ()
- virtual std::vector< std::string > **getMapNames** () const =0 throw (CMSEException)
*Returns an Enumeration of all the names in the **MapMessage** (p.1982) object.*
- virtual bool **itemExists** (const std::string &name) const =0 throw (CMSEException)
*Indicates whether an item exists in this **MapMessage** (p.1982) object.*
- virtual bool **getBoolean** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Boolean value of the Specified name.
- virtual void **setBoolean** (const std::string &name, bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a boolean value with the specified name into the Map.

- virtual unsigned char **getByte** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Byte value of the Specified name.

- virtual void **setByte** (const std::string &name, unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Byte value with the specified name into the Map.

- virtual std::vector< unsigned char > **getBytes** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Bytes value of the Specified name.

- virtual void **setBytes** (const std::string &name, const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Bytes value with the specified name into the Map.

- virtual char **getChar** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Char value of the Specified name.

- virtual void **setChar** (const std::string &name, char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Char value with the specified name into the Map.

- virtual double **getDouble** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Double value of the Specified name.

- virtual void **setDouble** (const std::string &name, double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Double value with the specified name into the Map.

- virtual float **getFloat** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Float value of the Specified name.

- virtual void **setFloat** (const std::string &name, float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Float value with the specified name into the Map.

- virtual int **getInt** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)

Returns the Int value of the Specified name.

- virtual void **setInt** (const std::string &name, int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Sets a Int value with the specified name into the Map.

- virtual long long **getLong** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Long value of the Specified name.
- virtual void **setLong** (const std::string &name, long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Long value with the specified name into the Map.
- virtual short **getShort** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the Short value of the Specified name.
- virtual void **setShort** (const std::string &name, short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (const std::string &name) const =0 throw (cms::MessageFormatException, cms::CMSEException)
Returns the String value of the Specified name.
- virtual void **setString** (const std::string &name, const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Sets a String value with the specified name into the Map.

6.424.1 Detailed Description

A **MapMessage** (p.1982) object is used to send a set of name-value pairs. The names are String objects, and the values are primitive data types in the Java programming language. The names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p.1982) inherits from the **Message** (p.2036) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p.1982), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p.2188) is thrown. To place the **MapMessage** (p.1982) back into a state where it can be read from and written to, call the **clearBody** method.

MapMessage (p.1982) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p.960). The String-to-primitive conversions may throw a **MessageFormatException** (p.2141) if the primitive's **valueOf()** method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X									X
byte		X	X		X	X				X
short			X		X	X				X
char				X						X
int					X	X				X
long						X				X
float							X	X		X

double								X	X
String		X	X	X		X	X	X	X
byte[]									X

6.424.2 Constructor & Destructor Documentation

6.424.2.1 virtual cms::MapMessage::~MapMessage () [inline, virtual]

6.424.3 Member Function Documentation

6.424.3.1 virtual bool cms::MapMessage::getBoolean (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Boolean value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageFormatException - if this type conversion is invalid.

6.424.3.2 virtual unsigned char cms::MapMessage::getByte (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Byte value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.3 virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSException) [pure virtual]

Returns the Bytes value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.4 virtual char cms::MapMessage::getChar (const std::string & *name*
) const throw (cms::MessageFormatException, cms::CMSEException)
[pure virtual]

Returns the Char value of the Specified name.

Parameters

name name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.5 virtual double cms::MapMessage::getDouble (const std::string & *name*
) const throw (cms::MessageFormatException, cms::CMSEException)
[pure virtual]

Returns the Double value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.6 virtual float cms::MapMessage::getFloat (const std::string & *name*
) const throw (cms::MessageFormatException, cms::CMSEException)
[pure virtual]

Returns the Float value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.7 `virtual int cms::MapMessage::getInt (const std::string & name) const
throw (cms::MessageFormatException, cms::CMSException) [pure
virtual]`

Returns the Int value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.8 `virtual long long cms::MapMessage::getLong (const std::string & name
) const throw (cms::MessageFormatException, cms::CMSException)
[pure virtual]`

Returns the Long value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.9 `virtual std::vector< std::string > cms::MapMessage::getMapNames ()
const throw (CMSException) [pure virtual]`

Returns an Enumeration of all the names in the **MapMessage** (p. 1982) object.

Returns

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1982)

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

6.424.3.10 `virtual short cms::MapMessage::getShort (const std::string & name)
const throw (cms::MessageFormatException, cms::CMSException)
[pure virtual]`

Returns the Short value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.11 virtual std::string cms::MapMessage::getString (const std::string & *name*) const throw (cms::MessageFormatException, cms::CMSEException) [pure virtual]

Returns the String value of the Specified name.

Parameters

name Name of the value to fetch from the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.424.3.12 virtual bool cms::MapMessage::itemExists (const std::string & *name*) const throw (CMSEException) [pure virtual]

Indicates whether an item exists in this **MapMessage** (p.1982) object.

Parameters

name String name of the Object in question

Returns

boolean value indicating if the name is in the map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

6.424.3.13 virtual void cms::MapMessage::setBoolean (const std::string & *name*, bool *value*) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]

Sets a boolean value with the specified name into the Map.

Parameters

name the name of the boolean

value the boolean value to set in the Map

Exceptions

CMSEException (p. 960) - if the operation fails due to an internal error.

MessageNotWritableException - if the **Message** (p.2036) is in Read-only Mode.

6.424.3.14 `virtual void cms::MapMessage::setByte (const std::string & name,
unsigned char value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Sets a Byte value with the specified name into the Map.

Parameters

name the name of the Byte

value the Byte value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.15 `virtual void cms::MapMessage::setBytes (const std::string &
name, const std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Sets a Bytes value with the specified name into the Map.

Parameters

name The name of the Bytes

value The Bytes value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.16 `virtual void cms::MapMessage::setChar (const std::string &
name, char value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Sets a Char value with the specified name into the Map.

Parameters

name the name of the Char

value the Char value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.17 `virtual void cms::MapMessage::setDouble (const std::string & name, double value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Double value with the specified name into the Map.

Parameters

name The name of the Double

value The Double value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.18 `virtual void cms::MapMessage::setFloat (const std::string & name, float value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Float value with the specified name into the Map.

Parameters

name The name of the Float

value The Float value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.19 `virtual void cms::MapMessage::setInt (const std::string & name, int value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Sets a Int value with the specified name into the Map.

Parameters

name The name of the Int

value The Int value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.

MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.20 `virtual void cms::MapMessage::setLong (const std::string & name,
long long value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Sets a Long value with the specified name into the Map.

Parameters

name The name of the Long
value The Long value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.
MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.21 `virtual void cms::MapMessage::setShort (const std::string &
name, short value) throw (cms::MessageNotWriteableException,
cms::CMSException) [pure virtual]`

Sets a Short value with the specified name into the Map.

Parameters

name The name of the Short
value The Short value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.
MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

6.424.3.22 `virtual void cms::MapMessage::setString (const std::string
& name, const std::string & value) throw (
cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Sets a String value with the specified name into the Map.

Parameters

name The name of the String
value The String value to set in the Map

Exceptions

CMSException (p. 960) - if the operation fails due to an internal error.
MessageNotWriteableException (p. 2188) - if the **Message** (p. 2036) is in Read-only Mode.

The documentation for this class was generated from the following file:

6.425 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

```
#include <src/main/decaf/util/logging/MarkBlockLogger.h>
```

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, const std::string &blockName)

Constructor - Marks Block entry.

- virtual ~**MarkBlockLogger** ()

6.425.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks. Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.425.2 Constructor & Destructor Documentation

- 6.425.2.1 decaf::util::logging::MarkBlockLogger::MarkBlockLogger (Logger *
logger, const std::string & blockName) [inline]**

Constructor - Marks Block entry.

Parameters

logger **Logger** (p.1908) to use

blockName Block name

- 6.425.2.2 virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger ()
[inline, virtual]**

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/MarkBlockLogger.h

6.426 activemq::wireformat::MarshalAware Class Reference

```
#include <src/main/activemq/wireformat/MarshalAware.h>
```

Inheritance diagram for activemq::wireformat::MarshalAware:

Public Member Functions

- virtual `~MarshalAware ()`
- virtual bool `isMarshalAware () const =0`
Determine if the class implementing this interface is really wanting to be told about marshaling.
- virtual void `beforeMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called before marshaling is started to prepare the object to be marshaled.
- virtual void `afterMarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called after marshaling is started to cleanup the object being marshaled.
- virtual void `beforeUnmarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called before unmarshaling is started to prepare the object to be unmarshaled.
- virtual void `afterUnmarshal (WireFormat *wireFormat)=0 throw (decaf::io::IOException)`
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual void `setMarshaledForm (WireFormat *wireFormat, const std::vector< char > &data)=0`
Called to set the data to this object that will contain the objects marshaled form.
- virtual `std::vector< unsigned char > getMarshaledForm (WireFormat *wireFormat)=0`
Called to get the data to this object that will contain the objects marshaled form.

6.426.1 Constructor & Destructor Documentation

- 6.426.1.1 `virtual activemq:wireformat::MarshalAware::~~MarshalAware ()`
`[inline, virtual]`

6.426.2 Member Function Documentation

- 6.426.2.1 `virtual void activemq:wireformat::MarshalAware::afterMarshal (WireFormat * wireFormat) throw (decaf::io::IOException)` `[pure virtual]`

Called after marshaling is started to cleanup the object being marshaled.

Parameters

wireFormat - the wireformat object to control marshaling

6.426.2.2 virtual void activemq::wireformat::MarshalAware::afterUnmarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

6.426.2.3 virtual void activemq::wireformat::MarshalAware::beforeMarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

wireFormat - the wireformat object to control marshaling

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 275), and `activemq::commands::ActiveMQTextMessage` (p. 526).

6.426.2.4 virtual void activemq::wireformat::MarshalAware::beforeUnmarshal (WireFormat * *wireFormat*) throw (decaf::io::IOException) [pure virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

6.426.2.5 virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm (WireFormat * *wireFormat*) [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters

wireFormat - the wireformat object to control unmarshaling

Returns

buffer that holds the objects data.

6.426.2.6 `virtual bool activemq::wireformat::MarshalAware::isMarshalAware ()` `const [pure virtual]`

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Implemented in `activemq::commands::ActiveMQMapMessage` (p. 280), `activemq::commands::BaseDataStructure` (p. 662), `activemq::commands::Message` (p. 2029), and `activemq::commands::WireFormatInfo` (p. 3158).

6.426.2.7 `virtual void activemq::wireformat::MarshalAware::setMarshaledForm (` `WireFormat * wireFormat, const std::vector< char > & data) [pure` `virtual]`

Called to set the data to this object that will contain the objects marshaled form.

Parameters

wireFormat - the wireformat object to control unmarshaling

data - vector of object binary data

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/MarshalAware.h`

6.427 `activemq::wireformat::openwire::marshal::v2::MarshallerFactory` Class Reference

Used to create marshallers for a specific version of the wire protocol.

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MarshallerFactory.h>
```

Public Member Functions

- `virtual ~MarshallerFactory ()`

6.432 decaf::lang::Math Class Reference

The class `Math` (p. 1999) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

`#include <src/main/decaf/lang/Math.h>`

Public Member Functions

- `Math ()`
- `virtual ~Math ()`

Static Public Member Functions

- static int **abs** (int value)
Returns the absolute value of an int value.
- static long long **abs** (long long value)
Returns the absolute value of an long long value.
- static float **abs** (float value)
Returns the absolute value of a float value.
- static double **abs** (double value)
Returns the absolute value of a double value.
- static double **sqrt** (double value)
Returns the arc cosine of an angle, in the range of 0.0 through pi.
- static double **pow** (double base, double exp)
Returns the value of the first argument raised to the power of the second argument.
- static short **min** (short a, short b)

Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

- static int **min** (int a, int b)
*Returns the smaller of two **int** values.*
- static int **min** (unsigned int a, unsigned int b)
*Returns the smaller of two **unsigned int** values.*
- static long long **min** (long long a, long long b)
*Returns the smaller of two **long long** values.*
- static float **min** (float a, float b)
Returns the smaller of two float values.
- static double **min** (double a, double b)
Returns the smaller of two double values.
- static short **max** (short a, short b)
*Returns the larger of two **short** values.*
- static int **max** (int a, int b)
*Returns the larger of two **int** values.*
- static long long **max** (long long a, long long b)
*Returns the larger of two **long long** values.*
- static float **max** (float a, float b)
Returns the greater of two float values.
- static double **max** (double a, double b)
Returns the greater of two double values.
- static double **ceil** (double value)
Returns the natural logarithm (base e) of a double value.
- static double **floor** (double value)
Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.
- static int **round** (float value)
Returns the closest int to the argument.
- static long long **round** (double value)
Returns the closest long long to the argument.
- static double **random** ()
Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.
- static float **signum** (float value)

Returns Euler's number e raised to the power of a double value.

- static double **signum** (double value)

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

- static double **toRadians** (double angdeg)

Returns the measure in radians of the supplied degree angle.

- static double **toDegrees** (double angrad)

Returns the measure in degrees of the supplied radian angle.

Static Public Attributes

- static const double **E**
- static const double **PI**

6.432.1 Detailed Description

The class `Math` (p. 1999) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.432.2 Constructor & Destructor Documentation

6.432.2.1 `decaf::lang::Math::Math ()` [inline]

6.432.2.2 `virtual decaf::lang::Math::~~Math ()` [inline, virtual]

6.432.3 Member Function Documentation

6.432.3.1 `static int decaf::lang::Math::abs (int value)` [inline, static]

Returns the absolute value of an int value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.432.3.2 `static long long decaf::lang::Math::abs (long long value)` [inline, static]

Returns the absolute value of an long long value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.432.3.3 static double decaf::lang::Math::abs (double *value*) [static]

Returns the absolute value of a double value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Double::longBitsToDouble** (p. 1447)(0x7fffffffffffULL & Double::doubleToLongBits(*value*))

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.432.3.4 static float decaf::lang::Math::abs (float *value*) [static]

Returns the absolute value of a float value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Float::intBitsToFloat** (p. 1549)(0x7fffffff & Float::floatToIntBits(*value*))

Parameters

value - the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.432.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value.

Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters

value the value to compute the natural log of.

Returns

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10^n for integer n , then the result is n .

Parameters

value - the value to operate on

Returns

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x , the result of $\log_{10}(x)$ is much closer to the true result of $\ln(1 + x)$ than the floating-point evaluation of $\log(1.0+x)$.

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to operate on

Returns

the the value $\ln(x + 1)$, the natural log of $x + 1$ Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of `Math.ceil(x)` is exactly the value of `-Math.floor(-x)`.

Parameters

value - the value to find the ceiling of

Returns

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.432.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

Special cases:

- o If the argument value is already equal to a mathematical integer, then the result is the same as the argument.
- o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the value to find the floor of

Returns

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.432.3.7 static float decaf::lang::Math::max (float *a*, float *b*) [static]

Returns the greater of two float values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of *a* and *b*.

6.432.3.8 static double decaf::lang::Math::max (double *a*, double *b*) [static]

Returns the greater of two double values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the larger of *a* and *b*.

6.432.3.9 `static short decaf::lang::Math::max (short a, short b) [inline, static]`

Returns the larger of two `short` values.

That is, the result the argument closer to the value of `Short::MAX_VALUE` (p.2738). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the larger of *a* and *b*.

6.432.3.10 `static int decaf::lang::Math::max (int a, int b) [inline, static]`

Returns the larger of two `int` values.

That is, the result the argument closer to the value of `Integer::MAX_VALUE` (p.1666). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the larger of *a* and *b*.

6.432.3.11 `static long long decaf::lang::Math::max (long long a, long long b) [inline, static]`

Returns the larger of two `long long` values.

That is, the result the argument closer to the value of `Long::MAX_VALUE` (p.1947). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the larger of *a* and *b*.

6.432.3.12 static int decaf::lang::Math::min (int *a*, int *b*) [inline, static]

Returns the smaller of two `int` values.

That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1666). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of `a` and `b`.

6.432.3.13 static int decaf::lang::Math::min (unsigned int *a*, unsigned int *b*) [inline, static]

Returns the smaller of two `unsigned int` values.

That is, the result the argument closer to the value of `Integer::MIN_VALUE` (p.1666). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of `a` and `b`.

6.432.3.14 static long long decaf::lang::Math::min (long long *a*, long long *b*) [inline, static]

Returns the smaller of two `long long` values.

That is, the result the argument closer to the value of `Long::MIN_VALUE` (p.1947). If the arguments have the same value, the result is that same value.

Parameters

a - an argument.

b - another argument.

Returns

the smaller of `a` and `b`.

6.432.3.15 `static float decaf::lang::Math::min (float a, float b) [static]`

Returns the smaller of two float values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.432.3.16 `static double decaf::lang::Math::min (double a, double b) [static]`

Returns the smaller of two double values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.432.3.17 `static short decaf::lang::Math::min (short a, short b) [inline, static]`

Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

- o If the argument value is already equal to a mathematical integer, then the result is the same as the argument.
- o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

- value* - the value to round to the nearest integer

Returns

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of `decaf::lang::Short::MIN_VALUE` (p. 2738). If the arguments have the same value, the result is that same value.

Parameters

- a* - an argument.
- b* - another argument.

Returns

the smaller of *a* and *b*.

6.432.3.18 `static double decaf::lang::Math::pow (double base, double exp)`
[static]

Returns the value of the first argument raised to the power of the second argument.

Special cases:

- o If the second argument is positive or negative zero, then the result is 1.0.
- o If the second argument is 1.0, then the result is the same as the first argument.
- o If the second argument is NaN, then the result is NaN.
- o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters

- base* - the base
- exp* - the exponent

Returns

the base raised to the power of *exp*.

6.432.3.19 `static double decaf::lang::Math::random ()` [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

The remainder value is mathematically equal to $f1 - f2 \times n$, where *n* is the mathematical integer closest to the exact mathematical value of the quotient $f1/f2$, and if two mathematical integers are equally close to $f1/f2$, then *n* is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

- o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN.
- o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters

- f1* - the dividend.
- f2* - the divisor

Returns

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.432.3.20 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long)Math.floor (p. 2004)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p. 1947), the result is equal to the value of **Long::MIN_VALUE** (p. 1947). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p. 1947), the result is equal to the value of **Long::MAX_VALUE** (p. 1947).

Parameters

value - the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.432.3.21 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int)Math.floor (p. 2004)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p. 1666), the result is equal to the value of **Integer::MIN_VALUE** (p. 1666). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p. 1666), the result is equal to the value of **Integer::MAX_VALUE** (p. 1666).

Parameters

value - the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.432.3.22 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.432.3.23 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value.

Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters

value - the exponent to raise e to

Returns

the value e^x , where e is the base of the natural logarithms. Returns $e^x - 1$. Note that for values of x near 0, the exact sum of $\expm1(x) + 1$ is much closer to the true result of e^x than $\exp(x)$. Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to raise $e^x - 1$

Returns

the value $e^x - 1$. Returns $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters

x - an argument

y - another argument

Returns

the $\sqrt{x^2 + y^2}$ without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0 if the argument is greater than zero, -1.0 if the argument is less than zero. Special Cases:

- o If the argument is NaN, then the result is NaN.
- o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value - the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.432.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi.

Special case:

- o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters

value - the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

- o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.
- o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

- o If the argument is NaN, then the result is NaN.
- o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the value to return the arc cosine of.

Returns

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3*pi/4. o If the first argument is negative infinity and the second argument is positive infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3*pi/4.

Parameters

y - the ordinate coordinate
x - the abscissa coordinate

Returns

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, `cbrt(-x) == -cbrt(x)`; that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the double to compute the cube root of

Returns

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters

value - an value in radians

Returns

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be $(e^x + e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters

value - the number whose hyperbolic cosine is to be found

Returns

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose sin is to be found

Returns

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be $(e^x - e^{-x})/2$ where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose hyperbolic sin is to be found

Returns

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value - the number whose tangent is to be found

Returns

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be $(e^x - e^{-x})/(e^x + e^{-x})$, in other words, $\sinh(x)/\cosh(x)$. Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters

value - the number whose hyperbolic tangent is to be found

Returns

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters

value - the value to find the square root of
the square root of the argument.

6.432.3.25 `static double decaf::lang::Math::toDegrees (double angrad)` [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters

angrad - an angle in radians

Returns

the degree measure of the angle.

6.432.3.26 `static double decaf::lang::Math::toRadians (double angdeg)` [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters

angdeg - an angle in degrees

Returns

the radian measure of the angle.

6.432.4 Field Documentation

6.432.4.1 `const double decaf::lang::Math::E` [static]

6.432.4.2 `const double decaf::lang::Math::PI` [static]

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Math.h`

6.433 activemq::util::MemoryUsage Class Reference

```
#include <src/main/activemq/util/MemoryUsage.h>
```

Inheritance diagram for `activemq::util::MemoryUsage`:

Public Member Functions

- **MemoryUsage** ()
Default Constructor.
- **MemoryUsage** (unsigned long long limit)
*Creates an instance of an **Usage** (p. 3137) monitor with a set limit.*
- virtual **~MemoryUsage** ()
- virtual void **waitForSpace** ()
*Waits forever for more space to be returned to this **Usage** (p. 3137) Manager.*
- virtual void **waitForSpace** (unsigned int timeout)
*Waits for more space to be returned to this **Usage** (p. 3137) Manager, times out when the given time span in milliseconds elapses.*
- virtual void **enqueueUsage** (unsigned long long value)
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void **increaseUsage** (unsigned long long value)
Increases the usage by the value amount.
- virtual void **decreaseUsage** (unsigned long long value)
Decreases the usage by the value amount.
- virtual bool **isFull** () const
*Returns true if this **Usage** (p. 3137) instance is full, i.e.*
- unsigned long long **getUsage** () const
Gets the current usage amount.
- void **setUsage** (unsigned long long usage)
Sets the current usage amount.
- unsigned long long **getLimit** () const
Gets the current limit amount.
- void **setLimit** (unsigned long long limit)
Sets the current limit amount.

6.433.1 Constructor & Destructor Documentation

6.433.1.1 activemq::util::MemoryUsage::MemoryUsage ()

Default Constructor.

6.433.1.2 `activemq::util::MemoryUsage::MemoryUsage (unsigned long long limit)`

Creates an instance of an `Usage` (p. 3137) monitor with a set limit.

Parameters

limit - amount of memory this manager allows.

6.433.1.3 `virtual activemq::util::MemoryUsage::~~MemoryUsage () [virtual]`

6.433.2 Member Function Documentation

6.433.2.1 `virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long value) [virtual]`

Decreases the usage by the value amount.

Parameters

value Amount of space to return to the pool

Implements `activemq::util::Usage` (p. 3137).

6.433.2.2 `virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long value) [inline, virtual]`

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

value Amount of usage in bytes to add.

Implements `activemq::util::Usage` (p. 3138).

6.433.2.3 `unsigned long long activemq::util::MemoryUsage::getLimit () const [inline]`

Gets the current limit amount.

Returns

the amount that can be used before full.

6.433.2.4 `unsigned long long activemq::util::MemoryUsage::getUsage () const [inline]`

Gets the current usage amount.

Returns

the amount of bytes currently used.

6.433.2.5 `virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long value) [virtual]`

Increases the usage by the value amount.

Parameters

value Amount of usage to add.

Implements `activemq::util::Usage` (p. 3138).

6.433.2.6 `virtual bool activemq::util::MemoryUsage::isFull () const [virtual]`

Returns true if this `Usage` (p. 3137) instance is full, i.e.

`Usage` (p. 3137) $\geq 100\%$

Implements `activemq::util::Usage` (p. 3138).

6.433.2.7 `void activemq::util::MemoryUsage::setLimit (unsigned long long limit) [inline]`

Sets the current limit amount.

Parameters

limit - The amount that can be used before full.

6.433.2.8 `void activemq::util::MemoryUsage::setUsage (unsigned long long usage) [inline]`

Sets the current usage amount.

Parameters

usage - The amount to tag as used.

6.433.2.9 `virtual void activemq::util::MemoryUsage::waitForSpace () [virtual]`

Waits forever for more space to be returned to this `Usage` (p. 3137) Manager.

Implements `activemq::util::Usage` (p. 3138).

6.433.2.10 `virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int timeout) [virtual]`

Waits for more space to be returned to this `Usage` (p. 3137) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout The time to wait for more space.

Implements **activemq::util::Usage** (p. 3138).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/MemoryUsage.h`

6.434 activemq::commands::Message Class Reference

```
#include <src/main/activemq/commands/Message.h>
```

Inheritance diagram for `activemq::commands::Message`:

Public Member Functions

- **Message** ()
- virtual **~Message** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **Message * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat AMQCPP_UNUSED) throw (decaf::io::IOException)
Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual void **setAckHandler** (const **Pointer**< **core::ActiveMQAckHandler** > &handler)

*Sets the Acknowledgment Handler that this **Message** (p. 2018) will use when the Acknowledge method is called.*

- virtual **Pointer**< **core::ActiveMQAckHandler** > **getAckHandler** () const
*Gets the Acknowledgment Handler that this **Message** (p. 2018) will use when the Acknowledge method is called.*
- virtual unsigned int **getSize** () const
Returns the Size of this message in Bytes.
- virtual bool **isExpired** () const
Returns if this message has expired, meaning that its Expiration time has elapsed.
- virtual void **onSend** ()
*Allows derived **Message** (p. 2018) classes to perform tasks before a message is sent.*
- **util::PrimitiveMap** & **getMessageProperties** ()
Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.
- const **util::PrimitiveMap** & **getMessageProperties** () const
- bool **isReadOnlyProperties** () const
*Returns if the **Message** (p. 2018) Properties Are Read Only.*
- void **setReadOnlyProperties** (bool value)
*Set the Read Only State of the **Message** (p. 2018) Properties.*
- bool **isReadOnlyBody** () const
*Returns if the **Message** (p. 2018) Body is Read Only.*
- void **setReadOnlyBody** (bool value)
*Set the Read Only State of the **Message** (p. 2018) Content.*
- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getOriginalDestination** () const

6.434.1 Constructor & Destructor Documentation

6.434.1.1 **activemq::commands::Message::Message (const Message &)** [inline, protected]

6.434.1.2 **activemq::commands::Message::Message ()**

6.434.1.3 **virtual activemq::commands::Message::~Message ()** [virtual]

6.434.2 Member Function Documentation

6.434.2.1 **virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) throw (decaf::io::IOException)** [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p.660).

6.434.2.2 **virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) throw (decaf::io::IOException)** [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters

wireFormat - the wireformat controller

Reimplemented from **activemq::commands::BaseDataStructure** (p.660).

6.434.2.3 `virtual Message* activemq::commands::Message::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 143), `activemq::commands::ActiveMQBytesMessage` (p. 170), `activemq::commands::ActiveMQMapMessage` (p. 276), `activemq::commands::ActiveMQMessage` (p. 306), `activemq::commands::ActiveMQObjectMessage` (p. 345), `activemq::commands::ActiveMQStreamMessage` (p. 425), and `activemq::commands::ActiveMQTextMessage` (p. 527).

6.434.2.4 `virtual void activemq::commands::Message::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 143), `activemq::commands::ActiveMQBytesMessage` (p. 170), `activemq::commands::ActiveMQMapMessage` (p. 276), `activemq::commands::ActiveMQMessage` (p. 306), `activemq::commands::ActiveMQObjectMessage` (p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 425), and `activemq::commands::ActiveMQTextMessage` (p. 527).

6.434.2.5 `virtual bool activemq::commands::Message::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if `DataStructure`'s are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

Reimplemented in `activemq::commands::ActiveMQBlobMessage` (p. 144), `activemq::commands::ActiveMQBytesMessage` (p. 171), `activemq::commands::ActiveMQMapMessage` (p. 276), `activemq::commands::ActiveMQMessage` (p. 306), `activemq::commands::ActiveMQMessageTemplate< T >` (p. 331), and `activemq::commands::ActiveMQObjectMessage`

(p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 426), `activemq::commands::ActiveMQTextMessage` (p. 527), `activemq::commands::ActiveMQMessageTemplate<cms::BytesMessage>` (p. 331), `activemq::commands::ActiveMQMessageTemplate<cms::MapMessage>` (p. 331), `activemq::commands::ActiveMQMessageTemplate<cms::Message>` (p. 331), `activemq::commands::ActiveMQMessageTemplate<cms::StreamMessage>` (p. 331), `activemq::commands::ActiveMQMessageTemplate<cms::TextMessage>` (p. 331), and `activemq::commands::ActiveMQMessageTemplate<cms::ObjectMessage>` (p. 331).

6.434.2.6 `virtual Pointer<core::ActiveMQAckHandler>
activemq::commands::Message::getAckHandler () const [inline,
virtual]`

Gets the Acknowledgment Handler that this **Message** (p. 2018) will use when the Acknowledge method is called.

Returns

handler `ActiveMQAckHandler` to call or `NULL` if not set

- 6.434.2.7 virtual long long activemq::commands::Message::getArrival () const [virtual]
- 6.434.2.8 virtual long long activemq::commands::Message::getBrokerInTime () const [virtual]
- 6.434.2.9 virtual long long activemq::commands::Message::getBrokerOutTime () const [virtual]
- 6.434.2.10 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () const [virtual]
- 6.434.2.11 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath () [virtual]
- 6.434.2.12 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () [virtual]
- 6.434.2.13 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster () const [virtual]
- 6.434.2.14 virtual const std::vector<unsigned char>& activemq::commands::Message::getContent () const [virtual]
- 6.434.2.15 virtual std::vector<unsigned char>& activemq::commands::Message::getContent () [virtual]
- 6.434.2.16 virtual std::string& activemq::commands::Message::getCorrelationId () [virtual]
- 6.434.2.17 virtual const std::string& activemq::commands::Message::getCorrelationId () const [virtual]
- 6.434.2.18 virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure () const [virtual]
- 6.434.2.19 virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure () [virtual]
- 6.434.2.20 virtual unsigned char activemq::commands::Message::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p. 144), **activemq::commands::ActiveMQBytesMessage** (p. 172), **activemq::commands::ActiveMQMapMessage** (p. 278), **activemq::commands::ActiveMQMessage** (p. 306), **activemq::commands::ActiveMQObjectMessage** (p. 346), **activemq::commands::ActiveMQStreamMessage** (p. 426), and **activemq::commands::ActiveMQTextMessage** (p. 528).

- 6.434.2.21 `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () const [virtual]`
- 6.434.2.22 `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination () [virtual]`
- 6.434.2.23 `virtual long long activemq::commands::Message::getExpiration () const [virtual]`
- 6.434.2.24 `virtual const std::string& activemq::commands::Message::getGroupID () const [virtual]`
- 6.434.2.25 `virtual std::string& activemq::commands::Message::getGroupID () [virtual]`
- 6.434.2.26 `virtual int activemq::commands::Message::getGroupSequence () const [virtual]`
- 6.434.2.27 `virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () const [virtual]`
- 6.434.2.28 `virtual std::vector<unsigned char>& activemq::commands::Message::getMarshaledProperties () [virtual]`
- 6.434.2.29 `virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId () const [virtual]`
- 6.434.2.30 `virtual Pointer<MessageId>& activemq::commands::Message::getMessageId () [virtual]`
- 6.434.2.31 `const util::PrimitiveMap& activemq::commands::Message::getMessageProperties () const [inline]`
- 6.434.2.32 `util::PrimitiveMap& activemq::commands::Message::getMessageProperties () [inline]`

Gets a reference to the Message's Properties object, allows the derived classes to get and set their own specific properties.

Returns

a reference to the Primitive Map that holds message properties.

- 6.434.2.33** `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () const [virtual]`
- 6.434.2.34** `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination () [virtual]`
- 6.434.2.35** `virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () [virtual]`
- 6.434.2.36** `virtual const Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId () const [virtual]`
- 6.434.2.37** `virtual unsigned char activemq::commands::Message::getPriority () const [virtual]`
- 6.434.2.38** `virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId () [virtual]`
- 6.434.2.39** `virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId () const [virtual]`
- 6.434.2.40** `virtual int activemq::commands::Message::getRedeliveryCounter () const [virtual]`
- 6.434.2.41** `virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () const [virtual]`
- 6.434.2.42** `virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo () [virtual]`
- 6.434.2.43** `virtual unsigned int activemq::commands::Message::getSize () const [virtual]`

Returns the Size of this message in Bytes.

Returns

number of bytes this message equates to.

Reimplemented in `activemq::commands::ActiveMQTextMessage` (p. 528).

- 6.434.2.44 `virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () const [virtual]`
- 6.434.2.45 `virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId () [virtual]`
- 6.434.2.46 `virtual long long activemq::commands::Message::getTimestamp () const [virtual]`
- 6.434.2.47 `virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId () const [virtual]`
- 6.434.2.48 `virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId () [virtual]`
- 6.434.2.49 `virtual std::string& activemq::commands::Message::getType () [virtual]`
- 6.434.2.50 `virtual const std::string& activemq::commands::Message::getType () const [virtual]`
- 6.434.2.51 `virtual const std::string& activemq::commands::Message::getUserID () const [virtual]`
- 6.434.2.52 `virtual std::string& activemq::commands::Message::getUserID () [virtual]`
- 6.434.2.53 `virtual bool activemq::commands::Message::isCompressed () const [virtual]`
- 6.434.2.54 `virtual bool activemq::commands::Message::isDroppable () const [virtual]`
- 6.434.2.55 `virtual bool activemq::commands::Message::isExpired () const [virtual]`

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns

true if message is expired.

- 6.434.2.56 `virtual bool activemq::commands::Message::isMarshalAware () const [inline, virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from `activemq::commands::BaseDataStructure` (p. 662).

Reimplemented in `activemq::commands::ActiveMQMapMessage` (p. 280).

6.434.2.57 `virtual bool activemq::commands::Message::isMessage () const`
[inline, virtual]

Returns

an answer of true to the `isMessage()` (p. 2030) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 600).

6.434.2.58 `virtual bool activemq::commands::Message::isPersistent () const`
[virtual]

6.434.2.59 `bool activemq::commands::Message::isReadOnlyBody () const`
[inline]

Returns if the `Message` (p. 2018) Body is Read Only.

Returns

true if `Message` (p. 2018) Content is Read Only.

6.434.2.60 `bool activemq::commands::Message::isReadOnlyProperties () const`
[inline]

Returns if the `Message` (p. 2018) Properties Are Read Only.

Returns

true if `Message` (p. 2018) Properties are Read Only.

6.434.2.61 `virtual bool activemq::commands::Message::isRecievedByDFBridge () const` [virtual]

6.434.2.62 `virtual void activemq::commands::Message::onSend ()` [inline, virtual]

Allows derived `Message` (p. 2018) classes to perform tasks before a message is sent.

Reimplemented in `activemq::commands::ActiveMQBytesMessage` (p. 172),
`activemq::commands::ActiveMQMessageTemplate< T >` (p. 338),
`activemq::commands::ActiveMQStreamMessage` (p. 426),
`activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >` (p. 338),
`activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >` (p. 338),
`activemq::commands::ActiveMQMessageTemplate< cms::Message >` (p. 338),
`activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >` (p. 338),
`activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >` (p. 338), and
`activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >` (p. 338).

6.434.2.63 `Message& activemq::commands::Message::operator= (const Message
&) [inline, protected]`

6.434.2.64 `virtual void activemq::commands::Message::setAckHandler (const
Pointer< core::ActiveMQAckHandler > & handler) [inline,
virtual]`

Sets the Acknowledgment Handler that this **Message** (p.2018) will use when the Acknowledge method is called.

Parameters

handler ActiveMQAckHandler to call

- 6.434.2.65 virtual void activemq::commands::Message::setArrival (long long *arrival*) [virtual]
- 6.434.2.66 virtual void activemq::commands::Message::setBrokerInTime (long long *brokerInTime*) [virtual]
- 6.434.2.67 virtual void activemq::commands::Message::setBrokerOutTime (long long *brokerOutTime*) [virtual]
- 6.434.2.68 virtual void activemq::commands::Message::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]
- 6.434.2.69 virtual void activemq::commands::Message::setCluster (const std::vector< decaf::lang::Pointer< BrokerId > > & *cluster*) [virtual]
- 6.434.2.70 virtual void activemq::commands::Message::setCompressed (bool *compressed*) [virtual]
- 6.434.2.71 virtual void activemq::commands::Message::setContent (const std::vector< unsigned char > & *content*) [virtual]
- 6.434.2.72 virtual void activemq::commands::Message::setCorrelationId (const std::string & *correlationId*) [virtual]
- 6.434.2.73 virtual void activemq::commands::Message::setDataStructure (const Pointer< DataStructure > & *dataStructure*) [virtual]
- 6.434.2.74 virtual void activemq::commands::Message::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.434.2.75 virtual void activemq::commands::Message::setDroppable (bool *droppable*) [virtual]
- 6.434.2.76 virtual void activemq::commands::Message::setExpiration (long long *expiration*) [virtual]
- 6.434.2.77 virtual void activemq::commands::Message::setGroupID (const std::string & *groupID*) [virtual]
- 6.434.2.78 virtual void activemq::commands::Message::setGroupSequence (int *groupSequence*) [virtual]
- 6.434.2.79 virtual void activemq::commands::Message::setMarshaledProperties (const std::vector< unsigned char > & *marshalledProperties*) [virtual]
- 6.434.2.80 virtual void activemq::commands::Message::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.434.2.81 virtual void activemq::commands::Message::setOriginalDestination (const Pointer< ActiveMQDestination > & *originalDestination*) [virtual]
- 6.434.2.82 virtual void activemq::commands::Message::setOriginalTransactionId (const Pointer< TransactionId > & *originalTransactionId*) [virtual]
- 6.434.2.83 virtual void activemq::commands::Message::setPersistent (bool *persistent*) [virtual]
- 6.434.2.84 virtual void activemq::commands::Message::setPriority (unsigned char *priority*) [virtual]

Parameters

value - true if Content should be read only.

6.434.2.87 `void activemq::commands::Message::setReadOnlyProperties (bool value) [inline]`

Set the Read Only State of the **Message** (p.2018) Properties.

Parameters

value - true if Properties should be read only.

6.434.2.88 `virtual void activemq::commands::Message::setRecievedByDFBridge (bool recievedByDFBridge) [virtual]`

6.434.2.89 `virtual void activemq::commands::Message::setRedeliveryCounter (int redeliveryCounter) [virtual]`

6.434.2.90 `virtual void activemq::commands::Message::setReplyTo (const Pointer< ActiveMQDestination > & replyTo) [virtual]`

6.434.2.91 `virtual void activemq::commands::Message::setTargetConsumerId (const Pointer< ConsumerId > & targetConsumerId) [virtual]`

6.434.2.92 `virtual void activemq::commands::Message::setTimestamp (long long timestamp) [virtual]`

6.434.2.93 `virtual void activemq::commands::Message::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`

6.434.2.94 `virtual void activemq::commands::Message::setType (const std::string & type) [virtual]`

6.434.2.95 `virtual void activemq::commands::Message::setUserID (const std::string & userID) [virtual]`

6.434.2.96 `virtual std::string activemq::commands::Message::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p.602).

Reimplemented in **activemq::commands::ActiveMQBlobMessage** (p.146), **activemq::commands::ActiveMQBytesMessage** (p.177), **activemq::commands::ActiveMQMapMessage** (p.284), **activemq::commands::ActiveMQMessage** (p.307), **activemq::commands::ActiveMQObjectMessage**

(p. 346), `activemq::commands::ActiveMQStreamMessage` (p. 432), and `activemq::commands::ActiveMQTextMessage` (p. 529).

```
6.434.2.97 virtual Pointer<Command> activemq::commands::Message::visit  
          ( activemq::state::CommandVisitor * visitor ) throw (   
            exceptions::ActiveMQException ) [virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 995).

6.435 cms::Message Class Reference

Root of all messages.

```
#include <src/main/cms/Message.h>
```

Inheritance diagram for cms::Message:

Public Member Functions

- virtual **~Message** ()
- virtual **Message * clone** () const =0
Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **acknowledge** () const =0 throw (IllegalStateException, CMSEException)
Acknowledges all consumed messages of the session of this consumed message.
- virtual void **clearBody** ()=0 throw (CMSEException)
Clears out the body of the message.
- virtual void **clearProperties** ()=0 throw (CMSEException)
Clears out the message body.
- virtual std::vector< std::string > **getPropertyNames** () const =0 throw (CMSEException)
Retrieves the property names.
- virtual bool **propertyExists** (const std::string &name) const =0 throw (CMSEException)
Indicates whether or not a given property exists.
- virtual bool **getBooleanProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a boolean property.
- virtual unsigned char **getByteProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a byte property.
- virtual double **getDoubleProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a float property.

- virtual int **getIntProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a int property.
- virtual long long **getLongProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const =0 throw (MessageFormatException, CMSEException)
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)=0 throw (MessageNotWriteableException, CMSEException)
Sets a string property.
- virtual std::string **getCMSCorrelationID** () const =0 throw (CMSEException)
Gets the correlation ID for the message.

- virtual void **setCMSCorrelationID** (const std::string &correlationId)=0 throw (CMSEception)
Sets the correlation ID for the message.
- virtual int **getCMSDeliveryMode** () const =0 throw (CMSEception)
*Gets the **DeliveryMode** (p. 1386) for this message.*
- virtual void **setCMSDeliveryMode** (int mode)=0 throw (CMSEception)
*Sets the **DeliveryMode** (p. 1386) for this message.*
- virtual const **Destination** * **getCMSDestination** () const =0 throw (CMSEception)
*Gets the **Destination** (p. 1387) object for this message.*
- virtual void **setCMSDestination** (const **Destination** *destination)=0 throw (CMSEception)
*Sets the **Destination** (p. 1387) object for this message.*
- virtual long long **getCMSExpiration** () const =0 throw (CMSEception)
Gets the message's expiration value.
- virtual void **setCMSExpiration** (long long expireTime)=0 throw (CMSEception)
Sets the message's expiration value.
- virtual std::string **getCMSMessageID** () const =0 throw (CMSEception)
The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.
- virtual void **setCMSMessageID** (const std::string &id)=0 throw (CMSEception)
Sets the message ID.
- virtual int **getCMSPriority** () const =0 throw (CMSEception)
Gets the message priority level.
- virtual void **setCMSPriority** (int priority)=0 throw (CMSEception)
Sets the Priority Value for this message.
- virtual bool **getCMSRedelivered** () const =0 throw (CMSEception)
Gets an indication of whether this message is being redelivered.
- virtual void **setCMSRedelivered** (bool redelivered)=0 throw (CMSEception)
Specifies whether this message is being redelivered.
- virtual const **cms::Destination** * **getCMSReplyTo** () const =0 throw (CMSEception)
*Gets the **Destination** (p. 1387) object to which a reply to this message should be sent.*
- virtual void **setCMSReplyTo** (const **cms::Destination** *destination)=0 throw (CMSEception)
*Sets the **Destination** (p. 1387) object to which a reply to this message should be sent.*

- virtual long long **getCMSTimestamp** () const =0 throw (CMSEException)
Gets the message timestamp.
- virtual void **setCMSTimestamp** (long long timeStamp)=0 throw (CMSEException)
Sets the message timestamp.
- virtual std::string **getCMSType** () const =0 throw (CMSEException)
Gets the message type identifier supplied by the client when the message was sent.
- virtual void **setCMSType** (const std::string &type)=0 throw (CMSEException)
Sets the message type.

6.435.1 Detailed Description

Root of all messages. As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 2036) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 2036) Interface definition.

- Stream - A **StreamMessage** (p. 2892) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 874) type the values written to a **StreamMessage** (p. 2892) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 2036) Body.
- Map - A **MapMessage** (p. 1982) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 1982) makes no guarantee on the order of the elements within the **Message** (p. 2036) body.
- Text - A **TextMessage** (p. 2974) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 874) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 2036) Properties

Message (p. 2036) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 960). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X							X
byte		X	X	X	X			X

short				X	X	X			X
int					X	X			X
long						X			X
float							X	X	X
double								X	X
String		X	X	X	X	X	X	X	X

When a **Message** (p. 2036) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered Message's properties will result in a **CMSEException** (p. 960) being thrown.

6.435.2 Constructor & Destructor Documentation

6.435.2.1 `virtual cms::Message::~Message () [inline, virtual]`

6.435.3 Member Function Documentation

6.435.3.1 `virtual void cms::Message::acknowledge () const throw (
 IllegalStateException, CMSEException) [pure virtual]`

Acknowledges all consumed messages of the session of this consumed message.

All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

IllegalStateException (p. 1621) - if this method is called on a closed session.

6.435.3.2 `virtual void cms::Message::clearBody () throw (CMSEException)
 [pure virtual]`

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.3 `virtual void cms::Message::clearProperties () throw (CMSEException)`
[pure virtual]

Clears out the message body.

Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.4 `virtual Message* cms::Message::clone () const` [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implemented in `cms::BytesMessage` (p. 877).

6.435.3.5 `virtual bool cms::Message::getBooleanProperty (const std::string & name) const throw (MessageFormatException, CMSEException)` [pure virtual]

Gets a boolean property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.6 `virtual unsigned char cms::Message::getByteProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a byte property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.7 `virtual std::string cms::Message::getCMSCorrelationID () const throw (CMSException) [pure virtual]`

Gets the correlation ID for the message.

This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns

string representation of the correlation Id

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.8 `virtual int cms::Message::getCMSDeliveryMode () const throw (CMSException) [pure virtual]`

Gets the **DeliveryMode** (p. 1386) for this message.

Returns

DeliveryMode (p. 1386) enumerated value.

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.9 `virtual const Destination* cms::Message::getCMSDestination () const throw (CMSException) [pure virtual]`

Gets the **Destination** (p. 1387) object for this message.

The CMSDestination header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its CMSDestination value must be equivalent to the value assigned when it was sent.

Returns

Destination (p. 1387) object

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.10 `virtual long long cms::Message::getCMSExpiration () const throw (CMSException) [pure virtual]`

Gets the message's expiration value.

When a message is sent, the CMSExpiration header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, CMSExpiration is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.11 `virtual std::string cms::Message::getCMSMessageID () const throw (CMSException) [pure virtual]`

The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.

When a message is sent, CMSMessageID can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A CMSMessageID is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All CMSMessageID values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used by an application. By calling the **MessageProducer.setDisableMessageID** (p. 2195) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns

provider-assigned message id

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.12 `virtual int cms::Message::getCMSPriority () const throw (CMSEException) [pure virtual]`

Gets the message priority level.

The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns

priority value

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.13 `virtual bool cms::Message::getCMSRedelivered () const throw (CMSEException) [pure virtual]`

Gets an indication of whether this message is being redelivered.

If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns

true if this message is being redelivered

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.14 `virtual const cms::Destination* cms::Message::getCMSReplyTo () const throw (CMSEException) [pure virtual]`

Gets the **Destination** (p. 1387) object to which a reply to this message should be sent.

Returns

Destination (p. 1387) to which to send a response to this message

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.15 `virtual long long cms::Message::getCMSTimestamp () const throw (CMSEException) [pure virtual]`

Gets the message timestamp.

The CMSTimestamp header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, CMSTimestamp is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the MessageProducer.setDisableMessageTimestamp method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns

the message timestamp

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.16 `virtual std::string cms::Message::getCMSType () const throw (CMSEException) [pure virtual]`

Gets the message type identifier supplied by the client when the message was sent.

Returns

the message type

See also

setCMSType (p. 2052)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.17 `virtual double cms::Message::getDoubleProperty (const std::string & name) const throw (MessageFormatException, CMSEException) [pure virtual]`

Gets a double property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.18 `virtual float cms::Message::getFloatProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a float property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.19 `virtual int cms::Message::getIntProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a int property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.20 `virtual long long cms::Message::getLongProperty (const std::string & name) const throw (MessageFormatException, CMSEException)`
[pure virtual]

Gets a long property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.21 `virtual std::vector<std::string> cms::Message::getPropertyNames ()
const throw (CMSEException) [pure virtual]`

Retrieves the property names.

Returns

The complete set of property names currently in this message.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.22 `virtual short cms::Message::getShortProperty (const std::string &
name) const throw (MessageFormatException, CMSEException)
[pure virtual]`

Gets a short property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.23 `virtual std::string cms::Message::getStringProperty (const std::string
& name) const throw (MessageFormatException, CMSEException)
[pure virtual]`

Gets a string property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSEException (p. 960) if the property does not exist.

MessageFormatException (p. 2141) - if this type conversion is invalid.

6.435.3.24 `virtual bool cms::Message::propertyExists (const std::string & name) const throw (CMSEException)` [pure virtual]

Indicates whether or not a given property exists.

Parameters

name The name of the property to look up.

Returns

True if the property exists in this message.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.25 `virtual void cms::Message::setBooleanProperty (const std::string & name, bool value) throw (MessageNotWriteableException, CMSEException)` [pure virtual]

Sets a boolean property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.26 `virtual void cms::Message::setByteProperty (const std::string & name, unsigned char value) throw (MessageNotWriteableException, CMSEException)` [pure virtual]

Sets a byte property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.27 `virtual void cms::Message::setCMSCorrelationID (const std::string & correlationId) throw (CMSException) [pure virtual]`

Sets the correlation ID for the message.

A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
- An application-specific String
- A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters

correlationId The message ID of a message being referred to.

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.28 `virtual void cms::Message::setCMSDeliveryMode (int mode) throw (CMSException) [pure virtual]`

Sets the **DeliveryMode** (p.1386) for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

mode **DeliveryMode** (p.1386) enumerated value.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.29 `virtual void cms::Message::setCMSDestination (const Destination *
destination) throw (CMSEException) [pure virtual]`

Sets the **Destination** (p.1387) object for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

destination **Destination** (p.1387) Object

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.30 `virtual void cms::Message::setCMSExpiration (long long expireTime
) throw (CMSEException) [pure virtual]`

Sets the message's expiration value.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

expireTime the message's expiration time

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.31 `virtual void cms::Message::setCMSMessageID (const std::string & id
) throw (CMSEException) [pure virtual]`

Sets the message ID.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

id the ID of the message

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.32 `virtual void cms::Message::setCMSPriority (int priority) throw (CMSEException) [pure virtual]`

Sets the Priority Value for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

priority priority value for this message

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.33 `virtual void cms::Message::setCMSRedelivered (bool redelivered) throw (CMSEException) [pure virtual]`

Specifies whether this message is being redelivered.

This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters

redelivered boolean redelivered value

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.34 `virtual void cms::Message::setCMSReplyTo (const cms::Destination * destination) throw (CMSEException) [pure virtual]`

Sets the **Destination** (p. 1387) object to which a reply to this message should be sent.

The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 2510) object or a **Topic** (p. 3014) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters

destination **Destination** (p. 1387) to which to send a response to this message

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.435.3.35 `virtual void cms::Message::setCMSTimestamp (long long timeStamp) throw (CMSException)` [pure virtual]

Sets the message timestamp.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

timeStamp integer time stamp value

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.36 `virtual void cms::Message::setCMSType (const std::string & type) throw (CMSException)` [pure virtual]

Sets the message type.

Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be valid type names for some CMS providers.

Parameters

type the message type

See also

`getCMSType` (p. 2045)

Exceptions

CMSException (p. 960) - if an internal error occurs.

6.435.3.37 `virtual void cms::Message::setDoubleProperty (const std::string & name, double value) throw (MessageNotWriteableException, CMSException)` [pure virtual]

Sets a double property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.38 `virtual void cms::Message::setFloatProperty (const std::string & name, float value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a float property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.39 `virtual void cms::Message::setIntProperty (const std::string & name, int value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a int property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.40 `virtual void cms::Message::setLongProperty (const std::string & name, long long value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a long property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.41 `virtual void cms::Message::setShortProperty (const std::string & name, short value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a short property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.435.3.42 `virtual void cms::Message::setStringProperty (const std::string & name, const std::string & value) throw (MessageNotWriteableException, CMSEException) [pure virtual]`

Sets a string property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

Exceptions

CMSEException (p. 960) - if the name is an empty string.

MessageNotWriteableException (p. 2188) - if properties are read-only

6.436 activemq::commands::MessageAck Class Reference

```
#include <src/main/activemq/commands/MessageAck.h>
```

Inheritance diagram for `activemq::commands::MessageAck`:

Public Member Functions

- **MessageAck** ()
- virtual **~MessageAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessageAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > & **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
- virtual unsigned char **getAckType** () const
- virtual void **setAckType** (unsigned char ackType)
- virtual const **Pointer**< **MessageId** > & **getFirstMessageId** () const
- virtual **Pointer**< **MessageId** > & **getFirstMessageId** ()
- virtual void **setFirstMessageId** (const **Pointer**< **MessageId** > &firstMessageId)
- virtual const **Pointer**< **MessageId** > & **getLastMessageId** () const
- virtual **Pointer**< **MessageId** > & **getLastMessageId** ()
- virtual void **setLastMessageId** (const **Pointer**< **MessageId** > &lastMessageId)
- virtual int **getMessageCount** () const
- virtual void **setMessageCount** (int messageCount)
- virtual bool **isMessageAck** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_MESSAGEACK** = 22

Protected Member Functions

- **MessageAck** (const MessageAck &)
- **MessageAck & operator=** (const MessageAck &)

Protected Attributes

- **Pointer< ActiveMQDestination > destination**
- **Pointer< TransactionId > transactionId**
- **Pointer< ConsumerId > consumerId**
- **unsigned char ackType**
- **Pointer< MessageId > firstMessageId**
- **Pointer< MessageId > lastMessageId**
- **int messageCount**

6.436.1 Constructor & Destructor Documentation

6.436.1.1 **activemq::commands::MessageAck::MessageAck** (const MessageAck &) [inline, protected]

6.436.1.2 **activemq::commands::MessageAck::MessageAck** ()

6.436.1.3 **virtual activemq::commands::MessageAck::~~MessageAck** () [virtual]

6.436.2 Member Function Documentation

6.436.2.1 **virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.436.2.2 **virtual void activemq::commands::MessageAck::copyDataStructure** (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.436.2.3 `virtual bool activemq::commands::MessageAck::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.436.2.4 `virtual unsigned char activemq::commands::MessageAck::getAckType () const [virtual]`

6.436.2.5 `virtual const Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () const [virtual]`

6.436.2.6 `virtual Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId () [virtual]`

6.436.2.7 `virtual unsigned char activemq::commands::MessageAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.436.2.8** virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination ()
[virtual]
- 6.436.2.9** virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination () const [virtual]
- 6.436.2.10** virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () const [virtual]
- 6.436.2.11** virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId () [virtual]
- 6.436.2.12** virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () const [virtual]
- 6.436.2.13** virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId () [virtual]
- 6.436.2.14** virtual int activemq::commands::MessageAck::getMessageCount () const [virtual]
- 6.436.2.15** virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () const [virtual]
- 6.436.2.16** virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId () [virtual]
- 6.436.2.17** virtual bool activemq::commands::MessageAck::isMessageAck () const [inline, virtual]

Returns

an answer of true to the `isMessageAck()` (p. 2058) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 600).

- 6.436.2.18 `MessageAck& activemq::commands::MessageAck::operator= (const MessageAck &) [inline, protected]`
- 6.436.2.19 `virtual void activemq::commands::MessageAck::setAckType (unsigned char ackType) [virtual]`
- 6.436.2.20 `virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & consumerId) [virtual]`
- 6.436.2.21 `virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.436.2.22 `virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & firstMessageId) [virtual]`
- 6.436.2.23 `virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & lastMessageId) [virtual]`
- 6.436.2.24 `virtual void activemq::commands::MessageAck::setMessageCount (int messageCount) [virtual]`
- 6.436.2.25 `virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & transactionId) [virtual]`
- 6.436.2.26 `virtual std::string activemq::commands::MessageAck::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.436.2.27 `virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.436.3 Field Documentation

- 6.436.3.1 unsigned char activemq::commands::MessageAck::ackType [protected]
- 6.436.3.2 Pointer<ConsumerId> activemq::commands::MessageAck::consumerId [protected]
- 6.436.3.3 Pointer<ActiveMQDestination> activemq::commands::MessageAck::destination [protected]
- 6.436.3.4 Pointer<MessageId> activemq::commands::MessageAck::firstMessageId [protected]
- 6.436.3.5 const unsigned char activemq::commands::MessageAck::ID_ - MESSAGEACK = 22 [static]
- 6.436.3.6 Pointer<MessageId> activemq::commands::MessageAck::lastMessageId [protected]
- 6.436.3.7 int activemq::commands::MessageAck::messageCount [protected]
- 6.436.3.8 Pointer<TransactionId> activemq::commands::MessageAck::transactionId [protected]

The documentation for this class was generated from the following file:

6.437 activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2060).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageAckMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller:

Public Member Functions

- **MessageAckMarshaller** ()
- virtual **~MessageAckMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.437.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2060). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.437.2 Constructor & Destructor Documentation

6.437.2.1 activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::MessageAckMarshaller () [inline]

6.437.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.437.3 Member Function Documentation

6.437.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.437.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::getDataSetType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.437.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 631).

6.437.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.437.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

6.437.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

6.437.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/MessageAckMarshaller.h`

6.438 `activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller` Class Reference

Marshaling code for Open Wire Format for `MessageAckMarshaller` (p. 2064).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/MessageAckMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller`:

Public Member Functions

- `MessageAckMarshaller ()`
- `virtual ~MessageAckMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.
- `virtual void tightMarshal2 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)`

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.438.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2064). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.438.2 Constructor & Destructor Documentation

6.438.2.1 **activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::MessageAckMarshaller** () [inline]

6.438.2.2 **virtual**
activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.438.3 Member Function Documentation

6.438.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.438.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.438.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.438.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.438.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

```
6.438.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.438.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/MessageAckMarshaller.h`

6.439 `activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller` Class Reference

6.439.2.2 virtual
activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.439.3 Member Function Documentation

6.439.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.439.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.439.3.3 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.439.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.439.3.5 virtual int activemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.439.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.439.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/MessageAckMarshaller.h`

6.440 activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2072).

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.440.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 2072). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.440.2 Constructor & Destructor Documentation

6.440.2.1 activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::MessageAckMarshaller () [inline]

6.440.2.2 virtual
activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.440.3 Member Function Documentation

6.440.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.440.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.440.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.440.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.440.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.440.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.440.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::~~MessageAckMarshaller () [inline, virtual]

6.441.3 Member Function Documentation

6.441.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.441.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.441.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.441.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.441.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.441.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.441.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.442 cms::MessageConsumer Class Reference

A client uses a **MessageConsumer** (p. 2080) to received messages from a destination.

#include <src/main/cms/MessageConsumer.h>

Inheritance diagram for cms::MessageConsumer:

Public Member Functions

- virtual **~MessageConsumer** ()
- virtual **Message * receive** ()=0 throw (**CMSEException**)
*Synchronously Receive a **Message** (p. 2036).*
- virtual **Message * receive** (int millisecs)=0 throw (**CMSEException**)
*Synchronously Receive a **Message** (p. 2036), time out after defined interval.*
- virtual **Message * receiveNoWait** ()=0 throw (**CMSEException**)
*Receive a **Message** (p. 2036), does not wait if there isn't a new message to read, returns NULL if nothing read.*
- virtual void **setMessageListener** (**MessageListener** *listener)=0 throw (**CMSEException**)
*Sets the **MessageListener** (p. 2165) that this class will send notifs on.*
- virtual **MessageListener * getMessageListener** () const =0 throw (**CMSEException**)
*Gets the **MessageListener** (p. 2165) that this class will send new **Message** (p. 2036) notification events to.*
- virtual std::string **getMessageSelector** () const =0 throw (cms::CMSEException)
Gets this message consumer's message selector expression.

6.442.1 Detailed Description

A client uses a **MessageConsumer** (p. 2080) to received messages from a destination. A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its **receive** methods. There are several variations of **receive** that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a **MessageListener** (p. 2165) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the **MessageListener** (p. 2165)'s **onMessage** method.

When the **MessageConsumer**'s **close** method is called the method can block while an asynchronous message delivery is in progress or until a **receive** operation completes. A blocked consumer in a **receive** call will return a Null when the **close** method is called.

MessageListener (p. 2165)

Since

1.0

6.442.2 Constructor & Destructor Documentation

6.442.2.1 **virtual cms::MessageConsumer::~MessageConsumer ()** [inline, virtual]

6.442.3 Member Function Documentation

6.442.3.1 **virtual MessageListener* cms::MessageConsumer::getMessageListener ()** **const throw (CMSEException)** [pure virtual]

Gets the **MessageListener** (p. 2165) that this class will send new **Message** (p. 2036) notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 889).

6.442.3.2 **virtual std::string cms::MessageConsumer::getMessageSelector ()** **const throw (cms::CMSEException)** [pure virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 889).

6.442.3.3 `virtual Message* cms::MessageConsumer::receive (int millisecs)
throw (CMSEException) [pure virtual]`

Synchronously Receive a **Message** (p. 2036), time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 890).

6.442.3.4 `virtual Message* cms::MessageConsumer::receive () throw (CMSEException) [pure virtual]`

Synchronously Receive a **Message** (p. 2036).

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 889).

6.442.3.5 `virtual Message* cms::MessageConsumer::receiveNoWait () throw (CMSEException) [pure virtual]`

Receive a **Message** (p. 2036), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 890).

6.442.3.6 `virtual void cms::MessageConsumer::setMessageListener (MessageListener * listener) throw (CMSEException) [pure virtual]`

Sets the **MessageListener** (p. 2165) that this class will send notifs on.

Parameters

listener The listener of messages received by this consumer.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::CachedConsumer** (p. 890).

The documentation for this class was generated from the following file:

6.444.1 Constructor & Destructor Documentation

6.444.1.1 **activemq::commands::MessageDispatch::MessageDispatch** (const **MessageDispatch** &) [inline, protected]

6.444.1.2 **activemq::commands::MessageDispatch::MessageDispatch** ()

6.444.1.3 **virtual activemq::commands::MessageDispatch::~~MessageDispatch** () [virtual]

6.444.2 Member Function Documentation

6.444.2.1 **virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.444.2.2 **virtual void activemq::commands::MessageDispatch::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.444.2.3 `virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.444.2.4 `virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId ()` [virtual]

6.444.2.5 `virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId () const` [virtual]

6.444.2.6 `virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.444.2.7 `virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination () const` [virtual]
- 6.444.2.8 `virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination ()` [virtual]
- 6.444.2.9 `virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage () const` [virtual]
- 6.444.2.10 `virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage ()` [virtual]
- 6.444.2.11 `virtual int activemq::commands::MessageDispatch::getRedeliveryCounter () const` [virtual]
- 6.444.2.12 `virtual bool activemq::commands::MessageDispatch::isMessageDispatch () const` [inline, virtual]

Returns

an answer of true to the `isMessageDispatch()` (p. 2087) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 600).

- 6.444.2.13 `MessageDispatch& activemq::commands::MessageDispatch::operator= (const MessageDispatch &)` [inline, protected]
- 6.444.2.14 `virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & consumerId)` [virtual]
- 6.444.2.15 `virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.444.2.16 `virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & message)` [virtual]
- 6.444.2.17 `virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int redeliveryCounter)` [virtual]
- 6.444.2.18 `virtual std::string activemq::commands::MessageDispatch::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 602).

```
6.444.2.19 virtual Pointer<Command> ac-
            tivemq::commands::MessageDispatch::visit (
            activemq::state::CommandVisitor * visitor ) throw (
            exceptions::ActiveMQException ) [virtual]
```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p. 995).

6.444.3 Field Documentation

6.445 activemq::core::MessageDispatchChannel Class Reference

```
#include <src/main/activemq/core/MessageDispatchChannel.h>
```

Inheritance diagram for `activemq::core::MessageDispatchChannel`:

Public Member Functions

- **MessageDispatchChannel** ()
- virtual **~MessageDispatchChannel** ()
- void **enqueue** (const **Pointer**< **MessageDispatch** > &message)
Add a Message to the Channel behind all pending message.
- void **enqueueFirst** (const **Pointer**< **MessageDispatch** > &message)
Add a message to the front of the Channel.
- bool **isEmpty** () const
- bool **isClosed** () const
- bool **isRunning** () const
- **Pointer**< **MessageDispatch** > **dequeue** (long long timeout) throw (exceptions::ActiveMQException)
Used to get an enqueued message.
- **Pointer**< **MessageDispatch** > **dequeueNoWait** ()
Used to get an enqueued message if there is one queued right now.
- **Pointer**< **MessageDispatch** > **peek** () const
Peek in the Queue and return the first message in the Channel without removing it from the channel.
- void **start** ()
Starts dispatch of messages from the Channel.
- void **stop** ()
Stops dispatch of message from the Channel.
- void **close** ()
Close this channel no messages will be dispatched after this method is called.
- void **clear** ()
Clear the Channel, all pending messages are removed.
- int **size** () const
- std::vector< **Pointer**< **MessageDispatch** > > **removeAll** ()
Remove all messages that are currently in the Channel and return them as a list of Messages.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.445.1 Constructor & Destructor Documentation

6.445.1.1 **activemq::core::MessageDispatchChannel::MessageDispatchChannel ()**

6.445.1.2 **virtual
activemq::core::MessageDispatchChannel::~~MessageDispatchChannel ()** [virtual]

6.445.2 Member Function Documentation

6.445.2.1 **void activemq::core::MessageDispatchChannel::clear ()**

Clear the Channel, all pending messages are removed.

6.445.2.2 **void activemq::core::MessageDispatchChannel::close ()**

Close this channel no messages will be dispatched after this method is called.

6.445.2.3 **Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long
long *timeout*) throw (exceptions::ActiveMQException)**

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout== -1 then it blocks until a message is received. - if timeout==0 then it tries to not block at all, it returns

a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will be consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

ActiveMQException

6.445.2.4 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait ()`

Used to get an enqueued message if there is one queued right now.

If there is no waiting message then this method returns Null.

Returns

a message if there is one in the queue.

6.445.2.5 `void activemq::core::MessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & message)`

Add a Message to the Channel behind all pending message.

Parameters

message - The message to add to the Channel.

6.445.2.6 `void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & message)`

Add a message to the front of the Channel.

Parameters

message - The Message to add to the front of the Channel.

6.445.2.7 `bool activemq::core::MessageDispatchChannel::isClosed () const [inline]`

Returns

has the Queue been closed.

6.445.2.8 `bool activemq::core::MessageDispatchChannel::isEmpty () const`

Returns

true if there are no messages in the Channel.

6.445.2.9 `bool activemq::core::MessageDispatchChannel::isRunning () const`
 `[inline]`

Returns

true if the Channel currently running and will dequeue message.

6.445.2.10 `virtual void activemq::core::MessageDispatchChannel::lock () throw (`
 `decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2932).

6.445.2.11 `virtual void activemq::core::MessageDispatchChannel::notify`
 `() throw (decaf::lang::exceptions::RuntimeException,`
 `decaf::lang::exceptions::IllegalMonitorStateException) [inline,`
 `virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2933).

6.445.2.12 `virtual void activemq::core::MessageDispatchChannel::notifyAll`
 `() throw (decaf::lang::exceptions::RuntimeException,`
 `decaf::lang::exceptions::IllegalMonitorStateException) [inline,`
 `virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2934).

6.445.2.13 `Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek () const`

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

6.445.2.14 `std::vector< Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll ()`

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

6.445.2.15 `int activemq::core::MessageDispatchChannel::size () const`

Returns

the number of Messages currently in the Channel.

6.445.2.16 `void activemq::core::MessageDispatchChannel::start ()`

Starts dispatch of messages from the Channel.

6.445.2.17 `void activemq::core::MessageDispatchChannel::stop ()`

Stops dispatch of message from the Channel.

6.445.2.18 `virtual bool activemq::core::MessageDispatchChannel::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.445.2.19 `virtual void activemq::core::MessageDispatchChannel::unlock ()
throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.445.2.20 `virtual void activemq::core::MessageDispatchChannel::wait (long
long millisecs) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2938).

6.445.2.21 `virtual void activemq::core::MessageDispatchChannel::wait
(long long millisecs, int nanos) throw
(decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

```
6.445.2.22  virtual void activemq::core::MessageDispatchChannel::wait
            (      ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

The documentation for this class was generated from the following file:

- src/main/activemq/core/MessageDispatchChannel.h

6.446 activemq::wireformat::openwire::marshal::v2::MessageDispatchMa

Class Reference

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2095).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageDispatchMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller**:

Public Member Functions

- **MessageDispatchMarshaller** ()
- virtual **~MessageDispatchMarshaller** ()
- virtual **commands::DataStructure * createObject** () const

Creates a new instance of this marshalable type.

- virtual unsigned char **getDataStructureType** () const

Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.446.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.2095). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.446.2 Constructor & Destructor Documentation

6.446.2.1 `activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]`

6.446.2.2 `virtual activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::~~MessageDispatchMarshaller () [inline, virtual]`

6.446.3 Member Function Documentation

6.446.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.446.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.446.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.446.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.446.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.446.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.446.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

6.447.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.2099). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.447.2 Constructor & Destructor Documentation

6.447.2.1 `activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::MessageDispatch`
() [inline]

6.447.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::~~MessageDispatch`
() [inline, virtual]

6.447.3 Member Function Documentation

6.447.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.447.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::getDataStructure`
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.447.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseMarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.447.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.447.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.447.3.6 virtual void activemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.447.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

6.448.2.1 `activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]`

6.448.2.2 `virtual activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::~~MessageDispatchMarshaller () [inline, virtual]`

6.448.3 Member Function Documentation

6.448.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.448.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.448.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

```

6.448.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

```

6.448.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```

6.448.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.448.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/MessageDispatchMarshaller.h`

6.449 `activemq::wireformat::openwire::marshal::v1::MessageDispatchMa` Class Reference

Marshaling code for Open Wire Format for `MessageDispatchMarshaller` (p. 2107).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/MessageDispatchMarshaller.h>
```

Write a object instance to data output stream.

6.449.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 2107). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.449.2 Constructor & Destructor Documentation

6.449.2.1 `activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::MessageDispatch`
() [inline]

6.449.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::~~MessageDispatch`
() [inline, virtual]

6.449.3 Member Function Documentation

6.449.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::createObject`
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.449.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::getDataStructure`
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.449.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseMarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

```

6.449.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

```

6.449.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```

6.449.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.449.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

6.450.1 Detailed Description

Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p.2111). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.450.2 Constructor & Destructor Documentation

6.450.2.1 `activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::MessageDispatchMarshaller () [inline]`

6.450.2.2 `virtual activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::~~MessageDispatchMarshaller () [inline, virtual]`

6.450.3 Member Function Documentation

6.450.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.450.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.450.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.450.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.450.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.450.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.450.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/MessageDispatchMarshaller.h`

6.451 `activemq::commands::MessageDispatchNotification` Class Reference

```
#include <src/main/activemq/commands/MessageDispatchNotification.h>
```

Inheritance diagram for `activemq::commands::MessageDispatchNotification`:

Public Member Functions

- **MessageDispatchNotification** ()
- virtual **~MessageDispatchNotification** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **MessageDispatchNotification * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

6.451.1 Constructor & Destructor Documentation

6.451.1.1 `activemq::commands::MessageDispatchNotification::MessageDispatchNotification (const MessageDispatchNotification &) [inline, protected]`

6.451.1.2 `activemq::commands::MessageDispatchNotification::MessageDispatchNotification ()`

6.451.1.3 `virtual
activemq::commands::MessageDispatchNotification::~~MessageDispatchNotification () [virtual]`

6.451.2 Member Function Documentation

6.451.2.1 `virtual MessageDispatchNotification* activemq::commands::MessageDispatchNotification::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.451.2.2 `virtual void activemq::commands::MessageDispatchNotification::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.451.2.3 `virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.451.2.4 virtual **Pointer<ConsumerId>&** **activemq::commands::MessageDispatchNotification::getConsumerId** ()
[virtual]

6.451.2.5 virtual const **Pointer<ConsumerId>&** **activemq::commands::MessageDispatchNotification::getConsumerId** ()
const [virtual]

6.451.2.6 virtual unsigned char **activemq::commands::MessageDispatchNotification::getDataStructureType**
() const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.451.2.7 virtual long long **activemq::commands::MessageDispatchNotification::getDeliverySequenceId**
() const [virtual]

6.451.2.8 virtual const **Pointer<ActiveMQDestination>&** **activemq::commands::MessageDispatchNotification::getDestination** ()
const [virtual]

6.451.2.9 virtual **Pointer<ActiveMQDestination>&** **activemq::commands::MessageDispatchNotification::getDestination** ()
[virtual]

6.451.2.10 virtual **Pointer<MessageId>&** **activemq::commands::MessageDispatchNotification::getMessageId** ()
[virtual]

6.451.2.11 virtual const **Pointer<MessageId>&** **activemq::commands::MessageDispatchNotification::getMessageId** ()
const [virtual]

6.451.2.12 virtual bool **activemq::commands::MessageDispatchNotification::isMessageDispatchNotification**
() const [inline, virtual]

Returns

an answer of true to the **isMessageDispatchNotification()** (p. 2118) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 601).

- 6.451.2.13 `MessageDispatchNotification& activemq::commands::MessageDispatchNotification::operator= (const MessageDispatchNotification &)` [inline, protected]
- 6.451.2.14 `virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & consumerId)` [virtual]
- 6.451.2.15 `virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long deliverySequenceId)` [virtual]
- 6.451.2.16 `virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & destination)` [virtual]
- 6.451.2.17 `virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & messageId)` [virtual]
- 6.451.2.18 `virtual std::string activemq::commands::MessageDispatchNotification::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.602).

- 6.451.2.19 `virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p.2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.995).

- 6.451.3.1 `Pointer<ConsumerId>` `activemq::commands::MessageDispatchNotification::consumerId`
[protected]
- 6.451.3.2 `long long` `activemq::commands::MessageDispatchNotification::deliverySequenceId`

6.452.3 Member Function Documentation

6.452.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::create () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.452.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::getDataStructureType() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.452.3.3 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::marshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 631).

6.452.3.4 virtual void activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::unmarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.452.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, utils::BooleanStream * bs) throw (`
`decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

6.452.3.6 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightM`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataOutputStream * dataOut,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

6.452.3.7 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::MessageDispatchNotificationMarshaller::tightU`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataInputStream * dataIn,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/MessageDispatchNotificationMarshaller.h`

6.453 activemq::wireformat::openwire::marshal::v4::MessageDispatchNo Class Reference

Marshaling code for Open Wire Format for `MessageDispatchNotificationMarshaller` (p. 2124).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/MessageDispatchNotificationMarshaller
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller`:

Public Member Functions

- `MessageDispatchNotificationMarshaller ()`
- `virtual ~MessageDispatchNotificationMarshaller ()`

() [inline, virtual]

6.453.3 Member Function Documentation

6.453.3.1 **virtual commands::DataStructure* ac-**
tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::create
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.453.3.2 **virtual unsigned char ac-**
tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::getDa
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.453.3.3 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::loose`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataOutputStream * dataOut) throw (`
`decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller`
 (p. 618).

6.453.3.4 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::loose`
`(OpenWireFormat * wireFormat, commands::DataStructure *`
`dataStructure, decaf::io::DataInputStream * dataIn) throw (`
`decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller`
 (p. 619).

6.453.3.5 `virtual int ac-`
`tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::tight`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, utils::BooleanStream * bs) throw (`
`decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.453.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.453.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/MessageDispatchNotificationMarshaller.h`

6.454 activemq::wireformat::openwire::marshal::v3::MessageDispatchNo Class Reference

Marshaling code for Open Wire Format for `MessageDispatchNotificationMarshaller` (p. 2128).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/MessageDispatchNotificationMarshaller
```

6.454.3 Member Function Documentation

6.454.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::createDataStructure () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1331).

6.454.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1336).

6.454.3.3 **virtual void ac-**
 tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::looseM
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * *dataOut*) throw (
 decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 604).

6.454.3.4 **virtual void ac-**
 tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::looseU
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*) throw (
 decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller**
 (p. 605).

6.454.3.5 **virtual int ac-**
 tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.454.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightM
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.454.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

6.455.3.5 `virtual int ac-`
 tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.455.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightM
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.455.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.456.3 Member Function Documentation

6.456.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::createDataStructure () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.456.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.456.3.3 virtual void ac-
 tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::looseM
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * *dataOut*) throw (
 decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller`
 (p. 624).

6.456.3.4 virtual void ac-
 tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::looseU
 (OpenWireFormat * *wireFormat*, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * *dataIn*) throw (
 decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller`
 (p. 625).

6.456.3.5 virtual int ac-
 tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightM
 (OpenWireFormat * *wireFormat*, commands::DataStructure
 * *dataStructure*, utils::BooleanStream * *bs*) throw (
 decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

```
6.456.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightM
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.456.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageDispatchNotificationMarshaller::tightU
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

- `src/main/cms/MessageEOFException.h`

6.458 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

```
#include <src/main/cms/MessageFormatException.h>
```

Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- `MessageFormatException () throw ()`
- `MessageFormatException (const MessageFormatException &ex) throw ()`
- `MessageFormatException (const std::string &message, const std::exception *cause) throw ()`
- `MessageFormatException (const std::string &message, const std::exception *cause, const std::vector< std::pair< std::string, int > > &stackTrace) throw ()`
- `virtual ~MessageFormatException () throw ()`

6.458.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type. It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if `StreamMessage.readShort` (p. 2899) is used to read a boolean value.

Since

1.3

6.458.2 Constructor & Destructor Documentation

6.459 activemq::commands::MessageId Class Reference

```
#include <src/main/activemq/commands/MessageId.h>
```

Inheritance diagram for `activemq::commands::MessageId`:

Public Types

- `typedef decaf::lang::PointerComparator< MessageId > COMPARATOR`

Public Member Functions

- `MessageId ()`
- `MessageId (const MessageId &other)`
- `virtual ~MessageId ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual MessageId * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- `virtual void copyDataStructure (const DataStructure *src)`
Copy the contents of the passed object into this object's members, overwriting any existing data.
- `virtual std::string toString () const`
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataSet** *value) const
*Compares the **DataSet** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual long long **getProducerSequenceId** () const
- virtual void **setProducerSequenceId** (long long producerSequenceId)
- virtual long long **getBrokerSequenceId** () const
- virtual void **setBrokerSequenceId** (long long brokerSequenceId)
- virtual int **compareTo** (const **MessageId** &value) const
- virtual bool **equals** (const **MessageId** &value) const
- virtual bool **operator==** (const **MessageId** &value) const
- virtual bool **operator<** (const **MessageId** &value) const
- **MessageId** & **operator=** (const **MessageId** &other)

Static Public Attributes

- static const unsigned char **ID_MESSAGEID** = 110

Protected Attributes

- **Pointer**< **ProducerId** > producerId
- long long producerSequenceId
- long long brokerSequenceId

6.459.1 Member Typedef Documentation

- 6.459.1.1 **typedef** decaf::lang::PointerComparator<MessageId>
activemq::commands::MessageId::COMPARATOR

6.459.2 Constructor & Destructor Documentation

- 6.459.2.1 **activemq::commands::MessageId::MessageId** ()
- 6.459.2.2 **activemq::commands::MessageId::MessageId** (const **MessageId** & *other*)
- 6.459.2.3 **virtual** **activemq::commands::MessageId::~~MessageId** () [virtual]

6.459.3 Member Function Documentation

- 6.459.3.1 **virtual** **MessageId*** **activemq::commands::MessageId::cloneDataSet**
() const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.459.3.2 `virtual int activemq::commands::MessageId::compareTo (const MessageId & value) const` [virtual]

6.459.3.3 `virtual void activemq::commands::MessageId::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.459.3.4 `virtual bool activemq::commands::MessageId::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.459.3.5 `virtual bool activemq::commands::MessageId::equals (const MessageId & value) const` [virtual]

6.459.3.6 `virtual long long activemq::commands::MessageId::getBrokerSequenceId () const` [virtual]

6.459.3.7 `virtual unsigned char activemq::commands::MessageId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

- 6.459.3.8 `virtual const Pointer<ProducerId>& activemq::commands::MessageId::getProducerId () const`
[virtual]
- 6.459.3.9 `virtual Pointer<ProducerId>& activemq::commands::MessageId::getProducerId ()`
[virtual]
- 6.459.3.10 `virtual long long activemq::commands::MessageId::getProducerSequenceId () const` [virtual]
- 6.459.3.11 `virtual bool activemq::commands::MessageId::operator< (const MessageId & value) const` [virtual]
- 6.459.3.12 `MessageId& activemq::commands::MessageId::operator= (const MessageId & other)`
- 6.459.3.13 `virtual bool activemq::commands::MessageId::operator== (const MessageId & value) const` [virtual]
- 6.459.3.14 `virtual void activemq::commands::MessageId::setBrokerSequenceId (long long brokerSequenceId)` [virtual]
- 6.459.3.15 `virtual void activemq::commands::MessageId::setProducerId (const Pointer< ProducerId > & producerId)` [virtual]
- 6.459.3.16 `virtual void activemq::commands::MessageId::setProducerSequenceId (long long producerSequenceId)` [virtual]
- 6.459.3.17 `virtual std::string activemq::commands::MessageId::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.459.4 Field Documentation

- 6.459.4.1 `long long activemq::commands::MessageId::brokerSequenceId`
[protected]
- 6.459.4.2 `const unsigned char activemq::commands::MessageId::ID_MESSAGEID`
`= 110` [static]
- 6.459.4.3 `Pointer<ProducerId> activemq::commands::MessageId::producerId`
[protected]
- 6.459.4.4 `long long activemq::commands::MessageId::producerSequenceId`
[protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/MessageId.h`

6.460 activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller Class Reference

Marshaling code for Open Wire Format for `MessageIdMarshaller` (p. 2146).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller`:

Public Member Functions

- `MessageIdMarshaller ()`
- `virtual ~MessageIdMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.460.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p.2146). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.460.2 Constructor & Destructor Documentation

6.460.2.1 **activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::MessageIdMarshaller** () [inline]

6.460.2.2 **virtual**
activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]

6.460.3 Member Function Documentation

6.460.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.460.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.460.3.3 virtual void `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseMarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataOutputStream * dataOut`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.460.3.4 virtual void `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.460.3.5 virtual int `activemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal1` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```
6.460.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

```
6.460.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/MessageIdMarshaller.h`

6.461 activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller Class Reference

6.461.2.2 virtual activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]

6.461.3 Member Function Documentation

6.461.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.461.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.461.3.3 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.461.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.461.3.5 virtual int activemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```
6.461.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

```
6.461.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessageIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.462.3 Member Function Documentation

6.462.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.462.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.462.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

```
6.462.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

```
6.462.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.462.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.462.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.463.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p.2157). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.463.2 Constructor & Destructor Documentation

6.463.2.1 `activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::MessageIdMarshaller () [inline]`

6.463.2.2 `virtual activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::~~MessageIdMarshaller () [inline, virtual]`

6.463.3 Member Function Documentation

6.463.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.463.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.463.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.463.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.463.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.463.3.6 virtual void activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.463.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::MessageIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/MessageIdMarshaller.h`

6.464 **activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller** Class Reference

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 2161).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/MessageIdMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller**:

Public Member Functions

- **MessageIdMarshaller** ()

6.464.3 Member Function Documentation

6.464.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.464.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.464.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.464.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.464.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.464.3.6 virtual void activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.464.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::MessageIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/MessageIdMarshaller.h`

6.465 cms::MessageListener Class Reference

A **MessageListener** (p. 2165) object is used to receive asynchronously delivered messages.

```
#include <src/main/cms/MessageListener.h>
```

Public Member Functions

- virtual **~MessageListener** ()
- virtual void **onMessage** (const **Message** *message)=0
*Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 2036) types.*

6.465.1 Detailed Description

A `MessageListener` (p. 2165) object is used to receive asynchronously delivered messages.

Since

1.0

6.465.2 Constructor & Destructor Documentation

6.465.2.1 `virtual cms::MessageListener::~~MessageListener () [inline, virtual]`

6.465.3 Member Function Documentation

6.465.3.1 `virtual void cms::MessageListener::onMessage (const Message * message) [pure virtual]`

Called asynchronously when a new message is received, the message reference can be to any of the `Message` (p. 2036) types.

a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the `onMessage` function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this `Message` (p. 2036).

It is considered a programming error for this method to throw an exception.

Parameters

message `Message` (p. 2036) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- `src/main/cms/MessageListener.h`

6.466 activemq::wireformat::openwire::marshal::v2::MessageMarshaller Class Reference

Marshaling code for Open Wire Format for `MessageMarshaller` (p. 2166).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/MessageMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::MessageMarshaller`:

Public Member Functions

- `MessageMarshaller ()`
- `virtual ~MessageMarshaller ()`
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.466.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2166). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.466.2 Constructor & Destructor Documentation

6.466.2.1 activemq::wireformat::openwire::marshal::v2::MessageMarshaller::MessageMarshaller () [inline]

6.466.2.2 virtual activemq::wireformat::openwire::marshal::v2::MessageMarshaller::~~MessageMarshaller () [inline, virtual]

6.466.3 Member Function Documentation

6.466.3.1 virtual void activemq::wireformat::openwire::marshal::v2::MessageMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 164), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 200), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 302), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 325), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 365), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 453), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 547).

      ( OpenWireFormat * wireFormat, commands::DataStructure *
      dataStructure, decaf::io::DataInputStream * dataIn ) throw (
      decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 165), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 200), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 303), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 325), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 365), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 454), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 548).

```

6.466.3.3 virtual int ac-
tivismq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 165), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 200), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 303), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 325), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 365), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 454), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 548).

```

tivismq::wireformat::openwire::marshal::v2::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 165), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 201), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 303), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 326), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 366), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 454), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 548).

```
6.466.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::ActiveMQBlobMessageMarshaller` (p. 166), `activemq::wireformat::openwire::marshal::v2::ActiveMQBytesMessageMarshaller` (p. 201), `activemq::wireformat::openwire::marshal::v2::ActiveMQMapMessageMarshaller` (p. 304), `activemq::wireformat::openwire::marshal::v2::ActiveMQMessageMarshaller` (p. 326), `activemq::wireformat::openwire::marshal::v2::ActiveMQObjectMessageMarshaller` (p. 366), `activemq::wireformat::openwire::marshal::v2::ActiveMQStreamMessageMarshaller` (p. 455), and `activemq::wireformat::openwire::marshal::v2::ActiveMQTextMessageMarshaller` (p. 549).

6.467.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2170). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.467.2 Constructor & Destructor Documentation

6.467.2.1 `activemq::wireformat::openwire::marshal::v4::MessageMarshaller::MessageMarshaller ()` [inline]

6.467.2.2 `virtual activemq::wireformat::openwire::marshal::v4::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.467.3 Member Function Documentation

6.467.3.1 `virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 156), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 192), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 294), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 317), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 445), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 539).

6.467.3.2 `virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 192), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 295), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 317), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 446), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 540).

```
6.467.3.3 virtual int ac-
      tivemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal1
      ( OpenWireFormat * wireFormat, commands::DataStructure
        * dataStructure, utils::BooleanStream * bs ) throw (
        decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 157), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 192), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 295), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 317), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 357), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 446), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 540).

6.467.3.4 virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller** (p. 157), **activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller** (p. 193), **activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller** (p. 295), **activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller** (p. 318), **activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller** (p. 358), **activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller** (p. 446), and **activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller** (p. 540).

6.467.3.5 virtual void activemq::wireformat::openwire::marshal::v4::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::ActiveMQBlobMessageMarshaller` (p. 158), `activemq::wireformat::openwire::marshal::v4::ActiveMQBytesMessageMarshaller` (p. 193), `activemq::wireformat::openwire::marshal::v4::ActiveMQMapMessageMarshaller` (p. 296), `activemq::wireformat::openwire::marshal::v4::ActiveMQMessageMarshaller` (p. 318), `activemq::wireformat::openwire::marshal::v4::ActiveMQObjectMessageMarshaller` (p. 358), `activemq::wireformat::openwire::marshal::v4::ActiveMQStreamMessageMarshaller` (p. 447), and `activemq::wireformat::openwire::marshal::v4::ActiveMQTextMessageMarshaller` (p. 541).

6.468.2.2 `virtual`
`activemq::wireformat::openwire::marshal::v3::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.468.3 Member Function Documentation

6.468.3.1 `virtual void` `activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 148), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 286), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 309), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 349), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 437), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 531).

6.468.3.2 `virtual void` `activemq::wireformat::openwire::marshal::v3::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn)` throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 149), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 309), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 349), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 438), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 532).

```
6.468.3.3  virtual int ac-
            tivemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
              * dataStructure, utils::BooleanStream * bs ) throw (
              decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 149), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 184), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 287), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 309), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 349), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 438), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 532).

6.468.3.4 virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller** (p. 149), **activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller** (p. 185), **activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller** (p. 287), **activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller** (p. 310), **activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller** (p. 350), **activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller** (p. 439), and **activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller** (p. 532).

6.468.3.5 virtual void activemq::wireformat::openwire::marshal::v3::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::ActiveMQBlobMessageMarshaller` (p. 150), `activemq::wireformat::openwire::marshal::v3::ActiveMQBytesMessageMarshaller` (p. 185), `activemq::wireformat::openwire::marshal::v3::ActiveMQMapMessageMarshaller` (p. 288), `activemq::wireformat::openwire::marshal::v3::ActiveMQMessageMarshaller` (p. 310), `activemq::wireformat::openwire::marshal::v3::ActiveMQObjectMessageMarshaller` (p. 350), `activemq::wireformat::openwire::marshal::v3::ActiveMQStreamMessageMarshaller` (p. 439), and `activemq::wireformat::openwire::marshal::v3::ActiveMQTextMessageMarshaller` (p. 533).

The documentation for this class was generated from the following file:

          tivemq::wireformat::openwire::marshal::v5::MessageMarshaller::tightMarshal1
          ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 161), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 196), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 299), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 321), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 361), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 450), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 544).

```

6.469.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

Reimplemented in **activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller** (p. 161), **activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller** (p. 197), **activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller** (p. 299), **activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller** (p. 322), **activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller** (p. 362), **activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller** (p. 450), and **activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller** (p. 544).

```

6.469.3.5 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessageMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::ActiveMQBlobMessageMarshaller` (p. 162), `activemq::wireformat::openwire::marshal::v5::ActiveMQBytesMessageMarshaller` (p. 197), `activemq::wireformat::openwire::marshal::v5::ActiveMQMapMessageMarshaller` (p. 300), `activemq::wireformat::openwire::marshal::v5::ActiveMQMessageMarshaller` (p. 322), `activemq::wireformat::openwire::marshal::v5::ActiveMQObjectMessageMarshaller` (p. 362), `activemq::wireformat::openwire::marshal::v5::ActiveMQStreamMessageMarshaller` (p. 451), and `activemq::wireformat::openwire::marshal::v5::ActiveMQTextMessageMarshaller` (p. 545).

6.470.1 Detailed Description

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 2183). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.470.2 Constructor & Destructor Documentation

6.470.2.1 `activemq::wireformat::openwire::marshal::v1::MessageMarshaller::MessageMarshaller ()` [inline]

6.470.2.2 `virtual activemq::wireformat::openwire::marshal::v1::MessageMarshaller::~~MessageMarshaller ()` [inline, virtual]

6.470.3 Member Function Documentation

6.470.3.1 `virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 152), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 290), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 313), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 353), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 441), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 535).

6.470.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 291), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 313), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 353), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 442), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 536).

```
6.470.3.3 virtual int ac-
            tivemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
              * dataStructure, utils::BooleanStream * bs ) throw (
              decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 153), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 188), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 291), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 313), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 353), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 442), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 536).

6.470.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 614).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller** (p. 153), **activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller** (p. 189), **activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller** (p. 291), **activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller** (p. 314), **activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller** (p. 354), **activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller** (p. 442), and **activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller** (p. 536).

6.470.3.5 virtual void activemq::wireformat::openwire::marshal::v1::MessageMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::ActiveMQBlobMessageMarshaller` (p. 154), `activemq::wireformat::openwire::marshal::v1::ActiveMQBytesMessageMarshaller` (p. 189), `activemq::wireformat::openwire::marshal::v1::ActiveMQMapMessageMarshaller` (p. 292), `activemq::wireformat::openwire::marshal::v1::ActiveMQMessageMarshaller` (p. 314), `activemq::wireformat::openwire::marshal::v1::ActiveMQObjectMessageMarshaller` (p. 354), `activemq::wireformat::openwire::marshal::v1::ActiveMQStreamMessageMarshaller` (p. 443), and `activemq::wireformat::openwire::marshal::v1::ActiveMQTextMessageMarshaller` (p. 537).

6.473 cms::MessageProducer Class Reference

A client uses a `MessageProducer` (p. 2189) object to send messages to a `Destination` (p. 1387).

`#include <src/main/cms/MessageProducer.h>`

Inheritance diagram for `cms::MessageProducer`:

Public Member Functions

- `virtual ~MessageProducer ()`
- `virtual void send (Message *message)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- `virtual void send (Message *message, int deliveryMode, int priority, long long timeToLive)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`
Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- `virtual void send (const Destination *destination, Message *message)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)`

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **send** (const **Destination** *destination, **Message** *message, int deliveryMode, int priority, long long timeToLive)=0 throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException)

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)=0 throw (CMSEException)

Sets the delivery mode for this Producer.

- virtual int **getDeliveryMode** () const =0 throw (CMSEException)

Gets the delivery mode for this Producer.

- virtual void **setDisableMessageID** (bool value)=0 throw (CMSEException)

*Sets if **Message** (p. 2036) Ids are disabled for this Producer.*

- virtual bool **getDisableMessageID** () const =0 throw (CMSEException)

*Gets if **Message** (p. 2036) Ids are disabled for this Producer.*

- virtual void **setDisableMessageTimeStamp** (bool value)=0 throw (CMSEException)

*Sets if **Message** (p. 2036) Time Stamps are disabled for this Producer.*

- virtual bool **getDisableMessageTimeStamp** () const =0 throw (CMSEException)

*Gets if **Message** (p. 2036) Time Stamps are disabled for this Producer.*

- virtual void **setPriority** (int priority)=0 throw (CMSEException)

Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () const =0 throw (CMSEException)

Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)=0 throw (CMSEException)

Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () const =0 throw (CMSEException)

Gets the Time to Live that this producer sends messages with.

6.473.1 Detailed Description

A client uses a **MessageProducer** (p. 2189) object to send messages to a **Destination** (p. 1387). A **MessageProducer** (p. 2189) object is created by passing a **Destination** (p. 1387) object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 1387) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's **CMSReplyTo** destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since

1.0

6.473.2 Constructor & Destructor Documentation

6.473.2.1 `virtual cms::MessageProducer::~MessageProducer () [inline, virtual]`

6.473.3 Member Function Documentation

6.473.3.1 `virtual int cms::MessageProducer::getDeliveryMode () const throw (CMSEException) [pure virtual]`

Gets the delivery mode for this Producer.

Returns

The **DeliveryMode** (p. 1386)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 892), and `activemq::core::ActiveMQProducer` (p. 369).

6.473.3.2 `virtual bool cms::MessageProducer::getDisableMessageID () const throw (CMSEException) [pure virtual]`

Gets if **Message** (p. 2036) Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 893), and `activemq::core::ActiveMQProducer` (p. 369).

6.473.3.3 `virtual bool cms::MessageProducer::getDisableMessageTimeStamp ()
const throw (CMSEException) [pure virtual]`

Gets if `Message` (p. 2036) Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 893), and `activemq::core::ActiveMQProducer` (p. 370).

6.473.3.4 `virtual int cms::MessageProducer::getPriority () const throw (CMSEException) [pure virtual]`

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 893), and `activemq::core::ActiveMQProducer` (p. 370).

6.473.3.5 `virtual long long cms::MessageProducer::getTimeToLive () const
throw (CMSEException) [pure virtual]`

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::cmsutil::CachedProducer` (p. 894), and `activemq::core::ActiveMQProducer` (p. 371).

6.473.3.6 `virtual void cms::MessageProducer::send (Message * message,
int deliveryMode, int priority, long long timeToLive)
throw (cms::CMSEException, cms::MessageFormatException,
cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]`

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException (p. 960) - if an internal error occurs while sending the message.

MessageFormatException (p. 2141) - if an Invalid **Message** (p. 2036) is given.

InvalidDestinationException (p. 1697) - if a client uses this method with a **MessageProducer** (p. 2189) with an invalid destination.

UnsupportedOperationException (p. 3093) - if a client uses this method with a **MessageProducer** (p. 2189) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 895), and **activemq::core::ActiveMQProducer** (p. 372).

6.473.3.7 virtual void cms::MessageProducer::send (const Destination * destination, Message * message, int deliveryMode, int priority, long long timeToLive) throw (cms::CMSEException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination The destination on which to send the message

message The message to be sent.

deliveryMode The delivery mode to be used.

priority The priority for this message.

timeToLive The time to live value for this message in milliseconds.

Exceptions

CMSEException (p. 960) - if an internal error occurs while sending the message.

MessageFormatException (p. 2141) - if an Invalid **Message** (p. 2036) is given.

InvalidDestinationException (p. 1697) - if a client uses this method with a **MessageProducer** (p. 2189) with an invalid destination.

UnsupportedOperationException (p. 3093) - if a client uses this method with a **MessageProducer** (p. 2189) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 895), and **activemq::core::ActiveMQProducer** (p. 371).

6.473.3.8 virtual void cms::MessageProducer::send (Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message The message to be sent.

Exceptions

CMSException (p. 960) - if an internal error occurs while sending the message.

MessageFormatException (p. 2141) - if an Invalid **Message** (p. 2036) is given.

InvalidDestinationException (p. 1697) - if a client uses this method with a **MessageProducer** (p. 2189) with an invalid destination.

UnsupportedOperationException (p. 3093) - if a client uses this method with a **MessageProducer** (p. 2189) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 894), and **activemq::core::ActiveMQProducer** (p. 372).

6.473.3.9 virtual void cms::MessageProducer::send (const Destination * *destination*, Message * *message*) throw (cms::CMSException, cms::MessageFormatException, cms::InvalidDestinationException, cms::UnsupportedOperationException) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination The destination on which to send the message

message the message to be sent.

Exceptions

CMSException (p. 960) - if an internal error occurs while sending the message.

MessageFormatException (p. 2141) - if an Invalid **Message** (p. 2036) is given.

InvalidDestinationException (p. 1697) - if a client uses this method with a **MessageProducer** (p. 2189) with an invalid destination.

UnsupportedOperationException (p. 3093) - if a client uses this method with a **MessageProducer** (p. 2189) that did not specify a destination at creation time.

Implemented in **activemq::cmsutil::CachedProducer** (p. 894), and **activemq::core::ActiveMQProducer** (p. 373).

6.473.3.10 `virtual void cms::MessageProducer::setDeliveryMode (int mode)
throw (CMSEException)` [pure virtual]

Sets the delivery mode for this Producer.

Parameters

mode The **DeliveryMode** (p. 1386)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 896), and **activemq::core::ActiveMQProducer** (p. 373).

6.473.3.11 `virtual void cms::MessageProducer::setDisableMessageID (bool value)
throw (CMSEException)` [pure virtual]

Sets if **Message** (p. 2036) Ids are disabled for this Producer.

Parameters

value boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 896), and **activemq::core::ActiveMQProducer** (p. 373).

6.473.3.12 `virtual void cms::MessageProducer::setDisableMessageTimeStamp (bool value)
throw (CMSEException)` [pure virtual]

Sets if **Message** (p. 2036) Time Stamps are disabled for this Producer.

Parameters

value - boolean indicating enable / disable (true / false)

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 896), and **activemq::core::ActiveMQProducer** (p. 374).

6.473.3.13 `virtual void cms::MessageProducer::setPriority (int priority) throw
(CMSEException)` [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters

priority int value for Priority level

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 897), and **activemq::core::ActiveMQProducer** (p. 374).

6.473.3.14 virtual void cms::MessageProducer::setTimeToLive (long long *time*) throw (CMSEException) [pure virtual]

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

time default time to live value in milliseconds

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in **activemq::cmsutil::CachedProducer** (p. 897), and **activemq::core::ActiveMQProducer** (p. 374).

The documentation for this class was generated from the following file:

- src/main/cms/MessageProducer.h

6.474 activemq::wireformat::openwire::utils::MessagePropertyInterceptor Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

```
#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>
```

Public Member Functions

- **MessagePropertyInterceptor** (commands::Message *message, util::PrimitiveMap *properties) throw (decaf::lang::exceptions::NullPointerException)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

- virtual ~**MessagePropertyInterceptor** ()
- virtual bool **getBooleanProperty** (const std::string &name) const

Gets a boolean property.

- virtual unsigned char **getByteProperty** (const std::string &name) const
Gets a byte property.
- virtual double **getDoubleProperty** (const std::string &name) const
Gets a double property.
- virtual float **getFloatProperty** (const std::string &name) const
Gets a float property.
- virtual int **getIntProperty** (const std::string &name) const
Gets a int property.
- virtual long long **getLongProperty** (const std::string &name) const
Gets a long property.
- virtual short **getShortProperty** (const std::string &name) const
Gets a short property.
- virtual std::string **getStringProperty** (const std::string &name) const
Gets a string property.
- virtual void **setBooleanProperty** (const std::string &name, bool value)
Sets a boolean property.
- virtual void **setByteProperty** (const std::string &name, unsigned char value)
Sets a byte property.
- virtual void **setDoubleProperty** (const std::string &name, double value)
Sets a double property.
- virtual void **setFloatProperty** (const std::string &name, float value)
Sets a float property.
- virtual void **setIntProperty** (const std::string &name, int value)
Sets a int property.
- virtual void **setLongProperty** (const std::string &name, long long value)
Sets a long property.
- virtual void **setShortProperty** (const std::string &name, short value)
Sets a short property.
- virtual void **setStringProperty** (const std::string &name, const std::string &value)
Sets a string property.

6.474.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties. Currently the only properties that are intercepted and handled are:

Name | Conversion Supported ----- JMSXDeliveryCount |
Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.474.2 Constructor & Destructor Documentation

6.474.2.1 `activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInterceptor (commands::Message * message, util::PrimitiveMap * properties)
throw (decaf::lang::exceptions::NullPointerException)`

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters

message - The Message to store reserved property data in
properties - The PrimitiveMap to store the rest of the properties in.

Exceptions

NullPointerException if either param is NULL

6.474.2.2 `virtual
activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~MessagePropertyInterceptor () [virtual]`

6.474.3 Member Function Documentation

6.474.3.1 `virtual bool activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty (const std::string & name) const [virtual]`

Gets a boolean property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.2 `virtual unsigned char activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getByteProperty (const std::string & name) const [virtual]`

Gets a byte property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.3 `virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty (const std::string & name) const [virtual]`

Gets a double property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.4 `virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty (const std::string & name) const [virtual]`

Gets a float property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.5 `virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty (const std::string & name) const [virtual]`

Gets a int property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.6 virtual long long activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty
(const std::string & *name*) const [virtual]

Gets a long property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.7 virtual short short activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty
(const std::string & *name*) const [virtual]

Gets a short property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.8 virtual std::string string activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty
(const std::string & *name*) const [virtual]

Gets a string property.

Parameters

name The name of the property to retrieve.

Returns

The value for the named property.

6.474.3.9 virtual void void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty
(const std::string & *name*, bool *value*) [virtual]

Sets a boolean property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.10 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty(const std::string & name, unsigned char value) [virtual]`

Sets a byte property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.11 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty(const std::string & name, double value) [virtual]`

Sets a double property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.12 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty(const std::string & name, float value) [virtual]`

Sets a float property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.13 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty(const std::string & name, int value) [virtual]`

Sets a int property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.14 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty(const std::string & name, long long value) [virtual]`

Sets a long property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.15 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & name, short value) [virtual]`

Sets a short property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

6.474.3.16 `virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & name, const std::string & value) [virtual]`

Sets a string property.

Parameters

name The name of the property to retrieve.

value The value for the named property.

- `virtual ~MessagePull ()`
- `virtual unsigned char getDataStructureType () const`
Get the unique identifier that this object and its own Marshaler share.
- `virtual MessagePull * cloneDataStructure () const`
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConsumerId** > & **getConsumerId** () const
- virtual **Pointer**< **ConsumerId** > & **getConsumerId** ()
- virtual void **setConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual long long **getTimeout** () const
- virtual void **setTimeout** (long long timeout)
- virtual const std::string & **getCorrelationId** () const
- virtual std::string & **getCorrelationId** ()
- virtual void **setCorrelationId** (const std::string &correlationId)
- virtual const **Pointer**< **MessageId** > & **getMessageId** () const
- virtual **Pointer**< **MessageId** > & **getMessageId** ()
- virtual void **setMessageId** (const **Pointer**< **MessageId** > &messageId)
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
 throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

6.475.1 Constructor & Destructor Documentation

6.475.1.1 `activemq::commands::MessagePull::MessagePull (const MessagePull &) [inline, protected]`

6.475.1.2 `activemq::commands::MessagePull::MessagePull ()`

6.475.1.3 `virtual activemq::commands::MessagePull::~MessagePull () [virtual]`

6.475.2 Member Function Documentation

6.475.2.1 `virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.475.2.2 `virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.475.2.3 `virtual bool activemq::commands::MessagePull::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

- 6.475.2.4 `virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId ()`
[virtual]
- 6.475.2.5 `virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId ()`
const [virtual]
- 6.475.2.6 `virtual std::string& activemq::commands::MessagePull::getCorrelationId ()`
[virtual]
- 6.475.2.7 `virtual const std::string& activemq::commands::MessagePull::getCorrelationId ()`
const [virtual]
- 6.475.2.8 `virtual unsigned char activemq::commands::MessagePull::getDataStructureType ()`
const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.475.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () const [virtual]
- 6.475.2.10 virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination () [virtual]
- 6.475.2.11 virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () [virtual]
- 6.475.2.12 virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId () const [virtual]
- 6.475.2.13 virtual long long activemq::commands::MessagePull::getTimeout () const [virtual]
- 6.475.2.14 MessagePull& activemq::commands::MessagePull::operator= (const MessagePull &) [inline, protected]
- 6.475.2.15 virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]
- 6.475.2.16 virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & *correlationId*) [virtual]
- 6.475.2.17 virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]
- 6.475.2.18 virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]
- 6.475.2.19 virtual void activemq::commands::MessagePull::setTimeout (long long *timeout*) [virtual]
- 6.475.2.20 virtual std::string activemq::commands::MessagePull::toString () const [virtual]

Returns a string containing the information for this **DataSet** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.475.2.21 virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.475.3 Field Documentation

6.475.3.1 `Pointer<ConsumerId> activemq::commands::MessagePull::consumerId` [protected]

6.476.3 Member Function Documentation

- 6.476.3.1** **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.476.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::getDataSetType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.476.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.476.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.476.3.5 virtual int activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.476.3.6 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

6.476.3.7 virtual void activemq::wireformat::openwire::marshal::v2::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

6.477.3 Member Function Documentation

6.477.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.477.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

```

6.477.3.3 virtual void ac-
tivismq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

```

6.477.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v3::MessagePullMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

```

6.477.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

```
6.477.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

```
6.477.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

6.478.3 Member Function Documentation

6.478.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.478.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.478.3.3 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.478.3.4 virtual void activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.478.3.5 virtual int activemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.478.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.478.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.479.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 2219). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.479.2 Constructor & Destructor Documentation

6.479.2.1 `activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::MessagePullMarshaller ()` [inline]

6.479.2.2 `virtual activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::~~MessagePullMarshaller ()` [inline, virtual]

6.479.3 Member Function Documentation

6.479.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::createObject () const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.479.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::getDataStructureType () const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.479.3.3 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.479.3.4 virtual void activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.479.3.5 virtual int activemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.479.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.479.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

The documentation for this class was generated from the following file:

6.480.3 Member Function Documentation

6.480.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::createObject () const [virtual]**

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.480.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::getDataStructureType () const [virtual]**

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

```

6.480.3.3 virtual void ac-
tivismq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseMarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

```

6.480.3.4 virtual void ac-
tivismq::wireformat::openwire::marshal::v4::MessagePullMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

```

6.480.3.5 virtual int ac-
tivismq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

```
6.480.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.480.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::MessagePullMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.481.1 Detailed Description

The **MockTransport** (p.2227) defines a base level **Transport** (p.3066) class that is intended to be used in place of an a regular protocol **Transport** (p.3066) such as TCP. This **Transport** (p.3066) assumes that it is the base **Transport** (p.3066) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p.3066) defines an Interface **ResponseBuilder** (p.2614) which must be implemented by any protocol for which the **Transport** (p.3066) is used to Emulate. The **Transport** (p.3066) hands off all outbound commands to the **ResponseBuilder** (p.2614) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.481.2 Constructor & Destructor Documentation

- 6.481.2.1 **activemq::transport::mock::MockTransport::MockTransport** (const **Pointer**< **wireformat::WireFormat** > & *wireFormat*, const **Pointer**< **ResponseBuilder** > & *responseBuilder*)
- 6.481.2.2 **virtual activemq::transport::mock::MockTransport::~MockTransport** () [inline, virtual]

6.481.3 Member Function Documentation

- 6.481.3.1 **virtual void activemq::transport::mock::MockTransport::close** () throw (**decaf::io::IOException**) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 951).

6.481.3.2 `virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > & command)` [inline, virtual]

Fires a Command back through this transport to its registered CommandListener if there is one.

Parameters

command - Command to send to the Listener.

6.481.3.3 `virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & ex)` [inline, virtual]

Fires a Exception back through this transport to its registered ExceptionListener if there is one.

Parameters

ex The Exception that will be passed on the the **Transport** (p. 3066) listener.

- 6.481.3.4** `static MockTransport* activemq::transport::mock::MockTransport::getInstance () [inline, static]`
- 6.481.3.5** `int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail () const [inline]`
- 6.481.3.6** `int activemq::transport::mock::MockTransport::getNumReceivedMessages () const [inline]`
- 6.481.3.7** `int activemq::transport::mock::MockTransport::getNumSentKeepAlives () const [inline]`
- 6.481.3.8** `int activemq::transport::mock::MockTransport::getNumSentKeepAlivesBeforeFail () const [inline]`
- 6.481.3.9** `int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail () const [inline]`
- 6.481.3.10** `int activemq::transport::mock::MockTransport::getNumSentMessages () const [inline]`
- 6.481.3.11** `virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress () const [inline, virtual]`

Returns

the remote address for this connection

Implements `activemq::transport::Transport` (p. 3067).

- 6.481.3.12** `virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener () const [inline, virtual]`

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

Implements `activemq::transport::Transport` (p. 3068).

- 6.481.3.13** `Pointer<wireformat::WireFormat> activemq::transport::mock::MockTransport::getWireFormat () const [inline]`

Gets the currently set WireFormat.

Returns

the current WireFormat object.

6.481.3.14 `virtual bool activemq::transport::mock::MockTransport::isClosed ()
const [inline, virtual]`

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

Implements **activemq::transport::Transport** (p. 3068).

6.481.3.15 `virtual bool activemq::transport::mock::MockTransport::isConnected ()
const [inline, virtual]`

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 3068).

6.481.3.16 `bool activemq::transport::mock::MockTransport::isFailOnClose ()
const [inline]`

6.481.3.17 `bool activemq::transport::mock::MockTransport::isFailOnKeepAliveSends ()
const [inline]`

6.481.3.18 `bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage ()
const [inline]`

6.481.3.19 `bool activemq::transport::mock::MockTransport::isFailOnSendMessage ()
const [inline]`

6.481.3.20 `bool activemq::transport::mock::MockTransport::isFailOnStart ()
const [inline]`

6.481.3.21 `bool activemq::transport::mock::MockTransport::isFailOnStop ()
const [inline]`

6.481.3.22 `virtual bool activemq::transport::mock::MockTransport::isFaultTolerant ()
const [inline, virtual]`

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

Implements **activemq::transport::Transport** (p. 3068).

6.481.3.23 `virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & typeId) [inline, virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 3068).

6.481.3.24 `virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 3069).

6.481.3.25 `virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri AMQCPP_UNUSED) throw (decaf::io::IOException) [inline, virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.481.3.26 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command - The command to be sent.

timeout - The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements `activemq::transport::Transport` (p. 3070).

6.481.3.27 `virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command the command to be sent.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implements `activemq::transport::Transport` (p. 3069).

- 6.481.3.28 `void activemq::transport::mock::MockTransport::setFailOnClose (bool value) [inline]`
- 6.481.3.29 `void activemq::transport::mock::MockTransport::setFailOnKeepAliveSends (bool value) [inline]`
- 6.481.3.30 `void activemq::transport::mock::MockTransport::setFailOnReceiveMessage (bool value) [inline]`
- 6.481.3.31 `void activemq::transport::mock::MockTransport::setFailOnSendMessage (bool value) [inline]`
- 6.481.3.32 `void activemq::transport::mock::MockTransport::setFailOnStart (bool value) [inline]`
- 6.481.3.33 `void activemq::transport::mock::MockTransport::setFailOnStop (bool value) [inline]`
- 6.481.3.34 `void activemq::transport::mock::MockTransport::setNumReceivedMessageBeforeFail (int value) [inline]`
- 6.481.3.35 `void activemq::transport::mock::MockTransport::setNumReceivedMessages (int value) [inline]`
- 6.481.3.36 `void activemq::transport::mock::MockTransport::setNumSentKeepAlives (int value) [inline]`
- 6.481.3.37 `void activemq::transport::mock::MockTransport::setNumSentKeepAlivesBeforeFail (int value) [inline]`
- 6.481.3.38 `void activemq::transport::mock::MockTransport::setNumSentMessageBeforeFail (int value) [inline]`
- 6.481.3.39 `void activemq::transport::mock::MockTransport::setNumSentMessages (int value) [inline]`
- 6.481.3.40 `virtual void activemq::transport::mock::MockTransport::setOutgoingListener (TransportListener * listener) [inline, virtual]`

Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters

listener - The CommandListener to notify for each message

6.481.3.41 `void activemq::transport::mock::MockTransport::setResponseBuilder (const Pointer< ResponseBuilder > & responseBuilder) [inline]`

Sets the **ResponseBuilder** (p. 2614) that this class uses to create Responses to Commands sent. These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters

responseBuilder - The **ResponseBuilder** (p. 2614) to use from now on.

6.481.3.42 `virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

Implements **activemq::transport::Transport** (p. 3070).

6.481.3.43 `virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat AMQCPP_UNUSED) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat WireFormat the object used to encode / decode commands.

6.481.3.44 `virtual void activemq::transport::mock::MockTransport::start () throw (decaf::io::IOException) [virtual]`

Starts the **Transport** (p. 3066), the send methods of a **Transport** (p. 3066) will throw an exception if used before the **Transport** (p. 3066) is started.

Exceptions

IOException if and error occurs while starting the **Transport** (p. 3066).

Implements **activemq::transport::Transport** (p. 3071).

6.481.3.45 `virtual void activemq::transport::mock::MockTransport::stop () throw (decaf::io::IOException) [virtual]`

Stops the **Transport** (p. 3066).

Exceptions

IOException if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 3071).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/MockTransport.h`

6.482 **activemq::transport::mock::MockTransportFactory** Class Reference

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

```
#include <src/main/activemq/transport/mock/MockTransportFactory.h>
```

Inheritance diagram for **activemq::transport::mock::MockTransportFactory**:

6.482.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.482.2 Constructor & Destructor Documentation

6.482.2.1 virtual
activemq::transport::mock::MockTransportFactory::~MockTransportFactory
() [inline, virtual]

6.482.3 Member Function Documentation

6.482.3.1 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::create
(const decaf::net::URI & *location*) throw (
exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p.3066) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.3072).

6.482.3.2 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::createComposite
(const decaf::net::URI & *location*) throw (
exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p.3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p.3072).

6.482.3.3 virtual Pointer<Transport> ac-
tivemq::transport::mock::MockTransportFactory::doCreateComposite
(const decaf::net::URI & *location*, const Pointer<
wireformat::WireFormat > & *wireFormat*, const decaf::util::Properties
& *properties*) throw (exceptions::ActiveMQException) [protected,
virtual]

Creates a slimed down **Transport** (p.3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3066).

properties - Properties to apply to the transport.

Returns

Pointer to a new **Transport** (p. 3066) instance.

Exceptions

ActiveMQException if an error occurs

*Attempts to **Lock** (p. 1903) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.483.1 Detailed Description

Mutex (p.2239) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

Since

1.0

6.483.2 Constructor & Destructor Documentation

6.483.2.1 decaf::util::concurrent::Mutex::Mutex ()

6.483.2.2 virtual decaf::util::concurrent::Mutex::~~Mutex () [virtual]

6.483.3 Member Function Documentation

6.483.3.1 virtual void decaf::util::concurrent::Mutex::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p.2932).

Referenced by decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::lock(), decaf::util::StlMap< std::string, cms::Topic * >::lock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock(), and decaf::util::AbstractCollection< Pointer< BackupTransport > >::lock().

6.483.3.2 `virtual void decaf::util::concurrent::Mutex::notify ()
 throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notify()`, `decaf::util::StlMap< std::string, cms::Topic * >::notify()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notify()`.

6.483.3.3 `virtual void decaf::util::concurrent::Mutex::notifyAll
 () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::notifyAll()`, `decaf::util::StlMap< std::string, cms::Topic * >::notifyAll()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::notifyAll()`.

6.483.3.4 `virtual bool decaf::util::concurrent::Mutex::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]`

Attempts to **Lock** (p.1903) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2935).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::tryLock()`, `decaf::util::StlMap< std::string, cms::Topic * >::tryLock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::tryLock()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::tryLock()`.

6.483.3.5 virtual void decaf::util::concurrent::Mutex::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2936).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::unlock()`, `decaf::util::StlMap< std::string, cms::Topic * >::unlock()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::unlock()`.

6.483.3.6 virtual void decaf::util::concurrent::Mutex::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::wait()`, `decaf::util::StlMap< std::string, cms::Topic * >::wait()`, `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait()`, and `decaf::util::AbstractCollection< Pointer< BackupTransport > >::wait()`.

6.483.3.7 `virtual void decaf::util::concurrent::Mutex::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

6.483.3.8 `virtual void decaf::util::concurrent::Mutex::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

6.485 decaf::internal::util::concurrent::MutexImpl Class Reference

```
#include <src/main/decaf/internal/util/concurrent/MutexImpl.h>
```

Static Public Member Functions

- static **decaf::util::concurrent::MutexHandle * create** ()
Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.
- static void **destroy** (decaf::util::concurrent::MutexHandle *handle)
Destroy a previously create Mutex instance.
- static void **lock** (decaf::util::concurrent::MutexHandle *handle)
Locks the Mutex.
- static bool **trylock** (decaf::util::concurrent::MutexHandle *handle)
Tries to lock the Mutex.
- static void **unlock** (decaf::util::concurrent::MutexHandle *handle)
Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

6.485.1 Member Function Documentation

6.485.1.1 static decaf::util::concurrent::MutexHandle* decaf::internal::util::concurrent::MutexImpl::create () [static]

Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.

Returns

handle to a newly created Mutex.

6.485.1.2 static void decaf::internal::util::concurrent::MutexImpl::destroy (decaf::util::concurrent::MutexHandle * *handle*) [static]

Destroy a previously create Mutex instance.

Parameters

mutex The Mutex instance to be destroyed.

6.485.1.3 static void decaf::internal::util::concurrent::MutexImpl::lock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Locks the Mutex.

If the Mutex is already locked by another thread this method blocks until the Mutex becomes unlocked and this thread acquires the lock.

Parameters

handle the handle to the Mutex to Lock.

6.485.1.4 `static bool decaf::internal::util::concurrent::MutexImpl::trylock (decaf::util::concurrent::MutexHandle * handle) [static]`

Tries to lock the Mutex.

If the Mutex is unlocked this Thread acquires the lock on the Mutex and this method returns true, if the Mutex is already locked then the lock is not acquired and this method returns false.

Parameters

handle the handle to the Mutex to attempt to Lock.

Returns

true if the lock was acquired false otherwise.

6.485.1.5 `static void decaf::internal::util::concurrent::MutexImpl::unlock (decaf::util::concurrent::MutexHandle * handle) [static]`

Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

Parameters

handle the handle to the Mutex to attempt to Lock.

6.486.1.3 virtual
activemq::commands::NetworkBridgeFilter::~~NetworkBridgeFilter ()
[virtual]

6.486.2 Member Function Documentation

6.486.2.1 virtual **NetworkBridgeFilter*** **activemq::commands::NetworkBridgeFilter::cloneDataStructure** () const
[virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.486.2.2 `virtual void activemq::commands::NetworkBridgeFilter::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements **activemq::commands::DataStructure** (p. 1374).

6.486.2.3 `virtual bool activemq::commands::NetworkBridgeFilter::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements **activemq::commands::DataStructure** (p. 1374).

6.486.2.4 `virtual unsigned char activemq::commands::NetworkBridgeFilter::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.486.2.5 `virtual const Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () const [virtual]`
- 6.486.2.6 `virtual Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId () [virtual]`
- 6.486.2.7 `virtual int activemq::commands::NetworkBridgeFilter::getNetworkTTL () const [virtual]`
- 6.486.2.8 `NetworkBridgeFilter& activemq::commands::NetworkBridgeFilter::operator= (const NetworkBridgeFilter &) [inline, protected]`
- 6.486.2.9 `virtual void activemq::commands::NetworkBridgeFilter::setNetworkBrokerId (const Pointer< BrokerId > & networkBrokerId) [virtual]`
- 6.486.2.10 `virtual void activemq::commands::NetworkBridgeFilter::setNetworkTTL (int networkTTL) [virtual]`
- 6.486.2.11 `virtual std::string activemq::commands::NetworkBridgeFilter::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseDataStructure` (p.662).

6.486.3 Field Documentation

- 6.486.3.1 `const unsigned char activemq::commands::NetworkBridgeFilter::ID_ - NETWORKBRIDGEFILTER = 91 [static]`
- 6.486.3.2 `Pointer<BrokerId> activemq::commands::NetworkBridgeFilter::networkBrokerId [protected]`
- 6.486.3.3 `int activemq::commands::NetworkBridgeFilter::networkTTL [protected]`

6.487 activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller Class Reference

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 2250).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/NetworkBridgeFilterMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller:

Public Member Functions

- **NetworkBridgeFilterMarshaller** ()
- virtual **~NetworkBridgeFilterMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.487.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p.2250).
 NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.487.2 Constructor & Destructor Documentation

6.487.2.1 `activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller()` [inline]

6.487.2.2 `virtual activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller()` [inline, virtual]

6.487.3 Member Function Documentation

6.487.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1331).

6.487.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p.1336).

6.487.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.487.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::looseUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure** *
dataStructure, **decaf::io::DataInputStream** * *dataIn*) throw (
decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.487.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **utils::BooleanStream** * *bs*) throw (
decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.487.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightMarshal2`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataOutputStream * dataOut,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.487.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::NetworkBridgeFilterMarshaller::tightUnmarshal`
`(OpenWireFormat * wireFormat, commands::DataStructure`
`* dataStructure, decaf::io::DataInputStream * dataIn,`
`utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/NetworkBridgeFilterMarshaller.h`

6.488 `activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilter` Class Reference

Marshaling code for Open Wire Format for `NetworkBridgeFilterMarshaller` (p. 2253).

#include <src/main/activemq/wireformat/openwire/marshal/v3/NetworkBridgeFilterMarshaller.h>

6.488.2 Constructor & Destructor Documentation

6.488.2.1 `activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller () [inline]`

6.488.2.2 `virtual activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.488.3 Member Function Documentation

6.488.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.488.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.488.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.488.3.4 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.488.3.5 virtual int activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.488.3.6 virtual void activemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.488.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.489.2.2 `virtual activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::~~NetworkBridgeFilterMarshaller () [inline, virtual]`

6.489.3 Member Function Documentation

6.489.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.489.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.489.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.489.3.4 virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.489.3.5 virtual int activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.489.3.6 virtual void activemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.489.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::NetworkBridgeFilterMarshaller::tightUnmarsh
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.491.3 Member Function Documentation

6.491.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.491.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.491.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.491.3.4 virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.491.3.5 virtual int activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.491.3.6 virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.491.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::NetworkBridgeFilterMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.492 decaf::net::NoRouteToHostException Class Reference

```
#include <src/main/decaf/net/NoRouteToHostException.h>
```

Inheritance diagram for `decaf::net::NoRouteToHostException`:

Public Member Functions

- **NoRouteToHostException** () throw ()
Default Constructor.

- **NoRouteToHostException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoRouteToHostException** (const NoRouteToHostException &ex) throw ()
Copy Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoRouteToHostException** (const std::exception *cause) throw ()
Constructor.
- **NoRouteToHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoRouteToHostException * clone** () const
Clones this exception.
- virtual ~**NoRouteToHostException** () throw ()

6.492.1 Constructor & Destructor Documentation

6.492.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException () throw () [inline]

Default Constructor.

6.492.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.492.1.3 decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.492.1.4 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.5 `decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.492.1.6 `decaf::net::NoRouteToHostException::NoRouteToHostException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.492.1.7 `virtual decaf::net::NoRouteToHostException::~~NoRouteToHostException () throw () [inline, virtual]`

6.492.2 Member Function Documentation

6.492.2.1 `virtual NoRouteToHostException* decaf::net::NoRouteToHostException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 2794).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**NoRouteToHostException.h**

6.493 decaf::security::NoSuchAlgorithmException Class Reference

```
#include <src/main/decaf/security/NoSuchAlgorithmException.h>
```

Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** () throw ()
Default Constructor.
- **NoSuchAlgorithmException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoSuchAlgorithmException** (const NoSuchAlgorithmException &ex) throw ()
Copy Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchAlgorithmException** (const std::exception *cause) throw ()
Constructor.
- **NoSuchAlgorithmException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchAlgorithmException * clone** () const
Clones this exception.
- virtual **~NoSuchAlgorithmException** () throw ()

6.493.1 Constructor & Destructor Documentation

6.493.1.1 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException () throw () [inline]`

Default Constructor.

6.493.1.2 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.493.1.3 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const NoSuchAlgorithmException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.493.1.4 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.493.1.5 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.493.1.6 `decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException`
 (`const char * file`, `const int lineNumber`, `const char * msg`, ...)
 throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.493.1.7 `virtual`
`decaf::security::NoSuchAlgorithmException::~~NoSuchAlgorithmException`
 () throw () [inline, virtual]

6.493.2 Member Function Documentation

6.493.2.1 `virtual NoSuchAlgorithmException* de-`
`caf::security::NoSuchAlgorithmException::clone ()`
`const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p. 1604).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/NoSuchAlgorithmException.h`

6.494 decaf::lang::exceptions::NoSuchElementException Class Reference

#include <src/main/decaf/lang/exceptions/NoSuchElementException.h>
```

Inheritance diagram for `decaf::lang::exceptions::NoSuchElementException`:

Public Member Functions

- **NoSuchElementException** () throw ()
Default Constructor.
- **NoSuchElementException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1476).*
- **NoSuchElementException** (const **NoSuchElementException** &ex) throw ()
Copy Constructor.
- **NoSuchElementException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchElementException** (const std::exception *cause) throw ()
Constructor.
- **NoSuchElementException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchElementException** * clone () const
Clones this exception.
- virtual ~**NoSuchElementException** () throw ()

6.494.1 Constructor & Destructor Documentation

6.494.1.1 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
() throw () [inline]

Default Constructor.

6.494.1.2 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
(const **Exception** & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.494.1.3 **decaf::lang::exceptions::NoSuchElementException::NoSuchElementException**
(const **NoSuchElementException** & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.494.1.4 `decaf::lang::exceptions::NoSuchElementException::NoSuchElementException`
(`const char * file`, `const int lineNumber`, `const std::exception * cause`, `const char * msg`, ...) `throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.494.1.5 `decaf::lang::exceptions::NoSuchElementException::NoSuchElementException`
(`const std::exception * cause`) `throw ()` [inline]

Constructor.

Parameters

cause Pointer (p.2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.494.1.6 `decaf::lang::exceptions::NoSuchElementException::NoSuchElementException`
(`const char * file`, `const int lineNumber`, `const char * msg`, ...)
`throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.494.1.7 `virtual`
`decaf::lang::exceptions::NoSuchElementException::~~NoSuchElementException`
() `throw ()` [inline, virtual]

6.494.2 Member Function Documentation

6.494.2.1 `virtual NoSuchElementException* decaf::lang::exceptions::NoSuchElementException::clone` (
) `const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/NoSuchElementException.h`

6.495 decaf::security::NoSuchProviderException Class Reference

```

```

Inheritance diagram for `decaf::security::NoSuchProviderException`:

Public Member Functions

- **NoSuchProviderException** () throw ()
Default Constructor.
- **NoSuchProviderException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **NoSuchProviderException** (const NoSuchProviderException &ex) throw ()
Copy Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NoSuchProviderException** (const std::exception *cause) throw ()
Constructor.
- **NoSuchProviderException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchProviderException** * clone () const
Clones this exception.
- virtual ~**NoSuchProviderException** () throw ()

6.495.1 Constructor & Destructor Documentation

6.495.1.1 decaf::security::NoSuchProviderException::NoSuchProviderException () throw () [inline]

Default Constructor.

6.495.1.2 decaf::security::NoSuchProviderException::NoSuchProviderException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.495.1.3 decaf::security::NoSuchProviderException::NoSuchProviderException (const NoSuchProviderException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.495.1.4 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.495.1.5 decaf::security::NoSuchProviderException::NoSuchProviderException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.495.1.6 `decaf::security::NoSuchProviderException::NoSuchProviderException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs

lineNumber line number where the exception occurred.

msg message to report

... list of primitives that are formatted into the message

6.495.1.7 `virtual decaf::security::NoSuchProviderException::~~NoSuchProviderException () throw ()` [inline, virtual]

6.495.2 Member Function Documentation

6.495.2.1 `virtual NoSuchProviderException* decaf::security::NoSuchProviderException::clone () const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from `decaf::security::GeneralSecurityException` (p. 1604).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/NoSuchProviderException.h`

6.496 decaf::lang::exceptions::NullPointerException Class Reference

```
#include <src/main/decaf/lang/exceptions/NullPointerException.h>
```

Inheritance diagram for `decaf::lang::exceptions::NullPointerException`:

Public Member Functions

- **NullPointerException** () throw ()
Default Constructor.
- **NullPointerException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1476).*
- **NullPointerException** (const **NullPointerException** &ex) throw ()
Copy Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NullPointerException** (const std::exception *cause) throw ()
Constructor.
- **NullPointerException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **NullPointerException** * **clone** () const
Clones this exception.
- virtual ~**NullPointerException** () throw ()

6.496.1 Constructor & Destructor Documentation

6.496.1.1 decaf::lang::exceptions::NullPointerException::NullPointerException () throw () [inline]

Default Constructor.

6.496.1.2 decaf::lang::exceptions::NullPointerException::NullPointerException (const Exception & ex) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.496.1.3 decaf::lang::exceptions::NullPointerException::NullPointerException (const NullPointerException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.496.1.4 `decaf::lang::exceptions::NullPointerException::NullPointerException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.496.1.5 `decaf::lang::exceptions::NullPointerException::NullPointerException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause **Pointer** (p.2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.496.1.6 `decaf::lang::exceptions::NullPointerException::NullPointerException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.496.1.7 `virtual decaf::lang::exceptions::NullPointerException::~~NullPointerException () throw () [inline, virtual]`

6.496.2 Member Function Documentation

6.496.2.1 `virtual NullPointerException* decaf::lang::exceptions::NullPointerException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/NullPointerException.h`

6.497 decaf::lang::Number Class Reference

The abstract class **Number** (p. 2282) is the superclass of classes **Byte** (p. 776), **Double** (p. 1441), **Float** (p. 1544), **Integer** (p. 1652), **Long** (p. 1934), and **Short** (p. 2729).

```
#include <src/main/decaf/lang/Number.h>
```

Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual `~Number ()`
- virtual unsigned char **byteValue ()** const
Answers the byte value which the receiver represents.
- virtual double **doubleValue ()** const =0
Answers the double value which the receiver represents.
- virtual float **floatValue ()** const =0
Answers the float value which the receiver represents.
- virtual int **intValue ()** const =0
Answers the int value which the receiver represents.
- virtual long long **longValue ()** const =0
Answers the long value which the receiver represents.
- virtual short **shortValue ()** const
Answers the short value which the receiver represents.

6.497.1 Detailed Description

The abstract class **Number** (p. 2282) is the superclass of classes **Byte** (p. 776), **Double** (p. 1441), **Float** (p. 1544), **Integer** (p. 1652), **Long** (p. 1934), and **Short** (p. 2729). Subclasses of **Number** (p. 2282) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

6.497.2 Constructor & Destructor Documentation

6.497.2.1 `virtual decaf::lang::Number::~~Number () [inline, virtual]`

6.497.3 Member Function Documentation

6.497.3.1 `virtual unsigned char decaf::lang::Number::byteValue () const [inline, virtual]`

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

6.497.3.2 `virtual double decaf::lang::Number::doubleValue () const [pure virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 584).

6.497.3.3 `virtual float decaf::lang::Number::floatValue () const [pure virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 584).

6.497.3.4 `virtual int decaf::lang::Number::intValue () const [pure virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 586).

6.497.3.5 `virtual long long decaf::lang::Number::longValue () const [pure virtual]`

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implemented in `decaf::util::concurrent::atomic::AtomicInteger` (p. 586).

6.497.3.6 `virtual short decaf::lang::Number::shortValue () const [inline, virtual]`

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Number.h`

6.498 decaf::lang::exceptions::NumberFormatException Class Reference

```
#include <src/main/decaf/lang/exceptions/NumberFormatException.h>
```

Inheritance diagram for `decaf::lang::exceptions::NumberFormatException`:

Public Member Functions

- **NumberFormatException** ()
Default Constructor.
- **NumberFormatException** (const **Exception** &ex) throw ()
*Conversion Constructor from some other **Exception** (p. 1476).*
- **NumberFormatException** (const **NumberFormatException** &ex) throw ()
Copy Constructor.
- **NumberFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **NumberFormatException** (const std::exception *cause) throw ()
Constructor.
- **NumberFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- virtual **NumberFormatException** * **clone** () const
Clones this exception.
- virtual ~**NumberFormatException** () throw ()

6.498.1 Constructor & Destructor Documentation

6.498.1.1 `decaf::lang::exceptions::NumberFormatException::NumberFormatException () [inline]`

Default Constructor.

Referenced by `clone()`.

6.498.1.2 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.498.1.3 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const NumberFormatException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.498.1.4 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

References `decaf::lang::Exception::buildMessage()`, and `decaf::lang::Exception::setMark()`.

6.498.1.5 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

***cause* Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.498.1.6 `decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

References `decaf::lang::Exception::buildMessage()`, and `decaf::lang::Exception::setMark()`.

6.498.1.7 `virtual decaf::lang::exceptions::NumberFormatException::~~NumberFormatException () throw () [inline, virtual]`

6.498.2 Member Function Documentation

6.498.2.1 `virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

References `NumberFormatException()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/NumberFormatException.h`

6.499 cms::ObjectMessage Class Reference

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

```
#include <src/main/cms/ObjectMessage.h>
```

Inheritance diagram for cms::ObjectMessage:

Public Member Functions

- virtual `~ObjectMessage ()`

6.499.1 Detailed Description

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object. serialized `ObjectMessage` (p. 2287)s.

Since

1.0

6.499.2 Constructor & Destructor Documentation

6.499.2.1 virtual cms::ObjectMessage::~ObjectMessage () [inline, virtual]

The documentation for this class was generated from the following file:

- `src/main/cms/ObjectMessage.h`

6.500 decaf::security_provider::unix::openssl::OpenSSLX500Principal Class Reference

The `OpenSSLX500Principal` (p. 2287) wraps around an OpenSSL `X509_NAME` structure.

```
#include <src/main/decaf/security_provider/unix/openssl/OpenSSLX500Principal.h>
```

Public Member Functions

- `OpenSSLX500Principal (X509_NAME *name)`
Constructor.
- virtual `~OpenSSLX500Principal ()`
Destructor.
- virtual `X509_NAME * getX509Name ()`
Accessor to the underlying X509 name structure.

- virtual bool **equals** (const Principal &another) const
Compares two principals to see if they are the same.
- virtual std::string **getName** () const
Returns the distinguished name string using the RFC2253 formatting.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const
Serializes the distinguished name to its ASN.1 DER encoded form.

Static Public Member Functions

- static void **getEncoded** (X509_NAME *name, std::vector< unsigned char > &output)
Serializes the given distinguished name to its ASN.1 DER encoded form.
- static std::string **toString** (X509_NAME *name) const
Converts the given name to a string using the RFC2253 formatting.

6.500.1 Detailed Description

The `OpenSSLX500Principal` (p. 2287) wraps around an OpenSSL `X509_NAME` structure. It does not, however, control the lifetime of the structure.

6.500.2 Constructor & Destructor Documentation

6.500.2.1 `decaf::security_provider::unix::openssl::OpenSSLX500Principal::OpenSSLX500Principal (X509_NAME * name)`

Constructor.

Saves the internal X509 name and caches the string representation of the name.

Parameters

name The underlying X509 name structure.

6.500.2.2 `virtual decaf::security_provider::unix::openssl::OpenSSLX500Principal::~~OpenSSLX500Principal () [inline, virtual]`

Destructor.

Does nothing.

6.500.3 Member Function Documentation

6.500.3.1 `virtual bool decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::equals (
const Principal & another) const [virtual]`

Compares two principals to see if they are the same.

Parameters

another A principal to be tested for equality to this one.

Returns

true if the given principal is equivalent to this one.

6.500.3.2 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::getEncoded (
std::vector< unsigned char > & output) const [inline, virtual]`

Serializes the distinguished name to its ASN.1 DER encoded form.

Parameters

output Receives the distinguished name in ASN.1 DER encoded form.

6.500.3.3 `static void decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::getEncoded (
X509_NAME * name, std::vector< unsigned char > & output)
[static]`

Serializes the given distinguished name to its ASN.1 DER encoded form.

Parameters

name the X509 name structure to be encoded.

output Receives the distinguished name in ASN.1 DER encoded form.

6.500.3.4 `virtual std::string decaf::security_-
provider::unix::openssl::OpenSSLX500Principal::getName
() const [inline, virtual]`

Returns the distinguished name string using the RFC2253 formatting.

Returns

the RFC2253 formatted distinguished name string.

References toString().

6.500.3.5 `virtual X509_NAME* decaf::security_provider::unix::openssl::OpenSSLX500Principal::getX509Name ()`
 [inline, virtual]

Accessor to the underlying X509 name structure.

6.500.3.6 `static std::string decaf::security_provider::unix::openssl::OpenSSLX500Principal::toString (`
 `X509_NAME * name) const [static]`

Converts the given name to a string using the RFC2253 formatting.

Parameters

name the X509 name structure to be formatted.

Returns

the RFC2253 formatted name string.

Referenced by getName().

The documentation for this class was generated from the following file:

- src/main/decaf/security_provider/unix/openssl/OpenSSLX500Principal.h

6.501 decaf::security_provider::unix::openssl::OpenSSLX509Certificate Class Reference

```

```

Inheritance diagram for decaf::security_provider::unix::openssl::OpenSSLX509Certificate:

Public Member Functions

- virtual `~OpenSSLX509Certificate ()`
- virtual bool **equals** (const Certificate &cert) const =0
Compares the encoded form of the two certificates.
- virtual void **getEncoded** (std::vector< unsigned char > &output) const =0 throw (CertificateEncodingException)
Provides the encoded form of this certificate.
- virtual std::string **getType** () const =0
Returns the type of this certificate.
- virtual PublicKey * **getPublicKey** ()=0
Gets the public key of this certificate.

- virtual const PublicKey * **getPublicKey** () const =0
Gets the public key of this certificate.
- virtual void **verify** (const PublicKey &publicKey) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual void **verify** (const PublicKey &publicKey, const std::string &sigProvider) const =0 throw (NoSuchAlgorithmException, InvalidKeyException, NoSuchProviderException, SignatureException, CertificateException)
Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual std::string **toString** () const =0
Returns a string representation of this certificate.
- virtual void **checkValidity** () const =0 throw (CertificateExpiredException, CertificateNotYetValidException)
- virtual void **checkValidity** (const decaf::util::Date &date) const =0 throw (CertificateExpiredException, CertificateNotYetValidException)
- virtual int **getBasicConstraints** () const =0
- virtual void **getIssuerUniqueID** (std::vector< bool > &output) const =0
- virtual const X500Principal * **getIssuerX500Principal** () const =0
- virtual void **getKeyUsage** (std::vector< unsigned char > &output) const =0
- virtual Date **getNotAfter** () const =0
- virtual Date **getNotBefore** () const =0
- virtual std::string **getSigAlgName** () const =0
- virtual std::string **getSigAlgOID** () const =0
- virtual void **getSigAlgParams** (std::vector< unsigned char > &output) const =0
- virtual void **getSignature** (std::vector< unsigned char > &output) const =0
- virtual void **getSubjectUniqueID** (std::vector< bool > &output) const =0
- virtual const X500Principal * **getSubjectX500Principal** () const =0
- virtual void **getTBSCertificate** (std::vector< unsigned char > &output) const =0 throw (CertificateEncodingException)
- virtual int **getVersion** () const =0

6.501.1 Constructor & Destructor Documentation

- 6.501.1.1 virtual decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::~~OpenSSLX509Certificate
() [virtual]

6.501.2 Member Function Documentation

- 6.501.2.1 virtual void decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::checkValidity
() const throw (CertificateExpiredException,
CertificateNotYetValidException) [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3190).

6.501.2.2 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::checkValidity (const decaf::util::Date & *date*) const throw (CertificateExpiredException, CertificateNotYetValidException) [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3190).

6.501.2.3 virtual bool decaf::security_provider::unix::openssl::OpenSSLX509Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters

cert The certificate to be tested for equality with this certificate.

Returns

true if the given certificate is equal to this certificate.

6.501.2.4 virtual int decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getBasicConstraints () const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3190).

6.501.2.5 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getEncoded (std::vector< unsigned char > & *output*) const throw (CertificateEncodingException) [pure virtual]

Provides the encoded form of this certificate.

Parameters

output Receives the encoded form of this certificate.

Exceptions

CertificateEncodingException if an encoding error occurs

Implements decaf::security::cert::Certificate (p. 902).

6.501.2.6 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getIssuerUniqueID (std::vector< bool > & *output*) const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3190).

6.501.2.7 `virtual const X500Principal* decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getIssuerX500Principal
() const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 3191).

6.501.2.8 `virtual void decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getKeyUsage (
std::vector< unsigned char > & output) const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 3191).

6.501.2.9 `virtual Date decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getNotAfter ()
const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 3191).

6.501.2.10 `virtual Date decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getNotBefore ()
const [pure virtual]`

Implements `decaf::security::cert::X509Certificate` (p. 3191).

6.501.2.11 `virtual PublicKey* decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getPublicKey ()
[pure virtual]`

Gets the public key of this certificate.

Returns

the public key

Implements `decaf::security::cert::Certificate` (p. 902).

6.501.2.12 `virtual const PublicKey* decaf::security_-
provider::unix::openssl::OpenSSLX509Certificate::getPublicKey ()
const [pure virtual]`

Gets the public key of this certificate.

Returns

the public key

Implements `decaf::security::cert::Certificate` (p. 903).

6.501.2.13 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgName ()
const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3191).

6.501.2.14 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgOID ()
const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3191).

6.501.2.15 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSigAlgParams (std::vector< unsigned char > & *output*) const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3191).

6.501.2.16 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSignature (std::vector< unsigned char > & *output*) const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3191).

6.501.2.17 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSubjectUniqueID (std::vector< bool > & *output*) const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3192).

6.501.2.18 virtual const X500Principal* decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getSubjectX500Principal () const [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3192).

6.501.2.19 virtual void decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getTBSCertificate (std::vector< unsigned char > & *output*) const throw (CertificateEncodingException) [pure virtual]

Implements decaf::security::cert::X509Certificate (p. 3192).

6.501.2.20 virtual std::string decaf::security_provider::unix::openssl::OpenSSLX509Certificate::getType () const
[pure virtual]

Returns the type of this certificate.

Returns

the type of this certificate

Implements **decaf::security::cert::Certificate** (p. 903).

6.501.2.21 `virtual int decaf::security_
provider::unix::openssl::OpenSSLX509Certificate::getVersion () const
[pure virtual]`

Implements **decaf::security::cert::X509Certificate** (p. 3192).

6.501.2.22 `virtual std::string decaf::security_
provider::unix::openssl::OpenSSLX509Certificate::toString () const
[pure virtual]`

Returns a string representation of this certificate.

Returns

a string representation of this certificate

Implements **decaf::security::cert::Certificate** (p. 903).

6.501.2.23 `virtual void decaf::security_
provider::unix::openssl::OpenSSLX509Certificate::verify (
const PublicKey & publicKey) const throw (NoSuchAlgorith-
mException, InvalidKeyException, NoSuchProviderException,
SignatureException, CertificateException) [pure virtual]`

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters

publicKey The public key used to carry out the validation.

Exceptions

NoSuchAlgorithmException - on unsupported signature algorithms.

InvalidKeyException - on incorrect key.

NoSuchProviderException - if there's no default provider.

SignatureException - on signature errors.

CertificateException - on encoding errors.

```

6.501.2.24 virtual void decaf::security_ -
              provider::unix::openssl::OpenSSLX509Certificate::verify (
                const PublicKey & publicKey, const std::string & sigProvider )
                const throw ( NoSuchAlgorithmException, InvalidKeyException,
                              NoSuchProviderException, SignatureException, CertificateException)
                [pure virtual]

```

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Uses the verification engine of the specified provider.

Parameters

publicKey The public key used to carry out the validation.
sigProvider The name of the signature provider

Exceptions

NoSuchAlgorithmException - on unsupported signature algorithms.
InvalidKeyException - on incorrect key.
NoSuchProviderException - if there's no default provider.
SignatureException - on signature errors.
CertificateException - on encoding errors.

The documentation for this class was generated from the following file:

- src/main/decaf/security_provider/unix/openssl/OpenSSLX509Certificate.h

6.502 activemq::wireformat::openwire::OpenWireFormat Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>
```

Inheritance diagram for activemq::wireformat::openwire::OpenWireFormat:

Public Member Functions

- **OpenWireFormat** (const decaf::util::Properties &properties)
Constructs a new OpenWireFormat (p. 2296) object.
- virtual ~OpenWireFormat ()
- virtual bool hasNegotiator () const
Returns true if this WireFormat (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.
- virtual Pointer< transport::Transport > createNegotiator
(const Pointer< transport::Transport > &transport) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

- void **addMarshaller** (**marshal::DataStreamMarshaller** *marshaller)
Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out) throw (**decaf::io::IOException**)
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in) throw (**decaf::io::IOException**)
Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.
- virtual int **tightMarshalNestedObject1** (**commands::DataStructure** *object, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Utility method for Tight Marshaling the given object to the boolean stream passed.
- void **tightMarshalNestedObject2** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.
- **commands::DataStructure** * **tightUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.
- **commands::DataStructure** * **looseUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis) throw (**decaf::io::IOException**)
Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.
- void **looseMarshalNestedObject** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Utility method to loosely Marshal an object that is derived from the DataStrcutre interface.
- void **renegotiateWireFormat** (const **commands::WireFormatInfo** &info) throw (**decaf::lang::exceptions::IllegalStateException**)
Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.
- virtual void **setPreferredWireFormatInfo** (const **Pointer**< **commands::WireFormatInfo** > &info) throw (**decaf::lang::exceptions::IllegalStateException**)

Configures this object using the provided WireFormatInfo object.

- virtual const **Pointer< commands::WireFormatInfo > & getPreferredWireFormatInfo** () const

Gets the Preferred WireFormatInfo object that this class holds.

- bool **isStackTraceEnabled** () const

Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () const

Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

Sets if the tcpNoDelayEnabled flag is on.

- int **getVersion** () const

Get the current Wireformat Version.

- void **setVersion** (int version) throw (decaf::lang::exceptions::IllegalArgumentException)

Set the current Wireformat Version.

- virtual bool **inReceive** () const

Is there a Message being unmarshaled?

- bool **isCacheEnabled** () const

Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)

Sets if the cacheEnabled flag is on.

- int **getCacheSize** () const

Returns the currently set Cache size.

- void **setCacheSize** (int value)

Sets the current Cache size.

- bool **isTightEncodingEnabled** () const

Checks if the tightEncodingEnabled flag is on.

- void **setTightEncodingEnabled** (bool tightEncodingEnabled)

Sets if the tightEncodingEnabled flag is on.

- bool **isSizePrefixDisabled** () const

Checks if the sizePrefixDisabled flag is on.

- void **setSizePrefixDisabled** (bool sizePrefixDisabled)

Sets if the sizePrefixDisabled flag is on.

- long long **getMaxInactivityDuration** () const
Gets the MaxInactivityDuration setting.
- void **setMaxInactivityDuration** (long long value)
Sets the MaxInactivityDuration setting.
- long long **getMaxInactivityDurationInitialDelay** () const
Gets the MaxInactivityDurationInitialDelay setting.
- void **setMaxInactivityDurationInitialDelay** (long long value)
Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure * doUnmarshal** (decaf::io::DataInputStream *dis)
throw (decaf::io::IOException)
Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.
- void **destroyMarshallers** ()
Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static const unsigned char **NULL_TYPE**
- static const int **DEFAULT_VERSION** = 1

6.502.1 Constructor & Destructor Documentation

6.502.1.1 activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 2296) object.

Parameters

properties - can contain optional config params.

6.502.1.2 virtual
activemq::wireformat::openwire::OpenWireFormat::~~OpenWireFormat () [virtual]

6.502.2 Member Function Documentation

6.502.2.1 void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (marshal::DataStreamMarshaller * *marshaller*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarshaled.

Parameters

marshaller - the Marshaller to add to the collection.

6.502.2.2 virtual Pointer<transport::Transport> activemq::wireformat::openwire::OpenWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 3182).

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.502.2.3 void activemq::wireformat::openwire::OpenWireFormat::destroyMarshallers () [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector.

This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.502.2.4 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::doUnmarshal (decaf::io::DataInputStream * *dis*) throw (decaf::io::IOException) [protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters

dis - DataInputStream to read from

Returns

new DataStructure* that the caller owns

Exceptions

IOException if an error occurs during the unmarshal

6.502.2.5 `int activemq::wireformat::openwire::OpenWireFormat::getCacheSize ()
const [inline]`

Returns the currently set Cache size.

Returns

the current value of the broker's cache size.

6.502.2.6 `long long ac-
tivemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration
() const [inline]`

Gets the MaxInactivityDuration setting.

Returns

maximum inactivity duration value in milliseconds.

6.502.2.7 `long long ac-
tivemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay
() const [inline]`

Gets the MaxInactivityDurationInitialDelay setting.

Returns

maximum inactivity duration initial delay value in milliseconds.

6.502.2.8 `virtual const Pointer<commands::WireFormatInfo>& ac-
tivemq::wireformat::openwire::OpenWireFormat::getPreferredWireFormatInfo
() const [inline, virtual]`

Gets the Preferred WireFormatInfo object that this class holds.

Returns

pointer to a preferred WireFormatInfo object

6.502.2.9 `int activemq::wireformat::openwire::OpenWireFormat::getVersion () const [inline, virtual]`

Get the current Wireformat Version.

Returns

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.502.2.10 `virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator () const [inline, virtual]`

Returns true if this **WireFormat** (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3148) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.502.2.11 `virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive () const [inline, virtual]`

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3150).

6.502.2.12 `bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled () const [inline]`

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.502.2.13 `bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled () const [inline]`

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.502.2.14 `bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled () const [inline]`

Checks if the `isStackTraceEnabled` flag is on.

Returns

true if the flag is on.

6.502.2.15 `bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled () const [inline]`

Checks if the `isTcpNoDelayEnabled` flag is on.

Returns

true if the flag is on.

6.502.2.16 `bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled () const [inline]`

Checks if the `isTightEncodingEnabled` flag is on.

Returns

true if the flag is on.

6.502.2.17 `void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (commands::DataStructure * o, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)`

Utility method to loosely Marshal an object that is derived from the `DataStructure` interface.

The marshaled data is written to the passed in `DataOutputStream`.

Parameters

o - `DataStructure` derived Object to Marshal

dataOut - `DataOutputStream` to write the data to

Exceptions

IOException if an error occurs.

6.502.2.18 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (decaf::io::DataInputStream * dis) throw (decaf::io::IOException)`

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

Parameters

dis - the DataInputStream to read the data from

Returns

a new DataStructure derived Object pointer

Exceptions

IOException if an error occurs.

6.502.2.19 `virtual void activemq::wireformat::openwire::OpenWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException)`
[virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal.

transport The Transport instance that called this method.

out The output stream to write the command to.

Exceptions

IOException

Implements `activemq::wireformat::WireFormat` (p. 3150).

6.502.2.20 `void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat (const commands::WireFormatInfo & info) throw (decaf::lang::exceptions::IllegalStateException)`

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters

info - The new Wireformat Info settings

Exceptions

IllegalStateException is wire format can't be negotiated.

6.502.2.21 `void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool cacheEnabled) [inline]`

Sets if the cacheEnabled flag is on.

Parameters

cacheEnabled - true to turn flag is on

6.502.2.22 `void activemq::wireformat::openwire::OpenWireFormat::setCacheSize (int value) [inline]`

Sets the current Cache size.

Parameters

value - the value to send as the broker's cache size.

6.502.2.23 `void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration (long long value) [inline]`

Sets the MaxInactivityDuration setting.

Parameters

value - the Max inactivity duration value in milliseconds.

6.502.2.24 `void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay (long long value) [inline]`

Sets the MaxInactivityDurationInitialDelay setting.

Parameters

value - the Max inactivity Initial Delay duration value in milliseconds.

6.502.2.25 `virtual void activemq::wireformat::openwire::OpenWireFormat::setPreferredWireFormatInfo (const Pointer< commands::WireFormatInfo > & info) throw (decaf::lang::exceptions::IllegalStateException) [virtual]`

Configures this object using the provided WireformatInfo object.

Parameters

info - a WireFormatInfo object, takes ownership.

6.502.2.26 void activemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled (bool *sizePrefixDisabled*) [inline]

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefixDisabled - true to turn flag is on

6.502.2.27 void activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled (bool *stackTraceEnabled*) [inline]

Sets if the stackTraceEnabled flag is on.

Parameters

stackTraceEnabled - true to turn flag is on

6.502.2.28 void activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*) [inline]

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelayEnabled - true to turn flag is on

6.502.2.29 void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled (bool *tightEncodingEnabled*) [inline]

Sets if the tightEncodingEnabled flag is on.

Parameters

tightEncodingEnabled - true to turn flag is on

6.502.2.30 void activemq::wireformat::openwire::OpenWireFormat::setVersion (int *version*) throw (decaf::lang::exceptions::IllegalArgumentException) [virtual]

Set the current Wireformat Version.

Parameters

version - int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 3150).

6.502.2.31 `virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 (commands::DataStructure * object, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters

object - The DataStructure to marshal
bs - the BooleanStream to write to

Returns

size of the data returned.

6.502.2.32 `void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * o, decaf::io::DataOutputStream * ds, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

Writes the data to the Data Output Stream provided.

Parameters

o - DataStructure object
ds - DataOutputStream for writing
bs - BooleanStream

Exceptions

IOException if an error occurs.

6.502.2.33 `commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * dis, utils::BooleanStream * bs) throw (decaf::io::IOException)`

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

The DataStructure instance that is returned is now the property of the caller.

Parameters

dis - DataInputStream to read from
bs - BooleanStream to read from

Returns

Newly allocated DataStructure Object

Exceptions

IOException if an error occurs.

6.502.2.34 virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and un-marshaled into the correct form.

Returns a Pointer to the newly un-marshaled Command.

Parameters

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implements **activemq::wireformat::WireFormat** (p. 3151).

6.502.3 Field Documentation

6.502.3.1 const int

6.503.1.2 **virtual** **activemq::wireformat::openwire::OpenWireFormatFactory::~~OpenWireFormatFactory** () [inline, virtual]

6.503.2 Member Function Documentation

6.503.2.1 **virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat** (const **decaf::util::Properties** & *properties*) throw (**decaf::lang::exceptions::IllegalStateException**) [virtual]

Creates a new **WireFormat** (p. 3148) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3148)

Implements **activemq::wireformat::WireFormatFactory** (p. 3152).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireFormatFactory.h`

6.504 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>
```

Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, const **Pointer**< **transport::Transport** > &next)
Constructor - Initializes this object around another Transport.
- virtual **~OpenWireFormatNegotiator** ()
- virtual void **oneway** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends a one-way command.
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual **Pointer**< **commands::Response** > **request** (const **Pointer**< **commands::Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Sends the given request to the server and waits for the response.
- virtual void **onCommand** (const **Pointer**< **commands::Command** > &command)
This is called in the context of the nested transport's reading thread.
- virtual void **onTransportException** (**transport::Transport** *source, const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.

6.504.1 Constructor & Destructor Documentation

- 6.504.1.1** **activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator** (**OpenWireFormat** * wireFormat, const **Pointer**< **transport::Transport** > & next)

Constructor - Initializes this object around another Transport.

Parameters

wireFormat - The **WireFormat** (p.3148) object we use to negotiate

next - The next transport in the chain

6.504.1.2 virtual

activemq::wireformat::openwire::OpenWireFormatNegotiator::~~OpenWireFormatNegotiator () [virtual]

6.504.2 Member Function Documentation**6.504.2.1 virtual void ac-**

tivemq::wireformat::openwire::OpenWireFormatNegotiator::close ()
throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p.3075).

6.504.2.2 virtual void ac-

tivemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand
(const Pointer< commands::Command > & command) [virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p.3077).

6.504.2.3 virtual void ac-

tivemq::wireformat::openwire::OpenWireFormatNegotiator::oneway
(const Pointer< commands::Command > &
command) throw (decaf::io::IOException, de-
caf::lang::exceptions::UnsupportedOperationException)
 [virtual]

Sends a one-way command.

Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3077).

6.504.2.4 `virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException (transport::Transport * source, const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

source The source of the exception

ex The exception.

6.504.2.5 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command The request to send.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3079).

6.504.2.6 `virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormatNegotiator::request (const Pointer< commands::Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

- command* The request to send.
- timeout* The time to wait for the response.

Returns

the response from the server.

Exceptions

- IOException* if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3078).

```
6.504.2.7 virtual void ac-
          tivemq::wireformat::openwire::OpenWireFormatNegotiator::start ( )
          throw ( decaf::io::IOException ) [virtual]
```

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

- IOException* if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3079).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h`

6.505 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

```
#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>
```

Inheritance diagram for `activemq::wireformat::openwire::OpenWireResponseBuilder`:

Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual **~OpenWireResponseBuilder** ()
- virtual **Pointer< commands::Response > buildResponse** (const **Pointer< commands::Command >** &command)

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

- virtual void **buildIncomingCommands** (const Pointer< commands::Command > &command, decaf::util::StlQueue< Pointer< commands::Command > > &queue)

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

6.505.1 Constructor & Destructor Documentation

6.505.1.1 `activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder () [inline]`

6.505.1.2 `virtual
activemq::wireformat::openwire::OpenWireResponseBuilder::~~OpenWireResponseBuilder () [inline, virtual]`

6.505.2 Member Function Documentation

6.505.2.1 `virtual void ac-
tivemq::wireformat::openwire::OpenWireResponseBuilder::buildIncomingCommands
(const Pointer< commands::Command > & command,
decaf::util::StlQueue< Pointer< commands::Command > > & queue)
[virtual]`

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

command - The Command being sent to the Broker.

queue - Queue of Command sent back from the broker.

Implements `activemq::transport::mock::ResponseBuilder` (p. 2615).

6.505.2.2 `virtual Pointer<commands::Response> ac-
tivemq::wireformat::openwire::OpenWireResponseBuilder::buildResponse
(const Pointer< commands::Command > & command) [virtual]`

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters

command - The command to build a response for

Returns

A Response object pointer, or NULL if no response.

Implements `activemq::transport::mock::ResponseBuilder` (p. 2616).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h`

6.506 activemq::wireformat::openwire::utils::OpenwireStringSupport Class Reference

```
#include <src/main/activemq/wireformat/openwire/utils/OpenwireStringSupport.h>
```

Static Public Member Functions

- static std::string **readString** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)

Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

- static void **writeString** (decaf::io::DataOutputStream &dataOut, const std::string *str) throw (decaf::io::IOException)

Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Protected Member Functions

- OpenwireStringSupport ()
- virtual ~OpenwireStringSupport ()

6.506.1 Constructor & Destructor Documentation

6.506.1.1 activemq::wireformat::openwire::utils::OpenwireStringSupport::OpenwireStringSupport () [inline, protected]

6.506.1.2 virtual
activemq::wireformat::openwire::utils::OpenwireStringSupport::~~OpenwireStringSupport () [inline, protected, virtual]

6.506.2 Member Function Documentation

6.506.2.1 static std::string **activemq::wireformat::openwire::utils::OpenwireStringSupport::readString** (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static]

Static method used for reading a string that uses the Openwire format from a DataInputStream, this can throw an IOException for the same reason as a DataInputStream.readUTF might, as well as if the string that is received doesn't conform to the supported character encoding.

Parameters

dataIn - DataInputStream to read from

Returns

A string that has been read

Exceptions

IOException on Error.

```

6.506.2.2 static void activemq::wireformat::openwire::utils::OpenwireStringSupport::writeString
( decaf::io::DataOutputStream & dataOut, const std::string * str )
throw ( decaf::io::IOException ) [static]

```

Static method used for writing a string that uses the Openwire format from a DataOutputStream, this can throw an IOException for the same reason as a DataOutputStream.writeUTF might.

Parameters

dataOut - DataOutputStream to write to

str - A pointer to a string that should be written, NULL needs to be an option here as its written as -1.

Exceptions

IOException on Error.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/OpenwireStringSupport.h

6.507 decaf::io::OutputStream Class Reference

Base interface for an output stream.

```
#include <src/main/decaf/io/OutputStream.h>
```

Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- virtual **~OutputStream** ()
- virtual void **write** (unsigned char c)=0 throw (IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer)=0 throw (IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len)=0 throw (IOException, lang::exceptions::NullPointerException)
Writes an array of bytes to the output stream.
- virtual void **flush** ()=0 throw (IOException)
Flushes any pending writes in this output stream.

6.507.1 Detailed Description

Base interface for an output stream.

6.507.2 Constructor & Destructor Documentation

6.507.2.1 `virtual decaf::io::OutputStream::~~OutputStream () [inline, virtual]`

6.507.3 Member Function Documentation

6.507.3.1 `virtual void decaf::io::OutputStream::flush () throw (IOException) [pure virtual]`

Flushes any pending writes in this output stream.

Exceptions

IOException (p. 1707)

Implemented in `decaf::internal::io::StandardErrorOutputStream` (p. 2814), `decaf::internal::io::StandardOutputStream` (p. 2827), `decaf::io::BufferedOutputStream` (p. 753), `decaf::io::ByteArrayOutputStream` (p. 838), `decaf::io::FilterOutputStream` (p. 1539), and `decaf::net::SocketOutputStream` (p. 2805).

6.507.3.2 `virtual void decaf::io::OutputStream::write (const std::vector< unsigned char > & buffer) throw (IOException) [pure virtual]`

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implemented in `decaf::internal::io::StandardErrorOutputStream` (p. 2817), `decaf::internal::io::StandardOutputStream` (p. 2829), `decaf::io::BufferedOutputStream` (p. 754), `decaf::io::ByteArrayOutputStream` (p. 843), `decaf::io::DataOutputStream` (p. 1303), `decaf::io::FilterOutputStream` (p. 1542), and `decaf::net::SocketOutputStream` (p. 2808).

6.507.3.3 `virtual void decaf::io::OutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (IOException, lang::exceptions::NullPointerException) [pure virtual]`

Writes an array of bytes to the output stream.

Parameters

buffer The array of bytes to write.

offset the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions

IOException (p. 1707) thrown if an error occurs.

NullPointerException thrown if buffer is Null.

Implemented in `activemq::io::LoggingOutputStream` (p. 1920), `decaf::internal::io::StandardErrorOutputStream` (p. 2817), `decaf::internal::io::StandardOutputStream` (p. 2830), `decaf::io::BufferedOutputStream` (p. 754), `decaf::io::ByteArrayOutputStream` (p. 842), `decaf::io::DataOutputStream` (p. 1303), `decaf::io::FilterOutputStream` (p. 1543), and `decaf::net::SocketOutputStream` (p. 2809).

6.507.3.4 `virtual void decaf::io::OutputStream::write (unsigned char c) throw (IOException) [pure virtual]`

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

Implemented in `activemq::io::LoggingOutputStream` (p. 1919), `decaf::internal::io::StandardErrorOutputStream` (p. 2817), `decaf::internal::io::StandardOutputStream` (p. 2830), `decaf::io::BufferedOutputStream` (p. 754), `decaf::io::ByteArrayOutputStream` (p. 842), `decaf::io::DataOutputStream` (p. 1302), `decaf::io::FilterOutputStream` (p. 1542), and `decaf::net::SocketOutputStream` (p. 2808).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/OutputStream.h`

6.508 activemq::commands::PartialCommand Class Reference

```
#include <src/main/activemq/commands/PartialCommand.h>
```

Inheritance diagram for `activemq::commands::PartialCommand`:

Public Member Functions

- `PartialCommand ()`

- virtual `~PartialCommand ()`
- virtual unsigned char `getDataStructureType ()` const

Get the unique identifier that this object and its own Marshaler share.

- virtual `PartialCommand * cloneDataStructure ()` const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void `copyDataStructure (const DataStructure *src)`

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string `toString ()` const

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool `equals (const DataStructure *value)` const

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual int `getCommandId ()` const
- virtual void `setCommandId (int commandId)`
- virtual const std::vector< unsigned char > & `getData ()` const
- virtual std::vector< unsigned char > & `getData ()`
- virtual void `setData (const std::vector< unsigned char > &data)`

Static Public Attributes

- static const unsigned char `ID_PARTIALCOMMAND = 60`

Protected Member Functions

- `PartialCommand & operator= (const PartialCommand &)`

Protected Attributes

- int `commandId`
- std::vector< unsigned char > `data`

6.508.1 Constructor & Destructor Documentation

6.508.1.1 `activemq::commands::PartialCommand::PartialCommand (const PartialCommand &)` [inline, protected]

6.508.1.2 `activemq::commands::PartialCommand::PartialCommand ()`

6.508.1.3 `virtual activemq::commands::PartialCommand::~~PartialCommand ()` [virtual]

6.508.2 Member Function Documentation

6.508.2.1 `virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1841).

6.508.2.2 `virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1841).

6.508.2.3 `virtual bool activemq::commands::PartialCommand::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

Reimplemented in `activemq::commands::LastPartialCommand` (p. 1841).

6.508.2.4 `virtual int activemq::commands::PartialCommand::getCommandId ()`
`const [virtual]`

6.508.2.5 `virtual const std::vector<unsigned char>& ac-`
`tivemq::commands::PartialCommand::getData () const`
`[virtual]`

6.508.2.6 `virtual std::vector<unsigned char>& ac-`
`tivemq::commands::PartialCommand::getData ()`
`[virtual]`

6.508.2.7 `virtual unsigned char ac-`
`tivemq::commands::PartialCommand::getDataStructureType () const`
`[virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1842).

6.508.2.8 `PartialCommand& activemq::commands::PartialCommand::operator= (`
`const PartialCommand &) [inline, protected]`

6.508.2.9 `virtual void activemq::commands::PartialCommand::setCommandId (`
`int commandId) [virtual]`

6.508.2.10 `virtual void activemq::commands::PartialCommand::setData (const`
`std::vector< unsigned char > & data) [virtual]`

6.508.2.11 `virtual std::string activemq::commands::PartialCommand::toString ()`
`const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 662).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1842).

6.508.3 Field Documentation

- 6.508.3.2 `std::vector<unsigned char> activemq::commands::PartialCommand::data`
[protected]
- 6.508.3.3 `const unsigned char activemq::commands::PartialCommand::ID_ - PARTIALCOMMAND = 60` [static]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/PartialCommand.h`

6.509 activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2322).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/PartialCommandMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller`:

Public Member Functions

- **PartialCommandMarshaller** ()
- virtual **~PartialCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.

- virtual void looseUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.509.1 Detailed Description

Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 2322). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.509.2 Constructor & Destructor Documentation

6.509.2.1 activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::PartialCommandMarshaller () [inline]

6.509.2.2 virtual activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::~~PartialCommandMarshaller () [inline, virtual]

6.509.3 Member Function Documentation

6.509.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1844).

6.509.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1844).

6.509.3.3 virtual void **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1844).

6.509.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1845).

```

6.509.3.5  virtual int ac-
            tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 1845).

```

6.509.3.6  virtual void ac-
            tivemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightMarshal2
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller` (p. 1846).

6.509.3.7 virtual void activemq::wireformat::openwire::marshal::v2::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LastPartialCommandMarshaller** (p. 1846).

The documentation for this class was generated from the following file:

6.510.2.2 virtual
activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::~~PartialCommandMarshaller () [inline, virtual]

6.510.3 Member Function Documentation

6.510.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1852).

6.510.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1852).

6.510.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1852).

6.510.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1853).

```
6.510.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1853).

```
6.510.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1854).

6.510.3.7 virtual void `activemq::wireformat::openwire::marshal::v3::PartialCommandMarshaller::tightUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
* `dataStructure`, `decaf::io::DataInputStream * dataIn`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::LastPartialCommandMarshaller` (p. 1854).

The documentation for this class was generated from the following file:

6.511.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 1856).

6.511.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 1856).

6.511.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 1856).

6.511.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 1857).

6.511.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller` (p. 1857).

6.511.3.6 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::LastPartialCommandMarshaller** (p. 1858).

6.511.3.7 virtual void activemq::wireformat::openwire::marshal::v4::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

```
6.513.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::PartialCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::LastPartialCommandMarshaller` (p. 1862).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/PartialCommandMarshaller.h`

6.514 decaf::lang::Pointer< T, REFCOUNTER > Class Template Reference

Decaf's implementation of a Smart **Pointer** (p. 2343) that is a template on a Type and is Thread Safe if the default Reference Counter is used.

```
#include <src/main/decaf/lang/Pointer.h>
```

Public Types

- `typedef T * PointerType`
- `typedef T & ReferenceType`
- `typedef REFCOUNTER CounterType`

Public Member Functions

6.514.1 Detailed Description

```
template<typename T, typename REFCOUNTER = AtomicRefCount> class
decaf::lang::Pointer< T, REFCOUNTER >
```

Decaf's implementation of a Smart **Pointer** (p. 2343) that is a template on a Type and is Thread Safe if the default Reference Counter is used. This **Pointer** (p. 2343) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of **ReferenceCounter**.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 2343) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 2343) in a STL container that requires it, **Pointer** (p. 2343) provides an implementation of std::less.

Since

1.0

6.514.2 Member Typedef Documentation

6.514.2.1 `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef REFCOUNTER decaf::lang::Pointer< T, REFCOUNTER >::CounterType`

6.514.2.2 `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef T* decaf::lang::Pointer< T, REFCOUNTER >::PointerType`

6.514.2.3 `template<typename T, typename REFCOUNTER = AtomicRefCount> typedef T& decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType`

6.514.3 Constructor & Destructor Documentation

6.514.3.1 `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer () [inline]`

Default Constructor.

Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::Pointer< TransactionId >::reset().

6.514.3.2 `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const PointerType value) [inline, explicit]`

Explicit Constructor, creates a **Pointer** (p. 2343) that contains value with a single reference.

This object now has ownership until a call to release.

Parameters

value - instance of the type we are containing here.

6.514.3.3 `template<typename T, typename REFCOUNTER = AtomicRefCount> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > & value) throw () [inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.514.3.4 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & value) throw () [inline]`

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.514.3.5 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & value, const STATIC_CAST_TOKEN &) throw () [inline]`

Static Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p.2343) object.

Parameters

value - **Pointer** (p.2343) instance to cast to this type.

6.514.3.6 `template<typename T, typename REFCOUNTER = AtomicRefCount> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & value, const DYNAMIC_CAST_TOKEN &) throw (decaf::lang::exceptions::ClassCastException) [inline]`

Dynamic Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p.2343) object. If the cast fails and return NULL then this method throws a ClassCastException.

Parameters

value - **Pointer** (p.2343) instance to cast to this type.

Exceptions

ClassCastException if the dynamic cast returns NULL

```
6.514.3.7  template<typename T, typename REFCOUNTER =
           AtomicRefCount> virtual decaf::lang::Pointer< T, REFCOUNTER
           >::~~Pointer ( ) throw () [inline, virtual]
```

6.514.4 Member Function Documentation

```
6.514.4.1  template<typename T, typename REFCOUNTER =
           AtomicRefCount> template<typename T1 > Pointer<T1,
           CounterType> decaf::lang::Pointer< T, REFCOUNTER >::dynamicCast
           ( ) const [inline]
```

```
6.514.4.2  template<typename T, typename REFCOUNTER =
           AtomicRefCount> PointerType decaf::lang::Pointer< T,
           REFCOUNTER >::get ( ) const [inline]
```

Gets the real pointer that is contained within this **Pointer** (p. 2343).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL `auto_ptr` and gives access in cases where the caller absolutely needs the real **Pointer** (p. 2343). Use at your own risk.

Returns

the contained pointer.

Referenced by `activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals()`, `activemq::core::ActiveMQConnectionSupport::getProperties()`, `activemq::core::ActiveMQConnectionSupport::getTransport()`, `decaf::lang::operator!=()`, `decaf::lang::Pointer< TransactionId >::operator!=()`, `std::less< decaf::lang::Pointer< T > >::operator()()`, `decaf::lang::operator==()`, `decaf::lang::Pointer< TransactionId >::operator==()`, and `activemq::state::ConnectionState::removeTempDestination()`.

```
6.514.4.3  template<typename T, typename REFCOUNTER =
           AtomicRefCount> bool decaf::lang::Pointer< T, REFCOUNTER
           >::operator! ( ) const [inline]
```

```
6.514.4.4  template<typename T, typename REFCOUNTER =
           AtomicRefCount> template<typename T1 , typename R1 > bool
           decaf::lang::Pointer< T, REFCOUNTER >::operator!= ( const Pointer<
           T1, R1 > & right ) const [inline]
```

```
6.514.4.5  template<typename T, typename REFCOUNTER =
           AtomicRefCount> ReferenceType decaf::lang::Pointer< T,
           REFCOUNTER >::operator* ( ) const [inline]
```

```
6.514.4.6  template<typename T, typename REFCOUNTER =
           AtomicRefCount> ReferenceType decaf::lang::Pointer< T,
           REFCOUNTER >::operator* ( ) [inline]
```

Dereference Operator, returns a reference to the Contained value.

This method throws an `NullPointerException` if the contained value is `NULL`.

Returns

reference to the contained pointer.

Exceptions

NullPointerException if the contained value is `Null`

```
6.514.4.7  template<typename T, typename REFCOUNTER =  
           AtomicRefCount> PointerType decaf::lang::Pointer< T,  
           REFCOUNTER >::operator-> (    ) [inline]
```

Indirection Operator, returns a pointer to the Contained value.

This method throws an `NullPointerException` if the contained value is `NULL`.

Returns

reference to the contained pointer.

Exceptions

NullPointerException if the contained value is `Null`

```
6.514.4.8  template<typename T, typename REFCOUNTER =  
           AtomicRefCount> PointerType decaf::lang::Pointer< T,  
           REFCOUNTER >::operator-> (    ) const [inline]
```

```
6.514.4.9  template<typename T, typename REFCOUNTER =  
           AtomicRefCount> Pointer& decaf::lang::Pointer< T, REFCOUNTER  
           >::operator= ( const Pointer< T, REFCOUNTER > & right ) throw ()  
           [inline]
```

Assigns the value of *right* to this **Pointer** (p. 2343) and increments the reference Count.

Parameters

right - **Pointer** (p. 2343) on the right hand side of an operator= call to this.

6.514.4.10 `template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1, typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T1, R1 > & right) throw () [inline]`

6.514.4.11 `template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1, typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (const Pointer< T1, R1 > & right) const [inline]`

6.514.4.12 `template<typename T, typename REFCOUNTER = AtomicRefCounter> T* decaf::lang::Pointer< T, REFCOUNTER >::release () [inline]`

Releases the **Pointer** (p.2343) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 2343) is held by more than one object or this method is called from more than one thread.

Parameters

value - The new value to contain.

Returns

The pointer instance that was held by this **Pointer** (p. 2343) object, the pointer is no longer owned by this **Pointer** (p. 2343) and won't be freed when this **Pointer** (p. 2343) goes out of scope.

Referenced by `decaf::lang::Pointer< TransactionId >::Pointer()`.

6.514.4.13 `template<typename T, typename REFCOUNTER = AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::reset (T * value) [inline]`

Resets the **Pointer** (p. 2343) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 2343) to a NULL pointer.

Parameters

value - The new value to contain.

6.514.4.14 `template<typename T, typename REFCOUNTER = AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::staticCast () const [inline]`

6.514.4.15 `template<typename T, typename REFCOUNTER = AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T, REFCOUNTER > & value) throw () [inline]`

Exception (p. 1476) Safe Swap Function.

Parameters

value - the value to swap with this.

Referenced by decaf::lang::Pointer< TransactionId >::operator=(), and decaf::lang::Pointer< TransactionId >::swap().

6.514.5 Friends And Related Function Documentation

6.514.5.1 `template<typename T, typename REFCOUNTER = AtomicRefCount> bool operator!= (const Pointer< T, REFCOUNTER > & left, const T * right) [friend]`

6.514.5.2 `template<typename T, typename REFCOUNTER = AtomicRefCount> bool operator!= (const T * left, const Pointer< T, REFCOUNTER > & right) [friend]`

6.515 decaf::lang::PointerComparator< T, R > Class Template Reference

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2343) instance.

```
#include <src/main/decaf/lang/Pointer.h>
```

Inheritance diagram for decaf::lang::PointerComparator< T, R >:

Public Member Functions

- virtual bool **operator()** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const
- virtual int **compare** (const **Pointer**< T, R > &left, const **Pointer**< T, R > &right) const

6.515.1 Detailed Description

```
template<typename T, typename R = AtomicRefCounter> class
decaf::lang::PointerComparator< T, R >
```

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 2343) instance. This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 2343) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.515.2 Member Function Documentation

6.515.2.1 `template<typename T , typename R = AtomicRefCounter> virtual int
decaf::lang::PointerComparator< T, R >::compare (const Pointer< T,
R > & left, const Pointer< T, R > & right) const [inline, virtual]`

6.515.2.2 `template<typename T , typename R = AtomicRefCounter> virtual bool
decaf::lang::PointerComparator< T, R >::operator() (const Pointer< T,
R > & left, const Pointer< T, R > & right) const [inline, virtual]`

The documentation for this class was generated from the following file:

6.516 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

```
#include <src/main/activemq/cmsutil/PooledSession.h>
```

Inheritance diagram for `activemq::cmsutil::PooledSession`:

Public Member Functions

- **PooledSession** (**SessionPool** *pool, **cms::Session** *session)
- virtual **~PooledSession** ()
Does nothing.
- virtual **cms::Session** * **getSession** ()
Returns a non-constant reference to the internal session object.
- virtual const **cms::Session** * **getSession** () const
Returns a constant reference to the internal session object.
- virtual void **close** () throw (cms::CMSException)

Returns this session back to the pool, but does not close or destroy the internal session object.

- virtual void **commit** () throw (cms::CMSEException)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** () throw (cms::CMSEException)
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** () throw (cms::CMSEException)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination, const std::string &selector) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual cms::MessageConsumer * **createConsumer** (const cms::Destination *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
Creates a MessageConsumer for the specified destination, using a message selector.
- virtual cms::MessageConsumer * **createDurableConsumer** (const cms::Topic *destination, const std::string &name, const std::string &selector, bool noLocal=false) throw (cms::CMSEException)
Creates a durable subscriber to the specified topic, using a Message selector.
- virtual cms::MessageConsumer * **createCachedConsumer** (const cms::Destination *destination, const std::string &selector, bool noLocal) throw (cms::CMSEException)
First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.
- virtual cms::MessageProducer * **createProducer** (const cms::Destination *destination) throw (cms::CMSEException)
Creates a MessageProducer to send messages to the specified destination.
- virtual cms::MessageProducer * **createCachedProducer** (const cms::Destination *destination) throw (cms::CMSEException)
First checks the internal producer cache and creates one if none exist for the given destination.
- virtual cms::QueueBrowser * **createBrowser** (const cms::Queue *queue) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.
- virtual cms::QueueBrowser * **createBrowser** (const cms::Queue *queue, const std::string &selector) throw (cms::CMSEException)
Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (const std::string &queueName) throw (cms::CMSEException)
Creates a queue identity given a Queue name.
- virtual **cms::Topic** * **createTopic** (const std::string &topicName) throw (cms::CMSEException)
Creates a topic identity given a Queue name.
- virtual **cms::TemporaryQueue** * **createTemporaryQueue** () throw (cms::CMSEException)
Creates a TemporaryQueue object.
- virtual **cms::TemporaryTopic** * **createTemporaryTopic** () throw (cms::CMSEException)
Creates a TemporaryTopic object.
- virtual **cms::Message** * **createMessage** () throw (cms::CMSEException)
Creates a new Message.
- virtual **cms::BytesMessage** * **createBytesMessage** () throw (cms::CMSEException)
Creates a BytesMessage.
- virtual **cms::BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesSize) throw (cms::CMSEException)
Creates a BytesMessage and sets the payload to the passed value.
- virtual **cms::StreamMessage** * **createStreamMessage** () throw (cms::CMSEException)
Creates a new StreamMessage.
- virtual **cms::TextMessage** * **createTextMessage** () throw (cms::CMSEException)
Creates a new TextMessage.
- virtual **cms::TextMessage** * **createTextMessage** (const std::string &text) throw (cms::CMSEException)
Creates a new TextMessage and set the text to the value given.
- virtual **cms::MapMessage** * **createMapMessage** () throw (cms::CMSEException)
Creates a new MapMessage.
- virtual **cms::Session::AcknowledgeMode** **getAcknowledgeMode** () const throw (cms::CMSEException)
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const throw (cms::CMSEException)
Gets if the Sessions is a Transacted Session.
- virtual void **unsubscribe** (const std::string &name) throw (cms::CMSEException)
Unsubscribes a durable subscription that has been created by a client.

6.516.1 Detailed Description

A pooled session object that wraps around a delegate session. Calls to close this session only result in giving the session back to the pool.

6.516.2 Constructor & Destructor Documentation

6.516.2.1 `activemq::cmsutil::PooledSession::PooledSession (SessionPool * pool, cms::Session * session)`

6.516.2.2 `virtual activemq::cmsutil::PooledSession::~~PooledSession ()` [virtual]

Does nothing.

6.516.3 Member Function Documentation

6.516.3.1 `virtual void activemq::cmsutil::PooledSession::close () throw (cms::CMSEException)` [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object. Implements `cms::Session` (p. 2667).

6.516.3.2 `virtual void activemq::cmsutil::PooledSession::commit () throw (cms::CMSEException)` [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements `cms::Session` (p. 2667).

References `cms::Session::commit()`.

6.516.3.3 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue) throw (cms::CMSEException)` [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue the Queue to browse

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2668).

6.516.3.4 `virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * queue, const std::string & selector) throw (cms::CMSEException)` [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue the Queue to browse

selector the Message selector to filter which messages are browsed.

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

InvalidDestinationException - if the destination given is invalid.

Implements **cms::Session** (p. 2668).

6.516.3.5 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage () throw (cms::CMSEException)` [inline, virtual]

Creates a BytesMessage.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2669).

References `cms::Session::createBytesMessage()`.

6.516.3.6 `virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * bytes, std::size_t bytesSize) throw (cms::CMSEException)` [inline, virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2669).

References **cms::Session::createBytesMessage()**.

6.516.3.7 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSEException) [virtual]`

First checks the internal consumer cache and creates one if none exist for the given destination, selector, noLocal.

If created, the consumer is added to the pool's lifecycle manager.

Parameters

destination the destination to receive on

selector the selector to use

noLocal whether or not to receive messages from the same connection

Returns

the consumer resource

Exceptions

cms::CMSEException (p. 960) if something goes wrong.

6.516.3.8 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * destination) throw (cms::CMSEException) [virtual]`

First checks the internal producer cache and creates one if none exist for the given destination.

If created, the producer is added to the pool's lifecycle manager.

Parameters

destination the destination to send on

Returns

the producer resource

Exceptions

cms::CMSEException (p. 960) if something goes wrong.

6.516.3.9 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector) throw (cms::CMSException)` [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2670).

References `cms::Session::createConsumer()`.

6.516.3.10 `virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * destination, const std::string & selector, bool noLocal) throw (cms::CMSException)` [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination the Destination that this consumer receiving messages for.

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2670).

References `cms::Session::createConsumer()`.

```

6.516.3.11 virtual cms::MessageConsumer* ac-
    tivemq::cmsutil::PooledSession::createConsumer ( const
    cms::Destination * destination ) throw ( cms::CMSException )
    [inline, virtual]

```

Creates a MessageConsumer for the specified destination.

Parameters

destination the Destination that this consumer receiving messages for.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2669).

References **cms::Session::createConsumer()**.

```

6.516.3.12 virtual cms::MessageConsumer* ac-
    tivemq::cmsutil::PooledSession::createDurableConsumer (
    const cms::Topic * destination, const std::string & name,
    const std::string & selector, bool noLocal = false ) throw (
    cms::CMSException ) [inline, virtual]

```

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination the topic to subscribe to

name The name used to identify the subscription

selector the Message Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

InvalidSelectorException - if the message selector is invalid.

Implements **cms::Session** (p. 2671).

References **cms::Session::createDurableConsumer()**.

6.516.3.13 `virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage ()
throw (cms::CMSException) [inline, virtual]`

Creates a new MapMessage.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2671).

References cms::Session::createMapMessage().

6.516.3.14 `virtual cms::Message* activemq::cmsutil::PooledSession::createMessage
() throw (cms::CMSException) [inline, virtual]`

Creates a new Message.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2671).

References cms::Session::createMessage().

6.516.3.15 `virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const
cms::Destination * destination) throw (cms::CMSException)
[inline, virtual]`

Creates a MessageProducer to send messages to the specified destination.

Parameters

destination the Destination to send on

Returns

New MessageProducer that is owned by the caller.

Exceptions

CMSException - If an internal error occurs.

InvalidDestinationException - if an invalid destination is specified.

Implements **cms::Session** (p. 2672).

References cms::Session::createProducer().

6.516.3.16 `virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue (const std::string & queueName) throw (cms::CMSException)
[inline, virtual]`

Creates a queue identity given a Queue name.

Parameters

queueName the name of the new Queue

Returns

new Queue pointer that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2672).

References cms::Session::createQueue().

6.516.3.17 `virtual cms::StreamMessage* activemq::cmsutil::PooledSession::createStreamMessage () throw (cms::CMSEException) [inline, virtual]`

Creates a new StreamMessage.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2672).

References cms::Session::createStreamMessage().

6.516.3.18 `virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue () throw (cms::CMSEException) [inline, virtual]`

Creates a TemporaryQueue object.

Returns

new TemporaryQueue pointer that is owned by the caller.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2673).

References cms::Session::createTemporaryQueue().

6.516.3.19 `virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic () throw (cms::CMSEException) [inline, virtual]`

Creates a TemporaryTopic object.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2673).

References cms::Session::createTemporaryTopic().

6.516.3.20 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage ()
throw (cms::CMSException) [inline, virtual]`

Creates a new TextMessage.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2674).

References cms::Session::createTextMessage().

6.516.3.21 `virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const std::string & text) throw (cms::CMSException) [inline, virtual]`

Creates a new TextMessage and set the text to the value given.

Parameters

text the initial text for the message

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2673).

References cms::Session::createTextMessage().

6.516.3.22 `virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic (const std::string & topicName) throw (cms::CMSException) [inline, virtual]`

Creates a topic identity given a Queue name.

Parameters

topicName the name of the new Topic

Returns

new Topic pointer that is owned by the caller.

Exceptions

CMSException - If an internal error occurs.

Implements **cms::Session** (p. 2674).

References cms::Session::createTopic().

6.516.3.23 `virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode () const throw (cms::CMSEException) [inline, virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2674).

References cms::Session::getAcknowledgeMode().

6.516.3.24 `virtual const cms::Session* activemq::cmsutil::PooledSession::getSession () const [inline, virtual]`

Returns a constant reference to the internal session object.

Returns

the session object.

6.516.3.25 `virtual cms::Session* activemq::cmsutil::PooledSession::getSession () [inline, virtual]`

Returns a non-constant reference to the internal session object.

Returns

the session object.

6.516.3.26 `virtual bool activemq::cmsutil::PooledSession::isTransacted () const throw (cms::CMSEException) [inline, virtual]`

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2674).

References cms::Session::isTransacted().

6.516.3.27 `virtual void activemq::cmsutil::PooledSession::recover () throw (cms::CMSException) [inline, virtual]`

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSException - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException - if the method is called by a transacted session.

Implements **cms::Session** (p. 2675).

References `cms::Session::recover()`.

6.516.3.28 `virtual void activemq::cmsutil::PooledSession::rollback () throw (cms::CMSException) [inline, virtual]`

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException - If an internal error occurs.

IllegalStateException - if the method is not called by a transacted session.

Implements **cms::Session** (p. 2675).

References `cms::Session::rollback()`.

6.516.3.29 `virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & name) throw (cms::CMSException) [inline, virtual]`

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name The name used to identify this subscription

Exceptions

CMSEException - If an internal error occurs.

Implements **cms::Session** (p. 2676).

References cms::Session::unsubscribe().

6.517 decaf::util::concurrent::PooledThread Class Reference

```
#include <src/main/decaf/util/concurrent/PooledThread.h>
```

Public Member Functions

- **PooledThread** (**ThreadPool** *pool)
Constructor.
- virtual **~PooledThread** ()
- virtual void **run** ()
*Run Method for this object waits for something to be enqueued on the **ThreadPool** (p. 2977) and then grabs it and calls its run method.*
- virtual void **stop** () throw (lang::Exception)
Stops the Thread, thread will complete its task if currently running one, and then die.
- virtual bool **isBusy** ()
Checks to see if the thread is busy, if busy it means that this thread has taken a task from the ThreadPool's queue and is processing it.
- virtual void **setPooledThreadListener** (**PooledThreadListener** *listener)
*Adds a listener to this **PooledThread** (p. 2364) to be notified when this thread starts and completes a task.*
- virtual **PooledThreadListener** * **getPooledThreadListener** ()
*Removes a listener for this **PooledThread** (p. 2364) to be notified when this thread starts and completes a task.*

6.517.1 Constructor & Destructor Documentation

6.517.1.1 decaf::util::concurrent::PooledThread::PooledThread (**ThreadPool** * pool)

Constructor.

Parameters

pool the parant **ThreadPool** (p. 2977) object

6.517.1.2 `virtual decaf::util::concurrent::PooledThread::~~PooledThread ()`
[virtual]

6.517.2 Member Function Documentation

6.517.2.1 `virtual PooledThreadListener* decaf::util::concurrent::PooledThread::getPooledThreadListener ()`
[inline, virtual]

Removes a listener for this `PooledThread` (p. 2364) to be notified when this thread starts and completes a task.

Returns

a pointer to this thread's listener or NULL

6.517.2.2 `virtual bool decaf::util::concurrent::PooledThread::isBusy ()` [inline, virtual]

Checks to see if the thread is busy, if busy it means that this thread has taken a task from the `ThreadPool`'s queue and is processing it.

Returns

true if the Thread is busy

6.517.2.3 `virtual void decaf::util::concurrent::PooledThread::run ()` [virtual]

Run Method for this object waits for something to be enqueued on the `ThreadPool` (p. 2977) and then grabs it and calls its run method.

6.517.2.4 `virtual void decaf::util::concurrent::PooledThread::setPooledThreadListener (PooledThreadListener * listener)` [inline, virtual]

Adds a listener to this `PooledThread` (p. 2364) to be notified when this thread starts and completes a task.

Parameters

listener the listener to send notifications to.

6.517.2.5 `virtual void decaf::util::concurrent::PooledThread::stop () throw (lang::Exception)` [virtual]

Stops the Thread, thread will complete its task if currently running one, and then die.

Does not block.

Exceptions

Exception

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/PooledThread.h`

6.518 decaf::util::concurrent::PooledThreadListener Class Reference

Abstract Listener Interface for users of `ThreadPool` (p. 2977).

```
#include <src/main/decaf/util/concurrent/PooledThreadListener.h>
```

Inheritance diagram for `decaf::util::concurrent::PooledThreadListener`:

Public Member Functions

- virtual `~PooledThreadListener ()`
- virtual void `onTaskStarted (PooledThread *thread)=0`

Called by a pooled thread when it is about to begin executing a new task.

- virtual void `onTaskCompleted (PooledThread *thread)=0`

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

- virtual void `onTaskException (PooledThread *thread, lang::Exception &ex)=0`

*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2364) is now no longer running.*

6.518.1 Detailed Description

Abstract Listener Interface for users of `ThreadPool` (p. 2977). The implementor of this class receives events related to the execution and termination of threads running in the **ThreadPool** (p. 2977).

Since

1.0

6.518.2 Constructor & Destructor Documentation

6.518.2.1 virtual
`decaf::util::concurrent::PooledThreadListener::~~PooledThreadListener (`
`) [inline, virtual]`

6.518.3 Member Function Documentation

6.518.3.1 virtual void `de-`
`caf::util::concurrent::PooledThreadListener::onTaskCompleted (`
`PooledThread * thread) [pure virtual]`

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run.

Parameters

thread - Pointer the the Pooled Thread that is making this call.

Implemented in `decaf::util::concurrent::ThreadPool` (p. 2981).

6.518.3.2 virtual void `de-`
`caf::util::concurrent::PooledThreadListener::onTaskException (`
`PooledThread * thread, lang::Exception & ex) [pure virtual]`

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2364) is now no longer running.

Parameters

thread - Pointer to the Pooled Thread that is making this call

ex - The Exception that occurred.

Implemented in `decaf::util::concurrent::ThreadPool` (p. 2981).

6.518.3.3 virtual void `decaf::util::concurrent::PooledThreadListener::onTaskStarted`
`(PooledThread * thread) [pure virtual]`

Called by a pooled thread when it is about to begin executing a new task.

Parameters

thread - Pointer to the Pooled Thread that is making this call

Implemented in `decaf::util::concurrent::ThreadPool` (p. 2981).

The documentation for this class was generated from the following file:

6.519 decaf::net::PortUnreachableException Class Reference

```
#include <src/main/decaf/net/PortUnreachableException.h>
```

Inheritance diagram for decaf::net::PortUnreachableException:

Public Member Functions

- **PortUnreachableException** () throw ()
Default Constructor.
- **PortUnreachableException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **PortUnreachableException** (const **PortUnreachableException** &ex) throw ()
Copy Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **PortUnreachableException** (const std::exception *cause) throw ()
Constructor.
- **PortUnreachableException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **PortUnreachableException** * clone () const
Clones this exception.
- virtual ~**PortUnreachableException** () throw ()

6.519.1 Constructor & Destructor Documentation

6.519.1.1 decaf::net::PortUnreachableException::PortUnreachableException () throw () [inline]

Default Constructor.

6.519.1.2 decaf::net::PortUnreachableException::PortUnreachableException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.519.1.3 `decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.519.1.4 `decaf::net::PortUnreachableException::PortUnreachableException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.519.1.5 `decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.519.1.6 `decaf::net::PortUnreachableException::PortUnreachableException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.519.1.7 `virtual`
`decaf::net::PortUnreachableException::~~PortUnreachableException ()`
`throw ()` [`inline`, `virtual`]

6.519.2 Member Function Documentation

6.519.2.1 `virtual PortUnreachableException* de-`
`caf::net::PortUnreachableException::clone () const`
`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::net::SocketException` (p. 2794).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/PortUnreachableException.h`

6.520 activemq::util::PrimitiveList Class Reference

List of primitives.

```
#include <src/main/activemq/util/PrimitiveList.h>
```

Inheritance diagram for `activemq::util::PrimitiveList`:

Public Member Functions

- `PrimitiveList ()`
Default Constructor, creates an Empty list.
- `virtual ~PrimitiveList ()`
- `PrimitiveList (const decaf::util::List< PrimitiveValueNode > &src)`
Copy Constructor.
- `PrimitiveList (const PrimitiveList &src)`
Copy Constructor.
- `std::string toString () const`
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

- virtual bool **getBool** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Boolean value at the specified index.

- virtual void **setBool** (std::size_t index, bool value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual unsigned char **getByte** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte value at the specified index.

- virtual void **setByte** (std::size_t index, unsigned char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual char **getChar** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Character value at the specified index.

- virtual void **setChar** (std::size_t index, char value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual short **getShort** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Short value at the specified index.

- virtual void **setShort** (std::size_t index, short value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual int **getInt** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Integer value at the specified index.

- virtual void **setInt** (std::size_t index, int value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual long long **getLong** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Long value at the specified index.

- virtual void **setLong** (std::size_t index, long long value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual float **getFloat** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Float value at the specified index.

- virtual void **setFloat** (std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual double **getDouble** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the specified index.

- virtual void **setDouble** (std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::string **getString** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the String value at the specified index.

- virtual void **setString** (std::size_t index, const std::string &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

- virtual std::vector< unsigned char > **getByteArray** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the specified index.

- virtual void **setByteArray** (std::size_t index, const std::vector< unsigned char > &value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.520.1 Detailed Description

List of primitives.

6.520.2 Constructor & Destructor Documentation

6.520.2.1 activemq::util::PrimitiveList::PrimitiveList ()

Default Constructor, creates an Empty list.

6.520.2.2 virtual activemq::util::PrimitiveList::~~PrimitiveList () [virtual]

6.520.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & src)

Copy Constructor.

Parameters

src - the Decaf List of PrimitiveNodeValues to copy

6.520.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & src)

Copy Constructor.

Parameters

src - the **PrimitiveList** (p. 2370) to copy

6.520.3 Member Function Documentation

6.520.3.1 virtual bool activemq::util::PrimitiveList::getBool (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Boolean value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.2 virtual unsigned char activemq::util::PrimitiveList::getBytes (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveList::getBytesArray (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Gets the Byte Array value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.4 `virtual char activemq::util::PrimitiveList::getChar (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Character value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.5 `virtual double activemq::util::PrimitiveList::getDouble (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Double value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.6 `virtual float activemq::util::PrimitiveList::getFloat (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Float value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > **size()** (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.7 `virtual int activemq::util::PrimitiveList::getInt (std::size_t index)
 const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Integer value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > **size()** (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.8 `virtual long long activemq::util::PrimitiveList::getLong (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Long value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > **size()** (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

6.520.3.9 `virtual short activemq::util::PrimitiveList::getShort (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException,
 decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Short value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

```
6.520.3.10  virtual std::string activemq::util::PrimitiveList::getString  
            ( std::size_t  index ) const throw ( de-  
            caf::lang::exceptions::IndexOutOfBoundsException,  
            decaf::lang::exceptions::UnsupportedOperationException ) [virtual]
```

Gets the String value at the specified index.

Parameters

index - index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBoundsException if index is > `size()` (p. 2844)

UnsupportedOperationException if the type at index is not of the type that this method is to return or can convert to.

```
6.520.3.11  virtual void activemq::util::PrimitiveList::setBool  
            ( std::size_t  index,  bool  value ) throw ( decaf::lang::exceptions::IndexOutOfBoundsException ) [virtual]
```

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > `size()` (p. 2844).

6.520.3.12 `virtual void activemq::util::PrimitiveList::setByte (`
 `std::size_t index, unsigned char value) throw (`
 `decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 2844).

6.520.3.13 `virtual void activemq::util::PrimitiveList::setByteArray (std::size_t`
 `index, const std::vector< unsigned char > & value) throw (`
 `decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 2844).

6.520.3.14 `virtual void activemq::util::PrimitiveList::setChar`
 `(std::size_t index, char value) throw (`
 `decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if `index > size()` (p. 2844).

6.520.3.15 `virtual void activemq::util::PrimitiveList::setDouble
(std::size_t index, double value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.16 `virtual void activemq::util::PrimitiveList::setFloat
(std::size_t index, float value) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.17 `virtual void activemq::util::PrimitiveList::setInt (std::size_t index, int
value) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
[virtual]`

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.18 **virtual void activemq::util::PrimitiveList::setLong**
 (**std::size_t** *index*, **long long** *value*) **throw (**
 decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.19 **virtual void activemq::util::PrimitiveList::setShort**
 (**std::size_t** *index*, **short** *value*) **throw (**
 decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.20 **virtual void activemq::util::PrimitiveList::setString (**
 std::size_t *index*, **const std::string &** *value*) **throw (**
 decaf::lang::exceptions::IndexOutOfBoundsException) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index - location to set in the list

value - the new value to assign to the element at index

Exceptions

IndexOutOfBoundsException if index > size() (p. 2844).

6.520.3.21 `std::string activemq::util::PrimitiveList::toString () const`

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveList.h`

6.521 `activemq::util::PrimitiveMap` Class Reference

Map of named primitives.

```
#include <src/main/activemq/util/PrimitiveMap.h>
```

Inheritance diagram for `activemq::util::PrimitiveMap`:

Public Member Functions

- **PrimitiveMap** ()
Default Constructor, creates an empty map.
- virtual **~PrimitiveMap** ()
- **PrimitiveMap** (const **decaf::util::Map**< `std::string`, **PrimitiveValueNode** > &source)
Copy Constructor.
- **PrimitiveMap** (const **PrimitiveMap** &source)
Copy Constructor.
- `std::string toString` () const
Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual `bool getBool` (const `std::string` &key) const
throw (`decaf::lang::exceptions::NoSuchElementException`, `decaf::lang::exceptions::UnsupportedOperationException`)
Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.
- virtual void **setBool** (const `std::string` &key, bool value)
Sets the value at key to the specified type.
- virtual `unsigned char getByte` (const `std::string` &key) const
throw (`decaf::lang::exceptions::NoSuchElementException`, `decaf::lang::exceptions::UnsupportedOperationException`)

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setByte** (const std::string &key, unsigned char value)

Sets the value at key to the specified type.

- virtual char **getChar** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setChar** (const std::string &key, char value)

Sets the value at key to the specified type.

- virtual short **getShort** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setShort** (const std::string &key, short value)

Sets the value at key to the specified type.

- virtual int **getInt** (const std::string &key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setInt** (const std::string &key, int value)

Sets the value at key to the specified type.

- virtual long long **getLong** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setLong** (const std::string &key, long long value)

Sets the value at key to the specified type.

- virtual float **getFloat** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setFloat** (const std::string &key, float value)

Sets the value at key to the specified type.

- virtual double **getDouble** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
caf::lang::exceptions::UnsupportedOperationException)

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setDouble** (const std::string &key, double value)

Sets the value at key to the specified type.

- virtual std::string **getString** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
caf::lang::exceptions::UnsupportedOperationException)

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setString** (const std::string &key, const std::string &value)

Sets the value at key to the specified type.

- virtual std::vector< unsigned char > **getByteArray** (const std::string &key) const
throw (decaf::lang::exceptions::NoSuchElementException, de-
caf::lang::exceptions::UnsupportedOperationException)

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

- virtual void **setByteArray** (const std::string &key, const std::vector< unsigned char > &value)

Sets the value at key to the specified type.

6.521.1 Detailed Description

Map of named primitives.

6.521.2 Constructor & Destructor Documentation

6.521.2.1 activemq::util::PrimitiveMap::PrimitiveMap ()

Default Constructor, creates an empty map.

6.521.2.2 virtual activemq::util::PrimitiveMap::~~PrimitiveMap () [virtual]

6.521.2.3 activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & source)

Copy Constructor.

Parameters

source The Decaf Library Map instance whose elements will be copied into this Map.

6.521.2.4 `activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & source)`

Copy Constructor.

Parameters

source The **PrimitiveMap** (p.2381) whose elements will be copied into this Map.

6.521.3 Member Function Documentation

6.521.3.1 `virtual bool activemq::util::PrimitiveMap::getBool (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.2 `virtual unsigned char activemq::util::PrimitiveMap::getBytes (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.3 `virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.4 `virtual char activemq::util::PrimitiveMap::getChar (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.5 `virtual double activemq::util::PrimitiveMap::getDouble (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.6 `virtual float activemq::util::PrimitiveMap::getFloat (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.7 `virtual int activemq::util::PrimitiveMap::getInt (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.8 `virtual long long activemq::util::PrimitiveMap::getLong (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.9 `virtual short activemq::util::PrimitiveMap::getShort (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at *key* in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.10 `virtual std::string activemq::util::PrimitiveMap::getString (const std::string & key) const throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type `NoSuchElementException` is thrown.

Parameters

key - the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException if key is not in the map.

UnsupportedOperationException if the value cannot be converted to the type this method returns

6.521.3.11 virtual void activemq::util::PrimitiveMap::setBool (const std::string & key, bool value) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.12 virtual void activemq::util::PrimitiveMap::setByte (const std::string & key, unsigned char value) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.13 virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & key, const std::vector< unsigned char > & value) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.14 virtual void activemq::util::PrimitiveMap::setChar (const std::string & key, char value) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.15 `virtual void activemq::util::PrimitiveMap::setDouble (const std::string & key, double value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.16 `virtual void activemq::util::PrimitiveMap::setFloat (const std::string & key, float value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.17 `virtual void activemq::util::PrimitiveMap::setInt (const std::string & key, int value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.18 `virtual void activemq::util::PrimitiveMap::setLong (const std::string & key, long long value) [virtual]`

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.19 `virtual void activemq::util::PrimitiveMap::setShort (const std::string & key, short value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.20 `virtual void activemq::util::PrimitiveMap::setString (const std::string & key, const std::string & value)` [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key - the map key to set or insert.

value - the new value to set at the key location.

6.521.3.21 `std::string activemq::util::PrimitiveMap::toString ()` const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- `src/main/activemq/util/PrimitiveMap.h`

6.522 **activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller Class Reference**

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

```
#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>
```

Public Member Functions

- `PrimitiveTypesMarshaller ()`
- `virtual ~PrimitiveTypesMarshaller ()`

Static Public Member Functions

- static void **marshal** (const **util::PrimitiveMap** *map, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)
Static Marshal of a primitive map object.
- static void **unmarshal** (**util::PrimitiveMap** *map, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)
Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.
- static void **marshal** (const **util::PrimitiveList** *list, std::vector< unsigned char > &dest) throw (decaf::lang::Exception)
Static Marshal of a primitive map object.
- static void **unmarshal** (**util::PrimitiveList** *list, const std::vector< unsigned char > &src) throw (decaf::lang::Exception)
Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (decaf::io::DataOutputStream &dataOut, const decaf::util::Map< std::string, util::PrimitiveValueNode > &map) throw (decaf::io::IOException)
Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.
- static void **marshalPrimitiveList** (decaf::io::DataOutputStream &dataOut, const decaf::util::List< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)
Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.
- static void **marshalPrimitive** (decaf::io::DataOutputStream &dataOut, const util::PrimitiveValueNode &value) throw (decaf::io::IOException)
Used to Marshal the Primitive types out on the Wire.
- static void **unmarshalPrimitiveMap** (decaf::io::DataInputStream &dataIn, util::PrimitiveMap &map) throw (decaf::io::IOException)
Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.
- static void **unmarshalPrimitiveList** (decaf::io::DataInputStream &dataIn, decaf::util::StlList< util::PrimitiveValueNode > &list) throw (decaf::io::IOException)
Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.
- static util::PrimitiveValueNode **unmarshalPrimitive** (decaf::io::DataInputStream &dataIn) throw (decaf::io::IOException)
Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.522.1 Detailed Description

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.522.2 Constructor & Destructor Documentation

6.522.2.1 `activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::PrimitiveTypesMarshaller () [inline]`

6.522.2.2 `virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~~PrimitiveTypesMarshaller () [inline, virtual]`

6.522.3 Member Function Documentation

6.522.3.1 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * map, std::vector< unsigned char > & dest) throw (decaf::lang::Exception) [static]`

Static Marshal of a primitive map object.

Parameters

map Map to Marshal.

dest Reference to a byte array to house the data.

Exceptions

Exception

6.522.3.2 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveList * list, std::vector< unsigned char > & dest) throw (decaf::lang::Exception) [static]`

Static Marshal of a primitive map object.

Parameters

list The list object to Marshal

dest Reference to a byte array to house the data

Exceptions

Exception

6.522.3.3 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & dataOut, const util::PrimitiveValueNode & value) throw (decaf::io::IOException)` [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters

dataOut - the DataOutputStream to write to

value - the ValueNode to write.

Exceptions

IOException

6.522.3.4 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveList (decaf::io::DataOutputStream & dataOut, const decaf::util::List< util::PrimitiveValueNode > & list) throw (decaf::io::IOException)` [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataOut - the DataOutputStream to write to

list - the ValueNode to write.

Exceptions

IOException

6.522.3.5 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitiveMap (decaf::io::DataOutputStream & dataOut, const decaf::util::Map< std::string, util::PrimitiveValueNode > & map) throw (decaf::io::IOException)` [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataOut - the DataOutputStream to write to

map - the ValueNode to write.

Exceptions

IOException

6.522.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveList * *list*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

Caller owns the pointer.

Parameters

list The list object to Un-marshal
src Reference to a byte array to read data from.

Exceptions

Exception

6.522.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveMap * *map*, const std::vector< unsigned char > & *src*) throw (decaf::lang::Exception) [static]

Static Map Unmarshaler, takes an array of bytes and returns a new instance of a PrimitiveMap object.

Caller owns the pointer.

Parameters

map Map to Unmarshal into
src Reference to a byte array to read data from.

Exceptions

Exception

6.522.3.8 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) throw (decaf::io::IOException) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters

dataIn - DataInputStream to read from.

Returns

a PrimitiveValueNode containing the data.

Exceptions

IOException

6.522.3.9 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveList (decaf::io::DataInputStream & dataIn, decaf::util::StlList< util::PrimitiveValueNode > & list) throw (decaf::io::IOException)` [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataIn - DataInputStream to read from.

list - the ValueNode to write.

Exceptions

IOException

6.522.3.10 `static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveMap (decaf::io::DataInputStream & dataIn, util::PrimitiveMap & map) throw (decaf::io::IOException)` [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataIn - DataInputStream to read from.

map - the map to fill with data.

Exceptions

IOException

The documentation for this class was generated from the following file:

6.524 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2398) from one type to another.

```
#include <src/main/activemq/util/PrimitiveValueConverter.h>
```

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual **~PrimitiveValueConverter** ()
- template<typename TO >
TO **convert** (const **PrimitiveValueNode** &value) const throw (decaf::lang::exceptions::UnsupportedOperationException)

6.524.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 2398) from one type to another. If the conversion is supported then calling the convert method will throw an UnsupportedOperationException to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

		boolean	byte	short	int	long	float	double	String	-----														
boolean		X X	byte		X X X X X	short		X X X X	int		X X X	long		X X	float		X X X	double		X X	String		X X X X X X X X	-----

6.525 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

```
#include <src/main/activemq/util/PrimitiveValueNode.h>
```

Data Structures

- union **PrimitiveValue**

Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** {
 NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,
 SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,
 FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11,
 LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }

Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()
Default Constructor, creates a value of the NULL_TYPE.
- **PrimitiveValueNode** (bool value)
Boolean Value Constructor.
- **PrimitiveValueNode** (unsigned char value)
Byte Value Constructor.
- **PrimitiveValueNode** (char value)
Char Value Constructor.
- **PrimitiveValueNode** (short value)
Short Value Constructor.
- **PrimitiveValueNode** (int value)
Int Value Constructor.
- **PrimitiveValueNode** (long long value)
Long Value Constructor.
- **PrimitiveValueNode** (float value)

Float Value Constructor.

- **PrimitiveValueNode** (double value)
Double Value Constructor.
- **PrimitiveValueNode** (const char *value)
String Value Constructor.
- **PrimitiveValueNode** (const std::string &value)
String Value Constructor.
- **PrimitiveValueNode** (const std::vector< unsigned char > &value)
Byte Array Value Constructor.
- **PrimitiveValueNode** (const decaf::util::List< PrimitiveValueNode > &value)
Primitive List Constructor.
- **PrimitiveValueNode** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Primitive Map Value Constructor.
- **PrimitiveValueNode** (const PrimitiveValueNode &node)
Copy constructor.
- **~PrimitiveValueNode** ()
- **PrimitiveValueNode & operator=** (const PrimitiveValueNode &node)
Assignment operator, copies the data from the other node.
- **bool operator==** (const PrimitiveValueNode &node) const
Comparison Operator, compares this node to the other node.
- **PrimitiveType getType** () const
Gets the Value Type of this type wrapper.
- **PrimitiveValue getValue** () const
Gets the internal Primitive Value object from this wrapper.
- **void setValue** (const PrimitiveValue &value, PrimitiveType valueType)
Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.
- **void clear** ()
Clears the value from this wrapper converting it back to a blank NULL_ TYPE value.
- **void setBool** (bool value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- **bool getBool** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Boolean value of this Node.

- void **setByte** (unsigned char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- unsigned char **getByte** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte value of this Node.
- void **setChar** (char value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- char **getChar** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Character value of this Node.
- void **setShort** (short value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- short **getShort** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Short value of this Node.
- void **setInt** (int value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- int **getInt** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Integer value of this Node.
- void **setLong** (long long value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- long long **getLong** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Long value of this Node.
- void **setFloat** (float value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- float **getFloat** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Float value of this Node.
- void **setDouble** (double value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- double **getDouble** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Double value of this Node.

- void **setString** (const std::string &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::string **getString** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the String value of this Node.
- void **setByteArray** (const std::vector< unsigned char > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::vector< unsigned char > **getByteArray** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Byte Array value of this Node.
- void **setList** (const decaf::util::List< PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::List< PrimitiveValueNode > & **getList** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive List value of this Node.
- void **setMap** (const decaf::util::Map< std::string, PrimitiveValueNode > &value)
Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- const decaf::util::Map< std::string, PrimitiveValueNode > & **getMap** () const throw (decaf::lang::exceptions::NoSuchElementException)
Gets the Primitive Map value of this Node.
- std::string **toString** () const
Creates a string representation of this value.

6.525.1 Detailed Description

Class that wraps around a single value of one of the many types. Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.525.2 Member Enumeration Documentation

6.525.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_ TYPE

BOOLEAN_TYPE
BYTE_TYPE
CHAR_TYPE
SHORT_TYPE
INTEGER_TYPE
LONG_TYPE
DOUBLE_TYPE
FLOAT_TYPE
STRING_TYPE
BYTE_ARRAY_TYPE
MAP_TYPE
LIST_TYPE
BIG_STRING_TYPE

6.525.3 Constructor & Destructor Documentation

6.525.3.1 activemq::util::PrimitiveValueNode::PrimitiveValueNode ()

Default Constructor, creates a value of the `NULL_TYPE`.

6.525.3.2 activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool *value*)

Boolean Value Constructor.

Parameters

value - the new value to store.

6.525.3.3 activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char *value*)

Byte Value Constructor.

Parameters

value - the new value to store.

6.525.3.4 activemq::util::PrimitiveValueNode::PrimitiveValueNode (char *value*)

Char Value Constructor.

Parameters

value - the new value to store.

6.525.3.5 activemq::util::PrimitiveValueNode::PrimitiveValueNode (short *value*)

Short Value Constructor.

Parameters

value - the new value to store.

6.525.3.6 activemq::util::PrimitiveValueNode::PrimitiveValueNode (int *value*)

Int Value Constructor.

Parameters

value - the new value to store.

6.525.3.7 activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)

Long Value Constructor.

Parameters

value - the new value to store.

6.525.3.8 activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)

Float Value Constructor.

Parameters

value - the new value to store.

6.525.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters

value - the new value to store.

6.525.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters

value - the new value to store.

6.525.3.11 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & value)`

String Value Constructor.

Parameters

value - the new value to store.

6.525.3.12 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & value)`

Byte Array Value Constructor.

Parameters

value - the new value to store.

6.525.3.13 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & value)`

Primitive List Constructor.

Parameters

value - the new value to store.

6.525.3.14 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & value)`

Primitive Map Value Constructor.

Parameters

value - the new value to store.

6.525.3.15 `activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & node)`

Copy constructor.

Parameters

node The instance of another node to copy to this one.

6.525.3.16 `activemq::util::PrimitiveValueNode::~~PrimitiveValueNode ()`
`[inline]`

6.525.4 Member Function Documentation

6.525.4.1 `void activemq::util::PrimitiveValueNode::clear ()`

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.525.4.2 `bool activemq::util::PrimitiveValueNode::getBool () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Boolean value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.3 `unsigned char activemq::util::PrimitiveValueNode::getBytes () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.4 `std::vector<unsigned char> activemq::util::PrimitiveValueNode::getBytesArray () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Byte Array value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.5 `char activemq::util::PrimitiveValueNode::getChar () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Character value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.6 `double activemq::util::PrimitiveValueNode::getDouble () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Double value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.7 `float activemq::util::PrimitiveValueNode::getFloat () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Float value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.8 `int activemq::util::PrimitiveValueNode::getInt () const throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the Integer value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.9 `const decaf::util::List<PrimitiveValueNode>&
activemq::util::PrimitiveValueNode::getList () const throw (
decaf::lang::exceptions::NoSuchElementException)`

Gets the Primitive List value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.10 `long long activemq::util::PrimitiveValueNode::getLong () const throw (
(decaf::lang::exceptions::NoSuchElementException)`

Gets the Long value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.11 `const decaf::util::Map<std::string, PrimitiveValueNode>&
activemq::util::PrimitiveValueNode::getMap () const throw (
decaf::lang::exceptions::NoSuchElementException)`

Gets the Primitive Map value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.12 `short activemq::util::PrimitiveValueNode::getShort () const throw (
decaf::lang::exceptions::NoSuchElementException)`

Gets the Short value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.13 `std::string activemq::util::PrimitiveValueNode::getString () const`
`throw (decaf::lang::exceptions::NoSuchElementException)`

Gets the String value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException this node cannot be returned as the requested type.

6.525.4.14 `PrimitiveType activemq::util::PrimitiveValueNode::getType () const`
`[inline]`

Gets the Value Type of this type wrapper.

Returns

the PrimitiveType value for this wrapper.

6.525.4.15 `PrimitiveValue activemq::util::PrimitiveValueNode::getValue () const`
`[inline]`

Gets the internal Primitive Value object from this wrapper.

Returns

a copy of the contained **PrimitiveValue** (p. 2395)

6.525.4.16 `PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (`
`const PrimitiveValueNode & node)`

Assignment operator, copies the data from the other node.

Parameters

node The instance of another node to copy to this one.

6.525.4.17 `bool activemq::util::PrimitiveValueNode::operator== (const`
`PrimitiveValueNode & node) const`

Comparison Operator, compares this node to the other node.

Returns

true if the values are the same false otherwise.

6.525.4.18 void activemq::util::PrimitiveValueNode::setBool (bool *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.19 void activemq::util::PrimitiveValueNode::setByte (unsigned char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.20 void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.21 void activemq::util::PrimitiveValueNode::setChar (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.27 void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.28 void activemq::util::PrimitiveValueNode::setShort (short *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.29 void activemq::util::PrimitiveValueNode::setString (const std::string & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value - the new value to assign to the element at index

6.525.4.30 void activemq::util::PrimitiveValueNode::setValue (const PrimitiveValue & *value*, PrimitiveType *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters

value The value to set as the value contained in this Node.

valueType The type of the value being set into this one.

6.525.4.31 std::string activemq::util::PrimitiveValueNode::toString () const

Creates a string representation of this value.

Returns

string value of this type wrapper.

The documentation for this class was generated from the following file:

6.526.2.1 virtual decaf::security::Principal::~~Principal () [inline, virtual]

6.526.3 Member Function Documentation

6.526.3.1 virtual bool decaf::security::Principal::equals (const `Principal` &
another) const [pure virtual]

Compares two principals to see if they are the same.

Parameters

another A principal to be tested for equality to this one.

Returns

true if the given principal is equivalent to this one.

6.526.3.2 virtual std::string decaf::security::Principal::getName () const [pure virtual]

Provides the name of this principal.

Returns

the name of this principal.

Implemented in `decaf::security::auth::x500::X500Principal` (p. 3189).

*obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2413) is using to compare the elements in the queue with.*

Friends

- class **PriorityQueueIterator**

6.527.1 Detailed Description

template<typename E> class decaf::util::PriorityQueue< E >

An unbounded priority queue based on a binary heap algorithm. The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 1011) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 982) and **Iterator** (p. 1716) interfaces. The **Iterator** (p. 1716) provided in method **iterator()** (p. 2417) is

not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort(pq.toArray())`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 2413) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe `PriorityBlockingQueue` class.

Implementation note: this implementation provides $O(\log(n))$ time for the enqueueing and dequeuing methods (`offer`, `poll`, **`remove()`** (p. 2419) and `add`); linear time for the `remove(Object)` and `contains(Object)` methods; and constant time for the retrieval methods (`peek`, `element`, and `size`).

Since

1.0

6.527.2 Constructor & Destructor Documentation

6.527.2.1 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue () [inline]`

Creates a **Priority Queue** (p. 2507) with the default initial capacity.

6.527.2.2 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t initialCapacity) [inline]`

Creates a **Priority Queue** (p. 2507) with the capacity value supplied.

Parameters

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2413).

6.527.2.3 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (std::size_t initialCapacity, Comparator< E > * comparator) [inline]`

Creates a **Priority Queue** (p. 2507) with the default initial capacity.

This new **PriorityQueue** (p. 2413) takes ownership of the passed **Comparator** (p. 1011) instance and uses that to determine the ordering of the elements in the **Queue** (p. 2507).

Parameters

initialCapacity The initial number of elements allocated to this **PriorityQueue** (p. 2413).

comparator The **Comparator** (p. 1011) instance to use in sorting the elements in the **Queue** (p. 2507).

Exceptions

NullPointerException if the passed **Comparator** (p. 1011) is NULL.

6.527.2.4 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2413) containing the elements in the specified **Collection** (p. 982).

Parameters

source the **Collection** (p. 982) whose elements are to be placed into this priority queue

6.527.2.5 `template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & source) [inline]`

Creates a **PriorityQueue** (p. 2413) containing the elements in the specified priority queue.

This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters

source the priority queue whose elements are to be placed into this priority queue

6.527.2.6 `template<typename E> virtual decaf::util::PriorityQueue< E >::~~PriorityQueue () [inline, virtual]`

6.527.3 Member Function Documentation

6.527.3.1 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Inserts the specified element into this queue if it is possible to do so immediately without violating capacity restrictions, returning true upon success and throwing an `IllegalStateException` if no space is currently available.

This implementation returns true if offer succeeds, else throws an `IllegalStateException`.

Parameters

value - the element to offer to the **Queue** (p. 2507).

Returns

true if the add succeeds.

Exceptions

IllegalArgumentException if the element cannot be added.

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 135).

References `DECAF_CATCH_EXCEPTION_CONVERT`, `DECAF_CATCH_RETHROW`, `DECAF_CATCHALL_THROW`, and `decaf::util::PriorityQueue< E >::offer()`.

6.527.3.2 `template<typename E> virtual void decaf::util::PriorityQueue< E >::clear () throw (lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Removes all elements of the queue.

This implementation repeatedly invokes poll until it returns the empty marker.

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 136).

6.527.3.3 `template<typename E> decaf::lang::Pointer< Comparator<E> > decaf::util::PriorityQueue< E >::comparator () const [inline]`

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 2413) is using to compare the elements in the queue with.

The returned value is a copy, the caller cannot change the value if the internal Pointer value.

Returns

a copy of the **Comparator** (p. 1011) Pointer being used by this **Queue** (p. 2507).

6.527.3.4 `template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () const [inline, virtual]`

6.527.3.5 `template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator () [inline, virtual]`

References `decaf::util::PriorityQueue< E >::PriorityQueueIterator`.

6.527.3.6 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (const E & value) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]`

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters

value the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException if the **Queue** (p. 2507) implementation does not allow Null values to be inserted into the **Queue** (p. 2507).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 2509).

Referenced by **decaf::util::PriorityQueue< E >::add()**.

6.527.3.7 `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue<E>::operator= (const PriorityQueue< E > & source) [inline]`

Assignment operator, assign another **PriorityQueue** (p. 2413) to this one.

Parameters

source The **PriorityQueue** (p. 2413) to copy to this one.

6.527.3.8 `template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue<E>::operator= (const Collection< E > & source) [inline]`

Assignment operator, assign another **Collection** (p. 982) to this one.

Parameters

source The **Collection** (p. 982) to copy to this one.

6.527.3.9 `template<typename E> virtual bool decaf::util::PriorityQueue< E>::peek (E & result) const [inline, virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2509).

6.527.3.10 `template<typename E> virtual bool decaf::util::PriorityQueue< E>::poll (E & result) [inline, virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2507) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 2509).

6.527.3.11 `template<typename E> virtual E decaf::util::PriorityQueue< E >::remove () throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Retrieves and removes the head of this queue.

This method differs from poll only in that it throws an exception if this queue is empty.

This implementation returns the result of poll unless the queue is empty.

Returns

a copy of the element in the head of the queue.

Exceptions

NoSuchElementException if the queue is empty.

Reimplemented from `decaf::util::AbstractQueue< E >` (p. 136).

6.527.3.12 `template<typename E> virtual bool decaf::util::PriorityQueue< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 982).

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 127).

6.527.3.13 `template<typename E> virtual std::size_t decaf::util::PriorityQueue<E>::size () const [inline, virtual]`

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

Implements `decaf::util::Collection< E >` (p. 990).

6.527.4 Friends And Related Function Documentation

6.527.4.1 `template<typename E> friend class PriorityQueueIterator [friend]`

Referenced by `decaf::util::PriorityQueue< E >::iterator()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/ProducerAck.h`

6.528 activemq::commands::ProducerAck Class Reference

```
#include <src/main/activemq/commands/ProducerAck.h>
```

Inheritance diagram for `activemq::commands::ProducerAck`:

Public Member Functions

- **ProducerAck** ()
- virtual **~ProducerAck** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ProducerAck * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual int **getSize** () const
- virtual void **setSize** (int size)
- virtual bool **isProducerAck** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERACK** = 19

Protected Member Functions

- int **size**

6.528.1 Constructor & Destructor Documentation

6.528.1.1 **activemq::commands::ProducerAck::ProducerAck** (const **ProducerAck** &) [inline, protected]

6.528.1.2 **activemq::commands::ProducerAck::ProducerAck** ()

6.528.1.3 **virtual activemq::commands::ProducerAck::~~ProducerAck** ()
[virtual]

6.528.2 Member Function Documentation

6.528.2.1 **virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.528.2.2 `virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.528.2.3 `virtual bool activemq::commands::ProducerAck::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.528.2.4 `virtual unsigned char activemq::commands::ProducerAck::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new `DataStructure` (p. 1372) type copy.

Implements `activemq::commands::DataStructure` (p. 1375).

6.528.2.5 `virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () [virtual]`

6.528.2.6 `virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId () const [virtual]`

6.528.2.7 `virtual int activemq::commands::ProducerAck::getSize () const [virtual]`

6.528.2.8 `virtual bool activemq::commands::ProducerAck::isProducerAck () const [inline, virtual]`

Returns

an answer of true to the `isProducerAck()` (p. 2422) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 601).

- 6.528.2.9** `ProducerAck& activemq::commands::ProducerAck::operator= (const ProducerAck &)` [inline, protected]
- 6.528.2.10** `virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & producerId)` [virtual]
- 6.528.2.11** `virtual void activemq::commands::ProducerAck::setSize (int size)` [virtual]
- 6.528.2.12** `virtual std::string activemq::commands::ProducerAck::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.528.2.13** `virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.995).

6.528.3 Field Documentation

- 6.528.3.1** `const unsigned char activemq::commands::ProducerAck::ID_-PRODUCERACK = 19` [static]
- 6.528.3.2** `Pointer<ProducerId> activemq::commands::ProducerAck::producerId` [protected]

Write a object instance to data output stream.

6.529.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 2424). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.529.2 Constructor & Destructor Documentation

6.529.2.1 `activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.529.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.529.3 Member Function Documentation

6.529.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.529.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.529.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.529.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.529.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.529.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.529.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ProducerAckMarshaller.h`

6.530 `activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller` Class Reference

6.530.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2427). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.530.2 Constructor & Destructor Documentation

6.530.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.530.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.530.3 Member Function Documentation

6.530.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.530.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.530.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.530.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.530.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.530.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.530.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ProducerAckMarshaller.h`

6.531 `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller` Class Reference

Marshaling code for Open Wire Format for `ProducerAckMarshaller` (p. 2431).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ProducerAckMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller`:

Public Member Functions

- **ProducerAckMarshaller** ()
- virtual **~ProducerAckMarshaller** ()

Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.531.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2431). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.531.2 Constructor & Destructor Documentation

6.531.2.1 `activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.531.2.2 `virtual activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.531.3 Member Function Documentation

6.531.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.531.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.531.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.531.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.531.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.531.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.531.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

The documentation for this class was generated from the following file:

6.532.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p.2435). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.532.2 Constructor & Destructor Documentation

6.532.2.1 `activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::ProducerAckMarshaller () [inline]`

6.532.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::~~ProducerAckMarshaller () [inline, virtual]`

6.532.3 Member Function Documentation

6.532.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.532.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.532.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.532.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.532.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.532.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.532.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

6.533.3 Member Function Documentation

6.533.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.533.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.533.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.533.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.533.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.533.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 614).

```
6.533.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerAckMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ProducerAckMarshaller.h`

6.534 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

```
#include <src/main/activemq/cmsutil/ProducerCallback.h>
```

Inheritance diagram for `activemq::cmsutil::ProducerCallback`:

Public Member Functions

- virtual `~ProducerCallback` ()
- virtual void `doInCms` (`cms::Session` *session, `cms::MessageProducer` *producer)=0
throw (`cms::CMSEException`)

Execute an action given a session and producer.

6.534.1 Detailed Description

Callback for sending a message to a CMS destination.

6.534.2 Constructor & Destructor Documentation

- 6.534.2.1** virtual `activemq::cmsutil::ProducerCallback::~~ProducerCallback` ()
[inline, virtual]

#include <src/main/activemq/commands/ProducerId.h>
```

Inheritance diagram for activemq::commands::ProducerId:

Public Types

- typedef decaf::lang::PointerComparator< ProducerId > COMPARATOR

Public Member Functions

- **ProducerId** ()
- **ProducerId** (const **ProducerId** &other)
- **ProducerId** (const **SessionId** &sessionId, long long consumerId)
- virtual ~**ProducerId** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ProducerId** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.

6.536.2.4 `virtual activemq::commands::ProducerId::~~ProducerId () [virtual]`

6.536.3 Member Function Documentation

6.536.3.1 `virtual ProducerId* activemq::commands::ProducerId::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.536.3.2 `virtual int activemq::commands::ProducerId::compareTo (const ProducerId & value) const [virtual]`

6.536.3.3 `virtual void activemq::commands::ProducerId::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.536.3.4 `virtual bool activemq::commands::ProducerId::equals (const DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.536.3.5 `virtual bool activemq::commands::ProducerId::equals (const ProducerId & value) const [virtual]`

6.536.3.6 `virtual std::string& activemq::commands::ProducerId::getConnectionId () [virtual]`

- **ProducerIdMarshaller** ()
- virtual **~ProducerIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.537.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2450). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.537.2 Constructor & Destructor Documentation

6.537.2.1 activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::ProducerIdMarshaller () [inline]

6.537.2.2 virtual activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::~~ProducerIdMarshaller () [inline, virtual]

6.537.3 Member Function Documentation

6.537.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.537.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.537.3.3 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.537.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.537.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```
6.537.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

```
6.537.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

Write a object instance to data output stream.

6.538.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 2454). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.538.2 Constructor & Destructor Documentation

6.538.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::ProducerIdMarshaller()` [inline]

6.538.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::~~ProducerIdMarshaller()` [inline, virtual]

6.538.3 Member Function Documentation

6.538.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.538.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.538.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

```
6.538.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

```
6.538.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshall
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.538.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.538.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.539.3 Member Function Documentation

6.539.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.539.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.539.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.539.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.539.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.539.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.539.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::ProducerIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.540.2 Constructor & Destructor Documentation

6.540.2.1 `activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::ProducerIdMarshaller () [inline]`

6.540.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::~~ProducerIdMarshaller () [inline, virtual]`

6.540.3 Member Function Documentation

6.540.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.540.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.540.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.540.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.540.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.540.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.540.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.541.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.541.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.541.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.541.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.541.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.541.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.541.3.7 `virtual void activemq::wireformat::openwire::marshal::v4::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/ProducerIdMarshaller.h`

6.542 activemq::commands::ProducerInfo Class Reference

```
#include <src/main/activemq/commands/ProducerInfo.h>
```

Inheritance diagram for `activemq::commands::ProducerInfo`:

Public Member Functions

- `ProducerInfo ()`
- `virtual ~ProducerInfo ()`
- `virtual unsigned char getDataStructureType () const`

Get the unique identifier that this object and its own Marshaler share.

- virtual **ProducerInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ProducerId** > & **getProducerId** () const
- virtual **Pointer**< **ProducerId** > & **getProducerId** ()
- virtual void **setProducerId** (const **Pointer**< **ProducerId** > &producerId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** () const
- virtual std::vector< **decaf::lang::Pointer**< **BrokerId** > > & **getBrokerPath** ()
- virtual void **setBrokerPath** (const std::vector< **decaf::lang::Pointer**< **BrokerId** > > &brokerPath)
- virtual bool **isDispatchAsync** () const
- virtual void **setDispatchAsync** (bool dispatchAsync)
- virtual int **getWindowSize** () const
- virtual void **setWindowSize** (int windowSize)
- virtual bool **isProducerInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_PRODUCERINFO** = 6

Protected Member Functions

- **ProducerInfo** (const **ProducerInfo** &)
- **ProducerInfo** & **operator=** (const **ProducerInfo** &)

Protected Attributes

- **Pointer< ProducerId > producerId**
- **Pointer< ActiveMQDestination > destination**
- **std::vector< decaf::lang::Pointer< BrokerId > > brokerPath**
- **bool dispatchAsync**
- **int windowSize**

6.542.1 Constructor & Destructor Documentation

6.542.1.1 **activemq::commands::ProducerInfo::ProducerInfo (const ProducerInfo &)** [inline, protected]

6.542.1.2 **activemq::commands::ProducerInfo::ProducerInfo ()**

6.542.1.3 **virtual activemq::commands::ProducerInfo::~~ProducerInfo ()** [virtual]

6.542.2 Member Function Documentation

6.542.2.1 **virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure () const** [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.542.2.2 **virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * src)** [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.542.2.3 **virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * value) const** [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.542.2.4 `virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () const [virtual]`

6.542.2.5 `virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath () [virtual]`

6.542.2.6 `virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.542.2.7 `virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () const [virtual]`

6.542.2.8 `virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination () [virtual]`

6.542.2.9 `virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () [virtual]`

6.542.2.10 `virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId () const [virtual]`

6.542.2.11 `virtual int activemq::commands::ProducerInfo::getWindowSize () const [virtual]`

6.542.2.12 `virtual bool activemq::commands::ProducerInfo::isDispatchAsync () const [virtual]`

6.542.2.13 `virtual bool activemq::commands::ProducerInfo::isProducerInfo () const [inline, virtual]`

Returns

an answer of true to the **isProducerInfo()** (p. 2472) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 601).

- 6.542.2.14 `ProducerInfo& activemq::commands::ProducerInfo::operator= (const ProducerInfo &) [inline, protected]`
- 6.542.2.15 `virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & brokerPath) [virtual]`
- 6.542.2.16 `virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & destination) [virtual]`
- 6.542.2.17 `virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool dispatchAsync) [virtual]`
- 6.542.2.18 `virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & producerId) [virtual]`
- 6.542.2.19 `virtual void activemq::commands::ProducerInfo::setWindowSize (int windowSize) [virtual]`
- 6.542.2.20 `virtual std::string activemq::commands::ProducerInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.542.2.21 `virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.995).

6.542.3 Field Documentation

6.543 activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2474).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ProducerInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller`:

Public Member Functions

- **ProducerInfoMarshaller** ()
- virtual **~ProducerInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.543.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2474). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.543.2 Constructor & Destructor Documentation

6.543.2.1 **activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::ProducerInfoMarshaller** () [inline]

6.543.2.2 **virtual**
activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::~~ProducerInfoMarshaller () [inline, virtual]

6.543.3 Member Function Documentation

6.543.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.543.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.543.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.543.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.543.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

```
6.543.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.543.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.

- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Write a object instance to data output stream.

6.544.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 2478). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.544.2 Constructor & Destructor Documentation

6.544.2.1 `activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::ProducerInfoMarshaller () [inline]`

6.544.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::~~ProducerInfoMarshaller () [inline, virtual]`

6.544.3 Member Function Documentation

6.544.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.544.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.544.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.544.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.544.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.544.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.544.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 624).

6.545.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.545.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

```
6.545.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.545.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

The documentation for this class was generated from the following file:

6.546.3 Member Function Documentation

6.546.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.546.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.546.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 618).

6.546.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.546.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.546.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.546.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.547.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.547.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ProducerInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.549 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

```
#include <src/main/decaf/util/Properties.h>
```

Public Member Functions

- **Properties** ()

- **Properties** (const **Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator=** (const **Properties** &src)
Assignment Operator.
- bool **isEmpty** () const
Returns true if the properties object is empty.
- std::size_t **size** () const
- const char * **getProperty** (const std::string &name) const
Looks up the value for the given property.
- std::string **getProperty** (const std::string &name, const std::string &defaultValue) const
Looks up the value for the given property.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the value for a given property.
- bool **hasProperty** (const std::string &name) const
Check to see if the Property exists in the set.
- void **remove** (const std::string &name)
Removes the property with the given name.
- std::vector< std::pair< std::string, std::string > > **toArray** () const
Method that serializes the contents of the property map to an array.
- void **copy** (const **Properties** &source)
*Copies the contents of the given properties object to this one, if the given **Properties** (p. 2494) instance in NULL then this **List** (p. 1865) is not modified.*
- **Properties** * **clone** () const
Clones this object.
- void **clear** ()
Clears all properties from the map.
- bool **equals** (const **Properties** &source) const
*Test whether two **Properties** (p. 2494) objects are equivalent.*
- std::string **toString** () const
*Formats the contents of the **Properties** (p. 2494) Object into a string that can be logged, etc.*
- void **load** (decaf::io::InputStream *stream) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)
Reads a property list (key and element pairs) from the input byte stream.
- void **load** (decaf::io::Reader *reader) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

- void **store** (decaf::io::OutputStream *out, const std::string &comment) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

*Writes this property list (key and element pairs) in this **Properties** (p. 2494) table to the output stream in a format suitable for loading into a **Properties** (p. 2494) table using the load(InputStream) method.*

- void **store** (decaf::io::Writer *writer, const std::string &comments) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)

*Writes this property list (key and element pairs) in this **Properties** (p. 2494) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- std::auto_ptr< **Properties** > **defaults**

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.549.1 Detailed Description

Java-like properties class for mapping string names to string values. The **Properties** (p. 2494) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 2494) instance can contain an internal **Properties** (p. 2494) list that contains default values for keys not found in the **Properties** (p. 2494) **List** (p. 1865).

The **Properties** (p. 2494) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since

1.0

6.549.2 Constructor & Destructor Documentation

6.549.2.1 decaf::util::Properties::Properties ()

6.549.2.2 decaf::util::Properties::Properties (const Properties & src)

6.549.2.3 virtual decaf::util::Properties::~~Properties () [virtual]

6.549.3 Member Function Documentation

6.549.3.1 void decaf::util::Properties::clear ()

Clears all properties from the map.

6.549.3.2 Properties* decaf::util::Properties::clone () const

Clones this object.

Returns

a replica of this object.

6.549.3.3 void decaf::util::Properties::copy (const Properties & source)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 2494) instance is NULL then this **List** (p. 1865) is not modified.

Parameters

source The source properties object.

6.549.3.4 bool decaf::util::Properties::equals (const Properties & source) const

Test whether two **Properties** (p. 2494) objects are equivalent.

Two **Properties** (p. 2494) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters

source The **Properties** (p. 2494) object to compare this instance to.

Returns

true if the contents of the two **Properties** (p. 2494) objects are the same.

6.549.3.5 const char* decaf::util::Properties::getProperty (const std::string & name) const

Looks up the value for the given property.

Parameters

name The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Referenced by decaf::util::logging::LogManager::getProperty().

6.549.3.6 `std::string decaf::util::Properties::getProperty (const std::string & name, const std::string & defaultValue) const`

Looks up the value for the given property.

Parameters

name the name of the property to be looked up.

defaultValue The value to be returned if the given property does not exist.

Returns

The value of the property specified by *name*, if it exists, otherwise the *defaultValue*.

6.549.3.7 `bool decaf::util::Properties::hasProperty (const std::string & name) const`

Check to see if the Property exists in the set.

Parameters

name - property name to check for in this properties set.

Returns

true if property exists, false otherwise.

6.549.3.8 `bool decaf::util::Properties::isEmpty () const`

Returns true if the properties object is empty.

Returns

true if empty

6.549.3.9 `void decaf::util::Properties::load (decaf::io::Reader * reader) throw (decaf::io::IOException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)`

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

Properties (p. 2494) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character \. Note that a comment line cannot be extended in this manner; every

natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab (""), and form feed ("") to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no effect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of $2n$ contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

```
\:\=
```

would be the two-character key ":\=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=', ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

```
Truth = Beauty Truth:Beauty Truth :Beauty
```

As another example, the following three lines specify a single property:

```
fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango
```

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

```
cheeses
```

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
- The character sequence **does** not represent a backspace character.

- The method does not treat a backslash character, `\`, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence `"\z"` would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence `"\b"` as equivalent to the single character `'b'`.
- Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters

reader The Reader that provides an character stream as input.

Exceptions

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

```
6.549.3.10 void decaf::util::Properties::load ( decaf::io::InputStream
        * stream ) throw ( decaf::io::IOException,
        decaf::lang::exceptions::IllegalArgumentException,
        decaf::lang::exceptions::NullPointerException )
```

Reads a property list (key and element pairs) from the input byte stream.

The input stream is in a simple line-oriented format as specified in `load(Reader)` and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters

stream The stream to read the properties data from.

Exceptions

IOException if there is an error while reading from the stream.

IllegalArgumentException if malformed data is found while reading the properties.

NullPointerException if the passed stream is Null.

```
6.549.3.11 Properties& decaf::util::Properties::operator= ( const Properties &
        src )
```

Assignment Operator.

Parameters

src The **Properties** (p. 2494) list to copy to this **List** (p. 1865).

Returns

a reference to this **List** (p. 1865) for use in chaining.

6.549.3.12 void decaf::util::Properties::remove (const std::string & *name*)

Removes the property with the given name.

Parameters

name the name of the property to remove.

6.549.3.13 void decaf::util::Properties::setProperty (const std::string & *name*,
const std::string & *value*)

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name The name of the value to be written.

value The value to be written.

6.549.3.14 std::size_t decaf::util::Properties::size () const**Returns**

The number of **Properties** (p. 2494) in this **Properties** (p. 2494) Object.

6.549.3.15 void decaf::util::Properties::store (decaf::io::Writer * *writer*,
const std::string & *comments*) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException)

Writes this property list (key and element pairs) in this **Properties** (p. 2494) table to the output character stream in a format that can be read by the load(Reader) method.

Properties (p. 2494) from the defaults table of this **Properties** (p. 2494) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed (

'), a carriage return ("), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII # character, the current date and time (as if produced by the toString method of **Date** (p. 1377) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 2494) table is written out, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with a preceding \ character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding \ character. The key and element characters #, !, =, and : are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

- writer* The Writer instance to use to output the properties.
- comments* A description of these properties that is written before writing the properties.

Exceptions

- IOException* if there is an error while writing from the stream.
- NullPointerException* if the passed stream is Null.

6.549.3.16 `void decaf::util::Properties::store (decaf::io::OutputStream * out,
const std::string & comment) throw (decaf::io::IOException,
decaf::lang::exceptions::NullPointerException)`

Writes this property list (key and element pairs) in this **Properties** (p.2494) table to the output stream in a format suitable for loading into a **Properties** (p.2494) table using the load(InputStream) method.

Properties (p.2494) from the defaults table of this **Properties** (p.2494) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
- Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
- Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

- out* The OutputStream instance to write the properties to.
- comment* A description of these properties that is written to the output stream.

Exceptions

- IOException* if there is an error while writing from the stream.
- NullPointerException* if the passed stream is Null.

6.549.3.17 `std::vector< std::pair< std::string, std::string > >
decaf::util::Properties::toArray () const`

Method that serializes the contents of the property map to an array.

Returns

- list of pairs where the first is the name and the second is the value.

6.549.3.18 `std::string decaf::util::Properties::toString () const`

Formats the contents of the **Properties** (p. 2494) Object into a string that can be logged, etc.

Returns

string value of this object.

6.549.4 Field Documentation

6.549.4.1 `std::auto_ptr<Properties> decaf::util::Properties::defaults` [protected]

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

- **ProtocolException** (const std::exception *cause) throw ()
Constructor.

- **ProtocolException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **ProtocolException * clone** () const
Clones this exception.
- virtual ~**ProtocolException** () throw ()

6.551.1 Constructor & Destructor Documentation

6.551.1.1 decaf::net::ProtocolException::ProtocolException () throw () [inline]

Default Constructor.

6.551.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.551.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.551.1.4 decaf::net::ProtocolException::ProtocolException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.551.1.5 `decaf::net::ProtocolException::ProtocolException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.551.1.6 `decaf::net::ProtocolException::ProtocolException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.551.1.7 `virtual decaf::net::ProtocolException::~~ProtocolException () throw () [inline, virtual]`

6.551.2 Member Function Documentation

6.551.2.1 `virtual ProtocolException* decaf::net::ProtocolException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ProtocolException.h`

6.552 decaf::security::PublicKey Class Reference

A public key.

```
#include <src/main/decaf/security/PublicKey.h>
```

Inheritance diagram for decaf::security::PublicKey:

Public Member Functions

- virtual `~PublicKey ()`

6.552.1 Detailed Description

A public key. This interface contains no methods or constants. It merely serves to group (and provide type safety for) all public key interfaces.

6.552.2 Constructor & Destructor Documentation

6.552.2.1 `virtual decaf::security::PublicKey::~~PublicKey () [inline, virtual]`

The documentation for this class was generated from the following file:

6.553 decaf::util::Queue< E > Class Template Reference

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

```
#include <src/main/decaf/util/Queue.h>
```

Inheritance diagram for decaf::util::Queue< E >:

Public Member Functions

- virtual `~Queue ()`
- virtual bool **offer** (const E &value)=0 throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException)

Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)=0

Gets and removes the element in the head of the queue.

- virtual E **remove** ()=0 throw (decaf::lang::exceptions::NoSuchElementException)

Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) const =0

Gets but not removes the element in the head of the queue.

- virtual E **element** () const =0 throw (decaf::lang::exceptions::NoSuchElementException)

Gets but not removes the element in the head of the queue.

6.553.1 Detailed Description

template<typename E> class decaf::util::Queue< E >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection. Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 2507) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 2507) interface the methods of this class cannot return null to indicate that a **Queue** (p. 2507) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 2507) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 2507) must be *assignable* in order to utilize these methods.

Since

1.0

6.553.2 Constructor & Destructor Documentation

6.553.2.1 **template<typename E > virtual decaf::util::Queue< E >::~~Queue ()**
[inline, virtual]

6.553.3 Member Function Documentation

6.553.3.1 **template<typename E > virtual E decaf::util::Queue< E >::element ()**
const throw (decaf::lang::exceptions::NoSuchElementException) [pure virtual]

Gets but not removes the element in the head of the queue.

Throws a NoSuchElementException if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 136).

6.553.3.2 `template<typename E > virtual bool decaf::util::Queue< E >::offer (const E & value) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException) [pure virtual]`

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the `collection.add(E)`, since the latter might throw an exception if the operation fails.

Parameters

value the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException if the **Queue** (p. 2507) implementation does not allow Null values to be inserted into the **Queue** (p. 2507).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::PriorityQueue< E >** (p. 2417).

Referenced by `decaf::util::AbstractQueue< E >::add()`.

6.553.3.3 `template<typename E > virtual bool decaf::util::Queue< E >::peek (E & result) const [pure virtual]`

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::PriorityQueue< E >** (p. 2418).

Referenced by `decaf::util::AbstractQueue< E >::element()`.

6.553.3.4 `template<typename E > virtual bool decaf::util::Queue< E >::poll (E & result) [pure virtual]`

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 2507) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::PriorityQueue< E >** (p. 2418).

Referenced by **decaf::util::AbstractQueue< E >::clear()**, and **decaf::util::AbstractQueue< E >::remove()**.

6.553.3.5 `template<typename E > virtual E decaf::util::Queue< E >::remove ()
throw (decaf::lang::exceptions::NoSuchElementException) [pure
virtual]`

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException if there is no element in the queue.

Implemented in **decaf::util::AbstractQueue< E >** (p. 136), and **decaf::util::PriorityQueue< E >** (p. 2419).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/Queue.h`

6.554 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

```
#include <src/main/cms/Queue.h>
```

Inheritance diagram for cms::Queue:

Public Member Functions

- `virtual ~Queue ()`
- `virtual std::string getQueueName () const =0 throw (CMSException)`

Gets the name of this queue.

6.554.1 Detailed Description

An interface encapsulating a provider-specific queue name. Messages sent to a **Queue** (p. 2510) are sent to a Single Subscriber on that **Queue** (p. 2510) **Destination** (p. 1387). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 2036) in a **Queue** (p. 2510) is not defined by the CMS API, consult your Provider documentation for this information.

Since

1.0

6.554.2 Constructor & Destructor Documentation

6.554.2.1 `virtual cms::Queue::~Queue () [inline, virtual]`

6.554.3 Member Function Documentation

6.554.3.1 `virtual std::string cms::Queue::getQueueName () const throw (CMSEException) [pure virtual]`

Gets the name of this queue.

Returns

The queue name.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::commands::ActiveMQQueue** (p. 382).

The documentation for this class was generated from the following file:

- `src/main/cms/Queue.h`

6.555 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 2510) without removing them.

```
#include <src/main/cms/QueueBrowser.h>
```

Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- `virtual ~QueueBrowser ()`
- `virtual const Queue * getQueue () const =0 throw (cms::CMSEException)`
- `virtual std::string getMessageSelector () const =0 throw (cms::CMSEException)`

- virtual std::vector< const cms::Message * > **getEnumeration** () const =0 throw (cms::CMSEException)

Gets an enumeration for browsing the current queue messages in the order they would be received.

6.555.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p.2510) without removing them. The **getEnumeration** method of this class returns a static snapshot of the **Queue** (p.2510) at the time the method is called. Since new Message's can be arriving and old Message's could expire the client should periodically refresh its view by calling **getEnumeration** again.

Since

1.1

6.555.2 Constructor & Destructor Documentation

6.555.2.1 virtual cms::QueueBrowser::~~QueueBrowser () [inline, virtual]

6.555.3 Member Function Documentation

6.555.3.1 virtual std::vector<const cms::Message*>
cms::QueueBrowser::getEnumeration () const throw (cms::CMSEException) [pure virtual]

Gets an enumeration for browsing the current queue messages in the order they would be received.

The enumeration returned is a static view of the **Queue** (p.2510) and is not updated as new Messages arrive, the client should refresh its enumeration by calling this method again.

Returns

an STL vector for browsing the messages.

Exceptions

CMSEException (p. 960) if an internal error occurs.

6.555.3.2 virtual std::string cms::QueueBrowser::getMessageSelector () const
throw (cms::CMSEException) [pure virtual]

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

CMSEException (p. 960) if an internal error occurs.

6.555.3.3 `virtual const Queue* cms::QueueBrowser::getQueue () const throw (cms::CMSEException)` [pure virtual]

Returns

the **Queue** (p. 2510) that this browser is listening on.

Exceptions

CMSEException (p. 960) if an internal error occurs.

The documentation for this class was generated from the following file:

- `src/main/cms/QueueBrowser.h`

6.556 decaf::util::Random Class Reference

Random (p. 2513) Value Generator which is used to generate a stream of pseudorandom numbers.

`#include <src/main/decaf/util/Random.h>`

Public Member Functions

- **Random** ()
Construct a random generator with the current time of day in milliseconds as the initial state.
- **Random** (unsigned long long seed)
*Construct a random generator with the given **seed** as the initial state.*
- `bool nextBoolean` ()
Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.
- `void nextBytes` (std::vector< unsigned char > &buf)
Modifies the byte array by a random sequence of bytes generated by this random number generator.
- `double nextDouble` ()
Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.
- `float nextFloat` ()
Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.
- `double nextGaussian` ()
*Pseudo-randomly generates (approximately) a normally distributed **double** value with mean 0.0 and a standard deviation value of 1.0 using the polar method of G.*
- `int nextInt` ()
*Generates a uniformly distributed 32-bit **int** value from the this random number sequence.*
- `int nextInt` (int n) throw (lang::exceptions::IllegalArgumentException)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

- long long **nextLong** ()

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

- void **setSeed** (unsigned long long seed)

*Modifies the seed using linear congruential formula presented in *The Art of Computer Programming*, Volume 2, Section 3.2.1.*

Protected Member Functions

- virtual int **next** (int bits)

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

6.556.1 Detailed Description

Random (p. 2513) Value Generator which is used to generate a stream of pseudorandom numbers. The algorithms implemented by class **Random** (p. 2513) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since

1.0

6.556.2 Constructor & Destructor Documentation

6.556.2.1 decaf::util::Random::Random ()

Construct a random generator with the current time of day in milliseconds as the initial state.

See also

setSeed (p. 2517)

6.556.2.2 decaf::util::Random::Random (unsigned long long seed)

Construct a random generator with the given **seed** as the initial state.

Parameters

seed the seed that will determine the initial state of this random number generator

See also

setSeed (p. 2517)

6.556.3 Member Function Documentation

6.556.3.1 `virtual int decaf::util::Random::next (int bits)` [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

`int` a pseudo-random generated `int` number

Parameters

`bits` number of bits of the returned value

See also

`nextBytes` (p. 2515)
`nextDouble` (p. 2515)
`nextFloat` (p. 2516)
`nextInt()` (p. 2517)
`nextInt(int)` (p. 2516)
`nextGaussian` (p. 2516)
`nextLong` (p. 2517)

6.556.3.2 `bool decaf::util::Random::nextBoolean ()`

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns

`boolean` a pseudo-random, uniformly distributed boolean value

6.556.3.3 `void decaf::util::Random::nextBytes (std::vector< unsigned char > & buf)`

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

`buf` non-null array to contain the new random bytes

See also

`next` (p. 2515)

6.556.3.4 `double decaf::util::Random::nextDouble ()`

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns

double

See also

nextFloat (p. 2516)

6.556.3.5 float decaf::util::Random::nextFloat ()

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns

float a random float number between 0.0 and 1.0

See also

nextDouble (p. 2515)

6.556.3.6 double decaf::util::Random::nextGaussian ()

Pseudo-randomly generates (approximately) a normally distributed **double** value with mean 0.0 and a standard deviation value of 1.0 using the *polar method* of G.

E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns

double

See also

nextDouble (p. 2515)

6.556.3.7 int decaf::util::Random::nextInt (int *n*) throw (lang::exceptions::IllegalArgumentException)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of **n** (exclusively).

Returns

int

Parameters

n int

Exceptions

IllegalArgumentException

6.556.3.8 `int decaf::util::Random::nextInt ()`

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns

`int` uniformly distributed `int` value

See also

`next` (p. 2515)
`nextLong` (p. 2517)

6.556.3.9 `long long decaf::util::Random::nextLong ()`

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns

64-bit `int` random number

See also

`next` (p. 2515)
`nextInt()` (p. 2517)
`nextInt(int)` (p. 2516)

6.556.3.10 `void decaf::util::Random::setSeed (unsigned long long seed)`

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

seed the seed that alters the state of the random number generator

See also

`next` (p. 2515)
`Random()` (p. 2514)
`Random(long)`

6.558 decaf::io::Reader Class Reference

```
#include <src/main/decaf/io/Reader.h>
```

Public Member Functions

- virtual **~Reader** ()
- virtual void **setInputStream** (**InputStream** *is)=0

Sets the target input stream.

- virtual **InputStream * getInputStream ()**=0
Gets the target input stream.
- virtual **std::size_t read (unsigned char *buffer, std::size_t count)**=0 throw (**IOException**, **lang::exceptions::NullPointerException**)
Attempts to read an array of bytes from the stream.
- virtual **unsigned char readByte ()**=0 throw (**IOException**)
Attempts to read a byte from the input stream.

6.558.1 Constructor & Destructor Documentation

6.558.1.1 **virtual decaf::io::Reader::~~Reader ()** [inline, virtual]

6.558.2 Member Function Documentation

6.558.2.1 **virtual InputStream* decaf::io::Reader::getInputStream ()** [pure virtual]

Gets the target input stream.

6.558.2.2 **virtual std::size_t decaf::io::Reader::read (unsigned char * *buffer*, std::size_t *count*)** throw (**IOException**, **lang::exceptions::NullPointerException**) [pure virtual]

Attempts to read an array of bytes from the stream.

Parameters

buffer The target byte buffer.
count The number of bytes to read.

Returns

The number of bytes read.

Exceptions

IOException (p. 1707) thrown if an error occurs.

6.558.2.3 **virtual unsigned char decaf::io::Reader::readByte ()** throw (**IOException**) [pure virtual]

Attempts to read a byte from the input stream.

Returns

The byte.

Exceptions

IOException (p. 1707) thrown if an error occurs.

6.558.2.4 virtual void decaf::io::Reader::setInputStream (InputStream * is) [pure virtual]

Sets the target input stream.

6.559.1 Constructor & Destructor Documentation

6.559.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException () throw () [inline]

Default Constructor.

6.559.1.2 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const lang::Exception & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy

6.559.1.3 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const ReadOnlyBufferException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.559.1.4 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.559.1.5 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.559.1.6 `decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.559.1.7 virtual decaf::nio::ReadOnlyBufferException::~~ReadOnlyBufferException () throw () [inline, virtual]

6.559.2 Member Function Documentation

6.559.2.1 virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from decaf::lang::exceptions::UnsupportedOperationException (p. 3096).

The documentation for this class was generated from the following file:

6.560 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 2522) maintains a pair of associated locks, one for read-only operations and one for writing.

```
#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>
```

Public Member Functions

- virtual ~**ReadWriteLock** ()
- virtual **Lock** & **readLock** ()=0
Returns the lock used for reading.
- virtual **Lock** & **writeLock** ()=0
Returns the lock used for writing.

6.560.1 Detailed Description

A **ReadWriteLock** (p. 2522) maintains a pair of associated locks, one for read-only operations and one for writing. The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 2522) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 1898) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

- * Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible.
- * Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency.
- * Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant?
- * Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

```

Inheritance diagram for decaf::util::concurrent::locks::ReentrantLock:

Public Member Functions

- **ReentrantLock** ()
- virtual ~**ReentrantLock** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Acquires the lock.

- virtual void **lockInterruptibly** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Acquires the lock only if it is not held by another thread at the time of invocation.
- virtual bool **tryLock** (long long time, const **TimeUnit** &unit) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException)
Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Attempts to release this lock.
- virtual **Condition** * **newCondition** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException)
*Returns a **Condition** (p. 1040) instance for use with this **Lock** (p. 1898) instance.*
- int **getHoldCount** () const
Queries the number of holds on this lock by the current thread.
- bool **isHeldByCurrentThread** () const
Queries if this lock is held by the current thread.
- bool **isLocked** () const
Queries if this lock is held by any thread.
- bool **isFair** () const
Returns true if this lock has fairness set true.
- std::string **toString** () const
Returns a string identifying this lock, as well as its lock state.

6.562.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 1898) with extended capabilities. A **ReentrantLock** (p. 2526) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldByCurrentThread**() (p. 2529), and **getHoldCount**() (p. 2528).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many

threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

```
class X { private:
ReentrantLock (p. 2526) lock; // ...
public:
void m() { lock.lock(); // block until condition holds
try { // ... method body } finally { lock.unlock() } } }
```

In addition to implementing the **Lock** (p. 1898) interface, this class defines methods isLocked and getLockQueueLength, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since

1.0

6.562.2 Constructor & Destructor Documentation

6.562.2.1 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ()

6.562.2.2 virtual decaf::util::concurrent::locks::ReentrantLock::~~ReentrantLock () [virtual]

6.562.3 Member Function Documentation

6.562.3.1 int decaf::util::concurrent::locks::ReentrantLock::getHoldCount ()
const

Queries the number of holds on this lock by the current thread.

A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

```
class X { private:
ReentrantLock (p. 2526) lock; // ...
public:
void m() { assert( lock.getHoldCount() == 0 ); lock.lock(); try { // ... method body } catch(...)
{ lock.unlock(); } } }
```

Returns

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.562.3.2 bool decaf::util::concurrent::locks::ReentrantLock::isFair () const

Returns true if this lock has fairness set true.

Returns

true if this lock has fairness set true

6.562.3.3 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread () const

Queries if this lock is held by the current thread.

This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

```
class X { private: ReentrantLock (p. 2526) lock = new ReentrantLock() (p. 2528); // ...
public: void m() { assert( lock.isHeldByCurrentThread() ); // ... method body } }
```

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

```
class X { private: ReentrantLock (p. 2526) lock = new ReentrantLock() (p. 2528); // ...
public: void m() { assert !lock.isHeldByCurrentThread() (p. 2529); lock.lock(); try { // ...
method body } finally { lock.unlock(); } } }
```

Returns

true if current thread holds this lock and false otherwise

6.562.3.4 bool decaf::util::concurrent::locks::ReentrantLock::isLocked () const

Queries if this lock is held by any thread.

This method is designed for use in monitoring of the system state, not for synchronization control.

Returns

true if any thread holds this lock and false otherwise

6.562.3.5 virtual void decaf::util::concurrent::locks::ReentrantLock::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Acquires the lock.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1900).

6.562.3.6 `virtual void decaf::util::concurrent::locks::ReentrantLock::lockInterruptibly () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::InterruptedException) [virtual]`

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* The lock is acquired by the current thread; or * Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while acquiring the lock,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 1900).

6.562.3.7 `virtual Condition* decaf::util::concurrent::locks::ReentrantLock::newCondition () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Returns a **Condition** (p. 1040) instance for use with this **Lock** (p. 1898) instance.

The returned **Condition** (p. 1040) instance supports the same usages as do the **Mutex** (p. 2239) Class' methods (wait, notify, and notifyAll).

* If this lock is not held when any of the **Condition** (p. 1040) waiting or signalling methods are called, then an **IllegalMonitorStateException** is thrown. * When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called. * If a thread is interrupted while

waiting then the wait will terminate, an `InterruptedException` will be thrown, and the thread's interrupted status will be cleared. * Waiting threads are signaled in FIFO order. * The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

Exceptions

RuntimeException if an error occurs while creating the **Condition** (p. 1040).

UnsupportedOperationException if this **Lock** (p. 1898) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 1901).

6.562.3.8 `std::string decaf::util::concurrent::locks::ReentrantLock::toString ()` `const`

Returns a string identifying this lock, as well as its lock state.

The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns

a string identifying this lock, as well as its lock state

6.562.3.9 `virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock` `(long long time, const TimeUnit & unit)` `throw (decaf::lang::exceptions::RuntimeException,` `decaf::lang::exceptions::InterruptedException) [virtual]`

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 2532) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

```
if (lock.tryLock() || lock.tryLock(timeout, unit) ) { ... }
```

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* The lock is acquired by the current thread; or
* Some other thread interrupts the current thread;
or
* The specified waiting time elapses

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

* has its interrupted status set on entry to this method; or
* is interrupted while acquiring the lock,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters

time the maximum time to wait for the lock

unit the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException if an error occurs while acquiring the lock.

InterruptedException if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 1901).

6.562.3.10 `virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock ()
throw (decaf::lang::exceptions::RuntimeException) [virtual]`

Acquires the lock only if it is not held by another thread at the time of invocation.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 2532) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use **tryLock(0, TimeUnit.SECONDS)** (p. 3014) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1902).

6.562.3.11 `virtual void decaf::util::concurrent::locks::ReentrantLock::unlock
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [virtual]`

Attempts to release this lock.

If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then `IllegalMonitorStateException` is thrown.

Exceptions

RuntimeException if an error occurs while acquiring the lock.

Implements `decaf::util::concurrent::locks::Lock` (p. 1903).

6.563.1 Constructor & Destructor Documentation

6.563.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException () throw () [inline]

Default Constructor.

6.563.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.563.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex - The Exception to copy in this new instance.

References decaf::lang::Exception::Exception().

6.563.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.563.1.5 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* - The file name where exception occurs
- lineNumber* - The line number where the exception occurred.
- msg* - The message to report
- ... - list of primitives that are formatted into the message

6.563.1.6 `decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException`
 (`const char * file`, `const int lineNumber`, `const std::exception * cause`, `const char * msg`, ...) `throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* - The file name where exception occurs
- lineNumber* - The line number where the exception occurred.
- cause* - The exception that was the cause for this one to be thrown.
- msg* - The message to report
- ... - list of primitives that are formatted into the message

6.563.1.7 `virtual`
`decaf::util::concurrent::RejectedExecutionException::~RejectedExecutionException`
 () `throw ()` [inline, virtual]

6.563.2 Member Function Documentation

6.563.2.1 `virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone` () `const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance this exception type with a copy the current state.

Reimplemented from `decaf::lang::Exception` (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/RejectedExecutionException.h`

6.564 decaf::util::concurrent::RejectedExecutionHandler Class Reference

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. ??).

#include <src/main/decaf/util/concurrent/RejectedExecutionHandler.h>

Public Member Functions

- virtual ~**RejectedExecutionHandler** ()

6.564.1 Detailed Description

A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. ??).

Since

1.0

6.564.2 Constructor & Destructor Documentation

- 6.564.2.1 virtual
decaf::util::concurrent::RejectedExecutionHandler::~RejectedExecutionHandler
() [inline, virtual]

6.565 activemq::commands::RemoveInfo Class Reference

#include <src/main/activemq/commands/RemoveInfo.h>

Inheritance diagram for activemq::commands::RemoveInfo:

Public Member Functions

- **RemoveInfo** ()
- virtual ~**RemoveInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **RemoveInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataSet** *value) const

*Compares the **DataSet** (p. 1372) passed in to this one, and returns if they are equivalent.*

- virtual const **Pointer**< **DataSet** > & **getObjectId** () const
- virtual **Pointer**< **DataSet** > & **getObjectId** ()
- virtual void **setObjectId** (const **Pointer**< **DataSet** > &objectId)
- virtual long long **getLastDeliveredSequenceId** () const
- virtual void **setLastDeliveredSequenceId** (long long lastDeliveredSequenceId)
- virtual bool **isRemoveInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVEINFO** = 12

Protected Member Functions

- **RemoveInfo** (const **RemoveInfo** &)
- **RemoveInfo** & **operator=** (const **RemoveInfo** &)

Protected Attributes

- **Pointer**< **DataSet** > **objectId**
- long long **lastDeliveredSequenceId**

6.565.1 Constructor & Destructor Documentation

6.565.1.1 `activemq::commands::RemoveInfo::RemoveInfo (const RemoveInfo &) [inline, protected]`

6.565.1.2 `activemq::commands::RemoveInfo::RemoveInfo ()`

6.565.1.3 `virtual activemq::commands::RemoveInfo::~~RemoveInfo () [virtual]`

6.565.2 Member Function Documentation

6.565.2.1 `virtual RemoveInfo* activemq::commands::RemoveInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.565.2.2 `virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.565.2.3 `virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.565.2.4 `virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType () const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

6.565.2.5 virtual long long **activemq::commands::RemoveInfo::getLastDeliveredSequenceId** () const [virtual]

6.565.2.6 virtual Pointer<DataSet>& **activemq::commands::RemoveInfo::getObjectId** () [virtual]

6.565.2.7 virtual const Pointer<DataSet>& **activemq::commands::RemoveInfo::getObjectId** () const [virtual]

6.565.2.8 virtual bool **activemq::commands::RemoveInfo::isRemoveInfo** () const [inline, virtual]

Returns

an answer of true to the **isRemoveInfo()** (p. 2539) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 601).

6.565.2.9 RemoveInfo& **activemq::commands::RemoveInfo::operator=** (const RemoveInfo &) [inline, protected]

6.565.2.10 virtual void **activemq::commands::RemoveInfo::setLastDeliveredSequenceId** (long long *lastDeliveredSequenceId*) [virtual]

6.565.2.11 virtual void **activemq::commands::RemoveInfo::setObjectId** (const Pointer< DataSet > & *objectId*) [virtual]

6.565.2.12 virtual std::string **activemq::commands::RemoveInfo::toString** () const [virtual]

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.565.2.13 `virtual Pointer<Command> activemq::commands::RemoveInfo::visit
 (activemq::state::CommandVisitor * visitor) throw (
 exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.565.3 Field Documentation

6.565.3.1 `const unsigned char activemq::commands::RemoveInfo::ID_ -
 REMOVEINFO = 12 [static]`

6.565.3.2 `long long activemq::commands::RemoveInfo::lastDeliveredSequenceId
 [protected]`

6.565.3.3 `Pointer<DataStructure> activemq::commands::RemoveInfo::objectId
 [protected]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/RemoveInfo.h`

6.566 activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2540).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/RemoveInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller`:

Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual **~RemoveInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.566.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2540). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.566.2 Constructor & Destructor Documentation

6.566.2.1 **activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::RemoveInfoMarshaller**
() [inline]

6.566.2.2 **virtual**
activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::~~RemoveInfoMarshaller
() [inline, virtual]

6.566.3 Member Function Documentation

6.566.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.566.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::getDataSetType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.566.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 611).

6.566.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataSet * dataSet, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.566.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

6.566.3.6 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

6.566.3.7 `virtual void activemq::wireformat::openwire::marshal::v1::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

The documentation for this class was generated from the following file:

6.567.3 Member Function Documentation

6.567.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.567.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.567.3.3 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.567.3.4 virtual void activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.567.3.5 virtual int activemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

```
6.567.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.567.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]

6.568.3 Member Function Documentation

6.568.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.568.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.568.3.3 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 631).

6.568.3.4 virtual void activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.568.3.5 virtual int activemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

```
6.568.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.568.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p.2552). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.569.2 Constructor & Destructor Documentation

6.569.2.1 activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::RemoveInfoMarshaller () [inline]

6.569.2.2 virtual
activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]

6.569.3 Member Function Documentation

6.569.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.569.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.569.3.3 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.569.3.4 virtual void activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.569.3.5 virtual int activemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.569.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.569.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**RemoveInfoMarshaller.h**

6.570 activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 2556).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/RemoveInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller**:

Public Member Functions

- **RemoveInfoMarshaller** ()
- virtual **~RemoveInfoMarshaller** ()

Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- `virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)`

Write a object instance to data output stream.

6.570.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p.2556). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.570.2 Constructor & Destructor Documentation

6.570.2.1 `activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::RemoveInfoMarshaller () [inline]`

6.570.2.2 `virtual activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::~~RemoveInfoMarshaller () [inline, virtual]`

6.570.3 Member Function Documentation

6.570.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.570.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.570.3.3 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.570.3.4 virtual void activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.570.3.5 virtual int activemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.570.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.570.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/RemoveInfoMarshaller.h`

6.571 activemq::commands::RemoveSubscriptionInfo Class Reference

```
#include <src/main/activemq/commands/RemoveSubscriptionInfo.h>
```

Inheritance diagram for **activemq::commands::RemoveSubscriptionInfo**:

Public Member Functions

- **RemoveSubscriptionInfo** ()
- virtual **~RemoveSubscriptionInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaller share.
- virtual **RemoveSubscriptionInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual const std::string & **getSubscriptionName** () const
- virtual std::string & **getSubscriptionName** ()
- virtual void **setSubscriptionName** (const std::string &subscriptionName)
- virtual const std::string & **getClientId** () const
- virtual std::string & **getClientId** ()
- virtual void **setClientId** (const std::string &clientId)

- virtual bool **isRemoveSubscriptionInfo** () const
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_REMOVESUBSCRIPTIONINFO** = 9

Protected Member Functions

- **RemoveSubscriptionInfo** (const **RemoveSubscriptionInfo** &)
- **RemoveSubscriptionInfo** & **operator=** (const **RemoveSubscriptionInfo** &)

Protected Attributes

- **Pointer**< **ConnectionId** > **connectionId**
- std::string **subscriptionName**

6.571.1 Constructor & Destructor Documentation

6.571.1.1 **activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo** (const **RemoveSubscriptionInfo** &) [inline, protected]

6.571.1.2 **activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo** ()

6.571.1.3 virtual **activemq::commands::RemoveSubscriptionInfo::~~RemoveSubscriptionInfo** () [virtual]

6.571.2 Member Function Documentation

6.571.2.1 virtual **RemoveSubscriptionInfo*** **activemq::commands::RemoveSubscriptionInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.571.2.2 virtual void activemq::commands::RemoveSubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.571.2.3 virtual bool activemq::commands::RemoveSubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.571.2.4 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () const [virtual]

6.571.2.5 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId () [virtual]

6.571.2.6 virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () [virtual]

6.571.2.7 virtual const Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId () const [virtual]

6.571.2.8 virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

- 6.571.2.9** `virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () const [virtual]`
- 6.571.2.10** `virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubscriptionName () [virtual]`
- 6.571.2.11** `virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo () const [inline, virtual]`

Returns

an answer of true to the `isRemoveSubscriptionInfo()` (p. 2563) query.

Reimplemented from `activemq::commands::BaseCommand` (p. 601).

- 6.571.2.12** `RemoveSubscriptionInfo& activemq::commands::RemoveSubscriptionInfo::operator= (const RemoveSubscriptionInfo &) [inline, protected]`
- 6.571.2.13** `virtual void activemq::commands::RemoveSubscriptionInfo::setClientId (const std::string & clientId) [virtual]`
- 6.571.2.14** `virtual void activemq::commands::RemoveSubscriptionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId) [virtual]`
- 6.571.2.15** `virtual void activemq::commands::RemoveSubscriptionInfo::setSubscriptionName (const std::string & subscriptionName) [virtual]`
- 6.571.2.16** `virtual std::string activemq::commands::RemoveSubscriptionInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p. 602).

- 6.571.2.17** `virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

6.572

activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller Class Reference

2567

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.571.3 Field Documentation

6.571.3.1 `std::string activemq::commands::RemoveSubscriptionInfo::clientId`
[protected]

6.571.3.2 `Pointer<ConnectionId> activemq::commands::RemoveSubscriptionInfo::connectionId`

6.572

activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller

Class Reference

2569

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.572.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaller.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.572.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::marshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 624).

6.572.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::unmarshal(const OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.572.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

6.572.3.6 `virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

6.572.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::RemoveSubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

The documentation for this class was generated from the following file:

6.573

activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller

Class Reference

2573

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.573.3.3 virtual void **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - **BinaryWriter** that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 631).

6.573.3.4 virtual void **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::looseUnmarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - **BinaryReader** that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.573.3.5 virtual int **activemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMarshal** (**OpenWireFormat** * *wireFormat*, **commands::DataStructure** * *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a **BooleanStream**.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

```
6.573.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.573.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::RemoveSubscriptionInfoMarshaller::tightUnm
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

6.574

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller

Class Reference

2575

bs - `BooleanStream` stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/RemoveSubscriptionInfoMarshaller.h`

6.574 **activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 2572).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/RemoveSubscriptionInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller**:

Public Member Functions

- **RemoveSubscriptionInfoMarshaller** ()
- virtual **~RemoveSubscriptionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::~~RemoveSubscriptionInfoMarshaller () [inline, virtual]

6.574.3 Member Function Documentation

6.574.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements activemq::wireformat::openwire::marshal::DataStreamMarshaller (p. 1331).

6.574.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements activemq::wireformat::openwire::marshal::DataStreamMarshaller (p. 1336).

6.574

activemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller

Class Reference

2577

```
6.574.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

```
6.574.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

```
6.574.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

```
6.574.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.574.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::RemoveSubscriptionInfoMarshaller::tightUnma
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.575

activemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller

Class Reference

2581

```
6.575.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

```
6.575.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

```
6.575.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.575.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.575.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::RemoveSubscriptionInfoMarshaller::tightUnma
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.576

activemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller

Class Reference

2585

```
6.576.3.3 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseMars
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

```
6.576.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::looseUnm
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

```
6.576.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

```
6.576.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightMars
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.576.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::RemoveSubscriptionInfoMarshaller::tightUnma
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

6.577.2 Member Function Documentation

6.577.2.1 **virtual** **ReplayCommand*** **activemq::commands::ReplayCommand::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.577.2.2 **virtual** void **activemq::commands::ReplayCommand::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.577.2.3 virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.577.2.4 virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.577.2.5 virtual int activemq::commands::ReplayCommand::getFirstNakNumber () const [virtual]**6.577.2.6 virtual int activemq::commands::ReplayCommand::getLastNakNumber () const** [virtual]**6.577.2.7 ReplayCommand& activemq::commands::ReplayCommand::operator= (const ReplayCommand &)** [inline, protected]**6.577.2.8 virtual void activemq::commands::ReplayCommand::setFirstNakNumber (int *firstNakNumber*)** [virtual]**6.577.2.9 virtual void activemq::commands::ReplayCommand::setLastNakNumber (int *lastNakNumber*)** [virtual]**6.577.2.10 virtual std::string activemq::commands::ReplayCommand::toString () const** [virtual]

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

```

6.577.2.11  virtual Pointer<Command> activemq::commands::ReplayCommand::visit (
               activemq::state::CommandVisitor * visitor ) throw (
               exceptions::ActiveMQException ) [virtual]

```

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.577.3 Field Documentation

```

6.577.3.1  int activemq::commands::ReplayCommand::firstNakNumber [protected]

```

```

6.577.3.2  const unsigned char activemq::commands::ReplayCommand::ID _ -
             REPLAYCOMMAND = 65 [static]

```

```

6.577.3.3  int activemq::commands::ReplayCommand::lastNakNumber [protected]

```

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.578.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 2587). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.578.2 Constructor & Destructor Documentation

- 6.578.2.1 **activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::ReplayCommandMarshaller** () [inline]
- 6.578.2.2 **virtual activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::~~ReplayCommandMarshaller** () [inline, virtual]

6.578.3 Member Function Documentation

- 6.578.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.578.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.578.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.578.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.578.3.5 `virtual int ac-`
`tivemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
`* dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller`
(p. 633).

6.578.3.6 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightMarshal2`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
`* dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller`
(p. 634).

6.578.3.7 `virtual void ac-`
`tivemq::wireformat::openwire::marshal::v2::ReplayCommandMarshaller::tightUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
`* dataStructure`, `decaf::io::DataInputStream * dataIn`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ReplayCommandMarshaller.h`

6.579 `activemq::wireformat::openwire::marshal::v3::ReplayCommandMa` Class Reference

Marshaling code for Open Wire Format for `ReplayCommandMarshaller` (p. 2591).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/ReplayCommandMarshaller.h>
```

activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::~~ReplayCommandMarshaller () [inline, virtual]

6.579.3 Member Function Documentation

6.579.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.579.3.2 **virtual unsigned char** **activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.579.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.579.3.4 `virtual void activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.579.3.5 `virtual int activemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

```
6.579.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.579.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

6.580.3 Member Function Documentation

6.580.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.580.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.580.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.580.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

6.580.3.5 `virtual int activemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.580.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.580.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

6.581.3 Member Function Documentation

6.581.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.581.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.581.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.581.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.581.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

```
6.581.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.581.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual **~ReplayCommandMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.582.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p.2603). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.582.2 Constructor & Destructor Documentation

6.582.2.1 activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::ReplayCommandMarshaller () [inline]

6.582.2.2 virtual
activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::~~ReplayCommandMarshaller () [inline, virtual]

6.582.3 Member Function Documentation

6.582.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.582.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.582.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.582.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.582.3.5 `virtual int activemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

```
6.582.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 614).

```
6.582.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ReplayCommandMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.585 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

```
#include <src/main/activemq/cmsutil/ResourceLifecycleManager.h>
```

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual **~ResourceLifecycleManager** ()
Destructor - calls destroy

- void **addConnection** (**cms::Connection** *connection)
Adds a connection so that its life will be managed by this object.
- void **addSession** (**cms::Session** *session)
Adds a session so that its life will be managed by this object.
- void **addDestination** (**cms::Destination** *dest)
Adds a destination so that its life will be managed by this object.
- void **addMessageProducer** (**cms::MessageProducer** *producer)
Adds a message producer so that its life will be managed by this object.
- void **addMessageConsumer** (**cms::MessageConsumer** *consumer)
Adds a message consumer so that its life will be managed by this object.
- void **destroy** () throw (cms::CMSException)
Closes and destroys the contained CMS resources.
- void **releaseAll** ()
Releases all of the contained resources so that this object will no longer control their lifetimes.

6.585.1 Detailed Description

Manages the lifecycle of a set of CMS resources. A call to **destroy** will close and destroy all of the contained resources in the appropriate manner.

6.585.2 Constructor & Destructor Documentation

6.585.2.1 **activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager**
()

6.585.2.2 **virtual**
activemq::cmsutil::ResourceLifecycleManager::~~ResourceLifecycleManager
() [virtual]

Destructor - calls **destroy**

6.585.3 Member Function Documentation

6.585.3.1 **void activemq::cmsutil::ResourceLifecycleManager::addConnection** (
cms::Connection * *connection*) [inline]

Adds a connection so that its life will be managed by this object.

Parameters

connection the object to be managed

6.585.3.2 void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * *dest*) [inline]

Adds a destination so that its life will be managed by this object.

Parameters

dest the object to be managed

6.585.3.3 void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * *consumer*) [inline]

Adds a message consumer so that its life will be managed by this object.

Parameters

consumer the object to be managed

6.585.3.4 void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * *producer*) [inline]

Adds a message producer so that its life will be managed by this object.

Parameters

producer the object to be managed

6.585.3.5 void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * *session*) [inline]

Adds a session so that its life will be managed by this object.

Parameters

session the object to be managed

6.585.3.6 void activemq::cmsutil::ResourceLifecycleManager::destroy () throw (cms::CMSEException)

Closes and destroys the contained CMS resources.

Exceptions

cms::CMSEException (p. 960) thrown if an error occurs.

6.585.3.7 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ()

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ResourceLifecycleManager.h**

6.586 activemq::commands::Response Class Reference

```
#include <src/main/activemq/commands/Response.h>
```

Inheritance diagram for activemq::commands::Response:

Public Member Functions

- **Response** ()
- virtual **~Response** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **Response * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual int **getCorrelationId** () const
- virtual void **setCorrelationId** (int correlationId)
- virtual bool **isResponse** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_RESPONSE** = 30

Protected Member Functions

- **Response** (const **Response** &)

Protected Attributes

- int **correlationId**

6.586.1 Constructor & Destructor Documentation

6.586.1.1 **activemq::commands::Response::Response** (const **Response** &)
[inline, protected]

6.586.1.2 **activemq::commands::Response::Response** ()

6.586.1.3 **virtual activemq::commands::Response::~~Response** () [virtual]

6.586.2 Member Function Documentation

6.586.2.1 **virtual Response*** **activemq::commands::Response::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1269), **activemq::commands::DataResponse** (p. 1308), **activemq::commands::ExceptionResponse** (p. 1485), and **activemq::commands::IntegerResponse** (p. 1668).

6.586.2.2 **virtual void activemq::commands::Response::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1269), **activemq::commands::DataResponse** (p. 1308), **activemq::commands::ExceptionResponse** (p. 1485), and **activemq::commands::IntegerResponse** (p. 1668).

6.586.2.3 `virtual bool activemq::commands::Response::equals (const
DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1269), **activemq::commands::DataResponse** (p. 1309), **activemq::commands::ExceptionResponse** (p. 1485), and **activemq::commands::IntegerResponse** (p. 1668).

6.586.2.4 `virtual int activemq::commands::Response::getCorrelationId () const` [virtual]

6.586.2.5 `virtual unsigned char activemq::commands::Response::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1270), **activemq::commands::DataResponse** (p. 1309), **activemq::commands::ExceptionResponse** (p. 1486), and **activemq::commands::IntegerResponse** (p. 1669).

6.586.2.6 `virtual bool activemq::commands::Response::isResponse () const` [inline, virtual]

Returns

an answer of true to the **isResponse()** (p. 2613) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 601).

6.586.2.7 `Response& activemq::commands::Response::operator= (const Response &)` [inline, protected]

6.586.2.8 `virtual void activemq::commands::Response::setCorrelationId (int correlationId)` [virtual]

6.586.2.9 `virtual std::string activemq::commands::Response::toString () const` [virtual]

Returns a string containing the information for this **DataSet** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 1270), **activemq::commands::DataResponse** (p. 1309), **activemq::commands::ExceptionResponse** (p. 1486), and **activemq::commands::IntegerResponse** (p. 1669).

6.586.2.10 `virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.586.3 Field Documentation

6.586.3.1 `int activemq::commands::Response::correlationId` [protected]

6.586.3.2 `const unsigned char activemq::commands::Response::ID_RESPONSE = 30` [static]

The documentation for this class was generated from the following file:

6.587 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

```
#include <src/main/activemq/transport/mock/ResponseBuilder.h>
```

Inheritance diagram for `activemq::transport::mock::ResponseBuilder`:

Public Member Functions

- virtual `~ResponseBuilder()`
- virtual `Pointer< Response > buildResponse (const Pointer< Command > &command)=0`
Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.
- virtual void `buildIncomingCommands (const Pointer< Command > &command, decaf::util::StlQueue< Pointer< Command > > &queue)=0`
*When called the **ResponseBuilder** (p. 2614) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

6.587.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.587.2 Constructor & Destructor Documentation

6.587.2.1 virtual `activemq::transport::mock::ResponseBuilder::~ResponseBuilder ()` [inline, virtual]

6.587.3 Member Function Documentation

6.587.3.1 virtual void `activemq::transport::mock::ResponseBuilder::buildIncomingCommands (const Pointer< Command > & command, decaf::util::StlQueue< Pointer< Command > > & queue)` [pure virtual]

When called the **ResponseBuilder** (p. 2614) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

- command* - The Command being sent to the Broker.
- queue* - Queue of Command sent back from the broker.

Implemented in `activemq::wireformat::openwire::OpenWireResponseBuilder` (p. 2314).

6.587.3.2 virtual **Pointer<Response>** **activemq::transport::mock::ResponseBuilder::buildResponse**
(**const Pointer< Command > & command**) [pure virtual]

Given a **Command**, check if it requires a response and return the appropriate **Response** that the **Broker** would send for this **Command**.

Parameters

command - The command to build a response for

Returns

A **Response** object pointer, or **NULL** if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 2314).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/mock/ResponseBuilder.h`

6.588 activemq::transport::correlator::ResponseCorrelator Class Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

`#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>`

Inheritance diagram for **activemq::transport::correlator::ResponseCorrelator**:

Public Member Functions

- **ResponseCorrelator** (**const Pointer< Transport > &next**)
Constructor.
- virtual **~ResponseCorrelator** ()
- virtual void **oneway** (**const Pointer< Command > &command**) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends a one-way command.
- virtual **Pointer< Response > request** (**const Pointer< Command > &command**) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends the given request to the server and waits for the response.
- virtual **Pointer< Response > request** (**const Pointer< Command > &command**, **unsigned int timeout**) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends the given request to the server and waits for the response.
- virtual void **onCommand** (**const Pointer< Command > &command**)

This is called in the context of the nested transport's reading thread.

- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual void **onTransportException** (Transport *source, const decaf::lang::Exception &ex)
Event handler for an exception from a command transport.

6.588.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests. Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

6.588.2 Constructor & Destructor Documentation

6.588.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (const Pointer< Transport > & next)

Constructor.

Parameters

next the next transport in the chain

6.588.2.2 virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator () [virtual]

6.588.3 Member Function Documentation

6.588.3.1 virtual void activemq::transport::correlator::ResponseCorrelator::close () throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 3075).

6.588.3.2 virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3077).

6.588.3.3 virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 3077).

6.588.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * *source*, const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

source The source of the exception

ex The exception.

6.588.3.5 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

Parameters

command The request to send.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3079).

```
6.588.3.6 virtual Pointer<Response> ac-
    tivemq::transport::correlator::ResponseCorrelator::request
    ( const Pointer< Command > & command, un-
      signed int timeout ) throw ( decaf::io::IOException,
      decaf::lang::exceptions::UnsupportedOperationException ) [virtual]
```

Sends the given request to the server and waits for the response.

Parameters

command The request to send.

timeout The time to wait for a response.

Returns

the response from the server.

Exceptions

IOException if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 3078).

```
6.588.3.7 virtual void activemq::transport::correlator::ResponseCorrelator::start (
    ) throw ( decaf::io::IOException ) [virtual]
```

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 3079).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

6.589 activemq::wireformat::openwire::marshal::v2::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2620).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ResponseMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v2::ResponseMarshaller:

Public Member Functions

- **ResponseMarshaller** ()
- virtual **~ResponseMarshaller** ()

6.589.2.2 `virtual
activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]`

6.589.3 Member Function Documentation

6.589.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1288), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1327), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1488), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1671).

6.589.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1288), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1327), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1488), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1671).

6.589.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1288), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1328), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1488), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1671).

```
6.589.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1289), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1328), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1489), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1672).

```
6.589.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1289), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1328), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1489), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1672).

6.589.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller` (p. 1290), `activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller` (p. 1329), `activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller` (p. 1490), and `activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller` (p. 1673).

```
6.589.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::DataArrayResponseMarshaller** (p. 1290), **activemq::wireformat::openwire::marshal::v2::DataResponseMarshaller** (p. 1329), **activemq::wireformat::openwire::marshal::v2::ExceptionResponseMarshaller** (p. 1490), and **activemq::wireformat::openwire::marshal::v2::IntegerResponseMarshaller** (p. 1673).

The documentation for this class was generated from the following file:

6.590.3 Member Function Documentation

6.590.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1272), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1311), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1496), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1679).

6.590.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1272), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1311), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1496), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1679).

6.590.3.3 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 604).

Reimplemented in **activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller** (p. 1272), **activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller** (p. 1312), **activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller** (p. 1496), and **activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller** (p. 1679).

```

6.590.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1273), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1312), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1497), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1680).

```

6.590.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 606).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1273), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1312), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1497), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1680).

```
6.590.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1274), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1313), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller` (p. 1498), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1681).

```
6.590.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

Reimplemented in `activemq::wireformat::openwire::marshal::v3::DataArrayResponseMarshaller` (p. 1274), `activemq::wireformat::openwire::marshal::v3::DataResponseMarshaller` (p. 1313), `activemq::wireformat::openwire::marshal::v3::ExceptionResponseMarshaller`

(p. 1498), and `activemq::wireformat::openwire::marshal::v3::IntegerResponseMarshaller` (p. 1681).

The documentation for this class was generated from the following file:

6.591.2.2 `virtual
activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]`

6.591.3 Member Function Documentation

6.591.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1284), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1319), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1504), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1687).

6.591.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1284), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1319), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller`

(p. 1504), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1687).

6.591.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1284), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1320), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1504), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1687).

6.591.3.4 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1285), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1320), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1505), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1688).

```
6.591.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 626).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1285), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1320), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1505), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1688).

```
6.591.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1286), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller`

(p. 1321), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1506), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1689).

6.591.3.7 `virtual void activemq::wireformat::openwire::marshal::v5::ResponseMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

Reimplemented in `activemq::wireformat::openwire::marshal::v5::DataArrayResponseMarshaller` (p. 1286), `activemq::wireformat::openwire::marshal::v5::DataResponseMarshaller` (p. 1321), `activemq::wireformat::openwire::marshal::v5::ExceptionResponseMarshaller` (p. 1506), and `activemq::wireformat::openwire::marshal::v5::IntegerResponseMarshaller` (p. 1689).

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1280), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1315), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1492), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1675).

6.592.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1280), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1315), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1492), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1675).

6.592.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1280), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1316), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1492), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1675).

```
6.592.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ResponseMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
dataStructure, decaf::io::DataInputStream * dataIn ) throw (
decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1281), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1316), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1493), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1676).

```
6.592.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]
```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 613).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1281), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1316), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1493), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1676).

6.592.3.6 virtual void `activemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightMarshal2`
 (`OpenWireFormat * wireFormat`, `commands::DataStructure`
 * `dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller` (p. 1282), `activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller` (p. 1317), `activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller` (p. 1494), and `activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller` (p. 1677).

```

6.592.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ResponseMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::DataArrayResponseMarshaller** (p. 1282), **activemq::wireformat::openwire::marshal::v1::DataResponseMarshaller** (p. 1317), **activemq::wireformat::openwire::marshal::v1::ExceptionResponseMarshaller** (p. 1494), and **activemq::wireformat::openwire::marshal::v1::IntegerResponseMarshaller** (p. 1677).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v1/ResponseMarshaller.h`

6.593 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2637).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v4::ResponseMarshaller**:

Public Member Functions

- **ResponseMarshaller** ()
- virtual **~ResponseMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.593.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 2637). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.593.2 Constructor & Destructor Documentation

6.593.2.1 activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::ResponseMarshaller () [inline]

6.593.2.2 virtual
activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::~~ResponseMarshaller () [inline, virtual]

6.593.3 Member Function Documentation

6.593.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1276), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1323), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1500), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1683).

6.593.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1276), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1323), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1500), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1683).

6.593.3.3 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 618).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1276), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1324), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1500), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1683).

6.593.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1277), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1324), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1501), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1684).

6.593.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 620).

Reimplemented in `activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller` (p. 1277), `activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller` (p. 1324), `activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller` (p. 1501), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1684).

6.593.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1278), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1325), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller** (p. 1502), and **activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller** (p. 1685).

6.593.3.7 virtual void activemq::wireformat::openwire::marshal::v4::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

Reimplemented in **activemq::wireformat::openwire::marshal::v4::DataArrayResponseMarshaller** (p. 1278), **activemq::wireformat::openwire::marshal::v4::DataResponseMarshaller** (p. 1325), **activemq::wireformat::openwire::marshal::v4::ExceptionResponseMarshaller**

(p. 1502), and `activemq::wireformat::openwire::marshal::v4::IntegerResponseMarshaller` (p. 1685).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/ResponseMarshaller.h`

6.594 decaf::lang::Runnable Class Reference

Interface for a runnable object - defines a task that can be run by a thread.

```
#include <src/main/decaf/lang/Runnable.h>
```

Inheritance diagram for `decaf::lang::Runnable`:

Public Member Functions

- virtual `~Runnable()`
- virtual void `run()` = 0

Run method - called by the Thread class in the context of the thread.

6.594.1 Detailed Description

Interface for a runnable object - defines a task that can be run by a thread.

6.594.2 Constructor & Destructor Documentation

6.594.2.1 virtual `decaf::lang::Runnable::~~Runnable()` [inline, virtual]

6.594.3 Member Function Documentation

6.594.3.1 virtual void `decaf::lang::Runnable::run()` [pure virtual]

Run method - called by the Thread class in the context of the thread.

Implemented in `activemq::threads::CompositeTaskRunner` (p. 1018), `activemq::threads::DedicatedTaskRunner` (p. 1383), `activemq::transport::inactivity::ReadChecker` (p. 2518), `activemq::transport::inactivity::WriteChecker` (p. 3186), and `activemq::transport::IOTransport` (p. 1714).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Runnable.h`

6.595 decaf::lang::Runtime Class Reference

```
#include <src/main/decaf/lang/Runtime.h>
```

Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual `~Runtime ()`

Static Public Member Functions

- static `Runtime * getRuntime ()`
*Gets the single instance of the Decaf **Runtime** (p. 2643) for this Process.*
- static void `initializeRuntime (int argc, char **argv)`
Initialize the Decaf Library passing it the args that were passed to the application at startup.
- static void `initializeRuntime ()`
Initialize the Decaf Library.
- static void `shutdownRuntime ()`
Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.595.1 Constructor & Destructor Documentation

6.595.1.1 virtual `decaf::lang::Runtime::~~Runtime ()` [inline, virtual]

6.595.2 Member Function Documentation

6.595.2.1 static `Runtime* decaf::lang::Runtime::getRuntime ()` [static]

Gets the single instance of the Decaf **Runtime** (p. 2643) for this Process.

Returns

pointer to the single Decaf **Runtime** (p. 2643) instance that exists for this process

6.595.2.2 static void `decaf::lang::Runtime::initializeRuntime (int argc, char **argv)` [static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters

argc - The number of args passed
argv - Array of char* values passed to the Process on start.

Exceptions

runtime_error if the library is already initialized or an error occurs during initialization.

6.595.2.3 static void decaf::lang::Runtime::initializeRuntime () [static]

Initialize the Decaf Library.

Exceptions

runtime_error if the library is already initialized or an error occurs during initialization.

6.595.2.4 static void decaf::lang::Runtime::shutdownRuntime () [static]

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions

runtime_error if the library has not already been initialized or an error occurs during shutdown.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runtime.h**

6.596 decaf::lang::exceptions::RuntimeException Class Reference

```
#include <src/main/decaf/lang/exceptions/RuntimeException.h>
```

Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()
Default Constructor.
- **RuntimeException** (const **Exception** &ex) throw ()
Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (const **RuntimeException** &ex) throw ()
Copy Constructor.
- **RuntimeException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **RuntimeException** (const std::exception *cause) throw ()
Constructor.

- **RuntimeException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **RuntimeException** * clone () const
Clones this exception.
- virtual ~**RuntimeException** () throw ()

6.596.1 Constructor & Destructor Documentation

6.596.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException () throw () [inline]

Default Constructor.

6.596.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const Exception & ex) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.596.1.3 decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & ex) throw () [inline]

Copy Constructor.

Parameters

ex The **Exception** (p. 1476) whose data is to be copied into this one.

6.596.1.4 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.596.1.5 `decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

***cause* Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.596.1.6 `decaf::lang::exceptions::RuntimeException::RuntimeException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.596.1.7 `virtual decaf::lang::exceptions::RuntimeException::~~RuntimeException () throw () [inline, virtual]`

6.596.2 Member Function Documentation

6.596.2.1 `virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/RuntimeException.h`

6.597 decaf::security_provider::SecurityProvider Class Reference

```
#include <src/main/decaf/security_provider/SecurityProvider.h>
```

Public Member Functions

6.598 decaf::security_provider::SecurityProviderMap Class Reference

Lookup Map for Connector Factories.

```
#include <src/main/decaf/security_provider/SecurityProviderMap.h>
```

Public Member Functions

- void **registerSecurityProvider** (const std::string &name, **SecurityProvider** *provider)
Registers a new provider with this map.
- void **unregisterSecurityProvider** (const std::string &name)
Unregisters a provider from this map.
- **SecurityProvider * lookup** (const std::string &name)
Lookup the named provider in the Map.
- std::size_t **getSecurityProviderNames** (std::vector< std::string > &providers)
Fetch a list of provider names that this Map contains.

Static Public Member Functions

- static **SecurityProviderMap** * **getInstance** ()

Gets a singleton instance of this class.

6.598.1 Detailed Description

Lookup Map for Connector Factories. Use the Connector name to find the associated factory. This class does not take ownership of the stored factories, they must be deallocated somewhere.

6.598.2 Member Function Documentation

- 6.598.2.1** static **SecurityProviderMap*** **decaf::security_provider::SecurityProviderMap::getInstance** ()
[static]

Gets a singleton instance of this class.

Referenced by `decaf::security_provider::SecurityProviderRegistrar::SecurityProviderRegistrar()`, and `decaf::security_provider::SecurityProviderRegistrar::~~SecurityProviderRegistrar()`.

- 6.598.2.2** **std::size_t** **decaf::security_provider::SecurityProviderMap::getSecurityProviderNames** (**std::vector**< **std::string** > & *providers*)

Fetch a list of provider names that this Map contains.

Parameters

providers A vector object to receive the list

Returns

count of providers.

- 6.598.2.3** **SecurityProvider*** **decaf::security_provider::SecurityProviderMap::lookup** (const **std::string** & *name*)

Lookup the named provider in the Map.

Parameters

name the provider name to lookup

Returns

the provider associated with the name, or NULL

6.598.2.4 void decaf::security_provider::SecurityProviderMap::registerSecurityProvider (const std::string & *name*, SecurityProvider * *provider*)

Registers a new provider with this map.

Parameters

name A name to associate the provider with
provider the provider object to store in the map.

6.598.2.5 void decaf::security_provider::SecurityProviderMap::unregisterSecurityProvider (const std::string & *name*)

Unregisters a provider from this map.

Parameters

name the name of the provider to remove

The documentation for this class was generated from the following file:

- src/main/decaf/security_provider/SecurityProviderMap.h

6.599 decaf::security_provider::SecurityProviderRegistrar Class Reference

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

```
#include <src/main/decaf/security_provider/SecurityProviderRegistrar.h>
```

Public Member Functions

- **SecurityProviderRegistrar** (const std::string &name, SecurityProvider *provider, bool manageLifetime=true)
Creates a registrar and registers the provider with the provider map.
- virtual ~**SecurityProviderRegistrar** ()
*Unregisters the provider from the provider map and destroys it if *manageLifetime* is set.*
- virtual SecurityProvider * **getProvider** ()
get a reference to the factory that this class is holding

6.599.1 Detailed Description

Registers the passed in provider into the provider map, this class can manage the lifetime of the registered provider (default behaviour).

6.599.2 Constructor & Destructor Documentation

6.599.2.1 `decaf::security_ - provider::SecurityProviderRegistrar::SecurityProviderRegistrar (const std::string & name, SecurityProvider * provider, bool manageLifetime = true) [inline]`

Creates a registrar and registers the provider with the provider map.

Parameters

name name of the provider to register

provider the provider object

manageLifetime boolean indicating if this object manages the lifetime of the factory that is being registered.

References `decaf::security_provider::SecurityProviderMap::getInstance()`.

6.599.2.2 `virtual decaf::security_ - provider::SecurityProviderRegistrar::~~SecurityProviderRegistrar () [inline, virtual]`

Unregisters the provider from the provider map and destroys it if `manageLifetime` is set.

References `decaf::security_provider::SecurityProviderMap::getInstance()`.

6.599.3 Member Function Documentation

6.599.3.1 `virtual SecurityProvider* decaf::security_ - provider::SecurityProviderRegistrar::getProvider () [inline, virtual]`

get a reference to the factory that this class is holding

Returns

reference to a factory class

The documentation for this class was generated from the following file:

6.600 decaf::util::concurrent::Semaphore Class Reference

A counting semaphore.

```
#include <src/main/decaf/util/concurrent/Semaphore.h>
```

Public Member Functions

- `Semaphore (int permits)`

Creates a **Semaphore** (p. 2651) with the given number of permits and nonfair fairness setting.

- **Semaphore** (int permits, bool fair)
Creates a **Semaphore** (p. 2651) with the given number of permits and the given fairness setting.
- virtual **~Semaphore** ()
- void **acquire** () throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.
- void **acquireUninterruptibly** () throw (decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, blocking until one is available.
- bool **tryAcquire** () throw (decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, only if one is available at the time of invocation.
- bool **tryAcquire** (long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::RuntimeException)
Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.
- void **release** () throw (decaf::lang::exceptions::RuntimeException)
Releases a permit, returning it to the semaphore.
- void **acquire** (int permits) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.
- void **acquireUninterruptibly** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, blocking until all are available.
- bool **tryAcquire** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.
- bool **tryAcquire** (int permits, long long timeout, const **TimeUnit** &unit) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.
- void **release** (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)
Releases the given number of permits, returning them to the semaphore.
- int **availablePermits** () const

Returns the current number of permits available in this semaphore.

- `int drainPermits () throw (decaf::lang::exceptions::RuntimeException)`

Acquires and returns all permits that are immediately available.

- `bool isFair () const`
- `std::string toString () const`

Returns a string identifying this semaphore, as well as its state.

6.600.1 Detailed Description

A counting semaphore. Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 2654) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 2657) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 2651) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

```
class Pool { private:
static const int MAX_AVAILABLE = 100; Semaphore (p. 2651) available;
std::vector<std::string> items; std::vector<bool> used;
Mutex (p. 2239) lock;
public:
Pool() : available( MAX_AVAILABLE, true ) { used.resize( MAX_AVAILABLE ); items.resize(
MAX_AVAILABLE ); }
std::string getItem() throws InterruptedException { available.acquire(); return getNextAvail-
ableItem(); }
void putItem( std::string x ) { if( markAsUnused(x) ) { available.release(); } }
std::string getNextAvailableItem() {
synchronized( &lock ) (p. 3620) { for( int i = 0; i < MAX_AVAILABLE; ++i ) { if( !used[i] )
{ used[i] = true; return items[i]; } }
return std::string(); // not reached }
bool markAsUnused( const std::string& item ) { synchronized( &lock ) (p. 3620) { for( int i =
0; i < MAX_AVAILABLE; ++i ) { if( item == items[i] ) { if( used[i] ) { used[i] = false; return
true; } else return false; } } } return false; } };
```

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 2654) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this

way, the binary semaphore has the property (unlike many **Lock** (p. 1903) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 2654) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

Since

1.0

6.600.2 Constructor & Destructor Documentation

6.600.2.1 decaf::util::concurrent::Semaphore::Semaphore (int *permits*)

Creates a **Semaphore** (p. 2651) with the given number of permits and nonfair fairness setting.

Parameters

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

6.600.2.2 decaf::util::concurrent::Semaphore::Semaphore (int *permits*, bool *fair*)

Creates a **Semaphore** (p. 2651) with the given number of permits and the given fairness setting.

Parameters

permits the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

fair true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.600.2.3 `virtual decaf::util::concurrent::Semaphore::~~Semaphore () [virtual]`

6.600.3 Member Function Documentation

6.600.3.1 `void decaf::util::concurrent::Semaphore::acquire ()
throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::RuntimeException)`

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes the **release()** (p.2657) method for this semaphore and the current thread is next to be assigned a permit; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared.

Exceptions

InterruptedException - if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.2 `void decaf::util::concurrent::Semaphore::acquire (int permits
) throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::RuntimeException)`

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting for a permit,

then `InterruptedException` is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 2657).

Parameters

permits the number of permits to acquire.

Exceptions

InterruptedException if the current thread is interrupted.

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly () throw (decaf::lang::exceptions::RuntimeException)

Acquires a permit from this semaphore, blocking until one is available.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 2657) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int *permits*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, blocking until all are available.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters

permits the number of permits to acquire.

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.5 `int decaf::util::concurrent::Semaphore::availablePermits () const`

Returns the current number of permits available in this semaphore.

This method is typically used for debugging and testing purposes.

Returns

the number of permits available in this semaphore

6.600.3.6 `int decaf::util::concurrent::Semaphore::drainPermits () throw (decaf::lang::exceptions::RuntimeException)`

Acquires and returns all permits that are immediately available.

Returns

the number of permits acquired

Exceptions

RuntimeException if an unexpected error occurs while draining the **Semaphore** (p. 2651).

6.600.3.7 `bool decaf::util::concurrent::Semaphore::isFair () const`**Returns**

true if this semaphore has fairness set true

6.600.3.8 `void decaf::util::concurrent::Semaphore::release () throw (decaf::lang::exceptions::RuntimeException)`

Releases a permit, returning it to the semaphore.

Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 2654). Correct usage of a semaphore is established by programming convention in the application.

Exceptions

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2651).

6.600.3.9 `void decaf::util::concurrent::Semaphore::release (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)`

Releases the given number of permits, returning them to the semaphore.

Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters

permits the number of permits to release

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while releasing the **Semaphore** (p. 2651).

6.600.3.10 std::string decaf::util::concurrent::Semaphore::toString () const

Returns a string identifying this semaphore, as well as its state.

The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns

a string identifying this semaphore, as well as its state

6.600.3.11 bool decaf::util::concurrent::Semaphore::tryAcquire (int permits, long long timeout, const TimeUnit & unit) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

* Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or * Some other thread interrupts the current thread; or * The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

* has its interrupted status set on entry to this method; or * is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2657).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread,

are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 2657).

Parameters

permits the number of permits to acquire
timeout the maximum amount of time to wait to acquire the permits.
unit the units that the timeout param represents.

Returns

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions

IllegalArgumentException if the permits argument is negative.
RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.12 `bool decaf::util::concurrent::Semaphore::tryAcquire
 (long long timeout, const TimeUnit & unit)
 throw (decaf::lang::exceptions::InterruptedException,
 decaf::lang::exceptions::RuntimeException)`

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- * Some other thread invokes the **release()** (p. 2657) method for this semaphore and the current thread is next to be assigned a permit; or
- * Some other thread interrupts the current thread; or
- * The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

- * has its interrupted status set on entry to this method; or
- * is interrupted while waiting to acquire a permit,

then **InterruptedException** is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

timeout the maximum time to wait for a permit
unit the time unit of the timeout argument

Returns

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions

InterruptedException if the current thread is interrupted.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.13 `bool decaf::util::concurrent::Semaphore::tryAcquire () throw (decaf::lang::exceptions::RuntimeException)`

Acquires a permit from this semaphore, only if one is available at the time of invocation.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 2659) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use **tryAcquire(0, TimeUnit.SECONDS)** (p. 3014) which is almost equivalent (it also detects interruption).

Returns

true if a permit was acquired and false otherwise

Exceptions

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.600.3.14 `bool decaf::util::concurrent::Semaphore::tryAcquire (int permits) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::RuntimeException)`

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire** will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use **tryAcquire(permits, 0, TimeUnit.SECONDS)** (p. 3014) which is almost equivalent (it also detects interruption).

Parameters

permits the number of permits to acquire

Returns

true if the permits were acquired and false otherwise.

Exceptions

IllegalArgumentException if the permits argument is negative.

RuntimeException if an unexpected error occurs while acquiring the **Semaphore** (p. 2651).

6.601 activemq::cmsutil::CmsTemplate::SendExecutor Class Reference

```
#include <src/main/activemq/cmsutil/CmsTemplate.h>
```

Inheritance diagram for `activemq::cmsutil::CmsTemplate::SendExecutor`:

Public Member Functions

- **SendExecutor** (**MessageCreator** *messageCreator, **CmsTemplate** *parent)
- virtual **~SendExecutor** ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer) throw (**cms::CMSEException**)

Execute an action given a session and producer.

6.601.1 Constructor & Destructor Documentation

6.601.1.1 `activemq::cmsutil::CmsTemplate::SendExecutor::SendExecutor (MessageCreator * messageCreator, CmsTemplate * parent) [inline]`

6.601.1.2 `virtual activemq::cmsutil::CmsTemplate::SendExecutor::~~SendExecutor () [inline, virtual]`

6.601.2 Member Function Documentation

6.601.2.1 `virtual void activemq::cmsutil::CmsTemplate::SendExecutor::doInCms (cms::Session * session, cms::MessageProducer * producer) throw (cms::CMSEException) [inline, virtual]`

Execute an action given a session and producer.

Parameters

session the CMS Session

producer the CMS Producer

Exceptions

cms::CMSEException (p. 960) if thrown by CMS API methods

Implements **activemq::cmsutil::ProducerCallback** (p. 2444).

6.602 decaf::net::ServerSocket Class Reference

A server socket class (for testing purposes).

```
#include <src/main/decaf/net/ServerSocket.h>
```

Public Types

- `typedef apr_socket_t * SocketHandle`
- `typedef apr_sockaddr_t * SocketAddress`

Public Member Functions

- **ServerSocket** ()
Constructor.
- virtual **~ServerSocket** ()
Destructor.
- virtual void **bind** (const char *host, int port) throw (SocketException)
Bind and listen to given IP/dns and port.
- virtual void **bind** (const char *host, int port, int backlog) throw (SocketException)
Bind and listen to given IP/dns and port.
- virtual **Socket** * **accept** () throw (SocketException)
Blocks until a client connects to the bound socket.
- virtual void **close** () throw (lang::Exception)
Closes the server socket.
- virtual bool **isBound** () const

6.602.1 Detailed Description

A server socket class (for testing purposes).

6.602.2 Member Typedef Documentation

6.602.2.1 `typedef apr_socket_t* decaf::net::ServerSocket::SocketAddress`

6.602.2.2 `typedef apr_socket_t* decaf::net::ServerSocket::SocketHandle`

6.602.3 Constructor & Destructor Documentation

6.602.3.1 `decaf::net::ServerSocket::ServerSocket ()`

Constructor.

Creates a non-bound server socket.

6.602.3.2 `virtual decaf::net::ServerSocket::~ServerSocket () [virtual]`

Destructor.

Releases socket handle if `close()` (p. 2663) hasn't been called.

6.602.4 Member Function Documentation

6.602.4.1 `virtual Socket* decaf::net::ServerSocket::accept () throw (SocketException) [virtual]`

Blocks until a client connects to the bound socket.

Returns

new socket. Never returns NULL.

6.602.4.2 `virtual void decaf::net::ServerSocket::bind (const char * host, int port, int backlog) throw (SocketException) [virtual]`

Bind and listen to given IP/dns and port.

Parameters

host IP address or host name.

port TCP port between 1..65535

backlog Size of listen backlog.

6.602.4.3 `virtual void decaf::net::ServerSocket::bind (const char * host, int port) throw (SocketException) [virtual]`

Bind and listen to given IP/dns and port.

Parameters

host IP address or host name.

port TCP port between 1..65535

6.602.4.4 `virtual void decaf::net::ServerSocket::close () throw (lang::Exception) [virtual]`

Closes the server socket.

6.602.4.5 `virtual bool decaf::net::ServerSocket::isBound () const [virtual]`

Returns

true of the server socket is bound.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/ServerSocket.h`

6.603 cms::Session Class Reference

A **Session** (p.2663) object is a single-threaded context for producing and consuming messages.

```
#include <src/main/cms/Session.h>
```

Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_-**
ACKNOWLEDGE, **SESSION_TRANSACTIONED**,
INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual **~Session** ()
- virtual void **close** ()=0 throw (CMSEException)
Closes this session as well as any active child consumers or producers.
- virtual void **commit** ()=0 throw (CMSEException)
Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()=0 throw (CMSEException)
Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()=0 throw (CMSEException)
Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination)=0 throw (CMSEException)

*Creates a **MessageConsumer** (p. 2080) for the specified destination.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector)=0 throw (CMSEException)

*Creates a **MessageConsumer** (p. 2080) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createConsumer** (const **Destination** *destination, const std::string &selector, bool noLocal)=0 throw (CMSEException)

*Creates a **MessageConsumer** (p. 2080) for the specified destination, using a message selector.*

- virtual **MessageConsumer** * **createDurableConsumer** (const **Topic** *destination, const std::string &name, const std::string &selector, bool noLocal=false)=0 throw (CMSEException)

*Creates a durable subscriber to the specified topic, using a **Message** (p. 2036) selector.*

- virtual **MessageProducer** * **createProducer** (const **Destination** *destination)=0 throw (CMSEException)

*Creates a **MessageProducer** (p. 2189) to send messages to the specified destination.*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue)=0 throw (CMSEException)

*Creates a new **QueueBrowser** (p. 2511) to peek at Messages on the given **Queue** (p. 2510).*

- virtual **QueueBrowser** * **createBrowser** (const **cms::Queue** *queue, const std::string &selector)=0 throw (CMSEException)

*Creates a new **QueueBrowser** (p. 2511) to peek at Messages on the given **Queue** (p. 2510).*

- virtual **Queue** * **createQueue** (const std::string &queueName)=0 throw (CMSEException)

*Creates a queue identity given a **Queue** (p. 2510) name.*

- virtual **Topic** * **createTopic** (const std::string &topicName)=0 throw (CMSEException)

*Creates a topic identity given a **Queue** (p. 2510) name.*

- virtual **TemporaryQueue** * **createTemporaryQueue** ()=0 throw (CMSEException)

*Creates a **TemporaryQueue** (p. 2971) object.*

- virtual **TemporaryTopic** * **createTemporaryTopic** ()=0 throw (CMSEException)

*Creates a **TemporaryTopic** (p. 2973) object.*

- virtual **Message** * **createMessage** ()=0 throw (CMSEException)

*Creates a new **Message** (p. 2036).*

- virtual **BytesMessage** * **createBytesMessage** ()=0 throw (CMSEException)

*Creates a **BytesMessage** (p. 874).*

- virtual **BytesMessage** * **createBytesMessage** (const unsigned char *bytes, std::size_t bytesize)=0 throw (CMSEException)

*Creates a **BytesMessage** (p. 874) and sets the payload to the passed value.*

- virtual **StreamMessage** * **createStreamMessage** ()=0 throw (CMSEException)

*Creates a new **StreamMessage** (p. 2892).*

- virtual **TextMessage** * **createTextMessage** ()=0 throw (CMSEException)
*Creates a new **TextMessage** (p. 2974).*
- virtual **TextMessage** * **createTextMessage** (const std::string &text)=0 throw (CMSEException)
*Creates a new **TextMessage** (p. 2974) and set the text to the value given.*
- virtual **MapMessage** * **createMapMessage** ()=0 throw (CMSEException)
*Creates a new **MapMessage** (p. 1982).*
- virtual **AcknowledgeMode** **getAcknowledgeMode** () const =0 throw (CMSEException)
Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () const =0 throw (CMSEException)
*Gets if the Sessions is a Transacted **Session** (p. 2663).*
- virtual void **unsubscribe** (const std::string &name)=0 throw (CMSEException)
Unsubscribes a durable subscription that has been created by a client.

6.603.1 Detailed Description

A **Session** (p.2663) object is a single-threaded context for producing and consuming messages. A session serves several purposes:

- It is a factory for its message producers and consumers.
- It supplies provider-optimized message factories.
- It is a factory for **TemporaryTopics** and **TemporaryQueues**.
- It provides a way to create **Queue** (p. 2510) or **Topic** (p. 3014) objects for those clients that need to dynamically manipulate provider-specific destination names.
- It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
- It defines a serial order for the messages it consumes and the messages it produces.
- It retains messages it consumes until they have been acknowledged.
- It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 2080) until a message arrives. The thread may then use one or more of the Session's **MessageProducers**.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's **close** method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
- The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
- Closing a transacted session must roll back the transaction in progress.
- The close method is the only **Session** (p. 2663) method that can be called concurrently.
- Invoking any other **Session** (p. 2663) method on a closed session must throw an **IllegalStateException** (p. 1621). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 2663) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 2663) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 2663). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 2189) this implies that all messages sent by the producer are not sent to the Provider unit the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 2080) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 2036) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 2036).

Since

1.0

6.603.2 Member Enumeration Documentation

6.603.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 2036) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.603.3 Constructor & Destructor Documentation

6.603.3.1 virtual cms::Session::~~Session () [inline, virtual]

6.603.4 Member Function Documentation

6.603.4.1 virtual void cms::Session::close () throw (CMSEException) [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implements cms::Closeable (p. 952).

Implemented in activemq::cmsutil::PooledSession (p. 2354).

6.603.4.2 virtual void cms::Session::commit () throw (CMSEException) [pure virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

IllegalStateException (p. 1621) - if the method is not called by a transacted session.

Implemented in activemq::cmsutil::PooledSession (p. 2354).

Referenced by activemq::cmsutil::PooledSession::commit().

6.603.4.3 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*) throw (CMSEException) [pure virtual]

Creates a new QueueBrowser (p. 2511) to peek at Messages on the given Queue (p. 2510).

Parameters

queue the Queue (p. 2510) to browse

Returns

New QueueBrowser (p. 2511) that is owned by the caller.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if the destination given is invalid.

Implemented in activemq::cmsutil::PooledSession (p. 2354).

6.603.4.4 `virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * queue, const std::string & selector) throw (CMSException) [pure virtual]`

Creates a new **QueueBrowser** (p. 2511) to peek at Messages on the given **Queue** (p. 2510).

Parameters

queue the **Queue** (p. 2510) to browse

selector the **Message** (p. 2036) selector to filter which messages are browsed.

Returns

New **QueueBrowser** (p. 2511) that is owned by the caller.

Exceptions

CMSException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if the destination given is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2355).

6.603.4.5 `virtual BytesMessage* cms::Session::createBytesMessage () throw (CMSException) [pure virtual]`

Creates a **BytesMessage** (p. 874).

Exceptions

CMSException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2355).

Referenced by **activemq::cmsutil::PooledSession::createBytesMessage()**.

6.603.4.6 `virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * bytes, std::size_t bytesSize) throw (CMSException) [pure virtual]`

Creates a **BytesMessage** (p. 874) and sets the payload to the passed value.

Parameters

bytes an array of bytes to set in the message

bytesSize the size of the bytes array, or number of bytes to use

Exceptions

CMSException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2355).

6.603.4.7 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination) throw (CMSEException) [pure virtual]`

Creates a **MessageConsumer** (p. 2080) for the specified destination.

Parameters

destination the **Destination** (p. 1387) that this consumer receiving messages for.

Returns

pointer to a new **MessageConsumer** (p. 2080) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2358).

Referenced by **activemq::cmsutil::PooledSession::createConsumer()**.

6.603.4.8 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination, const std::string & selector) throw (CMSEException) [pure virtual]`

Creates a **MessageConsumer** (p. 2080) for the specified destination, using a message selector.

Parameters

destination the **Destination** (p. 1387) that this consumer receiving messages for.

selector the **Message** (p. 2036) Selector to use

Returns

pointer to a new **MessageConsumer** (p. 2080) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if an invalid destination is specified.

InvalidSelectorException (p. 1703) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2357).

6.603.4.9 `virtual MessageConsumer* cms::Session::createConsumer (const Destination * destination, const std::string & selector, bool noLocal) throw (CMSEException) [pure virtual]`

Creates a **MessageConsumer** (p. 2080) for the specified destination, using a message selector.

Parameters

destination the **Destination** (p. 1387) that this consumer receiving messages for.

selector the **Message** (p. 2036) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new **MessageConsumer** (p. 2080) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if an invalid destination is specified.

InvalidSelectorException (p. 1703) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2357).

```
6.603.4.10 virtual MessageConsumer* cms::Session::createDurableConsumer (
    const Topic * destination, const std::string & name, const std::string
    & selector, bool noLocal = false ) throw ( CMSEException ) [pure
    virtual]
```

Creates a durable subscriber to the specified topic, using a **Message** (p. 2036) selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination the topic to subscribe to

name The name used to identify the subscription

selector the **Message** (p. 2036) Selector to use

noLocal if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable **MessageConsumer** (p. 2080) that is owned by the caller (caller deletes)

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if an invalid destination is specified.

InvalidSelectorException (p. 1703) - if the message selector is invalid.

Implemented in **activemq::cmsutil::PooledSession** (p. 2358).

Referenced by **activemq::cmsutil::PooledSession::createDurableConsumer()**.

6.603.4.11 `virtual MapMessage* cms::Session::createMapMessage () throw (CMSEException) [pure virtual]`

Creates a new **MapMessage** (p. 1982).

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2359).

Referenced by **activemq::cmsutil::PooledSession::createMapMessage()**.

6.603.4.12 `virtual Message* cms::Session::createMessage () throw (CMSEException) [pure virtual]`

Creates a new **Message** (p. 2036).

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2359).

Referenced by **activemq::cmsutil::PooledSession::createMessage()**.

6.603.4.13 `virtual MessageProducer* cms::Session::createProducer (const Destination * destination) throw (CMSEException) [pure virtual]`

Creates a **MessageProducer** (p. 2189) to send messages to the specified destination.

Parameters

destination the **Destination** (p. 1387) to send on

Returns

New **MessageProducer** (p. 2189) that is owned by the caller.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

InvalidDestinationException (p. 1697) - if an invalid destination is specified.

Implemented in **activemq::cmsutil::PooledSession** (p. 2359).

Referenced by **activemq::cmsutil::PooledSession::createProducer()**.

6.603.4.14 `virtual Queue* cms::Session::createQueue (const std::string & queueName) throw (CMSEException) [pure virtual]`

Creates a queue identity given a **Queue** (p. 2510) name.

Parameters

queueName the name of the new **Queue** (p. 2510)

Returns

new **Queue** (p. 2510) pointer that is owned by the caller.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2359).

Referenced by **activemq::cmsutil::PooledSession::createQueue()**.

6.603.4.15 `virtual StreamMessage* cms::Session::createStreamMessage () throw (CMSEException) [pure virtual]`

Creates a new **StreamMessage** (p. 2892).

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2360).

Referenced by **activemq::cmsutil::PooledSession::createStreamMessage()**.

6.603.4.16 `virtual TemporaryQueue* cms::Session::createTemporaryQueue () throw (CMSEException) [pure virtual]`

Creates a **TemporaryQueue** (p. 2971) object.

Returns

new **TemporaryQueue** (p. 2971) pointer that is owned by the caller.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2360).

Referenced by **activemq::cmsutil::PooledSession::createTemporaryQueue()**.

6.603.4.17 `virtual TemporaryTopic* cms::Session::createTemporaryTopic () throw (CMSEException) [pure virtual]`

Creates a **TemporaryTopic** (p. 2973) object.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2360).

Referenced by **activemq::cmsutil::PooledSession::createTemporaryTopic()**.

6.603.4.18 `virtual TextMessage* cms::Session::createTextMessage (const std::string & text) throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 2974) and set the text to the value given.

Parameters

text the initial text for the message

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2361).

6.603.4.19 `virtual TextMessage* cms::Session::createTextMessage () throw (CMSEException) [pure virtual]`

Creates a new **TextMessage** (p. 2974).

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2361).

Referenced by **activemq::cmsutil::PooledSession::createTextMessage()**.

6.603.4.20 `virtual Topic* cms::Session::createTopic (const std::string & topicName) throw (CMSEException) [pure virtual]`

Creates a topic identity given a **Queue** (p. 2510) name.

Parameters

topicName the name of the new **Topic** (p. 3014)

Returns

new **Topic** (p. 3014) pointer that is owned by the caller.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2361).

Referenced by **activemq::cmsutil::PooledSession::createTopic()**.

6.603.4.21 `virtual AcknowledgeMode cms::Session::getAcknowledgeMode () const throw (CMSEException) [pure virtual]`

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2362).

Referenced by **activemq::cmsutil::PooledSession::getAcknowledgeMode()**.

6.603.4.22 **virtual bool cms::Session::isTransacted () const throw (CMSEException)** [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 2663).

Returns

transacted true - false.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2362).

Referenced by **activemq::cmsutil::PooledSession::isTransacted()**.

6.603.4.23 **virtual void cms::Session::recover () throw (CMSEException)** [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
- Mark all messages that might have been delivered but not acknowledged as "redelivered"
- Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSEException (p. 960) - if the CMS provider fails to stop and restart message delivery due to some internal error.

IllegalStateException (p. 1621) - if the method is called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2363).

Referenced by **activemq::cmsutil::PooledSession::recover()**.

6.603.4.24 `virtual void cms::Session::rollback () throw (CMSEException)` [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSEException (p. 960) - If an internal error occurs.

IllegalStateException (p. 1621) - if the method is not called by a transacted session.

Implemented in **activemq::cmsutil::PooledSession** (p. 2363).

Referenced by **activemq::cmsutil::PooledSession::rollback()**.

6.603.4.25 `virtual void cms::Session::unsubscribe (const std::string & name) throw (CMSEException)` [pure virtual]

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 2080) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name The name used to identify this subscription

Exceptions

CMSEException (p. 960) - If an internal error occurs.

Implemented in **activemq::cmsutil::PooledSession** (p. 2363).

Referenced by **activemq::cmsutil::PooledSession::unsubscribe()**.

The documentation for this class was generated from the following file:

6.604 activemq::cmsutil::SessionCallback Class Reference

Callback for executing any number of operations on a provided CMS Session.

```
#include <src/main/activemq/cmsutil/SessionCallback.h>
```

Inheritance diagram for **activemq::cmsutil::SessionCallback**:

Public Member Functions

- `virtual ~SessionCallback ()`
- `virtual void doInCms (cms::Session *session)=0 throw (cms::CMSEException)`

Execute any number of operations against the supplied CMS session.

6.604.1 Detailed Description

Callback for executing any number of operations on a provided CMS Session.

6.604.2 Constructor & Destructor Documentation

6.604.2.1 `virtual activemq::cmsutil::SessionCallback::~SessionCallback ()`
[inline, virtual]

6.604.3 Member Function Documentation

6.604.3.1 `virtual void activemq::cmsutil::SessionCallback::doInCms (cms::Session * session) throw (cms::CMSException)` [pure virtual]

Execute any number of operations against the supplied CMS session.

Parameters

session the CMS Session

Exceptions

cms::CMSException (p. 960) if thrown by CMS API methods

Implemented in `activemq::cmsutil::CmsTemplate::ProducerExecutor` (p. 2445), and `activemq::cmsutil::CmsTemplate::ReceiveExecutor` (p. 2525).

The documentation for this class was generated from the following file:

- `src/main/activemq/cmsutil/SessionCallback.h`

```
#include <src/main/activemq/commands/SessionId.h>
```

Inheritance diagram for `activemq::commands::SessionId`:

Public Types

- `typedef decaf::lang::PointerComparator< SessionId > COMPARATOR`

Public Member Functions

- `SessionId ()`
- `SessionId (const SessionId &other)`
- `SessionId (const ConnectionId *connectionId, long long sessionId)`
- `SessionId (const ProducerId *producerId)`
- `SessionId (const ConsumerId *consumerId)`
- `virtual ~SessionId ()`

- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **SessionId** * **cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- const **Pointer**< **ConnectionId** > & **getParentId** () const
- virtual const std::string & **getConnectionId** () const

consumerId)`

6.605.2.6 `virtual activemq::commands::SessionId::~~SessionId () [virtual]`

6.605.3 Member Function Documentation

6.605.3.1 `virtual SessionId* activemq::commands::SessionId::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.605.3.2 `virtual int activemq::commands::SessionId::compareTo (const SessionId
& value) const [virtual]`

6.605.3.3 `virtual void activemq::commands::SessionId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.605.3.4 `virtual bool activemq::commands::SessionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.605.3.5 `virtual bool activemq::commands::SessionId::equals (const SessionId & value) const` [virtual]

6.605.3.6 `virtual std::string& activemq::commands::SessionId::getConnectionId ()` [virtual]

6.605.3.7 `virtual const std::string& activemq::commands::SessionId::getConnectionId () const` [virtual]

Referenced by `activemq::commands::ConsumerId::ConsumerId()`, and `activemq::commands::ProducerId::ProducerId()`.

6.605.3.8 `virtual unsigned char activemq::commands::SessionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

6.605.3.9 `const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId () const`

6.605.3.10 `virtual long long activemq::commands::SessionId::getValue () const` [virtual]

Referenced by `activemq::commands::ConsumerId::ConsumerId()`, and `activemq::commands::ProducerId::ProducerId()`.

- 6.605.3.11 `virtual bool activemq::commands::SessionId::operator< (const SessionId & value) const` [virtual]
- 6.605.3.12 `SessionId& activemq::commands::SessionId::operator= (const SessionId & other)`
- 6.605.3.13 `virtual bool activemq::commands::SessionId::operator== (const SessionId & value) const` [virtual]
- 6.605.3.14 `virtual void activemq::commands::SessionId::setConnectionId (const std::string & connectionId)` [virtual]
- 6.605.3.15 `virtual void activemq::commands::SessionId::setValue (long long value)` [virtual]
- 6.605.3.16 `virtual std::string activemq::commands::SessionId::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

6.605.4 Field Documentation

- 6.605.4.1 `std::string activemq::commands::SessionId::connectionId` [protected]
- 6.605.4.2 `const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121` [static]

Referenced by `activemq::state::CommandVisitorAdapter::processRemoveInfo()`.

- 6.605.4.3 `long long activemq::commands::SessionId::value` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionId.h`

6.606 `activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller` Class Reference

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2681).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/SessionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller`:

Public Member Functions

- **SessionIdMarshaller** ()
- virtual **~SessionIdMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaler.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.606.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2681). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.606.2 Constructor & Destructor Documentation

6.606.2.1 `activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::SessionIdMarshaller () [inline]`

6.606.2.2 `virtual activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]`

6.606.3 Member Function Documentation

6.606.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.606.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.606.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.606.3.4 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.606.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.606.3.6 virtual void activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.606.3.7 virtual void **activemq::wireformat::openwire::marshal::v5::SessionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.607.3 Member Function Documentation

6.607.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.607.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.607.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.607.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.607.3.5 virtual int activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.607.3.6 virtual void activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.607.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::SessionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.608.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2689). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.608.2 Constructor & Destructor Documentation

6.608.2.1 `activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::SessionIdMarshaller () [inline]`

6.608.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]`

6.608.3 Member Function Documentation

6.608.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.608.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.608.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.608.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.608.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.608.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.608.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::SessionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.609.3 Member Function Documentation

6.609.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.609.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.609.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.609.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.609.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.609.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.609.3.7 virtual void **activemq::wireformat::openwire::marshal::v4::SessionIdMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.610.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 2697). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.610.2 Constructor & Destructor Documentation

6.610.2.1 `activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::SessionIdMarshaller () [inline]`

6.610.2.2 `virtual activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::~~SessionIdMarshaller () [inline, virtual]`

6.610.3 Member Function Documentation

6.610.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.610.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.610.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.610.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.610.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.610.3.6 virtual void activemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.610.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::SessionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/SessionIdMarshaller.h

6.611 activemq::commands::SessionInfo Class Reference

```
#include <src/main/activemq/commands/SessionInfo.h>
```

Inheritance diagram for **activemq::commands::SessionInfo**:

Public Member Functions

- **SessionInfo** ()
- virtual **~SessionInfo** ()
- virtual unsigned char **getDataStructureType** () const

Get the unique identifier that this object and its own Marshaler share.

- virtual **SessionInfo** * **cloneDataStructure** () const

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (const **DataStructure** *src)

Copy the contents of the passed object into this object's members, overwriting any existing data.

- virtual std::string **toString** () const

*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*

- virtual bool **equals** (const **DataStructure** *value) const

*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*

- unsigned int **getAckMode** () const

- void **setAckMode** (unsigned int mode)

- virtual const **Pointer**< **SessionId** > & **getSessionId** () const

- virtual **Pointer**< **SessionId** > & **getSessionId** ()

- virtual void **setSessionId** (const **Pointer**< **SessionId** > &sessionId)

- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_SESSIONINFO** = 4

Protected Member Functions

- **SessionInfo** (const **SessionInfo** &)
- **SessionInfo** & **operator=** (const **SessionInfo** &)

Protected Attributes

- **Pointer**< **SessionId** > **sessionId**

6.611.1 Constructor & Destructor Documentation

6.611.1.1 `activemq::commands::SessionInfo::SessionInfo (const SessionInfo &)`
[inline, protected]

6.611.1.2 `activemq::commands::SessionInfo::SessionInfo ()`

6.611.1.3 `virtual activemq::commands::SessionInfo::~~SessionInfo ()` [virtual]

6.611.2 Member Function Documentation

6.611.2.1 `virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure ()`
`const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.611.2.2 `virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.611.2.3 `virtual bool activemq::commands::SessionInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.611.2.4 `unsigned int activemq::commands::SessionInfo::getAckMode () const`
[inline]

6.611.2.5 `virtual unsigned char activemq::commands::SessionInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.611.2.6 `virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId () const`
[virtual]

6.611.2.7 `virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ()`
[virtual]

6.611.2.8 `SessionInfo& activemq::commands::SessionInfo::operator= (const SessionInfo &)` [inline, protected]

6.611.2.9 `void activemq::commands::SessionInfo::setAckMode (unsigned int mode)` [inline]

6.611.2.10 `virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & sessionId)` [virtual]

6.611.2.11 `virtual std::string activemq::commands::SessionInfo::toString () const`
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.611.2.12 `virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.611.3 Field Documentation

6.611.3.1 `const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4` [static]

6.611.3.2 `Pointer<SessionId> activemq::commands::SessionInfo::sessionId` [protected]

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/SessionInfo.h`

6.612 **activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2705).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/SessionInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller**:

Public Member Functions

- **SessionInfoMarshaller** ()
- virtual **~SessionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.612.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p.2705). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.612.2 Constructor & Destructor Documentation

6.612.2.1 **activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::SessionInfoMarshaller**
() [inline]

6.612.2.2 **virtual**
activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::~~SessionInfoMarshaller
() [inline, virtual]

6.612.3 Member Function Documentation

6.612.3.1 **virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::createObject**
() const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.612.3.2 **virtual unsigned char activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::getDataStructureType**
() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.612.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.612.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.612.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

```
6.612.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.612.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

6.613.3 Member Function Documentation

6.613.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.613.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.613.3.3 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.613.3.4 virtual void activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 612).

6.613.3.5 virtual int activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.613.3.6 virtual void **activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 614).

6.613.3.7 virtual void **activemq::wireformat::openwire::marshal::v1::SessionInfoMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

6.614.3 Member Function Documentation

6.614.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.614.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.614.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.614.3.4 `virtual void activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 619).

6.614.3.5 `virtual int activemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

```
6.614.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.614.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.615.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

```

6.615.3.3  virtual void ac-
            tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseMarshal
            ( OpenWireFormat * wireFormat, commands::DataStructure *
              dataStructure, decaf::io::DataOutputStream * dataOut ) throw (
              decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

```

6.615.3.4  virtual void ac-
            tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::looseUnmarshal
            ( OpenWireFormat * wireFormat, commands::DataStructure *
              dataStructure, decaf::io::DataInputStream * dataIn ) throw (
              decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 625).

```

6.615.3.5  virtual int ac-
            tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
              * dataStructure, utils::BooleanStream * bs ) throw (
              decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```
6.615.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 628).

```
6.615.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SessionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 629).

6.616 activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 2721).

```
#include <src/main/activemq/wireformat/openwire/marshal/v3/SessionInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller**:

Public Member Functions

- **SessionInfoMarshaller** ()
- virtual **~SessionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.

- virtual void looseMarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.616.1 Detailed Description

Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p.2721). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.616.2 Constructor & Destructor Documentation

6.616.2.1 activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::SessionInfoMarshaller () [inline]

6.616.2.2 virtual activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::~~SessionInfoMarshaller () [inline, virtual]

6.616.3 Member Function Documentation

6.616.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1331).

6.616.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p.1336).

6.616.3.3 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.616.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 605).

6.616.3.5 virtual int activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.616.3.6 virtual void **activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightMarshal2**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataOutputStream** * *dataOut*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

6.616.3.7 virtual void **activemq::wireformat::openwire::marshal::v3::SessionInfoMarshaller::tightUnmarshal**
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/SessionInfoMarshaller.h`

6.617 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

```
#include <src/main/activemq/cmsutil/SessionPool.h>
```

Public Member Functions

- **SessionPool** (`cms::Connection *connection`, `cms::Session::AcknowledgeMode ackMode`, `ResourceLifecycleManager *resourceLifecycleManager`)
Constructs a session pool.
- virtual `~SessionPool ()`
Destroys the pooled session objects, but not the underlying session resources.
- virtual `PooledSession * takeSession ()` throw (`cms::CMSException`)
Takes a session from the pool, creating one if necessary.
- virtual void `returnSession (PooledSession *session)`
Returns a session to the pool.
- `ResourceLifecycleManager * getResourceLifecycleManager ()`

6.617.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode. Internal session resources are managed through a provided `ResourceLifecycleManager` (p. 2608), not by this pool. This class is thread-safe.

6.617.2 Constructor & Destructor Documentation

6.617.2.1 `activemq::cmsutil::SessionPool::SessionPool (cms::Connection * connection, cms::Session::AcknowledgeMode ackMode, ResourceLifecycleManager * resourceLifecycleManager)`

Constructs a session pool.

Parameters

connection the connection to be used for creating all sessions.

ackMode the acknowledge mode to be used for all sessions

resourceLifecycleManager the object responsible for managing the lifecycle of any allocated **cms::Session** (p. 2663) resources.

6.617.2.2 virtual activemq::cmsutil::SessionPool::~SessionPool () [virtual]

Destroys the pooled session objects, but not the underlying session resources.

That is the job of the **ResourceLifecycleManager** (p. 2608).

6.617.3 Member Function Documentation

6.617.3.1 ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager () [inline]

6.617.3.2 virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession * session) [virtual]

Returns a session to the pool.

Parameters

session the session to be returned.

6.617.3.3 virtual PooledSession* activemq::cmsutil::SessionPool::takeSession () throw (cms::CMSException) [virtual]

Takes a session from the pool, creating one if necessary.

Returns

the pooled session object

Exceptions

cms::CMSException (p. 960) if an error occurred

6.619 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

```
#include <src/main/decaf/util/Set.h>
```

Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual `~Set()`

6.619.1 Detailed Description

```
template<typename E> class decaf::util::Set< E >
```

A collection that contains no duplicate elements. More formally, sets contain no pair of elements `e1` and `e2` such that `e1 == e2`, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since

1.0

6.619.2 Constructor & Destructor Documentation

6.620 decaf::lang::Short Class Reference

```
#include <src/main/decaf/lang/Short.h>
```

Inheritance diagram for decaf::lang::Short:

Public Member Functions

- **Short** (short value)
- **Short** (const std::string &value) throw (exceptions::NumberFormatException)
- virtual ~**Short** ()
- virtual int **compareTo** (const **Short** &s) const
*Compares this **Short** (p. 2729) instance with another.*
- bool **equals** (const **Short** &s) const
- virtual bool **operator==** (const **Short** &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **Short** &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (const short &s) const
*Compares this **Short** (p. 2729) instance with another.*
- bool **equals** (const short &s) const
- virtual bool **operator==** (const short &s) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const short &s) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () const
- virtual double **doubleValue** () const
Answers the double value which the receiver represents.
- virtual float **floatValue** () const
Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () const
Answers the byte value which the receiver represents.
- virtual short **shortValue** () const
Answers the short value which the receiver represents.
- virtual int **intValue** () const
Answers the int value which the receiver represents.
- virtual long long **longValue** () const
Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (const std::string &value) throw (exceptions::NumberFormatException)
*Decodes a String into a **Short** (p. 2729).*
- static short **reverseBytes** (short value)
Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.
- static short **parseShort** (const std::string &s, int radix) throw (exceptions::NumberFormatException)
Parses the string argument as a signed short in the radix specified by the second argument.
- static short **parseShort** (const std::string &s) throw (exceptions::NumberFormatException)
Parses the string argument as a signed decimal short.
- static **Short valueOf** (short value)
*Returns a **Short** (p. 2729) instance representing the specified short value.*
- static **Short valueOf** (const std::string &value) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 2729) object holding the value given by the specified std::string.*
- static **Short valueOf** (const std::string &value, int radix) throw (exceptions::NumberFormatException)
*Returns a **Short** (p. 2729) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static const int **SIZE** = 16
Size of this objects primitive type in bits.
- static const short **MAX_VALUE** = (short)0x7FFF
Max Value for this Object's primitive type.
- static const short **MIN_VALUE** = (short)0x8000
Max Value for this Object's primitive type.

6.620.1 Constructor & Destructor Documentation

6.620.1.1 decaf::lang::Short::Short (short value)

Parameters

value - short to wrap

6.620.1.2 decaf::lang::Short::Short (const std::string & *value*) throw (exceptions::NumberFormatException)

Parameters

value - string value to convert to short and wrap

Exceptions

NumberFormatException

6.620.1.3 virtual decaf::lang::Short::~~Short () [inline, virtual]

6.620.2 Member Function Documentation

6.620.2.1 virtual unsigned char decaf::lang::Short::byteValue () const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

6.620.2.2 virtual int decaf::lang::Short::compareTo (const short & *s*) const [virtual]

Compares this **Short** (p. 2729) instance with another.

Parameters

s - the **Short** (p. 2729) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **short** > (p. 1010).

6.620.2.3 virtual int decaf::lang::Short::compareTo (const Short & *s*) const [virtual]

Compares this **Short** (p. 2729) instance with another.

Parameters

s - the **Short** (p. 2729) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

6.620.2.4 `static Short decaf::lang::Short::decode (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Decodes a String into a **Short** (p.2729).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p.2735) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a **NumberFormatException** will be thrown. The result is negated if first character of the specified String is the minus sign. No whitespace characters are permitted in the string.

Parameters

value - The string to decode

Returns

a **Short** (p.2729) object containing the decoded value

Exceptions

NumberFormatException if the string is not formatted correctly.

6.620.2.5 `virtual double decaf::lang::Short::doubleValue () const [inline,
virtual]`

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

6.620.2.6 `bool decaf::lang::Short::equals (const Short & s) const [inline]`

Returns

true if the two **Short** (p.2729) Objects have the same value.

6.620.2.7 `bool decaf::lang::Short::equals (const short & s) const [inline,
virtual]`

Returns

true if the two **Short** (p.2729) Objects have the same value.

Implements **decaf::lang::Comparable< short >** (p.1010).

6.620.2.8 `virtual float decaf::lang::Short::floatValue () const [inline, virtual]`

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

6.620.2.9 `virtual int decaf::lang::Short::intValue () const [inline, virtual]`

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

6.620.2.10 `virtual long long decaf::lang::Short::longValue () const [inline, virtual]`

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

6.620.2.11 `virtual bool decaf::lang::Short::operator< (const Short & s) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.620.2.12 `virtual bool decaf::lang::Short::operator< (const short & s) const [inline, virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< short >` (p.1011).

6.620.2.13 `virtual bool decaf::lang::Short::operator==(const Short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.620.2.14 `virtual bool decaf::lang::Short::operator==(const short & s) const`
[inline, virtual]

Compares equality between this object and the one passed.

Parameters

s - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements `decaf::lang::Comparable< short >` (p.1011).

6.620.2.15 `static short decaf::lang::Short::parseShort (const std::string & s, int`
radix) throw (exceptions::NumberFormatException) [static]

Parses the string argument as a signed short in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether `Character.digit(char, int)` (p. 917) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type `NumberFormatException` is thrown if any of the following situations occurs:
* The first argument is null or is a string of length zero. * The radix is either smaller than `Character.MIN_RADIX` (p. 921) or larger than `Character.MAX_RADIX` (p. 921). * Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1. * The value represented by the string is not a value of type short.

Parameters

s - the String containing the short representation to be parsed

radix - the radix to be used while parsing s

Returns

the short represented by the string argument in the specified radix.

Exceptions

NumberFormatException - If String does not contain a parsable short.

6.620.2.16 `static short decaf::lang::Short::parseShort (const std::string & s)
 throw (exceptions::NumberFormatException) [static]`

Parses the string argument as a signed decimal short.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the `parseShort(const std::string, int)` method.

Parameters

s - String to convert to a short

Returns

the converted short value

Exceptions

NumberFormatException if the string is not a short.

6.620.2.17 `static short decaf::lang::Short::reverseBytes (short value) [static]`

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters

value - the short whose bytes we are to reverse

Returns

the reversed short.

6.620.2.18 `virtual short decaf::lang::Short::shortValue () const [inline,
 virtual]`

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

6.620.2.19 `static std::string decaf::lang::Short::toString (short value) [static]`

Returns

a string representing the primitive value as Base 10

6.620.2.20 `std::string decaf::lang::Short::toString () const`**Returns**

this **Short** (p. 2729) Object as a String Representation

6.620.2.21 `static Short decaf::lang::Short::valueOf (short value) [static]`

Returns a **Short** (p. 2729) instance representing the specified short value.

Parameters

value - the short to wrap

Returns

the new **Short** (p. 2729) object wrapping value.

6.620.2.22 `static Short decaf::lang::Short::valueOf (const std::string & value)
throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 2729) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the `parseShort(std::string)` method. The result is a **Short** (p. 2729) object that represents the short value specified by the string.

Parameters

value - std::string to parse as base 10

Returns

new **Short** (p. 2729) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a decimal short.

6.620.2.23 `static Short decaf::lang::Short::valueOf (const std::string & value, int
radix) throw (exceptions::NumberFormatException) [static]`

Returns a **Short** (p. 2729) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the `parseShort(std::string, int)` method. The result is a **Short** (p. 2729) object that represents the short value specified by the string.

Parameters

value - std::string to parse as base (radix)

radix - base of the string to parse.

Returns

new **Short** (p. 2729) Object wrapping the primitive

Exceptions

NumberFormatException if the string is not a valid short.

6.620.3 Field Documentation

6.620.3.1 `const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF`
[static]

Max Value for this Object's primitive type.

6.620.3.2 `const short decaf::lang::Short::MIN_VALUE = (short)0x8000` [static]

Max Value for this Object's primitive type.

6.620.3.3 `const int decaf::lang::Short::SIZE = 16` [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Short.h**

6.621 decaf::internal::nio::ShortArrayBuffer Class Reference

```
#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>
```

Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (std::size_t capacity, bool readOnly=false)
*Creates a **ShortArrayBuffer** (p. 2738) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ShortArrayBuffer** (short *array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::NullPointerException)
*Creates a **ShortArrayBuffer** (p. 2738) object that wraps the given array.*
- **ShortArrayBuffer** (ByteArrayPerspective &array, std::size_t offset, std::size_t capacity, bool readOnly=false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
*Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.*
- **ShortArrayBuffer** (const **ShortArrayBuffer** &other)

Create a **ShortArrayBuffer** (p. 2738) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.

- virtual **~ShortArrayBuffer** ()
- virtual short * **array** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the short array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual ShortBuffer * **asReadOnlyBuffer** () const
Creates a new, read-only short buffer that shares this buffer's content.
- virtual ShortBuffer & **compact** () throw (decaf::nio::ReadOnlyBufferException)
Compacts this buffer.
- virtual ShortBuffer * **duplicate** ()
Creates a new short buffer that shares this buffer's content.
- virtual short **get** () throw (decaf::nio::BufferUnderflowException)
Relative get method.
- virtual short **get** (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- virtual bool **hasArray** () const
Tells whether or not this buffer is backed by an accessible short array.
- virtual bool **isReadOnly** () const
Tells whether or not this buffer is read-only.
- virtual ShortBuffer & **put** (short value) throw (decaf::nio::BufferOverflowException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the current position, and then increments the position.
- virtual ShortBuffer & **put** (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, decaf::nio::ReadOnlyBufferException)
Writes the given doubles into this buffer at the given index.
- virtual ShortBuffer * **slice** () const
Creates a new ShortBuffer whose content is a shared subsequence of this buffer's content.

Protected Member Functions

- virtual void **setReadOnly** (bool value)
*Sets this **ByteBuffer** (p. 806) as Read-Only.*

6.621.1 Constructor & Destructor Documentation

6.621.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (std::size_t capacity, bool readOnly = false)

Creates a **ShortArrayBuffer** (p. 2738) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

6.621.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::NullPointerException)

Creates a **ShortArrayBuffer** (p. 2738) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array - array to wrap
offset - the position that is this buffers start pos.
capacity - size of the array, this is the limit we read and write to.
readOnly - should this buffer be read-only, default as false

Exceptions

NullPointerException if buffer is NULL

6.621.1.3 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (ByteArrayPerspective & array, std::size_t offset, std::size_t capacity, bool readOnly = false) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Creates a byte buffer that wraps the passed **ByteArrayPerspective** (p. 843) and start at the given offset.

The capacity and limit of the new **ShortArrayBuffer** (p. 2738) will be that of the remaining capacity of the passed buffer.

Parameters

array - the **ByteArrayPerspective** (p. 843) to wrap

offset - the position that is this buffers start pos.

capacity - the length of the array we are wrapping or limit.

readOnly - is this a readOnly buffer.

Exceptions

IndexOutOfBoundsException if offset is greater than array capacity.

6.621.1.4 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & other)

Create a **ShortArrayBuffer** (p. 2738) that mirrors this one, meaning it shares a reference to this buffers **ByteArrayPerspective** (p. 843) and when changes are made to that data it is reflected in both.

Parameters

other - the **ShortArrayBuffer** (p. 2738) this one is to mirror.

6.621.1.5 virtual decaf::internal::nio::ShortArrayBuffer::~ShortArrayBuffer () [virtual]

6.621.2 Member Function Documentation

6.621.2.1 virtual short* decaf::internal::nio::ShortArrayBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this Buffer

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2748).

6.621.2.2 virtual std::size_t decaf::internal::nio::ShortArrayBuffer::arrayOffset () throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::nio::ReadOnlyBufferException) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException if this Buffer is read only.

UnsupportedOperationException if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 2749).

6.621.2.3 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer () const [virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 2749).

6.621.2.4 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact () throw (decaf::nio::ReadOnlyBufferException) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index `p = position()` (p. 746) is copied to index zero, the byte at index `p + 1` is copied to index one, and so forth until the byte at index `limit()` (p. 745) - 1 is copied to index `n = limit()` (p. 745) - 1 - `p`. The buffer's position is then set to `n+1` and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this ShortBuffer

Exceptions

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2750).

6.621.2.5 `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate ()` [virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short Buffer which the caller owns.

Implements `decaf::nio::ShortBuffer` (p. 2750).

6.621.2.6 `virtual short decaf::internal::nio::ShortArrayBuffer::get ()` throw (`decaf::nio::BufferUnderflowException`) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position

Exceptions

BufferUnderflowException if there no more data to return

Implements `decaf::nio::ShortBuffer` (p. 2752).

6.621.2.7 `virtual short decaf::internal::nio::ShortArrayBuffer::get (std::size_t index)` const throw (`lang::exceptions::IndexOutOfBoundsException`) [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the Buffer where the short is to be read

Returns

the short that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implements `decaf::nio::ShortBuffer` (p. 2751).

6.621.2.8 virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray () const
[inline, virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::ShortBuffer** (p. 2752).

6.621.2.9 virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly () const
[inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

6.621.2.10 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put
(std::size_t *index*, short *value*) throw
(lang::exceptions::IndexOutOfBoundsException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters

index - position in the Buffer to write the data

value - the doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2753).

6.621.2.11 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put
(short *value*) throw (decaf::nio::BufferOverflowException,
decaf::nio::ReadOnlyBufferException) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value - the doubles value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException - If this buffer is read-only

Implements **decaf::nio::ShortBuffer** (p. 2753).

6.621.2.12 `virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool value)` [inline, protected, virtual]

Sets this **ByteBuffer** (p. 806) as Read-Only.

Parameters

value - true if this buffer is to be read-only.

6.621.2.13 `virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice ()`
`const` [virtual]

Creates a new **ShortBuffer** whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 2755).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/nio/ShortArrayBuffer.h`

6.622 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:

```
#include <src/main/decaf/nio/ShortBuffer.h>
```

Inheritance diagram for **decaf::nio::ShortBuffer**:

Public Member Functions

- virtual **~ShortBuffer** ()
- virtual std::string **toString** () const
- virtual short * **array** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the short array that backs this buffer (optional operation).
- virtual std::size_t **arrayOffset** ()=0 throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException)
Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **ShortBuffer** * **asReadOnlyBuffer** () const =0
Creates a new, read-only short buffer that shares this buffer's content.
- virtual **ShortBuffer** & **compact** ()=0 throw (ReadOnlyBufferException)
Compacts this buffer.
- virtual **ShortBuffer** * **duplicate** ()=0
Creates a new short buffer that shares this buffer's content.
- virtual short **get** ()=0 throw (BufferUnderflowException)
Relative get method.
- virtual short **get** (std::size_t index) const =0 throw (lang::exceptions::IndexOutOfBoundsException)
Absolute get method.
- **ShortBuffer** & **get** (std::vector< short > buffer) throw (BufferUnderflowException)
Relative bulk get method.
- **ShortBuffer** & **get** (short *buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)
Relative bulk get method.
- virtual bool **hasArray** () const =0
Tells whether or not this buffer is backed by an accessible short array.
- **ShortBuffer** & **put** (**ShortBuffer** &src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)
This method transfers the shorts remaining in the given source buffer into this buffer.
- **ShortBuffer** & **put** (const short *buffer, std::size_t offset, std::size_t length) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::NullPointerException)
This method transfers shorts into this buffer from the given source array.
- **ShortBuffer** & **put** (std::vector< short > &buffer) throw (BufferOverflowException, ReadOnlyBufferException)
This method transfers the entire content of the given source shorts array into this buffer.

- virtual **ShortBuffer** & **put** (short value)=0 throw (**BufferOverflowException**, **ReadOnlyBufferException**)
Writes the given shorts into this buffer at the current position, and then increments the position.
- virtual **ShortBuffer** & **put** (std::size_t index, short value)=0 throw (**lang::exceptions::IndexOutOfBoundsException**, **ReadOnlyBufferException**)
Writes the given shorts into this buffer at the given index.
- virtual **ShortBuffer** * **slice** () const =0
*Creates a new **ShortBuffer** (p. 2745) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (const **ShortBuffer** &value) const
Compares this object with the specified object for order.
- virtual bool **equals** (const **ShortBuffer** &value) const
- virtual bool **operator==** (const **ShortBuffer** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **ShortBuffer** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.

Static Public Member Functions

- static **ShortBuffer** * **allocate** (std::size_t capacity)
*Allocates a new **Double** buffer.*
- static **ShortBuffer** * **wrap** (short *array, std::size_t offset, std::size_t length) throw (**lang::exceptions::NullPointerException**)
*Wraps the passed buffer with a new **ShortBuffer** (p. 2745).*
- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)
*Wraps the passed STL short Vector in a **ShortBuffer** (p. 2745).*

Protected Member Functions

- **ShortBuffer** (std::size_t capacity)
*Creates a **ShortBuffer** (p. 2745) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.622.1 Detailed Description

This class defines four categories of operations upon short buffers: o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer

contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.622.2 Constructor & Destructor Documentation

6.622.2.1 decaf::nio::ShortBuffer::ShortBuffer (std::size_t *capacity*) [protected]

Creates a **ShortBuffer** (p. 2745) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity - size and limit of the **Buffer** (p. 741) in doubles

6.622.2.2 virtual decaf::nio::ShortBuffer::~~ShortBuffer () [inline, virtual]

6.622.3 Member Function Documentation

6.622.3.1 static ShortBuffer* decaf::nio::ShortBuffer::allocate (std::size_t *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity - The size of the Double buffer in shorts

Returns

the **ShortBuffer** (p. 2745) that was allocated, caller owns.

6.622.3.2 virtual short* decaf::nio::ShortBuffer::array () throw (decaf::lang::exceptions::UnsupportedOperationException, ReadOnlyBufferException) [pure virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 741)

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2741).

6.622.3.3 `virtual std::size_t decaf::nio::ShortBuffer::arrayOffset ()
throw (decaf::lang::exceptions::UnsupportedOperationException,
ReadOnlyBufferException) [pure virtual]`

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the `hasArray` method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 2520) if this **Buffer** (p. 741) is read only.

UnsupportedOperationException if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2741).

6.622.3.4 `virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer ()
const [pure virtual]`

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the `duplicate` method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2742).

6.622.3.5 virtual ShortBuffer& decaf::nio::ShortBuffer::compact () throw (ReadOnlyBufferException) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index $p = \text{position}()$ (p. 746) is copied to index zero, the byte at index $p + 1$ is copied to index one, and so forth until the byte at index $\text{limit}()$ (p. 745) - 1 is copied to index $n = \text{limit}()$ (p. 745) - 1 - p . The buffer's position is then set to $n+1$ and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 2745)

Exceptions

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2742).

6.622.3.6 virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & value) const [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.622.3.7 virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate () [pure virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 741) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2743).

6.622.3.8 `virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & value) const [virtual]`

Returns

true if this value is considered equal to the passed value.

6.622.3.9 `ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > buffer) throw (BufferUnderflowException)`

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form `src.get(a)` behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call `buffer.resize(N)` before calling this get method.

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than length shorts remaining in this buffer

6.622.3.10 `virtual short decaf::nio::ShortBuffer::get (std::size_t index) const throw (lang::exceptions::IndexOutOfBoundsException) [pure virtual]`

Absolute get method.

Reads the value at the given index.

Parameters

index - the index in the **Buffer** (p. 741) where the short is to be read

Returns

the short that is located at the given index

Exceptions

IndexOutOfBoundsException - If index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2743).

6.622.3.11 `ShortBuffer& decaf::nio::ShortBuffer::get (short * buffer, std::size_t offset, std::size_t length) throw (BufferUnderflowException, lang::exceptions::NullPointerException)`

Relative bulk get method.

This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if `length > remaining()` (p. 746), then no bytes are transferred and a **BufferUnderflowException** (p. 774) is thrown.

Otherwise, this method copies `length` shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by `length`.

Parameters

buffer - pointer to an allocated buffer to fill
offset - position in the buffer to start filling
length - amount of data to put in the passed buffer

Returns

a reference to this **Buffer** (p. 741)

Exceptions

BufferUnderflowException (p. 774) - If there are fewer than `length` shorts remaining in this buffer
NullPointerException if the passed buffer is null.

6.622.3.12 virtual short decaf::nio::ShortBuffer::get () throw (BufferUnderflowException) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position

Exceptions

BufferUnderflowException (p. 774) if there no more data to return

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2743).

6.622.3.13 virtual bool decaf::nio::ShortBuffer::hasArray () const [pure virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the `array` and `arrayOffset` methods may safely be invoked. Sub-classes should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2744).

6.622.3.14 `virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & value) const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.622.3.15 `virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & value) const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.622.3.16 `virtual ShortBuffer& decaf::nio::ShortBuffer::put (short value) throw (BufferOverflowException, ReadOnlyBufferException) [pure virtual]`

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value - the shorts value to be written

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If this buffer's current position is not smaller than its limit

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in `decaf::internal::nio::ShortArrayBuffer` (p. 2744).

6.622.3.17 `virtual ShortBuffer& decaf::nio::ShortBuffer::put (std::size_t index, short value) throw (lang::exceptions::IndexOutOfBoundsException, ReadOnlyBufferException) [pure virtual]`

Writes the given shorts into this buffer at the given index.

Parameters

index - position in the **Buffer** (p. 741) to write the data
value - the shorts to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException - If index greater than the buffer's limit minus the size of the type being written.

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 2744).

6.622.3.18 **ShortBuffer& decaf::nio::ShortBuffer::put (const short
 * buffer, std::size_t offset, std::size_t length) throw
 (BufferOverflowException, ReadOnlyBufferException,
 lang::exceptions::NullPointerException)**

This method transfers shorts into this buffer from the given source array.

If there are more shorts to be copied from the array than remain in this buffer, that is, if `length > remaining()` (p. 746), then no shorts are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer- The array from which shorts are to be read
offset- The offset within the array of the first short to be read;
length - The number of shorts to be read from the given array

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

NullPointerException if the passed buffer is null.

6.622.3.19 **ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > &
 buffer) throw (BufferOverflowException, ReadOnlyBufferException)**

This method transfers the entire content of the given source shorts array into this buffer.

This is the same as calling `put(&buffer[0], 0, buffer.size()`

Parameters

buffer - The buffer whose contents are copied to this **ShortBuffer** (p. 2745)

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.622.3.20 **ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & src) throw (BufferOverflowException, ReadOnlyBufferException, lang::exceptions::IllegalArgumentException)**

This method transfers the shorts remaining in the given source buffer into this buffer.

If there are more shorts remaining in the source buffer than in this buffer, that is, if `src.remaining() > remaining()` (p. 746), then no shorts are transferred and a **BufferOverflowException** (p. 771) is thrown.

Otherwise, this method copies `n = src.remaining()` shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by `n`.

Parameters

src - the buffer to take shorts from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException (p. 771) - If there is insufficient space in this buffer for the remaining shorts in the source buffer

IllegalArgumentException - If the source buffer is this buffer

ReadOnlyBufferException (p. 2520) - If this buffer is read-only

6.622.3.21 **virtual ShortBuffer* decaf::nio::ShortBuffer::slice () const [pure virtual]**

Creates a new **ShortBuffer** (p.2745) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p.2745) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p.2745).

6.622.3.22 virtual std::string decaf::nio::ShortBuffer::toString () const [virtual]**Returns**

a std::string describing this object

6.622.3.23 static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * array, std::size_t offset, std::size_t length) throw (lang::exceptions::NullPointerException) [static]

Wraps the passed buffer with a new **ShortBuffer** (p.2745).

The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array - The array that will back the new buffer

offset - The offset of the subarray to be used

length - The length of the subarray to be used

Returns

a new **ShortBuffer** (p.2745) that is backed by buffer, caller owns.

6.622.3.24 static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & buffer) [static]

Wraps the passed STL short Vector in a **ShortBuffer** (p.2745).

The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer - The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **ShortBuffer** (p.2745) that is backed by buffer, caller owns.

6.623 activemq::commands::ShutdownInfo Class Reference

```
#include <src/main/activemq/commands/ShutdownInfo.h>
```

Inheritance diagram for activemq::commands::ShutdownInfo:

Public Member Functions

- **ShutdownInfo** ()
- virtual **~ShutdownInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **ShutdownInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual bool **isShutdownInfo** () const
- virtual **Pointer< Command > visit** (activemq::state::CommandVisitor *visitor) throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID _SHUTDOWNINFO** = 11

Protected Member Functions

- **ShutdownInfo** (const **ShutdownInfo** &)
- **ShutdownInfo** & **operator=** (const **ShutdownInfo** &)

6.623.1 Constructor & Destructor Documentation

6.623.1.1 `activemq::commands::ShutdownInfo::ShutdownInfo (const ShutdownInfo &)` [inline, protected]

6.623.1.2 `activemq::commands::ShutdownInfo::ShutdownInfo ()`

6.623.1.3 `virtual activemq::commands::ShutdownInfo::~~ShutdownInfo ()` [virtual]

6.623.2 Member Function Documentation

6.623.2.1 `virtual ShutdownInfo* activemq::commands::ShutdownInfo::cloneDataStructure () const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.623.2.2 `virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure * src)` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.623.2.3 `virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * value) const` [virtual]

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.623.2.4 `virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

6.623.2.5 `virtual bool activemq::commands::ShutdownInfo::isShutdownInfo ()
const [inline, virtual]`

Returns

an answer of true to the **isShutdownInfo()** (p. 2759) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.623.2.6 `ShutdownInfo& activemq::commands::ShutdownInfo::operator= (const
ShutdownInfo &) [inline, protected]`

6.623.2.7 `virtual std::string activemq::commands::ShutdownInfo::toString ()
const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.623.2.8 `virtual Pointer<Command> activemq::commands::ShutdownInfo::visit
(activemq::state::CommandVisitor * visitor) throw (
exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 995).

6.623.3 Field Documentation

6.623.3.1 `const unsigned char activemq::commands::ShutdownInfo::ID_-
SHUTDOWNINFO = 11 [static]`

6.624.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2760). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.624.2 Constructor & Destructor Documentation

6.624.2.1 `activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.624.2.2 `virtual activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.624.3 Member Function Documentation

6.624.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.624.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.624.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.624.3.4 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.624.3.5 virtual int activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.624.3.6 virtual void activemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 614).

```
6.624.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 615).

The documentation for this class was generated from the following file:

6.625.3 Member Function Documentation

6.625.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.625.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.625.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.625.3.4 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.625.3.5 virtual int activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.625.3.6 virtual void activemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 621).

```
6.625.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 622).

Write a object instance to data output stream.

6.626.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2767). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.626.2 Constructor & Destructor Documentation

6.626.2.1 `activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.626.2.2 `virtual activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.626.3 Member Function Documentation

6.626.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.626.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.626.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.626.3.4 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.626.3.5 virtual int activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.626.3.6 virtual void activemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 608).

```
6.626.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 609).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v3/ShutdownInfoMarshaller.h`

6.627 **activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2771).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/ShutdownInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller**:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual **~ShutdownInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual int **tightMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.627.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2771). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.627.2 Constructor & Destructor Documentation

6.627.2.1 `activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.627.2.2 `virtual activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.627.3 Member Function Documentation

6.627.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.627.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.627.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.627.3.4 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 632).

6.627.3.5 virtual int activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 633).

6.627.3.6 virtual void activemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 634).

```
6.627.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller** (p. 635).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/ShutdownInfoMarshaller.h`

6.628 **activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2775).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/ShutdownInfoMarshaller.h>
```

Inheritance diagram for **activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller**:

Public Member Functions

- **ShutdownInfoMarshaller** ()
- virtual **~ShutdownInfoMarshaller** ()

Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshall an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.628.1 Detailed Description

Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 2775). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.628.2 Constructor & Destructor Documentation

6.628.2.1 `activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::ShutdownInfoMarshaller()` [inline]

6.628.2.2 `virtual activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::~~ShutdownInfoMarshaller()` [inline, virtual]

6.628.3 Member Function Documentation

6.628.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.628.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.628.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 624).

6.628.3.4 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.628.3.5 virtual int activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

6.628.3.6 virtual void activemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```
6.628.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::ShutdownInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/ShutdownInfoMarshaller.h`

6.629 decaf::security::SignatureException Class Reference

```
#include <src/main/decaf/security/SignatureException.h>
```

Inheritance diagram for `decaf::security::SignatureException`:

Public Member Functions

- **SignatureException** () throw ()
Default Constructor.
- **SignatureException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SignatureException** (const **SignatureException** &ex) throw ()
Copy Constructor.
- **SignatureException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (const std::exception *cause) throw ()
Constructor.
- **SignatureException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * clone () const
Clones this exception.
- virtual ~**SignatureException** () throw ()

6.629.1 Constructor & Destructor Documentation

6.629.1.1 decaf::security::SignatureException::SignatureException () throw () [inline]

Default Constructor.

6.629.1.2 decaf::security::SignatureException::SignatureException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.629.1.3 decaf::security::SignatureException::SignatureException (const SignatureException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.629.1.4 `decaf::security::SignatureException::SignatureException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
 ... list of primitives that are formatted into the message

6.629.1.5 `decaf::security::SignatureException::SignatureException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.629.1.6 `decaf::security::SignatureException::SignatureException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file name where exception occurs
lineNumber line number where the exception occurred.
msg message to report
 ... list of primitives that are formatted into the message

6.629.1.7 `virtual decaf::security::SignatureException::~SignatureException () throw () [inline, virtual]`

6.629.2 Member Function Documentation

6.629.2.1 `virtual SignatureException* decaf::security::SignatureException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1604).

The documentation for this class was generated from the following file:

- `src/main/decaf/security/SignatureException.h`

6.630 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 1928) in a human readable format.

```
#include <src/main/decaf/util/logging/SimpleFormatter.h>
```

Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual **~SimpleFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const
Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (const **LogRecord** &record) const
Format the message string from a log record.
- virtual std::string **getHead** (const **Handler** *handler)
Return the header string for a set of formatted records.
- virtual std::string **getTail** (const **Handler** *handler)
Return the tail string for a set of formatted records.

6.630.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 1928) in a human readable format. The summary will typically be 1 or 2 lines.

6.630.2 Constructor & Destructor Documentation

6.630.2.1 `decaf::util::logging::SimpleFormatter::SimpleFormatter ()` [inline]

6.630.2.2 `virtual decaf::util::logging::SimpleFormatter::~~SimpleFormatter ()`
[inline, virtual]

6.630.3 Member Function Documentation

6.630.3.1 `virtual std::string decaf::util::logging::SimpleFormatter::format (const LogRecord & record) const` [inline, virtual]

Format the given log record and return the formatted string.

Parameters

record The Log Record to Format

Implements `decaf::util::logging::Formatter` (p. 1596).

6.630.3.2 `virtual std::string decaf::util::logging::SimpleFormatter::formatMessage (const LogRecord & record) const` [inline, virtual]

Format the message string from a log record.

Parameters

record The Log Record to Format

Implements `decaf::util::logging::Formatter` (p. 1596).

References `decaf::util::logging::LogRecord::getMessage()`.

6.630.3.3 `virtual std::string decaf::util::logging::SimpleFormatter::getHead (const Handler * handler)` [inline, virtual]

Return the header string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler the target handler, can be null

Returns

empty string

Implements `decaf::util::logging::Formatter` (p. 1597).

6.630.3.4 `virtual std::string decaf::util::logging::SimpleFormatter::getTail (const Handler * handler)` [inline, virtual]

Return the tail string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler the target handler, can be null

Returns

empty string

Implements **decaf::util::logging::Formatter** (p. 1597).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/SimpleFormatter.h`

6.631 decaf::util::logging::SimpleLogger Class Reference

```
#include <src/main/decaf/util/logging/SimpleLogger.h>
```

Public Member Functions

- **SimpleLogger** (const std::string &name)
Constructor.
- virtual **~SimpleLogger** ()
Destructor.
- virtual void **mark** (const std::string &message)
Log a Mark Block Level Log.
- virtual void **debug** (const std::string &file, const int line, const std::string &message)
Log a Debug Level Log.
- virtual void **info** (const std::string &file, const int line, const std::string &message)
Log a Informational Level Log.
- virtual void **warn** (const std::string &file, const int line, const std::string &message)
Log a Warning Level Log.
- virtual void **error** (const std::string &file, const int line, const std::string &message)
Log a Error Level Log.
- virtual void **fatal** (const std::string &file, const int line, const std::string &message)
Log a Fatal Level Log.
- virtual void **log** (const std::string &message)
No-frills log.

6.631.1 Constructor & Destructor Documentation

6.631.1.1 `decaf::util::logging::SimpleLogger::SimpleLogger (const std::string & name)`

Constructor.

6.631.1.2 `virtual decaf::util::logging::SimpleLogger::~SimpleLogger () [virtual]`

Destructor.

6.631.2 Member Function Documentation

6.631.2.1 `virtual void decaf::util::logging::SimpleLogger::debug (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Debug Level Log.

6.631.2.2 `virtual void decaf::util::logging::SimpleLogger::error (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Error Level Log.

6.631.2.3 `virtual void decaf::util::logging::SimpleLogger::fatal (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Fatal Level Log.

6.631.2.4 `virtual void decaf::util::logging::SimpleLogger::info (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Informational Level Log.

6.631.2.5 `virtual void decaf::util::logging::SimpleLogger::log (const std::string & message) [virtual]`

No-frills log.

6.631.2.6 `virtual void decaf::util::logging::SimpleLogger::mark (const std::string & message) [virtual]`

Log a Mark Block Level Log.

6.631.2.7 `virtual void decaf::util::logging::SimpleLogger::warn (const std::string & file, const int line, const std::string & message) [virtual]`

Log a Warning Level Log.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/SimpleLogger.h`

6.632 decaf::net::Socket Class Reference

```
#include <src/main/decaf/net/Socket.h>
```

Inheritance diagram for `decaf::net::Socket`:

Public Types

- `typedef apr_socket_t * SocketHandle`
Define the SocketHandle type.
- `typedef apr_sockaddr_t * SocketAddress`
Define the SocketAddress type.

Public Member Functions

- `virtual ~Socket ()`
- `virtual void connect (const char *host, int port)=0 throw (SocketException)`
Connects to the specified destination.
- `virtual bool isConnected () const =0`
Indicates whether or not this socket is connected to a destination.
- `virtual io::InputStream * getInputStream ()=0`
Gets the InputStream for this socket.
- `virtual io::OutputStream * getOutputStream ()=0`
Gets the OutputStream for this socket.
- `virtual int getSoLinger () const =0 throw (SocketException)`
Gets the linger time.
- `virtual void setSoLinger (int linger)=0 throw (SocketException)`
Sets the linger time.
- `virtual bool getKeepAlive () const =0 throw (SocketException)`
Gets the keep alive flag.
- `virtual void setKeepAlive (bool keepAlive)=0 throw (SocketException)`
Enables/disables the keep alive flag.
- `virtual int getReceiveBufferSize () const =0 throw (SocketException)`
Gets the receive buffer size.

- virtual void **setReceiveBufferSize** (int size)=0 throw (SocketException)
Sets the receive buffer size.
- virtual bool **getReuseAddress** () const =0 throw (SocketException)
Gets the reuse address flag.
- virtual void **setReuseAddress** (bool reuse)=0 throw (SocketException)
Sets the reuse address flag.
- virtual int **getSendBufferSize** () const =0 throw (SocketException)
Gets the send buffer size.
- virtual void **setSendBufferSize** (int size)=0 throw (SocketException)
Sets the send buffer size.
- virtual int **getSoTimeout** () const =0 throw (SocketException)
Gets the timeout for socket operations.
- virtual void **setSoTimeout** (int timeout)=0 throw (SocketException)
Sets the timeout for socket operations.

6.632.1 Member Typedef Documentation

6.632.1.1 typedef apr_sockaddr_t* decaf::net::Socket::SocketAddress

Define the SocketAddress type.

6.632.1.2 typedef apr_socket_t* decaf::net::Socket::SocketHandle

Define the SocketHandle type.

6.632.2 Constructor & Destructor Documentation

6.632.2.1 virtual decaf::net::Socket::~~Socket () [inline, virtual]

6.632.3 Member Function Documentation

6.632.3.1 virtual void decaf::net::Socket::connect (const char * *host*, int *port*) throw (SocketException) [pure virtual]

Connects to the specified destination.

Closes this socket if connected to another destination.

Parameters

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions

IOException Thrown if a failure occurred in the connect.

Implemented in **decaf::net::BufferedSocket** (p. 757), and **decaf::net::TcpSocket** (p. 2962).

6.632.3.2 `virtual io::InputStream* decaf::net::Socket::getInputStream () [pure virtual]`

Gets the InputStream for this socket.

Returns

The InputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 757), and **decaf::net::TcpSocket** (p. 2962).

6.632.3.3 `virtual bool decaf::net::Socket::getKeepAlive () const throw (SocketException) [pure virtual]`

Gets the keep alive flag.

Returns

True if keep alive is enabled.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 757), and **decaf::net::TcpSocket** (p. 2962).

Referenced by **decaf::net::BufferedSocket::getKeepAlive()**.

6.632.3.4 `virtual io::OutputStream* decaf::net::Socket::getOutputStream () [pure virtual]`

Gets the OutputStream for this socket.

Returns

the OutputStream for this socket. NULL if not connected.

Implemented in **decaf::net::BufferedSocket** (p. 758), and **decaf::net::TcpSocket** (p. 2963).

6.632.3.5 `virtual int decaf::net::Socket::getReceiveBufferSize () const throw (SocketException) [pure virtual]`

Gets the receive buffer size.

Returns

the receive buffer size in bytes.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 758), and **decaf::net::TcpSocket** (p. 2963).

Referenced by **decaf::net::BufferedSocket::getReceiveBufferSize()**.

6.632.3.6 `virtual bool decaf::net::Socket::getReuseAddress () const throw (SocketException) [pure virtual]`

Gets the reuse address flag.

Returns

True if the address can be reused.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 758), and **decaf::net::TcpSocket** (p. 2963).

Referenced by **decaf::net::BufferedSocket::getReuseAddress()**.

6.632.3.7 `virtual int decaf::net::Socket::getSendBufferSize () const throw (SocketException) [pure virtual]`

Gets the send buffer size.

Returns

the size in bytes of the send buffer.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 759), and **decaf::net::TcpSocket** (p. 2963).

Referenced by **decaf::net::BufferedSocket::getSendBufferSize()**.

6.632.3.8 `virtual int decaf::net::Socket::getSoLinger () const throw (SocketException) [pure virtual]`

Gets the linger time.

Returns

The linger time in seconds.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 759), and **decaf::net::TcpSocket** (p. 2964).

Referenced by **decaf::net::BufferedSocket::getSoLinger()**.

6.632.3.9 virtual int decaf::net::Socket::getSoTimeout () const throw (SocketException) [pure virtual]

Gets the timeout for socket operations.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 2793) Thrown if unable to retrieve the information.

Implemented in **decaf::net::BufferedSocket** (p. 759), and **decaf::net::TcpSocket** (p. 2964).

Referenced by `decaf::net::BufferedSocket::getSoTimeout()`.

6.632.3.10 virtual bool decaf::net::Socket::isConnected () const [pure virtual]

Indicates whether or not this socket is connected to a destination.

Returns

true if connected

Implemented in **decaf::net::BufferedSocket** (p. 759), and **decaf::net::TcpSocket** (p. 2965).

Referenced by `decaf::net::BufferedSocket::isConnected()`.

6.632.3.11 virtual void decaf::net::Socket::setKeepAlive (bool *keepAlive*) throw (SocketException) [pure virtual]

Enables/disables the keep alive flag.

Parameters

keepAlive If true, enables the flag.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 760), and **decaf::net::TcpSocket** (p. 2965).

Referenced by `decaf::net::BufferedSocket::setKeepAlive()`.

6.632.3.12 virtual void decaf::net::Socket::setReceiveBufferSize (int *size*) throw (SocketException) [pure virtual]

Sets the receive buffer size.

Parameters

size Number of bytes to set the receive buffer to.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 760), and **decaf::net::TcpSocket** (p. 2965).

Referenced by **decaf::net::BufferedSocket::setReceiveBufferSize()**.

6.632.3.13 **virtual void decaf::net::Socket::setReuseAddress (bool *reuse*) throw (SocketException)** [pure virtual]

Sets the reuse address flag.

Parameters

reuse If true, sets the flag.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 760), and **decaf::net::TcpSocket** (p. 2965).

Referenced by **decaf::net::BufferedSocket::setReuseAddress()**.

6.632.3.14 **virtual void decaf::net::Socket::setSendBufferSize (int *size*) throw (SocketException)** [pure virtual]

Sets the send buffer size.

Parameters

size The number of bytes to set the send buffer to.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 761), and **decaf::net::TcpSocket** (p. 2966).

Referenced by **decaf::net::BufferedSocket::setSendBufferSize()**.

6.632.3.15 **virtual void decaf::net::Socket::setSoLinger (int *linger*) throw (SocketException)** [pure virtual]

Sets the linger time.

Parameters

linger The linger time in seconds. If 0, linger is off.

Exceptions

SocketException (p. 2793) if the operation fails.

Implemented in **decaf::net::BufferedSocket** (p. 761), and **decaf::net::TcpSocket** (p. 2966).

Referenced by **decaf::net::BufferedSocket::setSoLinger()**.

6.632.3.16 `virtual void decaf::net::Socket::setSoTimeout (int timeout) throw (SocketException)` [pure virtual]

Sets the timeout for socket operations.

Parameters

timeout The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 2793) Thrown if unable to set the information.

Implemented in `decaf::net::BufferedSocket` (p. 761), and `decaf::net::TcpSocket` (p. 2966).

Referenced by `decaf::net::BufferedSocket::setSoTimeout()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/Socket.h`

6.633 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

`#include <src/main/decaf/net/SocketError.h>`

Static Public Member Functions

- static int `getErrorCode ()`
Gets the last error appropriate for the platform.
- static std::string `getErrorString ()`
Gets the string description for the last error.

6.633.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.633.2 Member Function Documentation

6.633.2.1 `static int decaf::net::SocketError::getErrorCode ()` [static]

Gets the last error appropriate for the platform.

6.633.2.2 `static std::string decaf::net::SocketError::getErrorString ()` [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketError.h`

6.634 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

```
#include <src/main/decaf/net/SocketException.h>
```

Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (const **lang::Exception** &ex) throw ()
- **SocketException** (const **SocketException** &ex) throw ()
- **SocketException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketException** (const std::exception *cause) throw ()
Constructor.
- **SocketException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketException** * **clone** () const
Clones this exception.
- virtual ~**SocketException** () throw ()

6.634.1 Detailed Description

Exception for errors when manipulating sockets.

6.634.2 Constructor & Destructor Documentation

6.634.2.1 decaf::net::SocketException::SocketException () throw () [inline]

6.634.2.2 decaf::net::SocketException::SocketException (const lang::Exception &ex) throw () [inline]

6.634.2.3 decaf::net::SocketException::SocketException (const SocketException &ex) throw () [inline]

6.634.2.4 decaf::net::SocketException::SocketException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.634.2.5 decaf::net::SocketException::SocketException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.634.2.6 decaf::net::SocketException::SocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.634.2.7 virtual decaf::net::SocketException::~SocketException () throw () [inline, virtual]

6.634.3 Member Function Documentation

6.634.3.1 virtual SocketException* decaf::net::SocketException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1709).

Reimplemented in **decaf::net::BindException** (p. 665), **decaf::net::ConnectException** (p. 1051), **decaf::net::NoRouteToHostException** (p. 2271), and **decaf::net::PortUnreachableException** (p. 2370).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketException.h`

6.635 decaf::net::SocketFactory Class Reference

Socket (p. 2786) Factory implementation for use in Creating Sockets.

```
#include <src/main/decaf/net/SocketFactory.h>
```

Public Member Functions

- virtual `~SocketFactory()`

Static Public Member Functions

- static **Socket** * **createSocket** (const std::string &uri, const **util::Properties** &properties) throw (**SocketException**)

*Creates and returns a **Socket** (p. 2786) derived Object based on the values defined in the Properties Object that is passed in.*

6.635.1 Detailed Description

Socket (p. 2786) Factory implementation for use in Creating Sockets. Property Options:

Name Value

inputBufferSize size in bytes of the buffered input stream buffer. Defaults to 10000.

outputBufferSize size in bytes of the buffered output stream buffer. Defaults to 10000.

soLinger linger time for the socket (in microseconds). Defaults to 0.

soKeepAlive keep alive flag for the socket (true/false). Defaults to false.

soReceiveBufferSize The size of the socket receive buffer (in bytes). Defaults to 2MB.

soSendBufferSize The size of the socket send buffer (in bytes). Defaults to 2MB.

soTimeout The timeout of socket IO operations (in microseconds). Defaults to 10000

Socket (p. 2786)

6.635.2 Constructor & Destructor Documentation

6.635.2.1 `virtual decaf::net::SocketFactory::~SocketFactory () [inline, virtual]`

6.635.3 Member Function Documentation

6.635.3.1 `static Socket* decaf::net::SocketFactory::createSocket (const std::string & uri, const util::Properties & properties) throw (SocketException) [static]`

Creates and returns a **Socket** (p. 2786) derived Object based on the values defined in the Properties Object that is passed in.

Parameters

- uri* the **URI** (p. 3096) for the **Socket** (p. 2786) Connection.
- properties* A Properties object that contains configuration details.

Exceptions

SocketException.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketFactory.h`

6.636 decaf::net::SocketInputStream Class Reference

Input stream for performing reads on a socket.

```
#include <src/main/decaf/net/SocketInputStream.h>
```

Inheritance diagram for decaf::net::SocketInputStream:

Public Member Functions

- **SocketInputStream** (**Socket::SocketHandle** socket)
Constructor.
- virtual **~SocketInputStream** ()
Destructor.
- virtual `std::size_t available () const throw (io::IOException)`
Returns the number of bytes available on the socket to be read right now.
- virtual `int read () throw (io::IOException)`
Reads a single byte from the buffer.

- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (io::IOException, lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (decaf::io::IOException)
Close - does nothing.
- virtual std::size_t **skip** (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)
Not supported.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
- virtual void **reset** () throw (io::IOException)
Repositions this stream to the position at the time the mark method was last called on this input stream.
- virtual bool **markSupported** () const
Determines if this input stream supports the mark and reset methods.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.636.1 Detailed Description

Input stream for performing reads on a socket. This class will only work properly for blocking sockets.

6.636.2 Constructor & Destructor Documentation

6.636.2.1 decaf::net::SocketInputStream::SocketInputStream (Socket::SocketHandle *socket*)

Constructor.

Parameters

socket the socket handle.

6.636.2.2 virtual decaf::net::SocketInputStream::~~SocketInputStream () [virtual]

Destructor.

6.636.3 Member Function Documentation

6.636.3.1 virtual std::size_t decaf::net::SocketInputStream::available () const throw (io::IOException) [virtual]

Returns the number of bytes available on the socket to be read right now.

Returns

The number of bytes currently available to be read on the socket.

Implements **decaf::io::InputStream** (p. 1631).

6.636.3.2 virtual void decaf::net::SocketInputStream::close () throw (decaf::io::IOException) [virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Exceptions

IOException

6.636.3.3 `virtual void decaf::net::SocketInputStream::lock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2932).

6.636.3.4 `virtual void decaf::net::SocketInputStream::mark (int readLimit DECAF_UNUSED)` [inline, virtual]

Marks the current position in the stream. A subsequent call to the `reset` method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the `reset` method is called so long the `readLimit` is not reached.

Parameters

readLimit - max bytes read before marked position is invalid.

Implements `decaf::io::InputStream` (p. 1631).

6.636.3.5 `virtual bool decaf::net::SocketInputStream::markSupported () const` [inline, virtual]

Determines if this input stream supports the `mark` and `reset` methods.

Whether or not `mark` and `reset` are supported is an invariant property of a particular input stream instance.

Returns

true if this stream instance supports marks

Implements `decaf::io::InputStream` (p. 1631).

6.636.3.6 `virtual void decaf::net::SocketInputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)` [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2933).

6.636.3.7 `virtual void decaf::net::SocketInputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2934).

6.636.3.8 `virtual int decaf::net::SocketInputStream::read () throw (io::IOException) [virtual]`

Reads a single byte from the buffer.

If no data is available, blocks until their is.

Returns

The next byte.

Exceptions

IOException thrown if an error occurs.

Implements `decaf::io::InputStream` (p. 1632).

6.636.3.9 `virtual int decaf::net::SocketInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]`

Reads an array of bytes from the buffer.

If the desired amount of data is not currently available, this operation will block until the appropriate amount of data is available.

Parameters

buffer (out) the target buffer

offset the position in the buffer to start from.

bufferSize the size of the output buffer.

Returns

the number of bytes read. or -1 if EOF

Exceptions

IOException f an error occurs.

Implements `decaf::io::InputStream` (p. 1632).

6.636.3.10 `virtual void decaf::net::SocketInputStream::reset () throw (io::IOException)` [inline, virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. * If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an IOException. * If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions

IOException

Implements `decaf::io::InputStream` (p. 1633).

6.636.3.11 `virtual std::size_t decaf::net::SocketInputStream::skip (std::size_t num) throw (io::IOException, lang::exceptions::UnsupportedOperationException)` [virtual]

Not supported.

Exceptions

an UnsupportedOperationException.

Implements `decaf::io::InputStream` (p. 1633).

6.636.3.12 `virtual bool decaf::net::SocketInputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.636.3.13 virtual void decaf::net::SocketInputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2936).

6.636.3.14 virtual void decaf::net::SocketInputStream::wait (long long *millisecs*, int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements decaf::util::concurrent::Synchronizable (p. 2940).

6.636.3.15 virtual void decaf::net::SocketInputStream::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

```
6.636.3.16  virtual void decaf::net::SocketInputStream::wait (    )
              throw ( decaf::lang::exceptions::RuntimeException,
                      decaf::lang::exceptions::IllegalMonitorStateException,
                      decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketInputStream.h`

6.637 decaf::net::SocketOutputStream Class Reference

Output stream for performing write operations on a socket.

```
#include <src/main/decaf/net/SocketOutputStream.h>
```

Inheritance diagram for `decaf::net::SocketOutputStream`:

Public Member Functions

- **SocketOutputStream** (**Socket::SocketHandle** socket)
Constructor.
- virtual **~SocketOutputStream** ()
- virtual void **write** (unsigned char c) throw (io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (io::IOException)

Writes an array of bytes to the output stream.

- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (io::IOException, lang::exceptions::NullPointerException)

Writes an array of bytes to the output stream.

- virtual void **flush** () throw (io::IOException)

Flush - does nothing.

- virtual void **close** () throw (decaf::io::IOException)

Close - does nothing.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.637.1 Detailed Description

Output stream for performing write operations on a socket.

6.637.2 Constructor & Destructor Documentation

6.637.2.1 `decaf::net::SocketOutputStream::SocketOutputStream (Socket::SocketHandle socket)`

Constructor.

Parameters

socket the socket handle.

6.637.2.2 `virtual decaf::net::SocketOutputStream::~~SocketOutputStream ()` [virtual]

6.637.3 Member Function Documentation

6.637.3.1 `virtual void decaf::net::SocketOutputStream::close () throw (decaf::io::IOException)` [virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Exceptions

IOException

6.637.3.2 `virtual void decaf::net::SocketOutputStream::flush () throw (io::IOException)` [inline, virtual]

Flush - does nothing.

Exceptions

IOException

Implements `decaf::io::OutputStream` (p. 2317).

6.637.3.3 `virtual void decaf::net::SocketOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException)` [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2932).

6.637.3.4 virtual void decaf::net::SocketOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements decaf::util::concurrent::Synchronizable (p. 2933).

6.637.3.5 virtual void decaf::net::SocketOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements decaf::util::concurrent::Synchronizable (p. 2934).

6.637.3.6 virtual bool decaf::net::SocketOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2935).

6.637.3.7 virtual void decaf::net::SocketOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.637.3.8 `virtual void decaf::net::SocketOutputStream::wait ()
throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.637.3.9 `virtual void decaf::net::SocketOutputStream::wait (long long
milliseconds) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2938).

6.637.3.10 `virtual void decaf::net::SocketOutputStream::wait (long long milliseconds,
int nanos) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentOutOfRangeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

6.637.3.11 virtual void decaf::net::SocketOutputStream::write (const std::vector< unsigned char > & *buffer*) throw (io::IOException) [virtual]

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2317).

6.637.3.12 virtual void decaf::net::SocketOutputStream::write (unsigned char *c*) throw (io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2318).

6.637.3.13 `virtual void decaf::net::SocketOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (io::IOException, lang::exceptions::NullPointerException) [virtual]`

Writes an array of bytes to the output stream.

Parameters

- buffer* The array of bytes to write.
- offset* the position to start writing in buffer.
- len* The number of bytes from the buffer to be written.

Exceptions

- IOException* thrown if an error occurs.
- NullPointerException* thrown if buffer is Null.

Implements **decaf::io::OutputStream** (p. 2317).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketOutputStream.h`

6.638 decaf::net::SocketTimeoutException Class Reference

```
#include <src/main/decaf/net/SocketTimeoutException.h>
```

Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** () throw ()
Default Constructor.
- **SocketTimeoutException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **SocketTimeoutException** (const **SocketTimeoutException** &ex) throw ()
Copy Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (const std::exception *cause) throw ()
Constructor.
- **SocketTimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- virtual **SocketTimeoutException * clone () const**
Clones this exception.
- virtual **~SocketTimeoutException () throw ()**

6.638.1 Constructor & Destructor Documentation

6.638.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException () throw () [inline]

Default Constructor.

6.638.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.638.1.3 decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.638.1.4 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.638.1.5 `decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.638.1.6 `decaf::net::SocketTimeoutException::SocketTimeoutException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.638.1.7 `virtual decaf::net::SocketTimeoutException::~~SocketTimeoutException () throw () [inline, virtual]`

6.638.2 Member Function Documentation

6.638.2.1 `virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::InterruptedIOException` (p.1695).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/SocketTimeoutException.h`

6.639 activemq::commands::BrokerError::StackTraceElement Struct Reference

```
#include <src/main/activemq/commands/BrokerError.h>
```

Data Fields

6.640 decaf::internal::io::StandardErrorOutputStream Class Reference

Wrapper Around the Standard error Output facility on the current platform.

```
#include <src/main/decaf/internal/io/StandardErrorOutputStream.h>
```

Inheritance diagram for decaf::internal::io::StandardErrorOutputStream:

Public Member Functions

- **StandardErrorOutputStream ()**
Default Constructor.
- virtual **~StandardErrorOutputStream ()**
- virtual void **write** (unsigned char c) throw (decaf::io::IOException)
Writes a single byte to the output stream.
- virtual void **write** (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)
Writes an array of bytes to the output stream.
- virtual void **write** (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)

Writes an array of bytes to the output stream.

- virtual void **flush** () throw (decaf::io::IOException)

Invokes flush on the target output stream.

- virtual void **close** () throw (decaf::io::IOException)

Invokes close on the target output stream.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.640.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform. This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.640.2 Constructor & Destructor Documentation

6.640.2.1 decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ()

Default Constructor.

6.640.2.2 virtual decaf::internal::io::StandardErrorOutputStream::~~StandardErrorOutputStream () [virtual]

6.640.3 Member Function Documentation

6.640.3.1 virtual void decaf::internal::io::StandardErrorOutputStream::close () throw (decaf::io::IOException) [inline, virtual]

Invokes close on the target output stream.

throws IOException if an error occurs

6.640.3.2 virtual void decaf::internal::io::StandardErrorOutputStream::flush () throw (decaf::io::IOException) [virtual]

Invokes flush on the target output stream.

throws **decaf::io::IOException** (p. 1707) if an error occurs

Implements **decaf::io::OutputStream** (p. 2317).

6.640.3.3 virtual void decaf::internal::io::StandardErrorOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2932).

6.640.3.4 virtual void decaf::internal::io::StandardErrorOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2933).

6.640.3.5 `virtual void decaf::internal::io::StandardErrorOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2934).

6.640.3.6 `virtual bool decaf::internal::io::StandardErrorOutputStream::tryLock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.640.3.7 `virtual void decaf::internal::io::StandardErrorOutputStream::unlock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.640.3.8 `virtual void decaf::internal::io::StandardErrorOutputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

6.640.3.9 `virtual void decaf::internal::io::StandardErrorOutputStream::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

6.640.3.10 `virtual void decaf::internal::io::StandardErrorOutputStream::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the *nanos* argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

6.640.3.11 `virtual void decaf::internal::io::StandardErrorOutputStream::write (const std::vector< unsigned char > & buffer) throw (decaf::io::IOException) [virtual]`

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2317).

6.640.3.12 `virtual void decaf::internal::io::StandardErrorOutputStream::write (unsigned char c) throw (decaf::io::IOException) [virtual]`

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2318).

6.640.3.13 `virtual void decaf::internal::io::StandardErrorOutputStream::write (const unsigned char * buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException) [virtual]`

Writes an array of bytes to the output stream.

Parameters

- buffer* The array of bytes to write.
- offset* The position to start writing in buffer.
- len* The number of bytes from the buffer to be written.

Exceptions

- decaf::io::IOException* (p. 1707) thrown if an error occurs.
- NullPointerException* if buffer is null.

Implements **decaf::io::OutputStream** (p. 2317).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardErrorOutputStream.h**

6.641 decaf::internal::io::StandardInputStream Class Reference

```
#include <src/main/decaf/internal/io/StandardInputStream.h>
```

Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual **~StandardInputStream** ()
- virtual std::size_t **available** () const throw (decaf::io::IOException)
Indicates the number of bytes available.
- virtual int **read** () throw (decaf::io::IOException)
Reads a single byte from the buffer.
- virtual int **read** (unsigned char *buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException)
Reads an array of bytes from the buffer.
- virtual void **close** () throw (decaf::io::IOException)
Closes the target input stream.
- virtual std::size_t **skip** (std::size_t num) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)
Skips over and discards n bytes of data from this input stream.
- virtual void **mark** (int readLimit DECAF_UNUSED)
Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** () throw (decaf::io::IOException)

Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () const

Determines if this input stream supports the mark and reset methods.

Protected Member Functions

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentOutOfRangeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.641.1 Constructor & Destructor Documentation

6.641.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ()

6.641.1.2 virtual decaf::internal::io::StandardInputStream::~~StandardInputStream () [virtual]

6.641.2 Member Function Documentation

6.641.2.1 virtual std::size_t decaf::internal::io::StandardInputStream::available () const throw (decaf::io::IOException) [virtual]

Indicates the number of bytes available.

Returns

The number of bytes until the end of the internal buffer.

Implements **decaf::io::InputStream** (p. 1631).

6.641.2.2 virtual void decaf::internal::io::StandardInputStream::close () throw (decaf::io::IOException) [inline, virtual]

Closes the target input stream.

Exceptions

IOException thrown if an error occurs.

6.641.2.3 virtual void decaf::internal::io::StandardInputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, protected, virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2932).

6.641.2.4 virtual void decaf::internal::io::StandardInputStream::mark (int readLimit *DECAF_UNUSED*) [inline, virtual]

Marks the current position in the stream. A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Parameters

readLimit - max bytes read before marked position is invalid.

Implements **decaf::io::InputStream** (p. 1631).

6.641.2.5 `virtual bool decaf::internal::io::StandardInputStream::markSupported () const [inline, virtual]`

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

Returns

true if this stream instance supports marks

Implements **decaf::io::InputStream** (p. 1631).

6.641.2.6 `virtual void decaf::internal::io::StandardInputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, protected, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

6.641.2.7 `virtual void decaf::internal::io::StandardInputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, protected, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.641.2.8 `virtual int decaf::internal::io::StandardInputStream::read () throw (decaf::io::IOException) [virtual]`

Reads a single byte from the buffer.

Returns

The next byte.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::InputStream** (p. 1632).

6.641.2.9 `virtual int decaf::internal::io::StandardInputStream::read (unsigned char * buffer, std::size_t offset, std::size_t bufferSize) throw (decaf::io::IOException, decaf::lang::exceptions::NullPointerException) [virtual]`

Reads an array of bytes from the buffer.

Parameters

buffer (out) the target buffer.

offset the position in the buffer to start reading from.

bufferSize the size of the output buffer.

Returns

The number of bytes read.

Exceptions

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::InputStream** (p. 1632).

6.641.2.10 `virtual void decaf::internal::io::StandardInputStream::reset () throw (decaf::io::IOException) [virtual]`

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then: * If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an IOException might be thrown. * If such an IOException is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset. If the method markSupported returns false, then: * The call to reset may throw an IOException. * If an IOException is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

Exceptions

IOException

Implements **decaf::io::InputStream** (p. 1633).

6.641.2.11 `virtual std::size_t decaf::internal::io::StandardInputStream::skip
(std::size_t num) throw (decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException) [virtual]`

Skips over and discards *n* bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before *n* bytes have been skipped is only one possibility. The actual number of bytes skipped is returned. If *n* is negative, no bytes are skipped.

The skip method of `InputStream` creates a byte array and then repeatedly reads into it until *n* bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num - the number of bytes to skip

Returns

total bytes skipped

Exceptions

IOException if an error occurs

UnsupportedOperationException If skip is not supported.

Implements `decaf::io::InputStream` (p. 1633).

6.641.2.12 `virtual bool decaf::internal::io::StandardInputStream::tryLock ()
throw (decaf::lang::exceptions::RuntimeException) [inline,
protected, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.641.2.13 `virtual void decaf::internal::io::StandardInputStream::unlock () throw
(decaf::lang::exceptions::RuntimeException) [inline, protected,
virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

```

6.641.2.14  virtual void decaf::internal::io::StandardInputStream::wait
            ( long long millisecs, int nanos ) throw
            ( decaf::lang::exceptions::RuntimeException,
              decaf::lang::exceptions::IllegalArgumentException,
              decaf::lang::exceptions::IllegalMonitorStateException,
              decaf::lang::exceptions::InterruptedException ) [inline, protected,
              virtual]

```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

```

6.641.2.15  virtual void decaf::internal::io::StandardInputStream::wait ( long
            long millisecs ) throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline, protected,
            virtual]

```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

6.641.2.16 `virtual void decaf::internal::io::StandardInputStream::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, protected, virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/io/StandardInputStream.h`

6.642 decaf::internal::io::StandardOutputStream Class Reference

```
#include <src/main/decaf/internal/io/StandardOutputStream.h>
```

Inheritance diagram for `decaf::internal::io::StandardOutputStream`:

Public Member Functions

- `StandardOutputStream ()`
- `virtual ~StandardOutputStream ()`
- `virtual void write (unsigned char c) throw (decaf::io::IOException)`
Writes a single byte to the output stream.
- `virtual void write (const std::vector< unsigned char > &buffer) throw (decaf::io::IOException)`
Writes an array of bytes to the output stream.
- `virtual void write (const unsigned char *buffer, std::size_t offset, std::size_t len) throw (decaf::io::IOException, lang::exceptions::NullPointerException)`
Writes an array of bytes to the output stream.
- `virtual void flush () throw (decaf::io::IOException)`
Invokes flush on the target output stream.
- `virtual void close () throw (decaf::io::IOException)`

Invokes close on the target output stream.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.642.1 Constructor & Destructor Documentation

6.642.1.1 decaf::internal::io::StandardOutputStream::StandardOutputStream ()

6.642.1.2 virtual
decaf::internal::io::StandardOutputStream::~~StandardOutputStream () [virtual]

6.642.2 Member Function Documentation

6.642.2.1 virtual void decaf::internal::io::StandardOutputStream::close () throw (decaf::io::IOException) [inline, virtual]

Invokes close on the target output stream.

throws IOException if an error occurs

6.642.2.2 `virtual void decaf::internal::io::StandardOutputStream::flush () throw (decaf::io::IOException) [virtual]`

Invokes flush on the target output stream.

throws `IOException` if an error occurs

Implements `decaf::io::OutputStream` (p. 2317).

6.642.2.3 `virtual void decaf::internal::io::StandardOutputStream::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2932).

6.642.2.4 `virtual void decaf::internal::io::StandardOutputStream::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2933).

6.642.2.5 `virtual void decaf::internal::io::StandardOutputStream::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements `decaf::util::concurrent::Synchronizable` (p. 2934).

6.642.2.6 virtual bool decaf::internal::io::StandardOutputStream::tryLock ()
throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2935).

6.642.2.7 virtual void decaf::internal::io::StandardOutputStream::unlock ()
throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2936).

6.642.2.8 virtual void decaf::internal::io::StandardOutputStream::wait
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements decaf::util::concurrent::Synchronizable (p. 2937).

6.642.2.9 virtual void decaf::internal::io::StandardOutputStream::wait (long
long *millisecs*) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

```
6.642.2.10 virtual void decaf::internal::io::StandardOutputStream::wait
( long long milliseconds, int nanos ) throw
( decaf::lang::exceptions::RuntimeException,
  decaf::lang::exceptions::IllegalArgumentException,
  decaf::lang::exceptions::IllegalMonitorStateException,
  decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

```
6.642.2.11 virtual void decaf::internal::io::StandardOutputStream::write ( const
std::vector< unsigned char > & buffer ) throw ( decaf::io::IOException
) [virtual]
```

Writes an array of bytes to the output stream.

Parameters

buffer The bytes to write.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2317).

6.642.2.12 virtual void decaf::internal::io::StandardOutputStream::write (unsigned char *c*) throw (decaf::io::IOException) [virtual]

Writes a single byte to the output stream.

Parameters

c the byte.

Exceptions

IOException thrown if an error occurs.

Implements **decaf::io::OutputStream** (p. 2318).

6.642.2.13 virtual void decaf::internal::io::StandardOutputStream::write (const unsigned char * *buffer*, std::size_t *offset*, std::size_t *len*) throw (decaf::io::IOException, lang::exceptions::NullPointerException) [virtual]

Writes an array of bytes to the output stream.

Parameters

buffer The array of bytes to write.

offset, the position to start writing in buffer.

len The number of bytes from the buffer to be written.

Exceptions

IOException thrown if an error occurs.

NullPointerException if buffer is null.

Implements **decaf::io::OutputStream** (p. 2317).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardOutputStream.h**

6.643 cms::Startable Class Reference

Interface for a class that implements the start method.

```
#include <src/main/cms/Startable.h>
```

Inheritance diagram for cms::Startable:

Public Member Functions

- virtual **~Startable** ()
- virtual void **start** ()=0 throw (CMSEException)
Starts the service.

6.643.1 Detailed Description

Interface for a class that implements the start method. An object that implements the **Startable** (p.2831) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since

1.0

6.643.2 Constructor & Destructor Documentation

6.643.2.1 virtual cms::Startable::~~Startable () [inline, virtual]

6.643.3 Member Function Documentation

6.643.3.1 virtual void cms::Startable::start () throw (CMSEException) [pure virtual]

Starts the service.

Exceptions

CMSEException (p. 960) if an internal error occurs while starting.

The documentation for this class was generated from the following file:

6.646 `decaf::util::StlList< E >` Class Template Reference

List (p.1865) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

```
#include <src/main/decaf/util/StlList.h>
```

Inheritance diagram for `decaf::util::StlList< E >`:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()
Default constructor - does nothing.
- **StlList** (const **StlList** &source)
Copy constructor - copies the content of the given set into this one.
- **StlList** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual **~StlList** ()
- virtual bool **equals** (const **StlList** &source) const
- virtual **Iterator**< E > * **iterator** ()
- virtual **Iterator**< E > * **iterator** () const
- virtual **ListIterator**< E > * **listIterator** ()
Returns
a list iterator over the elements in this list (in proper sequence).
- virtual **ListIterator**< E > * **listIterator** () const
- virtual **ListIterator**< E > * **listIterator** (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException)
Parameters
index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException if the index is out of range ($\text{index} < 0 \parallel \text{index} > \text{size}()$ (p. 990))

- virtual **ListIterator**< E > * **listIterator** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)
- virtual void **copy** (const **StlList** &source)

- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1718) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

- virtual bool **contains** (const E &value) const throw (lang::Exception)

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p. 982).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

- virtual std::size_t **indexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that $\text{get}(i) == \text{value}$, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

- virtual std::size_t **lastIndexOf** (const E &value) throw (decaf::lang::exceptions::NoSuchElementException)

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that $get(i) == value$ or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

***NoSuchElementException** if value is not in the list*

- virtual bool **isEmpty** () const

Returns true if this collection contains no elements.

*This implementation returns **size()** (p. 990) == 0.*

Returns

true if the size method return 0.

- virtual std::size_t **size** () const

Returns the number of elements in this collection.

If this collection contains more than Integer.MAX_VALUE elements, returns Integer.MAX_VALUE.

Returns

the number of elements in this collection

- virtual E **get** (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

- virtual E **set** (std::size_t index, const E &element) throw (decaf::lang::exceptions::IndexOutOfBoundsException)

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

***IndexOutOfBoundsException** - if the index is greater than size*

- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 982) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual void **add** (std::size_t index, const E &element) throw (decaf::lang::exceptions::UnsupportedOperationException, lang::exceptions::IndexOutOfBoundsException)

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index - index at which the specified element is to be inserted

element - element to be inserted

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **addAll** (std::size_t index, const **Collection**< E > &source) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index The index at which to insert the first element from the specified collection

source The **Collection** (p. 982) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

*More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 982).

- virtual E **remove** (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException)

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index - the index of the element to be removed

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

6.646.1 Detailed Description

```
template<typename E> class decaf::util::StlList< E >
```

List (p. 1865) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.646.2 Constructor & Destructor Documentation

6.646.2.1 `template<typename E> decaf::util::StlList< E >::StlList () [inline]`

Default constructor - does nothing.

6.646.2.2 `template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.646.2.3 `template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & source) [inline]`

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.646.2.4 `template<typename E> virtual decaf::util::StlList< E >::~~StlList () [inline, virtual]`

6.646.3 Member Function Documentation

6.646.3.1 `template<typename E> virtual bool decaf::util::StlList< E >::add (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]`

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 982) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions*UnsupportedOperationException**IllegalArgumentException**IllegalStateException* if the element cannot be added at this time due to insertion restrictionsImplements **decaf::util::Collection< E >** (p. 984).Referenced by **decaf::util::StlList< Pointer< BackupTransport > >::addAll()**.

6.646.3.2 `template<typename E> virtual void decaf::util::StlList< E >::add (std::size_t index, const E & element)
 throw (lang::exceptions::UnsupportedOperationException,
 lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters*index* - index at which the specified element is to be inserted*element* - element to be inserted**Exceptions***IndexOutOfBoundsException* - if the index is greater than size*UnsupportedOperationException* - If the collection is non-modifiable.Implements **decaf::util::List< E >** (p. 1867).

6.646.3.3 `template<typename E> virtual bool decaf::util::StlList< E >::addAll
 (std::size_t index, const Collection< E > & source)
 throw (decaf::lang::exceptions::UnsupportedOperationException,
 decaf::lang::exceptions::IndexOutOfBoundsException) [inline,
 virtual]`

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters*index* The index at which to insert the first element from the specified collection*source* The **Collection** (p. 982) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements **decaf::util::List< E >** (p.1867).

6.646.3.4 `template<typename E> virtual void decaf::util::StlList< E >::clear ()
throw (lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.1718) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p.123).

6.646.3.5 `template<typename E> virtual bool decaf::util::StlList< E >::contains (
const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p.982).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p.124).

6.646.3.6 `template<typename E> virtual void decaf::util::StlList< E >::copy (const StlList< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlList< Pointer< BackupTransport > >::StlList()`.

6.646.3.7 `template<typename E> virtual bool decaf::util::StlList< E >::equals (const StlList< E > & source) const [inline, virtual]`

6.646.3.8 `template<typename E> virtual E decaf::util::StlList< E >::get (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Gets the element contained at position passed.

Parameters

index - position to get

Returns

value at index

Implements `decaf::util::List< E >` (p. 1868).

6.646.3.9 `template<typename E> virtual std::size_t decaf::util::StlList< E >::indexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index *i* such that `get(i) == value`, or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NoSuchElementException if value is not in the list

Implements `decaf::util::List< E >` (p. 1868).

6.646.3.10 `template<typename E> virtual bool decaf::util::StlList< E >::isEmpty () const [inline, virtual]`

Returns true if this collection contains no elements.

This implementation returns `size() (p. 990) == 0`.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 125).

6.646.3.11 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () [inline, virtual]`

6.646.3.12 `template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator () const [inline, virtual]`

6.646.3.13 `template<typename E> virtual std::size_t decaf::util::StlList< E >::lastIndexOf (const E & value) throw (decaf::lang::exceptions::NoSuchElementException) [inline, virtual]`

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value - element to search for

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NoSuchElementException if value is not in the list

Implements **decaf::util::List< E >** (p. 1869).

6.646.3.14 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t index) throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Parameters

index index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBoundsException if the index is out of range (index < 0 || index > size() (p. 990))

Implements **decaf::util::List< E >** (p. 1870).

6.646.3.15 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () [inline, virtual]`

Returns

a list iterator over the elements in this list (in proper sequence).

Implements `decaf::util::List< E >` (p.1869).

6.646.3.16 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator () const [inline, virtual]`

Implements `decaf::util::List< E >` (p.1869).

6.646.3.17 `template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (std::size_t index) const throw (decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Implements `decaf::util::List< E >` (p.1869).

6.646.3.18 `template<typename E> virtual E decaf::util::StlList< E >::remove (std::size_t index) throw (decaf::lang::exceptions::UnsupportedOperationException, decaf::lang::exceptions::IndexOutOfBoundsException) [inline, virtual]`

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index - the index of the element to be removed

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

UnsupportedOperationException - If the collection is non-modifiable.

Implements `decaf::util::List< E >` (p.1870).

6.646.3.19 `template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 982).

Reimplemented from `decaf::util::AbstractCollection< E >` (p. 127).

```
6.646.3.20  template<typename E> virtual E decaf::util::StlList< E
            >::set ( std::size_t index, const E & element ) throw (
            decaf::lang::exceptions::IndexOutOfBoundsException ) [inline,
            virtual]
```

Replaces the element at the specified position in this list with the specified element.

Parameters

index - index of the element to replace

element - element to be stored at the specified position

Returns

the element previously at the specified position

Exceptions

IndexOutOfBoundsException - if the index is greater than size

Implements `decaf::util::List< E >` (p. 1871).

```
6.646.3.21  template<typename E> virtual std::size_t decaf::util::StlList< E >::size
            ( ) const [inline, virtual]
```

Returns the number of elements in this collection.

If this collection contains more than `Integer.MAX_VALUE` elements, returns `Integer.MAX_VALUE`.

Returns

the number of elements in this collection

Implements **decaf::util::Collection**< **E** > (p. 990).

Referenced by `decaf::util::StlList< Pointer< BackupTransport > >::add()`, `decaf::util::StlList< Pointer< BackupTransport > >::addAll()`, `decaf::util::StlList< Pointer< BackupTransport > >::get()`, `decaf::util::StlList< Pointer< BackupTransport > >::lastIndexOf()`, `decaf::util::StlList< Pointer< BackupTransport > >::listIterator()`, `decaf::util::StlList< Pointer< BackupTransport > >::remove()`, and `decaf::util::StlList< Pointer< BackupTransport > >::set()`.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlList.h`

6.647 **decaf::util::StlMap**< **K**, **V**, **COMPARATOR** > Class Template Reference

Map (p. 1970) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

```
#include <src/main/decaf/util/StlMap.h>
```

Inheritance diagram for `decaf::util::StlMap`< **K**, **V**, **COMPARATOR** >:

Public Member Functions

- **StlMap** ()
Default constructor - does nothing.
- **StlMap** (const **StlMap** &source)
Copy constructor - copies the content of the given map into this one.
- **StlMap** (const **Map**< **K**, **V**, **COMPARATOR** > &source)
Copy constructor - copies the content of the given map into this one.
- virtual **~StlMap** ()
- virtual bool **equals** (const **StlMap** &source) const
- virtual bool **equals** (const **Map**< **K**, **V**, **COMPARATOR** > &source) const
Comparison, equality is dependent on the method of determining if the element are equal.
Parameters
source - **Map** (p. 1970) to compare to this one.
Returns
true if the Map (p. 1970) passed is equal in value to this one.
- virtual void **copy** (const **StlMap** &source)

- virtual void **copy** (const **Map**< K, V, COMPARATOR > &source)
*Copies the content of the source map into this map.
Erases all existing data in this map.*
Parameters
source The source object to copy from.
- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)
Removes all keys and values from this map.
Exceptions
UnsupportedOperationException if this map is unmodifiable.
- virtual bool **containsKey** (const K &key) const
Indicates whether or this map contains a value for the given key.
Parameters
key The key to look up.
Returns
true if this map contains the value, otherwise false.
- virtual bool **containsValue** (const V &value) const
Indicates whether or this map contains a value for the given value, i.e. they are equal, this is done by operator== so the types must pass equivalence testing in this manner.
Parameters
value The Value to look up.
Returns
true if this map contains the value, otherwise false.
- virtual bool **isEmpty** () const
Returns
*if the **Map** (p. 1970) contains any element or not, TRUE or FALSE*
- virtual std::size_t **size** () const
Returns
The number of elements (key/value pairs) in this map.
- virtual V & **get** (const K &key) throw (lang::exceptions::NoSuchElementException)
*Gets the value mapped to the specified key in the **Map** (p. 1970).
If there is no element in the map whose key is equivalent to the key provided then a NoSuchElementException is thrown.*
Parameters
key The search key.
Returns
A reference to the value for the given key.
Exceptions
NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

- virtual const V & **get** (const K &key) const throw (decaf::lang::exceptions::NoSuchElementException)

*Gets the value mapped to the specified key in the **Map** (p. 1970).*

*If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.*

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

- virtual void **put** (const K &key, const V &value) throw (decaf::lang::exceptions::UnsupportedOperationException)

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

- virtual void **putAll** (const **StlMap**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

- virtual void **putAll** (const **Map**< K, V, COMPARATOR > &other) throw (decaf::lang::exceptions::UnsupportedOperationException)

*Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.*

Parameters

other A **Map** (p. 1970) instance whose elements are to all be inserted in this **Map** (p. 1970).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

- virtual V **remove** (const K &key) throw (decaf::lang::exceptions::NoSuchElementException, decaf::lang::exceptions::UnsupportedOperationException)

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the **Map** (p. 1970).
UnsupportedOperationException if this map is unmodifiable.

- virtual std::vector< K > **keySet** () const

Returns a **Set** (p. 2729) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1718), **Set.remove** (p. 127), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () const

Returns

the entire set of values in this map as a std::vector.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

Signals the waiters on this object that it can now wake up and continue.

6.647.1 Detailed Description

```
template<typename K, typename V, typename COMPARATOR = std::less<K>>
class decaf::util::StlMap< K, V, COMPARATOR >
```

Map (p.1970) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

Since

1.0

6.647.2 Constructor & Destructor Documentation

6.647.2.1 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap () [inline]`

Default constructor - does nothing.

6.647.2.2 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.647.2.3 `template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V, COMPARATOR > & source) [inline]`

Copy constructor - copies the content of the given map into this one.

Parameters

source The source map.

6.647.2.4 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual decaf::util::StlMap< K, V, COMPARATOR
>::~StlMap () [inline, virtual]`

6.647.3 Member Function Documentation

6.647.3.1 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual void decaf::util::StlMap<
K, V, COMPARATOR >::clear () throw (
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p.1972).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::copy()`.

6.647.3.2 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::containsKey (const K & key) const [inline, virtual]`

Indicates whether or this map contains a value for the given key.

Parameters

key The key to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p.1973).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::equals()`.

6.647.3.3 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::containsValue (const V & value) const [inline, virtual]`

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p.1973).

6.647.3.4 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const StlMap< K, V, COMPARATOR > & source) [inline, virtual]`

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::StlMap()`.

6.647.3.5 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & source) [inline, virtual]`

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source The source object to copy from.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1974).

6.647.3.6 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & source) const [inline, virtual]`

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source - `Map` (p. 1970) to compare to this one.

Returns

true if the `Map` (p. 1970) passed is equal in value to this one.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1974).

6.647.3.7 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const StlMap< K, V, COMPARATOR > & source) const [inline, virtual]`

6.647.3.8 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & key) throw (lang::exceptions::NoSuchElementException) [inline, virtual]`

Gets the value mapped to the specified key in the `Map` (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a `NoSuchElementException` is thrown.

Parameters

key The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1975).

```
6.647.3.9  template<typename K, typename V, typename COMPARATOR
           = std::less<K>> virtual const V& decaf::util::StlMap< K, V,
           COMPARATOR >::get ( const K & key ) const throw (
           lang::exceptions::NoSuchElementException ) [inline, virtual]
```

Gets the value mapped to the specified key in the **Map** (p. 1970).

If there is no element in the map whose key is equivalent to the key provided then a *NoSuchElementException* is thrown.

Parameters

key The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException if the key requests doesn't exist in the **Map** (p. 1970).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1976).

```
6.647.3.10 template<typename K, typename V, typename COMPARATOR =
           std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
           >::isEmpty ( ) const [inline, virtual]
```

Returns

if the **Map** (p. 1970) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1977).

```
6.647.3.11 template<typename K, typename V, typename COMPARATOR =
           std::less<K>> virtual std::vector<K> decaf::util::StlMap< K, V,
           COMPARATOR >::keySet ( ) const [inline, virtual]
```

Returns a **Set** (p. 2729) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own

remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1718), **Set.remove** (p. 127), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1977).

6.647.3.12 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::lock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2932).

6.647.3.13 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::notify () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

6.647.3.14 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::notifyAll () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [inline,
virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.647.3.15 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::put (const K & key, const V & value) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Sets the value for the specified key.

Parameters

key The target key.

value The value to be set.

Exceptions

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1978).

Referenced by **decaf::util::StlMap< std::string, cms::Topic * >::putAll()**.

6.647.3.16 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const StlMap< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Referenced by **decaf::util::StlMap< std::string, cms::Topic * >::copy()**.

6.647.3.17 `template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & other) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Stores a copy of the Mappings contained in the other **Map** (p. 1970) in this one.

Parameters

other A **Map** (p. 1970) instance whose elements are to all be inserted in this **Map** (p. 1970).

Exceptions

UnsupportedOperationException If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1979).

6.647.3.18 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual V decaf::util::StlMap< K, V,
COMPARATOR >::remove (const K & key) throw
(decaf::lang::exceptions::NoSuchElementException,
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException if this key is not in the **Map** (p. 1970).

UnsupportedOperationException if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1980).

6.647.3.19 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual std::size_t decaf::util::StlMap< K, V,
COMPARATOR >::size () const [inline, virtual]`

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1981).

6.647.3.20 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR
>::tryLock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2935).

6.647.3.21 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::unlock () throw (decaf::lang::exceptions::RuntimeException)
[inline, virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.647.3.22 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual std::vector<V> decaf::util::StlMap< K, V,
COMPARATOR >::values () const [inline, virtual]`

Returns

the entire set of values in this map as a `std::vector`.

Implements `decaf::util::Map< K, V, COMPARATOR >` (p. 1981).

Referenced by `decaf::util::StlMap< std::string, cms::Topic * >::values()`.

6.647.3.23 `template<typename K, typename V, typename COMPARATOR =
std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR
>::wait () throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.647.3.24 `template<typename K, typename V, typename COMPARATOR
= std::less<K>> virtual void decaf::util::StlMap< K, V,
COMPARATOR >::wait (long long millisecs, int
nanos) throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

```
6.647.3.25  template<typename K, typename V, typename COMPARATOR
            = std::less<K>> virtual void decaf::util::StlMap< K,
            V, COMPARATOR >::wait ( long long  milliseconds )
            throw ( decaf::lang::exceptions::RuntimeException,
            decaf::lang::exceptions::IllegalMonitorStateException,
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

The documentation for this class was generated from the following file:

Returns a Reference to the element at the head of the queue.
- const T & **front** () const
Returns a Reference to the element at the head of the queue.
- T & **back** ()
Returns a Reference to the element at the tail of the queue.
- const T & **back** () const
Returns a Reference to the element at the tail of the queue.
- void **push** (const T &t)
Places a new Object at the Tail of the queue.
- void **enqueueFront** (const T &t)
Places a new Object at the front of the queue.
- T **pop** ()
Removes and returns the element that is at the Head of the queue.
- size_t **size** () const
*Gets the Number of elements currently in the **Queue** (p. 2507).*
- bool **empty** () const

*Checks if this **Queue** (p. 2507) is currently empty.*

- virtual std::vector< T > **toArray** () const
- void **reverse** (**StlQueue**< T > &target) const
Reverses the order of the contents of this queue and stores them in the target queue.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.
- T & **getSafeValue** ()
Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.648.1 Detailed Description

```
template<typename T> class decaf::util::StlQueue< T >
```

The **Queue** (p. 2507) class accepts messages with an psuh(m) command where m is the message to be queued. It destructively returns the message with **pop()** (p. 2863). **pop()** (p. 2863) returns messages in the order they were enqueued.

Queue (p. 2507) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the pop method actually reaturns a reference to the element popped. This frees the app from having to call the **front** method before calling pop.

```
Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message
m string s = sq.pop(); // dequeues a message
```

= DESIGN CONSIDERATIONS

The **Queue** (p. 2507) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 2507).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.648.2 Constructor & Destructor Documentation

6.648.2.1 `template<typename T> decaf::util::StlQueue< T >::StlQueue ()`
[inline]

6.648.2.2 `template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue ()`
[inline, virtual]

6.648.3 Member Function Documentation

6.648.3.1 `template<typename T> T& decaf::util::StlQueue< T >::back ()`
[inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

6.648.3.2 `template<typename T> const T& decaf::util::StlQueue< T >::back ()`
const [inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

6.648.3.3 `template<typename T> void decaf::util::StlQueue< T >::clear ()`
[inline]

Empties this queue.

6.648.3.4 `template<typename T> bool decaf::util::StlQueue< T >::empty ()
 const [inline]`

Checks if this **Queue** (p. 2507) is currently empty.

Returns

boolean indicating queue emptiness

6.648.3.5 `template<typename T> void decaf::util::StlQueue< T >::enqueueFront ()
 const T & t) [inline]`

Places a new Object at the front of the queue.

Parameters

t - **Queue** (p. 2507) Object Type reference.

6.648.3.6 `template<typename T> const T& decaf::util::StlQueue< T >::front ()
 const [inline]`

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

6.648.3.7 `template<typename T> T& decaf::util::StlQueue< T >::front ()
 [inline]`

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

6.648.3.8 `template<typename T> T& decaf::util::StlQueue< T >::getSafeValue ()
 [inline]`

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns

Reference to this Queues safe object

Referenced by `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::back()`, `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::front()`, and `decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >::pop()`.

6.648.3.9 `template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator () [inline]`

Gets an **Iterator** (p. 1716) over this **Queue** (p. 2507).

Returns

new iterator pointer that is owned by the caller.

6.648.3.10 `template<typename T> virtual void decaf::util::StlQueue< T >::lock () throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]`

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2932).

6.648.3.11 `template<typename T> virtual void decaf::util::StlQueue< T >::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2933).

6.648.3.12 `template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]`

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2934).

6.648.3.13 `template<typename T> T decaf::util::StlQueue< T >::pop ()`
[inline]

Removes and returns the element that is at the Head of the queue.

Returns

reference to a queue type object or (safe)

6.648.3.14 `template<typename T> void decaf::util::StlQueue< T >::push (const T & t)` [inline]

Places a new Object at the Tail of the queue.

Parameters

t - **Queue** (p. 2507) Object Type reference.

6.648.3.15 `template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & target)` const [inline]

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters

target - The target queue that will receive the contents of this queue in reverse order.

6.648.3.16 `template<typename T> size_t decaf::util::StlQueue< T >::size ()` const [inline]

Gets the Number of elements currently in the **Queue** (p. 2507).

Returns

Queue (p. 2507) Size

6.648.3.17 `template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray ()` const [inline, virtual]

Returns

the all values in this queue as a std::vector.

6.648.3.18 `template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock ()` throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2935).

```
6.648.3.19  template<typename T> virtual void decaf::util::StlQueue< T >::unlock  
            ( ) throw ( decaf::lang::exceptions::RuntimeException ) [inline,  
            virtual]
```

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2936).

```
6.648.3.20  template<typename T> virtual void decaf::util::StlQueue< T  
            >::wait ( ) throw ( decaf::lang::exceptions::RuntimeException,  
            decaf::lang::exceptions::IllegalMonitorStateException,  
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2937).

```
6.648.3.21  template<typename T> virtual void decaf::util::StlQueue< T >::wait (  
            long long millisecs ) throw ( decaf::lang::exceptions::RuntimeException,  
            decaf::lang::exceptions::IllegalMonitorStateException,  
            decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

```
6.648.3.22  template<typename T> virtual void decaf::util::StlQueue<
              T >::wait ( long long millisecs, int nanos )
              throw ( decaf::lang::exceptions::RuntimeException,
                      decaf::lang::exceptions::IllegalArgumentException,
                      decaf::lang::exceptions::IllegalMonitorStateException,
                      decaf::lang::exceptions::InterruptedException ) [inline, virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

The documentation for this class was generated from the following file:

6.649 decaf::util::StlSet< E > Class Template Reference

Set (p. 2729) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

```
#include <src/main/decaf/util/StlSet.h>
```

Inheritance diagram for decaf::util::StlSet< E >:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()
Default constructor - does nothing.
- **StlSet** (const **StlSet** &source)
Copy constructor - copies the content of the given set into this one.
- **StlSet** (const **Collection**< E > &source)
Copy constructor - copies the content of the given set into this one.
- virtual ~**StlSet** ()
- **Iterator**< E > * **iterator** ()
- **Iterator**< E > * **iterator** () const
- virtual bool **equals** (const **StlSet** &source) const
- virtual void **copy** (const **StlSet** &source)
- virtual void **clear** () throw (lang::exceptions::UnsupportedOperationException)
*Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1718) operation. Most implementations will probably choose to override this method for efficiency.
Note that this implementation will throw an **UnsupportedOperationException** if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.*
Exceptions
***UnsupportedOperationException** if the clear operation is not supported by this collection*
- virtual bool **contains** (const E &value) const throw (lang::Exception)
*Returns true if this collection contains the specified element.
This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.*
Parameters
*value - the value whose presence is to be queried for in this **Collection** (p. 982).*
Returns
true if the value is contained in this collection
Exceptions
***Exception** if an error occurs,*

- virtual bool **isEmpty** () const
- virtual std::size_t **size** () const
- virtual bool **add** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException)

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 982) classes should clearly specify in their documentation any restrictions on what elements may be added.*

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

- virtual bool **remove** (const E &value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException)

Removes a single instance of the specified element from this collection, if it is present (optional operation).

*More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 982).

6.649.1 Detailed Description

template<typename E> class decaf::util::StlSet< E >

Set (p. 2729) template that wraps around a `std::set` to provide a more user-friendly interface and to provide common functions that do not exist in `std::set`.

6.649.2 Constructor & Destructor Documentation

6.649.2.1 template<typename E> decaf::util::StlSet< E >::StlSet () [inline]

Default constructor - does nothing.

6.649.2.2 template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.649.2.3 template<typename E> decaf::util::StlSet< E >::StlSet (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source The source set.

6.649.2.4 template<typename E> virtual decaf::util::StlSet< E >::~~StlSet () [inline, virtual]

6.649.3 Member Function Documentation

6.649.3.1 template<typename E> virtual bool decaf::util::StlSet< E >::add (const E & *value*) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException, lang::exceptions::IllegalStateException) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 982) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value - reference to the element to add.

Returns

true if the element was added

Exceptions

UnsupportedOperationException

IllegalArgumentException

IllegalStateException if the element cannot be added at this time due to insertion restrictions

Implements **decaf::util::Collection< E >** (p. 984).

6.649.3.2 `template<typename E> virtual void decaf::util::StlSet< E >::clear ()
throw (lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p.1718) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p.123).

6.649.3.3 `template<typename E> virtual bool decaf::util::StlSet< E >::contains (
const E & value) const throw (lang::Exception) [inline, virtual]`

Returns true if this collection contains the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Parameters

value - the value whose presence is to be queried for in this **Collection** (p. 982).

Returns

true if the value is contained in this collection

Exceptions

Exception if an error occurs,

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 124).

6.649.3.4 `template<typename E> virtual void decaf::util::StlSet< E >::copy (const StlSet< E > & source) [inline, virtual]`

Referenced by `decaf::util::StlSet< ActiveMQSession * >::StlSet()`.

6.649.3.5 `template<typename E> virtual bool decaf::util::StlSet< E >::equals (const StlSet< E > & source) const [inline, virtual]`

6.649.3.6 `template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty () const [inline, virtual]`

Returns

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 125).

6.649.3.7 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () const [inline]`

6.649.3.8 `template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator () [inline]`

6.649.3.9 `template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & value) throw (lang::exceptions::UnsupportedOperationException, lang::exceptions::IllegalArgumentException) [inline, virtual]`

Removes a single instance of the specified element from this collection, if it is present (optional operation).

More formally, removes the first element *e* such that *e* == *o*, if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an `UnsupportedOperationException` if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Parameters

value - element to be removed from this collection, if present

Returns

true if an element was removed as a result of this call

Exceptions

UnsupportedOperationException if the remove operation is not supported by this collection.

IllegalArgumentException If the value is not a valid entry for this **Collection** (p. 982).

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 127).

6.649.3.10 `template<typename E> virtual std::size_t decaf::util::StlSet< E >::size
() const [inline, virtual]`

Returns

The number of elements in this set.

Implements **decaf::util::Collection**< **E** > (p. 990).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/StlSet.h`

6.651 activemq::wireformat::stomp::StompFrame Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

```
#include <src/main/activemq/wireformat/stomp/StompFrame.h>
```

Public Member Functions

- **StompFrame** ()
Default constructor.
- virtual **~StompFrame** ()
Destruction.
- **StompFrame * clone** () const
Clone this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (const **StompFrame** *src)
Copies the contents of the passed Frame to this one.
- void **setCommand** (const std::string &cmd)
Sets the command for this stomp frame.
- const std::string & **getCommand** () const
Accessor for this frame's command field.
- bool **hasProperty** (const std::string &name) const
Checks if the given property is present in the Frame.
- std::string **getProperty** (const std::string &name, const std::string &fallback="") const
Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (const std::string &name)
Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (const std::string &name, const std::string &value)
Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()
Gets access to the header properties for this frame.
- const **decaf::util::Properties** & **getProperties** () const
- const std::vector< unsigned char > & **getBody** () const
Accessor for the body data of this frame.

- `std::vector< unsigned char > & getBody ()`
Non-const version of the body accessor.
- `std::size_t getBodyLength () const`
Return the number of bytes contained in this frames body.
- `void setBody (const unsigned char *bytes, std::size_t numBytes)`
Sets the body data of this frame as a byte sequence.
- `void toStream (decaf::io::DataOutputStream *stream) const throw (decaf::io::IOException)`
Writes this Frame to an OuputStream in the Stomp Wire Format.
- `void fromStream (decaf::io::DataInputStream *stream) throw (decaf::io::IOException)`
Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.651.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.651.2 Constructor & Destructor Documentation

6.651.2.1 `activemq::wireformat::stomp::StompFrame::StompFrame () [inline]`

Default constructor.

6.651.2.2 `virtual activemq::wireformat::stomp::StompFrame::~~StompFrame () [inline, virtual]`

Destruction.

6.651.3 Member Function Documentation

6.651.3.1 `StompFrame* activemq::wireformat::stomp::StompFrame::clone () const`

Clonse this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

6.651.3.2 `void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * src)`

Copies the contents of the passed Frame to this one.

Parameters

src - Frame to copy

6.651.3.3 void activemq::wireformat::stomp::StompFrame::fromStream (decaf::io::DataInputStream * *stream*) throw (decaf::io::IOException)

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters

stream - The stream to read the Frame from.

Exceptions

IOException if an error occurs while writing the Frame.

6.651.3.4 const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () const [inline]

Accessor for the body data of this frame.

Returns

char pointer to body data

6.651.3.5 std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody () [inline]

Non-const version of the body accessor.

6.651.3.6 std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength () const [inline]

Return the number of bytes contained in this frames body.

Returns

Body bytes length.

6.651.3.7 const std::string& activemq::wireformat::stomp::StompFrame::getCommand () const [inline]

Accessor for this frame's command field.

6.651.3.8 `decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () [inline]`

Gets access to the header properties for this frame.

Returns

the Properties object owned by this Frame

6.651.3.9 `const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties () const [inline]`

6.651.3.10 `std::string activemq::wireformat::stomp::StompFrame::getProperty (const std::string & name, const std::string & fallback = "") const [inline]`

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters

name - The name of the property to lookup

fallback - The default value to return if this value isn't set

Returns

string value of the property asked for.

6.651.3.11 `bool activemq::wireformat::stomp::StompFrame::hasProperty (const std::string & name) const [inline]`

Checks if the given property is present in the Frame.

Parameters

name - The name of the property to check for.

6.651.3.12 `std::string activemq::wireformat::stomp::StompFrame::removeProperty (const std::string & name) [inline]`

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters

name - the Name of the property to get and return.

6.651.3.13 `void activemq::wireformat::stomp::StompFrame::setBody (const unsigned char * bytes, std::size_t numBytes)`

Sets the body data of this frame as a byte sequence.

Parameters

bytes The byte buffer to be set in the body.

numBytes The number of bytes in the buffer.

6.651.3.14 `void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & cmd) [inline]`

Sets the command for this stomp frame.

Parameters

cmd command The command to be set.

6.651.3.15 `void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & name, const std::string & value) [inline]`

Sets the property given to the value specified in this Frame's Properties.

Parameters

name - Name of the property.

value - Value to set the property to.

6.651.3.16 `void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * stream) const throw (decaf::io::IOException)`

Writes this Frame to an OutputStream in the Stomp Wire Format.

Parameters

stream - The stream to write the Frame to.

Exceptions

IOException if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompFrame.h`

6.652 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from StompFrame's.

```
#include <src/main/activemq/wireformat/stomp/StompHelper.h>
```

Public Member Functions

- **StompHelper** ()
- virtual **~StompHelper** ()
- void **convertProperties** (const **Pointer**< **StompFrame** > &frame, const **Pointer**< **Message** > &message)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.
- void **convertProperties** (const **Pointer**< **Message** > &message, const **Pointer**< **StompFrame** > &frame)

*Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2874).*
- **Pointer**< **ActiveMQDestination** > **convertDestination** (const std::string &destination)

Converts from a Stomp Destination to an ActiveMQDestination.
- std::string **convertDestination** (const **Pointer**< **ActiveMQDestination** > &destination)

Converts from a ActiveMQDestination to a Stomp Destination Name.
- std::string **convertMessageId** (const **Pointer**< **MessageId** > &messageId)

Converts a MessageId instance to a Stomp MessageId String.
- **Pointer**< **MessageId** > **convertMessageId** (const std::string &messageId)

Converts a Stomp MessageId string to a MessageId.
- std::string **convertConsumerId** (const **Pointer**< **ConsumerId** > &consumerId)

Converts a ConsumerId instance to a Stomp ConsumerId String.
- **Pointer**< **ConsumerId** > **convertConsumerId** (const std::string &consumerId)

Converts a Stomp ConsumerId string to a ConsumerId.
- std::string **convertProducerId** (const **Pointer**< **ProducerId** > &producerId)

Converts a ProducerId instance to a Stomp ProducerId String.
- **Pointer**< **ProducerId** > **convertProducerId** (const std::string &producerId)

Converts a Stomp ProducerId string to a ProducerId.
- std::string **convertTransactionId** (const **Pointer**< **TransactionId** > &transactionId)

Converts a TransactionId instance to a Stomp TransactionId String.
- **Pointer**< **TransactionId** > **convertTransactionId** (const std::string &transactionId)

Converts a Stomp TransactionId string to a TransactionId.

6.652.1 Detailed Description

Utility Methods used when marshaling to and from StompFrame's.

Since

3.0

6.652.2 Constructor & Destructor Documentation

6.652.2.1 `activemq::wireformat::stomp::StompHelper::StompHelper ()` [inline]

6.652.2.2 `virtual activemq::wireformat::stomp::StompHelper::~~StompHelper ()`
[inline, virtual]

6.652.3 Member Function Documentation

6.652.3.1 `std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & consumerId)`

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters

consumerId - the Consumer instance to convert.

Returns

a Stomp Consumer Id String.

6.652.3.2 `Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & consumerId)`

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters

consumerId - the String Consumer Id to convert.

Returns

Pointer to a new ConsumerId.

6.652.3.3 `std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & destination)`

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters

destination - The ActiveMQDestination to Convert

Returns

the Stomp String name that defines the destination.

6.652.3.4 `Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & destination)`

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters

destination - The Stomp Destination name string.

Returns

Pointer to a new ActiveMQDestination.

6.652.3.5 `std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & messageId)`

Converts a MessageId instance to a Stomp MessageId String.

Parameters

messageId - the MessageId instance to convert.

Returns

a Stomp Message Id String.

6.652.3.6 `Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & messageId)`

Converts a Stomp MessageId string to a MessageId.

Parameters

messageId - the String message Id to convert.

Returns

Pointer to a new MessageId.

6.652.3.7 `std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & producerId)`

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters

producerId - the Producer instance to convert.

Returns

a Stomp Producer Id String.

6.652.3.8 `Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & producerId)`

Converts a Stomp ProducerId string to a ProducerId.

Parameters

producerId - the String Producer Id to convert.

Returns

Pointer to a new ProducerId.

6.652.3.9 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & message, const Pointer< StompFrame > & frame)`

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p.2874).

Parameters

message - The message to move the Headers to.

frame - The frame to extract headers from.

6.652.3.10 `void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & frame, const Pointer< Message > & message)`

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters

frame - The frame to extract headers from.

message - The message to move the Headers to.

6.652.3.11 `Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & transactionId)`

Converts a Stomp TransactionId string to a TransactionId.

Parameters

transactionId - the String Transaction Id to convert.

Returns

Pointer to a new TransactionId.

6.652.3.12 `std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & transactionId)`

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters

transactionId - the Transaction instance to convert.

Returns

a Stomp Transaction Id String.

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompHelper.h`

6.653 `activemq::wireformat::stomp::StompWireFormat` Class Reference

```
#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>
```

Inheritance diagram for `activemq::wireformat::stomp::StompWireFormat`:

Public Member Functions

- `StompWireFormat ()`
- `virtual ~StompWireFormat ()`
- `virtual void marshal (const Pointer< commands::Command > &command, const activemq::transport::Transport *transport, decaf::io::DataOutputStream *out) throw (decaf::io::IOException)`
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- `virtual Pointer< commands::Command > unmarshal (const activemq::transport::Transport *transport, decaf::io::DataInputStream *in) throw (decaf::io::IOException)`
Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- `virtual void setVersion (int version AMQCPP_UNUSED)`
Set the Version.
- `virtual int getVersion () const`
Get the Version.
- `virtual bool inReceive () const`
Is there a Message being unmarshaled?

- virtual bool **hasNegotiator** () const

Returns true if this **WireFormat** (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.

- virtual **Pointer< transport::Transport > createNegotiator** (const **Pointer< transport::Transport >** &transport) throw (decaf::lang::exceptions::UnsupportedOperationException)

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.653.1 Constructor & Destructor Documentation

6.653.1.1 **activemq::wireformat::stomp::StompWireFormat::StompWireFormat** ()

6.653.1.2 **virtual**
activemq::wireformat::stomp::StompWireFormat::~~StompWireFormat () [virtual]

6.653.2 Member Function Documentation

6.653.2.1 **virtual Pointer<transport::Transport> activemq::wireformat::stomp::StompWireFormat::createNegotiator** (const **Pointer< transport::Transport >** & *transport*) throw (decaf::lang::exceptions::UnsupportedOperationException) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 3182).

Exceptions

UnsupportedOperationException if the **WireFormat** (p. 3148) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.653.2.2 **virtual int activemq::wireformat::stomp::StompWireFormat::getVersion** () const [inline, virtual]

Get the Version.

Returns

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.653.2.3 `virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator () const`
`[inline, virtual]`

Returns true if this **WireFormat** (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3148) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 3149).

6.653.2.4 `virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive () const`
`[inline, virtual]`

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 3150).

6.653.2.5 `virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException)`
`[virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal to the output stream.

transport The Transport that initiated this marshal call.

out The output stream to write the command to.

Exceptions

IOException

Implements **activemq::wireformat::WireFormat** (p. 3150).

6.653.2.6 `virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version AMQCPP_UNUSED)`
`[inline, virtual]`

Set the Version.

Parameters

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 3150).

6.653.2.7 virtual Pointer<commands::Command> activemq::wireformat::stomp::StompWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException)
[virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implements **activemq::wireformat::WireFormat** (p. 3151).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/StompWireFormat.h

6.654 activemq::wireformat::stomp::StompWireFormatFactory Class Reference

Factory used to create the Stomp Wire Format instance.

```
#include <src/main/activemq/wireformat/stomp/StompWireFormatFactory.h>
```

Inheritance diagram for activemq::wireformat::stomp::StompWireFormatFactory:

Public Member Functions

- **StompWireFormatFactory** ()
- virtual ~**StompWireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (const decaf::util::Properties &properties) throw (decaf::lang::exceptions::IllegalStateException)

*Creates a new **WireFormat** (p. 3148) Object passing it a set of properties from which it can obtain any optional settings.*

6.654.1 Detailed Description

Factory used to create the Stomp Wire Format instance.

6.654.2 Constructor & Destructor Documentation

- 6.654.2.1** `activemq::wireformat::stomp::StompWireFormatFactory::StompWireFormatFactory ()` [inline]

6.654.3 Member Function Documentation

- 6.654.3.1** `virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat (const decaf::util::Properties & properties) throw (decaf::lang::exceptions::IllegalStateException)` [virtual]

Creates a new **WireFormat** (p. 3148) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3148)

Implements **activemq::wireformat::WireFormatFactory** (p. 3152).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/stomp/StompWireFormatFactory.h`

6.655 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

```
#include <src/main/cms/Stoppable.h>
```

Inheritance diagram for cms::Stoppable:

Public Member Functions

- `virtual ~Stoppable ()`
- `virtual void stop ()=0 throw (CMSException)`
Stops this service.

6.655.1 Detailed Description

Interface for a class that implements the stop method. An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since

1.0

6.655.2 Constructor & Destructor Documentation

6.655.2.1 virtual cms::Stoppable::~~Stoppable () [inline, virtual]

6.655.3 Member Function Documentation

6.655.3.1 virtual void cms::Stoppable::stop () throw (CMSException) [pure virtual]

Stops this service.

Exceptions

CMSException (p. 960) - if an internal error occurs while stopping the Service.

The documentation for this class was generated from the following file:

- src/main/cms/Stoppable.h

6.656 decaf::util::logging::StreamHandler Class Reference

```
#include <src/main/decaf/util/logging/StreamHandler.h>
```

Inheritance diagram for decaf::util::logging::StreamHandler:

Public Member Functions

- **StreamHandler** ()
*Create a **StreamHandler** (p. 2888), with no current output stream.*
- **StreamHandler** (io::OutputStream *stream, Formatter *formatter)
*Create a **StreamHandler** (p. 2888), with no current output stream.*
- virtual ~**StreamHandler** ()
- virtual void **close** () throw (decaf::io::IOException)
Close the current output stream.
- virtual void **flush** ()
Flush the Handler's output, clears any buffers.
- virtual void **publish** (const **LogRecord** &record)
*Publish the Log Record to this **Handler** (p. 1604).*
- virtual void **isLoggable** (const **LogRecord** &record)

Check if this **Handler** (p. 1604) would actually log a given **LogRecord** (p. 1928).

- virtual void **setFilter** (const **Filter** *filter)
Sets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.
- virtual const **Filter** * **getFilter** ()
Gets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.
- virtual void **setLevel** (**Level** level)
Set (p. 2729) the log level specifying which message levels will be logged by this **Handler** (p. 1604).
- virtual **Level** **getLevel** ()
Get the log level specifying which message levels will be logged by this **Handler** (p. 1604).
- virtual void **setFormatter** (const **Formatter** *formatter)
Sets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).
- virtual const **Formatter** * **getFormatter** ()
Gets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).
- virtual **io::OutputStream** * **getOutputStream** () const
Gets the output Stream that this **Handler** (p. 1604) is using.

6.656.1 Constructor & Destructor Documentation

6.656.1.1 decaf::util::logging::StreamHandler::StreamHandler () [inline]

Create a **StreamHandler** (p. 2888), with no current output stream.

6.656.1.2 decaf::util::logging::StreamHandler::StreamHandler (io::OutputStream * stream, Formatter * formatter) [inline]

Create a **StreamHandler** (p. 2888), with no current output stream.

6.656.1.3 virtual decaf::util::logging::StreamHandler::~~StreamHandler () [inline, virtual]

References DECAF_CATCH_NOTHROW, and DECAF_CATCHALL_NOTHROW.

6.656.2 Member Function Documentation

6.656.2.1 virtual void decaf::util::logging::StreamHandler::close () throw (decaf::io::IOException) [inline, virtual]

Close the current output stream.

The close method will perform a flush and then close the **Handler** (p. 1604). After close has been called this **Handler** (p. 1604) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions

IOException

Implements **decaf::io::Closeable** (p. 951).

6.656.2.2 virtual void decaf::util::logging::StreamHandler::flush () [inline, virtual]

Flush the Handler's output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 1605).

6.656.2.3 virtual const Filter* decaf::util::logging::StreamHandler::getFilter () [inline, virtual]

Gets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.

Returns

Filter (p. 1527) derived instance

Implements **decaf::util::logging::Handler** (p. 1606).

6.656.2.4 virtual const Formatter* decaf::util::logging::StreamHandler::getFormatter () [inline, virtual]

Gets the **Formatter** (p. 1595) used by this **Handler** (p. 1604).

Returns

currently configured **Formatter** (p. 1595) derived instance

Implements **decaf::util::logging::Handler** (p. 1606).

6.656.2.5 virtual Level decaf::util::logging::StreamHandler::getLevel () [inline, virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1604).

Returns

Currently set Level enumeration value

Implements **decaf::util::logging::Handler** (p. 1606).

6.656.2.6 virtual io::OutputStream* decaf::util::logging::StreamHandler::getOutputStream () const [inline, virtual]

Gets the output Stream that this **Handler** (p. 1604) is using.

Returns

OutputStream pointer used by this handler.

6.656.2.7 `virtual void decaf::util::logging::StreamHandler::isLoggable (const LogRecord & record) [inline, virtual]`

Check if this **Handler** (p. 1604) would actually log a given **LogRecord** (p. 1928).

Parameters

record LogRecord (p. 1928) to check

Implements **decaf::util::logging::Handler** (p. 1606).

6.656.2.8 `virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & record) [inline, virtual]`

Publish the Log Record to this **Handler** (p. 1604).

Parameters

record The LogRecord (p. 1928) to Publish

Implements **decaf::util::logging::Handler** (p. 1606).

References DECAF_CATCH_RETHROW, and DECAF_CATCHALL_THROW.

6.656.2.9 `virtual void decaf::util::logging::StreamHandler::setFilter (const Filter * filter) [inline, virtual]`

Sets the **Filter** (p. 1527) that this **Handler** (p. 1604) uses to filter Log Records.

Parameters

filter Filter (p. 1527) derived instance

Implements **decaf::util::logging::Handler** (p. 1607).

6.656.2.10 `virtual void decaf::util::logging::StreamHandler::setFormatter (const Formatter * formatter) [inline, virtual]`

Sets the Formatter (p. 1595) used by this **Handler** (p. 1604).

Parameters

formatter Formatter (p. 1595) derived instance

Implements **decaf::util::logging::Handler** (p. 1607).

6.656.2.11 `virtual void decaf::util::logging::StreamHandler::setLevel (Level level) [inline, virtual]`

Set (p. 2729) the log level specifying which message levels will be logged by this **Handler** (p. 1604).

The intention is to allow developers to turn on verbose logging, but to limit the messages that are sent to certain Handlers.

Parameters

level Level enumeration value

Implements **decaf::util::logging::Handler** (p. 1607).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.657 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 2892).

`#include <src/main/cms/StreamMessage.h>`

Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual `~StreamMessage ()`
- virtual `bool readBoolean () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)`
Reads a Boolean from the Stream message stream.
- virtual `void writeBoolean (bool value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)`
Writes a boolean to the Stream message stream as a 1-byte value.
- virtual `unsigned char readByte () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)`
Reads a Byte from the Stream message stream.
- virtual `void writeByte (unsigned char value)=0 throw (cms::MessageNotWriteableException, cms::CMSException)`
Writes a byte to the Stream message stream as a 1-byte value.
- virtual `std::size_t readBytes (std::vector< unsigned char > &value) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException)`
Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (const std::vector< unsigned char > &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual std::size_t **readBytes** (unsigned char *buffer, std::size_t length) const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a portion of the Stream message stream.

- virtual void **writeBytes** (const unsigned char *value, std::size_t offset, std::size_t length)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)

Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)

Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 16 bit unsigned short from the Stream message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a unsigned short to the Stream message stream as a 2 byte value.
- virtual int **readInt** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 32 bit signed integer from the Stream message stream.
- virtual void **writeInt** (int value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a signed int to the Stream message stream as a 4 byte value.
- virtual long long **readLong** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)
Reads a 64 bit long from the Stream message stream.
- virtual void **writeLong** (long long value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes a long long to the Stream message stream as a 8 byte value.
- virtual std::string **readString** () const =0 throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSEException)
Reads an ASCII String from the Stream message stream.
- virtual void **writeString** (const std::string &value)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)
Writes an ASCII String to the Stream message stream.

6.657.1 Detailed Description

Interface for a **StreamMessage** (p. 2892). The stream Messages provides a **Message** (p. 2036) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 2892) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSEException** (p. 960). The string-to-primitive conversions may throw a runtime exception if the primitive's `valueOf()` method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

		boolean	byte	short	char	int	long	float	double	String	byte[]

boolean	X								X
byte		X	X		X	X			X
short			X		X	X			X
char				X					X
int					X	X			X
long						X			X
float							X	X	X
double								X	X
String	X	X	X		X	X	X	X	X
byte[]									X

Since

1.3

6.657.2 Constructor & Destructor Documentation

6.657.2.1 `virtual cms::StreamMessage::~StreamMessage () [inline, virtual]`

6.657.3 Member Function Documentation

6.657.3.1 `virtual bool cms::StreamMessage::readBoolean () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.2 `virtual unsigned char cms::StreamMessage::readByte () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.3 `virtual std::size_t cms::StreamMessage::readBytes (std::vector< unsigned char > & value) const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.4 `virtual std::size_t cms::StreamMessage::readBytes (unsigned char * buffer, std::size_t length) const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than

the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 960) is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer the buffer into which the data is read

length the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.5 `virtual char cms::StreamMessage::readChar () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.6 `virtual double cms::StreamMessage::readDouble () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.7 virtual float cms::StreamMessage::readFloat () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.8 virtual int cms::StreamMessage::readInt () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.9 `virtual long long cms::StreamMessage::readLong () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.10 `virtual short cms::StreamMessage::readShort () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.11 `virtual std::string cms::StreamMessage::readString () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]`

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.12 virtual unsigned short cms::StreamMessage::readUnsignedShort () const throw (cms::MessageEOFException, cms::MessageFormatException, cms::MessageNotReadableException, cms::CMSException) [pure virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to read the message due to some internal error.

MessageEOFException (p. 2140) - if unexpected end of message stream has been reached.

MessageFormatException (p. 2141) - if this type conversion is invalid.

MessageNotReadableException (p. 2187) - if the message is in write-only mode.

6.657.3.13 virtual void cms::StreamMessage::writeBoolean (bool value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value boolean to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.14 `virtual void cms::StreamMessage::writeByte (unsigned char value)
throw (cms::MessageNotWriteableException, cms::CMSException)
[pure virtual]`

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

value byte to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.15 `virtual void cms::StreamMessage::writeBytes (const unsigned
char * value, std::size_t offset, std::size_t length) throw (cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

Parameters

value bytes to write to the stream

offset the initial offset within the byte array

length the number of bytes to use

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.16 `virtual void cms::StreamMessage::writeBytes (const
std::vector< unsigned char > & value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure
virtual]`

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

value bytes to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.17 `virtual void cms::StreamMessage::writeChar (char value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a char to the Stream message stream as a 1-byte value.

Parameters

value char to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.18 `virtual void cms::StreamMessage::writeDouble (double value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a double to the Stream message stream as a 8 byte value.

Parameters

value double to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.19 `virtual void cms::StreamMessage::writeFloat (float value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a float to the Stream message stream as a 4 byte value.

Parameters

value float to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.20 `virtual void cms::StreamMessage::writeInt (int value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

value signed int to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.21 `virtual void cms::StreamMessage::writeLong (long long value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

value signed long long to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.22 `virtual void cms::StreamMessage::writeShort (short value) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]`

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

value signed short to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.23 virtual void cms::StreamMessage::writeString (const std::string & *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters

value String to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

6.657.3.24 virtual void cms::StreamMessage::writeUnsignedShort (unsigned short *value*) throw (cms::MessageNotWriteableException, cms::CMSException) [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

value unsigned short to write to the stream

Exceptions

CMSException (p. 960) - if the CMS provider fails to write the message due to some internal error.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode.

The documentation for this class was generated from the following file:

- src/main/cms/StreamMessage.h

6.658 decaf::util::StringTokenizer Class Reference

```
#include <src/main/decaf/util/StringTokenizer.h>
```

Public Member Functions

- **StringTokenizer** (const std::string &str, const std::string &delim=" \t\n\r\f", bool returnDelims=false)

Constructs a string tokenizer for the specified string.

- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () const

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

- virtual bool **hasMoreTokens** () const
Tests if there are more tokens available from this tokenizer's string.
- virtual std::string **nextToken** () throw (lang::exceptions::NoSuchElementException)
Returns the next token from this string tokenizer.
- virtual std::string **nextToken** (const std::string &delim) throw (lang::exceptions::NoSuchElementException)
Returns the next token in this string tokenizer's string.
- virtual unsigned int **toArray** (std::vector< std::string > &array)
Grab all remaining tokens in the String and return them in the vector that is passed in by reference.
- virtual void **reset** (const std::string &str="", const std::string &delim="", bool returnDelims=false)
Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.658.1 Constructor & Destructor Documentation

6.658.1.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & str, const std::string & delim = " \t\n\r\f", bool returnDelims = false)

Constructs a string tokenizer for the specified string.

All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 2904) may result in an Exception.

Parameters

- str* - The string to tokenize
- delim* - String containing the delimiters
- returnDelims* - boolean indicating if the delimiters are returned as tokens

6.658.1.2 virtual decaf::util::StringTokenizer::~~StringTokenizer () [virtual]

6.658.2 Member Function Documentation

6.658.2.1 virtual int decaf::util::StringTokenizer::countTokens () const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

The current position is not advanced.

Returns

Count of remaining tokens

6.658.2.2 `virtual bool decaf::util::StringTokenizer::hasMoreTokens () const`
[virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns

true if there are more tokens remaining

6.658.2.3 `virtual std::string decaf::util::StringTokenizer::nextToken (const`
`std::string & delim) throw (lang::exceptions::NoSuchElementException`
`)` [virtual]

Returns the next token in this string tokenizer's string.

First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 2904) object is changed to be the characters in the string *delim*. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters

delim - string containing the new set of delimiters

Returns

next string in the token list

Exceptions

NoSuchElementException

6.658.2.4 `virtual std::string decaf::util::StringTokenizer::nextToken () throw (`
`lang::exceptions::NoSuchElementException)` [virtual]

Returns the next token from this string tokenizer.

Returns

string value of next token

Exceptions

NoSuchElementException

6.658.2.5 `virtual void decaf::util::StringTokenizer::reset (const std::string & str = "", const std::string & delim = "", bool returnDelims = false) [virtual]`

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing. If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made. If set the delim param will reset the string that this Tokenizer is using to tokenize the string. If set to "", no change is made. If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters

str - New String to tokenize or "", defaults to ""

delim - New Delimiter String to use or "", defaults to ""

returnDelims - Should the Tokenizer return delimiters as Tokens, default false

6.658.2.6 `virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & array) [virtual]`

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters

array - vector to place token strings in

Returns

number of string placed into the vector

The documentation for this class was generated from the following file:

#include <src/main/activemq/commands/SubscriptionInfo.h>
```

Inheritance diagram for `activemq::commands::SubscriptionInfo`:

Public Member Functions

- `SubscriptionInfo ()`
- `virtual ~SubscriptionInfo ()`
- `virtual unsigned char getDataStructureType () const`

Get the unique identifier that this object and its own Marshaler share.

- virtual **SubscriptionInfo** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const std::string & **getClientId** () const
- virtual std::string & **getClientId** ()
- virtual void **setClientId** (const std::string &clientId)
- virtual const **Pointer**< **ActiveMQDestination** > & **getDestination** () const
- virtual **Pointer**< **ActiveMQDestination** > & **getDestination** ()
- virtual void **setDestination** (const **Pointer**< **ActiveMQDestination** > &destination)
- virtual const std::string & **getSelector** () const
- virtual std::string & **getSelector** ()
- virtual void **setSelector** (const std::string &selector)
- virtual const std::string & **getSubscriptionName** () const
- virtual std::string & **getSubscriptionName** ()
- virtual void **setSubscriptionName** (const std::string &subscriptionName)

- virtual void **setSubscribedDestination** (const **Pointer**< **ActiveMQDestination** > &subscribedDestination)

Static Public Attributes

- static const unsigned char **ID_SUBSCRIPTIONINFO** = 55

Protected Member Functions

- **SubscriptionInfo** (const **SubscriptionInfo** &)
- **SubscriptionInfo** & **operator=** (const **SubscriptionInfo** &)

Protected Attributes

- std::string **clientId**
- **Pointer**< **ActiveMQDestination** > **destination**
- std::string **selector**
- std::string **subscriptionName**
- **Pointer**< **ActiveMQDestination** > **subscribedDestination**

6.659.1 Constructor & Destructor Documentation

- 6.659.1.1** `activemq::commands::SubscriptionInfo::SubscriptionInfo (const SubscriptionInfo &) [inline, protected]`
- 6.659.1.2** `activemq::commands::SubscriptionInfo::SubscriptionInfo ()`
- 6.659.1.3** `virtual activemq::commands::SubscriptionInfo::~~SubscriptionInfo () [virtual]`

6.659.2 Member Function Documentation

- 6.659.2.1** `virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

- 6.659.2.2** `virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Implements `activemq::commands::DataStructure` (p. 1374).

- 6.659.2.3** `virtual bool activemq::commands::SubscriptionInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Implements `activemq::commands::DataStructure` (p. 1374).

6.659.2.4 virtual std::string& activemq::commands::SubscriptionInfo::getClientId () [virtual]

6.659.2.5 virtual const std::string& activemq::commands::SubscriptionInfo::getClientId () const [virtual]

6.659.2.6 virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

Implements **activemq::commands::DataSet** (p. 1375).

- 6.659.2.7 `virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination () const` [virtual]
- 6.659.2.8 `virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination ()` [virtual]
- 6.659.2.9 `virtual const std::string& activemq::commands::SubscriptionInfo::getSelector () const` [virtual]
- 6.659.2.10 `virtual std::string& activemq::commands::SubscriptionInfo::getSelector ()` [virtual]
- 6.659.2.11 `virtual const std::string& activemq::commands::SubscriptionInfo::getSubscriptionName () const` [virtual]

```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller`:

Public Member Functions

- `SubscriptionInfoMarshaller ()`
- `virtual ~SubscriptionInfoMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaller.

- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.660.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2911). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.660.2 Constructor & Destructor Documentation

6.660.2.1 activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller () [inline]

6.660.2.2 virtual activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller () [inline, virtual]

6.660.3 Member Function Documentation

6.660.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.660.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::getDataStructureType() const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.660.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.660.3.4 `virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::looseUnmarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

```

6.660.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, utils::BooleanStream * bs ) throw (
decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```

6.660.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.660.3.7 virtual void activemq::wireformat::openwire::marshal::v1::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.661.3 Member Function Documentation

6.661.3.1 **virtual commands::DataStructure*** **activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.661.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::getDataStructureType() const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.661.3.3 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.661.3.4 virtual void activemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::looseUnmarshal(OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

```

6.661.3.5  virtual int ac-
            tivemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal1
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, utils::BooleanStream * bs ) throw (
            decaf::io::IOException ) [virtual]

```

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```

6.661.3.6  virtual void ac-
            tivemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightMarshal2
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataOutputStream * dataOut,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

```

6.661.3.7  virtual void ac-
            tivemq::wireformat::openwire::marshal::v3::SubscriptionInfoMarshaller::tightUnmarshal
            ( OpenWireFormat * wireFormat, commands::DataStructure
            * dataStructure, decaf::io::DataInputStream * dataIn,
            utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.662.3 Member Function Documentation

6.662.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.662.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.662.3.3 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.662.3.4 virtual void activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.662.3.5 virtual int activemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

```
6.662.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

```
6.662.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::SubscriptionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/SubscriptionInfoMarshaller.h`

6.663 **activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller** Class Reference

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2923).

```
#include <src/main/activemq/wireformat/openwire/marshal/v4/SubscriptionInfoMarshaller.h>
```

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.663.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2923). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.663.2 Constructor & Destructor Documentation

6.663.2.1 `activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller () [inline]`

6.663.2.2 `virtual activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller () [inline, virtual]`

6.663.3 Member Function Documentation

6.663.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.663.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.663.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1342).

6.663.3.4 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.663.3.5 virtual int activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.663.3.6 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.663.3.7 virtual void activemq::wireformat::openwire::marshal::v4::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

6.664.2.2 `virtual activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::~~SubscriptionInfoMarshaller()` [inline, virtual]

6.664.3 Member Function Documentation

6.664.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.664.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.664.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseMarshal(OpenWireFormat* wireFormat, commands::DataStructure* dataStructure, decaf::io::DataOutputStream* dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.664.3.4 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.664.3.5 virtual int activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.664.3.6 virtual void activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

6.664.3.7 virtual void **activemq::wireformat::openwire::marshal::v2::SubscriptionInfoMarshaller::tightUnmarshal**
 (**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
 * *dataStructure*, **decaf::io::DataInputStream** * *dataIn*,
utils::BooleanStream * *bs*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/SubscriptionInfoMarshaller.h`

6.665 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

```
#include <src/main/decaf/util/concurrent/Synchronizable.h>
```

Inheritance diagram for `decaf::util::concurrent::Synchronizable`:

Public Member Functions

- virtual \sim **Synchronizable** ()
- virtual void **lock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
*Attempts to **Lock** (p.1903) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** ()=0 throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()=0 throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.665.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since

1.0

6.665.2 Constructor & Destructor Documentation

6.665.2.1 virtual decaf::util::concurrent::Synchronizable::~~Synchronizable ()
[inline, virtual]

6.665.3 Member Function Documentation

6.665.3.1 virtual void decaf::util::concurrent::Synchronizable::lock () throw (decaf::lang::exceptions::RuntimeException) [pure virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implemented in `activemq::core::MessageDispatchChannel` (p. 2092), `decaf::internal::io::StandardErrorOutputStream` (p. 2814), `decaf::internal::io::StandardInputStream` (p. 2820), `decaf::internal::io::StandardOutputStream` (p. 2827), `decaf::internal::util::concurrent::SynchronizableImpl` (p. 2943), `decaf::io::BlockingByteArrayInputStream` (p. 669), `decaf::io::ByteArrayInputStream` (p. 831), `decaf::io::ByteArrayOutputStream` (p. 838), `decaf::io::FilterInputStream` (p. 1531), `decaf::io::FilterOutputStream` (p. 1539), `decaf::net::SocketInputStream` (p. 2799), `decaf::net::SocketOutputStream` (p. 2805), `decaf::util::AbstractCollection< E >` (p. 126), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1033), `decaf::util::concurrent::Mutex` (p. 2240), `decaf::util::StlMap< K, V, COMPARATOR >` (p. 2853), `decaf::util::StlQueue< T >` (p. 2862), `decaf::util::AbstractCollection< transport::TransportListener * >` (p. 126), `decaf::util::AbstractCollection< Pointer< Synchronization > >` (p. 126), `decaf::util::AbstractCollection< CompositeTask * >` (p. 126), `decaf::util::AbstractCollection< URI >` (p. 126), `decaf::util::AbstractCollection< ActiveMQSession * >` (p. 126), `decaf::util::AbstractCollection< Pointer< DestinationInfo > >` (p. 126), `decaf::util::AbstractCollection< PrimitiveValueNode >` (p. 126), `decaf::util::AbstractCollection< Pointer< Command > >` (p. 126), `decaf::util::AbstractCollection< Pointer< BackupTransport > >` (p. 126), `decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >` (p. 1033), `decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >` (p. 1033), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >` (p. 1033), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >` (p. 1033), `decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >` (p. 1033), `decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >` (p. 1033), `decaf::util::StlMap< cms::Session *, SessionResolver * >` (p. 2853), `decaf::util::StlMap< std::string, WireFormatFactory * >` (p. 2853), `decaf::util::StlMap< std::string, PrimitiveValueNode >` (p. 2853), `decaf::util::StlMap< std::string, cms::Queue * >` (p. 2853), `decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >` (p. 2853), `decaf::util::StlMap< std::string, CachedConsumer * >` (p. 2853), `decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >` (p. 2853),

decaf::util::StlMap< std::string, TransportFactory * > (p. 2853), decaf::util::StlMap< int, Pointer< Command > > (p. 2853), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2853), decaf::util::StlMap< std::string, CachedProducer * > (p. 2853), decaf::util::StlMap< std::string, cms::Topic * > (p. 2853), decaf::util::StlQueue< Pointer< Transport > > (p. 2862), decaf::util::StlQueue< Pointer< MessageDispatch > > (p. 2862), decaf::util::StlQueue< Task > (p. 2862), decaf::util::StlQueue< Pointer< Command > > (p. 2862), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > > (p. 2862).

Referenced by decaf::util::concurrent::Lock::lock().

6.665.3.2 virtual void decaf::util::concurrent::Synchronizable::notify
() throw (decaf::lang::exceptions::RuntimeException,
decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2092),
decaf::internal::io::StandardErrorOutputStream (p. 2814), **decaf::internal::io::StandardInputStream** (p. 2821), **decaf::internal::io::StandardOutputStream** (p. 2827), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2943), **decaf::io::BlockingByteArrayInputStream** (p. 669), **decaf::io::ByteArrayInputStream** (p. 831), **decaf::io::ByteArrayOutputStream** (p. 838), **decaf::io::FilterInputStream** (p. 1532), **decaf::io::FilterOutputStream** (p. 1540), **decaf::net::SocketInputStream** (p. 2799), **decaf::net::SocketOutputStream** (p. 2806), **decaf::util::AbstractCollection< E >** (p. 126), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1033), **decaf::util::concurrent::Mutex** (p. 2241), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2853), **decaf::util::StlQueue< T >** (p. 2862), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 126), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 126), **decaf::util::AbstractCollection< CompositeTask * >** (p. 126), **decaf::util::AbstractCollection< URI >** (p. 126), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 126), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 126), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 126), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 126), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 126), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1033), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1033), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1033), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1033), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId**

>, Pointer< SessionState >, SessionId::COMPARATOR > (p. 1033), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR > (p. 1033), decaf::util::StlMap< cms::Session *, SessionResolver * > (p. 2853), decaf::util::StlMap< std::string, WireFormatFactory * > (p. 2853), decaf::util::StlMap< std::string, PrimitiveValueNode > (p. 2853), decaf::util::StlMap< std::string, cms::Queue * > (p. 2853), decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR > (p. 2853), decaf::util::StlMap< std::string, CachedConsumer * > (p. 2853), decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR > (p. 2853), decaf::util::StlMap< std::string, TransportFactory * > (p. 2853), decaf::util::StlMap< int, Pointer< Command > > (p. 2853), decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR > (p. 2853), decaf::util::StlMap< std::string, CachedProducer * > (p. 2853), decaf::util::StlMap< std::string, cms::Topic * > (p. 2853), decaf::util::StlQueue< Pointer< Transport > > (p. 2862), decaf::util::StlQueue< Pointer< MessageDispatch > > (p. 2862), decaf::util::StlQueue< Task > (p. 2862), decaf::util::StlQueue< Pointer< Command > > (p. 2862), and decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > > (p. 2862).

6.665.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll
 () throw (decaf::lang::exceptions::RuntimeException,
 decaf::lang::exceptions::IllegalMonitorStateException) [pure virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2092), **decaf::internal::io::StandardErrorOutputStream** (p. 2815), **decaf::internal::io::StandardInputStream** (p. 2821), **decaf::internal::io::StandardOutputStream** (p. 2827), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2943), **decaf::io::BlockingByteArrayInputStream** (p. 670), **decaf::io::ByteArrayInputStream** (p. 832), **decaf::io::ByteArrayOutputStream** (p. 839), **decaf::io::FilterInputStream** (p. 1532), **decaf::io::FilterOutputStream** (p. 1540), **decaf::net::SocketInputStream** (p. 2800), **decaf::net::SocketOutputStream** (p. 2806), **decaf::util::AbstractCollection< E >** (p. 126), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1033), **decaf::util::concurrent::Mutex** (p. 2241), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2853), **decaf::util::StlQueue< T >** (p. 2862), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 126), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 126), **decaf::util::AbstractCollection< CompositeTask * >** (p. 126), **decaf::util::AbstractCollection< URI >** (p. 126), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 126), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 126), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 126), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 126), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 126), **decaf::util::concurrent::ConcurrentStlMap<**

Referenced by decaf::util::concurrent::Lock::unlock(), and decaf::util::concurrent::Lock::~~Lock().

6.665.3.6 virtual void decaf::util::concurrent::Synchronizable::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the *Synchronizable* (p. 2930) Object.

Implemented in *activemq::core::MessageDispatchChannel* (p. 2095), *decaf::internal::io::StandardErrorOutputStream* (p. 2815), *decaf::internal::io::StandardInputStream* (p. 2825), *decaf::internal::io::StandardOutputStream* (p. 2828), *decaf::internal::util::concurrent::SynchronizableImpl* (p. 2944), *decaf::io::BlockingByteArrayInputStream* (p. 672), *decaf::io::ByteArrayInputStream* (p. 835), *decaf::io::ByteArrayOutputStream* (p. 841), *decaf::io::FilterInputStream* (p. 1536), *decaf::io::FilterOutputStream* (p. 1541), *decaf::net::SocketInputStream* (p. 2803), *decaf::net::SocketOutputStream* (p. 2807), *decaf::util::AbstractCollection< E >* (p. 130), *decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >* (p. 1039), *decaf::util::concurrent::Mutex* (p. 2242), *decaf::util::StlMap< K, V, COMPARATOR >* (p. 2856), *decaf::util::StlQueue< T >* (p. 2864), *decaf::util::AbstractCollection< transport::TransportListener * >* (p. 130), *decaf::util::AbstractCollection< Pointer< Synchronization > >* (p. 130), *decaf::util::AbstractCollection< CompositeTask * >* (p. 130), *decaf::util::AbstractCollection< URI >* (p. 130), *decaf::util::AbstractCollection< ActiveMQSession * >* (p. 130), *decaf::util::AbstractCollection< Pointer< DestinationInfo > >* (p. 130), *decaf::util::AbstractCollection< PrimitiveValueNode >* (p. 130), *decaf::util::AbstractCollection< Pointer< Command > >* (p. 130), *decaf::util::AbstractCollection< Pointer< BackupTransport > >* (p. 130), *decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >* (p. 1039), *decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >* (p. 1039), *decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >* (p. 1039), *decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >* (p. 1039), *decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >* (p. 1039), *decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >* (p. 1039), *decaf::util::StlMap< cms::Session *, SessionResolver * >* (p. 2856), *decaf::util::StlMap< std::string, WireFormatFactory * >* (p. 2856), *decaf::util::StlMap< std::string, PrimitiveValueNode >* (p. 2856), *decaf::util::StlMap< std::string, cms::Queue * >* (p. 2856), *decaf::util::StlMap< Pointer< commands::ProducerId >, ActiveMQProducer *, commands::ProducerId::COMPARATOR >* (p. 2856), *decaf::util::StlMap< std::string, CachedConsumer * >* (p. 2856), *decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >* (p. 2856), *decaf::util::StlMap< std::string, TransportFactory * >* (p. 2856), *decaf::util::StlMap< int, Pointer< Command > >* (p. 2856), *decaf::util::StlMap< Pointer< commands::ConsumerId >, Dispatcher *, commands::ConsumerId::COMPARATOR >* (p. 2856), *decaf::util::StlMap< std::string, CachedProducer * >* (p. 2856), *decaf::util::StlMap< std::string, cms::Topic * >* (p. 2856), *decaf::util::StlQueue< Pointer< Transport > >* (p. 2864), *decaf::util::StlQueue< Pointer< MessageDispatch > >* (p. 2864), *decaf::util::StlQueue< Task >* (p. 2864), *decaf::util::StlQueue< Pointer< Command > >* (p. 2864), and *decaf::util::StlQueue< decaf::lang::Pointer< commands::MessageDispatch > >* (p. 2864).

6.665.3.7 virtual void decaf::util::concurrent::Synchronizable::wait (long long *milliseconds*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

milliseconds the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implemented in **activemq::core::MessageDispatchChannel** (p. 2094), **decaf::internal::io::StandardErrorOutputStream** (p. 2816), **decaf::internal::io::StandardInputStream** (p. 2824), **decaf::internal::io::StandardOutputStream** (p. 2828), **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2944), **decaf::io::BlockingByteArrayInputStream** (p. 673), **decaf::io::ByteArrayInputStream** (p. 835), **decaf::io::ByteArrayOutputStream** (p. 841), **decaf::io::FilterInputStream** (p. 1535), **decaf::io::FilterOutputStream** (p. 1541), **decaf::net::SocketInputStream** (p. 2802), **decaf::net::SocketOutputStream** (p. 2807), **decaf::util::AbstractCollection< E >** (p. 131), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 1038), **decaf::util::concurrent::Mutex** (p. 2243), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 2857), **decaf::util::StlQueue< T >** (p. 2864), **decaf::util::AbstractCollection< transport::TransportListener * >** (p. 131), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 131), **decaf::util::AbstractCollection< CompositeTask * >** (p. 131), **decaf::util::AbstractCollection< URI >** (p. 131), **decaf::util::AbstractCollection< ActiveMQSession * >** (p. 131), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 131), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 131), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 131), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 131), **decaf::util::concurrent::ConcurrentStlMap< Pointer< TransactionId >, Pointer< TransactionState >, TransactionId::COMPARATOR >** (p. 1038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 1038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 1038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 1038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 1038), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 1038), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 2857), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 2857), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 2857), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 2857),

6.665.3.8 `virtual void decaf::util::concurrent::Synchronizable::wait (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [pure virtual]`

Waits on a signal from this object, which is generated by a call to `Notify`.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or `WAIT_INFINITE`

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the *nanos* argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the **Synchronizable** (p. 2930) Object.

Implemented in `activemq::core::MessageDispatchChannel` (p. 2094), `decaf::internal::io::StandardErrorOutputStream` (p. 2816), `decaf::internal::io::StandardInputStream` (p. 2824), `decaf::internal::io::StandardOutputStream` (p. 2829), `decaf::internal::util::concurrent::SynchronizableImpl` (p. 2945), `decaf::io::BlockingByteArrayInputStream` (p. 673), `decaf::io::ByteArrayInputStream` (p. 834), `decaf::io::ByteArrayOutputStream` (p. 842), `decaf::io::FilterInputStream` (p. 1535), `decaf::io::FilterOutputStream` (p. 1541), `decaf::net::SocketInputStream` (p. 2802), `decaf::net::SocketOutputStream` (p. 2807), `decaf::util::AbstractCollection< E >` (p. 130), `decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >` (p. 1039), `decaf::util::concurrent::Mutex` (p. 2243), `decaf::util::StlMap<`

6.666 decaf::internal::util::concurrent::SynchronizableImpl Class Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

```
#include <src/main/decaf/internal/util/concurrent/SynchronizableImpl.h>
```

Inheritance diagram for decaf::internal::util::concurrent::SynchronizableImpl:

Public Member Functions

- **SynchronizableImpl** ()
- virtual \sim **SynchronizableImpl** ()
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)
Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)
Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)
Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)
Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)
Signals the waiters on this object that it can now wake up and continue.

6.666.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since

1.0

6.666.2 Constructor & Destructor Documentation

6.666.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ()

6.666.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~~SynchronizableImpl () [virtual]

6.666.3 Member Function Documentation

6.666.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock () throw (decaf::lang::exceptions::RuntimeException) [virtual]

Locks the object.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements decaf::util::concurrent::Synchronizable (p. 2932).

6.666.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying one of the waiting threads.

Implements decaf::util::concurrent::Synchronizable (p. 2933).

6.666.3.3 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

RuntimeException if an error occurs while notifying the waiting threads.

Implements decaf::util::concurrent::Synchronizable (p. 2934).

6.666.3.4 `virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock () throw (decaf::lang::exceptions::RuntimeException) [virtual]`

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException if an error occurs while locking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2935).

6.666.3.5 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock () throw (decaf::lang::exceptions::RuntimeException) [virtual]`

Unlocks the object.

Exceptions

RuntimeException if an error occurs while unlocking the object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2936).

6.666.3.6 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements `decaf::util::concurrent::Synchronizable` (p. 2937).

6.666.3.7 `virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [virtual]`

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

Exceptions

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2938).

```
6.666.3.8 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait
( long long millisecs, int nanos ) throw
( decaf::lang::exceptions::RuntimeException, de-
caf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalMonitorStateException,
decaf::lang::exceptions::InterruptedException ) [virtual]
```

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs the time in milliseconds to wait, or WAIT_INFINITE

nanos additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException if an error occurs or the nanos argument is not in the range of [0-999999]

RuntimeException if an error occurs while waiting on the object.

InterruptedException if the wait is interrupted before it completes.

IllegalMonitorStateException - if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2940).

6.668.1 Detailed Description

```
template<typename E> class decaf::util::concurrent::SynchronousQueue< E >
```

A `BlockingQueue` blocking queue} in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa. A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot `peek` at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and `poll()` (p. 2951) will return `null`. For purposes of other `Collection` (p. 982) methods (for example `contains`), a `SynchronousQueue` (p. 2946) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the `Collection` (p. 982) and `Iterator` (p. 1716) interfaces.

const E & e, long timeout, const TimeUnit & unit
) throw (decaf::lang::exceptions::InterruptedException,
decaf::lang::exceptions::NullPointerException, de-
caf::lang::exceptions::IllegalArgumentException) [inline,
virtual]`

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

Exceptions

InterruptedException

NullPointerException

IllegalArgumentException

- 6.668.3.11** `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::offer (const E
& value) throw (decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException) [inline, virtual]`

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters

value the element to add to the **Queue** (p.2507)

Returns

`true` if the element was added to this queue, else `false`

Exceptions

NullPointerException if the **Queue** (p. 2507) implementation does not allow Null values to be inserted into the **Queue** (p. 2507).

IllegalArgumentException if some property of the specified element prevents it from being added to this queue

6.668.3.12 `template<typename E > virtual bool

E &result DECAF_UNUSED) const [inline, virtual]`

6.668.3.13 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::poll (
E & result, long long timeout, const TimeUnit & unit) throw (
decaf::lang::exceptions::InterruptedException) [inline, virtual]`

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters

result a reference to the value where the head of the **Queue** (p. 2507) should be copied to.

timeout the time that the method should block if there is no element available to return.

unit the Time Units that the timeout value represents.

Returns

true if the head of the **Queue** (p. 2507) was copied to the result param or false if no value could be returned.

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.668.3.14 `template<typename E > virtual bool
decaf::util::concurrent::SynchronousQueue< E >::poll (
E & result) [inline, virtual]`

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters

result a reference to the value where the head of the **Queue** (p. 2507) should be copied to.

Returns

true if the head of the **Queue** (p. 2507) was copied to the result param or false if no value could be returned.

```

#include <src/main/decaf/lang/System.h>
```

Public Member Functions

- **System** ()
- virtual **~System** ()

Static Public Member Functions

- static const **util::Map**< std::string, std::string > & **getenv** () throw (lang::Exception)
Enumerates the system environment and returns a map of env variable names to the string values they hold.
- static std::string **getenv** (const std::string &name) throw (lang::Exception)
Reads an environment value from the system and returns it as a string object.
- static void **unsetenv** (const std::string &name) throw (lang::Exception)
Clears a set env value if one is set.
- static void **setenv** (const std::string &name, const std::string &value) throw (lang::Exception)
Sets the specified system property to the value given.
- static long long **currentTimeMillis** ()
Returns the current time in milliseconds.
- static long long **nanoTime** ()
Returns the current value of the most precise available system timer, in nanoseconds.
- static int **availableProcessors** ()
Returns the number of processors available for execution of Decaf Threads.

6.669.1 Constructor & Destructor Documentation

6.669.1.1 `decaf::lang::System::System ()`

6.669.1.2 `virtual decaf::lang::System::~~System ()` [inline, virtual]

6.669.2 Member Function Documentation

6.669.2.1 `static int decaf::lang::System::availableProcessors ()` [static]

Returns the number of processors available for execution of Decaf Threads.

This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns

the number of available processors.

6.669.2.2 `static long long decaf::lang::System::currentTimeMillis ()` [static]

Returns the current time in milliseconds.

Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.669.2.3 `static const util::Map<std::string, std::string>& decaf::lang::System::getenv ()` throw (`lang::Exception`) [static]

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns

A Map of all environment variables.

Exceptions

Exception (p. 1476) if an error occurs

6.669.2.4 `static std::string decaf::lang::System::getenv (const std::string & name) throw (lang::Exception) [static]`

Reads an environment value from the system and returns it as a string object.

Parameters

name - the env var to read

Returns

a string with the value from the var or ""

Exceptions

an Exception (p. 1476) if an error occurs while reading the Env.

6.669.2.5 `static long long decaf::lang::System::nanoTime () [static]`

Returns the current value of the most precise available system timer, in nanoseconds.

This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

```
long long startTime = System::nanoTime() (p. 2955); // ... the code being measured ... long
long estimatedTime = System::nanoTime() (p. 2955) - startTime;
```

Returns

The current value of the system timer, in nanoseconds.

6.669.2.6 `static void decaf::lang::System::setenv (const std::string & name, const std::string & value) throw (lang::Exception) [static]`

Sets the specified system property to the value given.

Parameters

name - name of the env val to set

value - value to assign to name

Exceptions

an Exception (p. 1476) if an error occurs

6.669.2.7 `static void decaf::lang::System::unsetenv (const std::string & name)
throw (lang::Exception) [static]`

Clears a set env value if one is set.

Parameters

name - the env var to clear

Exceptions

an Exception (p. 1476) if an error occurs while reading the Env.

- `src/main/decaf/lang/System.h`

6.670 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

`#include <src/main/activemq/threads/Task.h>`

Inheritance diagram for `activemq::threads::Task`:

Public Member Functions

- `virtual ~Task ()`
- `virtual bool iterate ()=0`

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.670.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since

3.0

6.670.2 Constructor & Destructor Documentation

6.670.2.1 `virtual activemq::threads::Task::~~Task () [inline, virtual]`

6.670.3 Member Function Documentation

6.670.3.1 `virtual bool activemq::threads::Task::iterate () [pure virtual]`

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in `activemq::core::ActiveMQSessionExecutor` (p. 421), `activemq::transport::failover::BackupTransportPool` (p. 596), `activemq::transport::failover::CloseTransportsTask` (p. 953), and `activemq::transport::failover::FailoverTransport` (p. 1518).

The documentation for this class was generated from the following file:

- `src/main/activemq/threads/Task.h`

6.671 decaf::util::concurrent::TaskListener Class Reference

```
#include <src/main/decaf/util/concurrent/TaskListener.h>
```

Public Member Functions

- virtual `~TaskListener()`
- virtual void `onTaskComplete (lang::Runnable *task)=0`
Called when a queued task has completed, the task that finished is passed along for user consumption.
- virtual void `onTaskException (lang::Runnable *task, lang::Exception &ex)=0`
Called when a queued task has thrown an exception while being run.

6.671.1 Constructor & Destructor Documentation

6.671.1.1 virtual `decaf::util::concurrent::TaskListener::~~TaskListener()`
[inline, virtual]

6.671.2 Member Function Documentation

6.671.2.1 virtual void `decaf::util::concurrent::TaskListener::onTaskComplete (lang::Runnable * task)` [pure virtual]

Called when a queued task has completed, the task that finished is passed along for user consumption.

Parameters

task Runnable Pointer to the task that finished

6.671.2.2 virtual void `decaf::util::concurrent::TaskListener::onTaskException (lang::Runnable * task, lang::Exception & ex)` [pure virtual]

Called when a queued task has thrown an exception while being run.

The Callee should assume that this was an unrecoverable exception and that this task is now defunct.

Parameters

- task* Runnable Pointer to the task
- ex* The ActiveMQException that was thrown.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**TaskListener.h**

6.672 activemq::threads::TaskRunner Class Reference

```
#include <src/main/activemq/threads/TaskRunner.h>
```

Inheritance diagram for activemq::threads::TaskRunner:

Public Member Functions

- virtual **~TaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)=0
Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()=0
Shutdown once the task has finished and the TaskRunner's thread has exited.
- virtual void **wakeup** ()=0
*Signal the **TaskRunner** (p. 2958) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2956) instance will be run until its iterate method has returned false indicating it is done.*

6.672.1 Constructor & Destructor Documentation

6.672.1.1 virtual **activemq::threads::TaskRunner::~TaskRunner** () [inline, virtual]

6.672.2 Member Function Documentation

6.672.2.1 virtual void **activemq::threads::TaskRunner::shutdown** (unsigned int *timeout*) [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

- timeout* - Time in Milliseconds to wait for the task to stop.

6.672.2.2 virtual void activemq::threads::TaskRunner::shutdown () [pure virtual]

Shutdown once the task has finished and the TaskRunner's thread has exited.

6.672.2.3 virtual void activemq::threads::TaskRunner::wakeup () [pure virtual]

Signal the **TaskRunner** (p. 2958) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2956) instance will be run until its iterate method has returned false indicating it is done.

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**TaskRunner.h**

6.673 decaf::net::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

```
#include <src/main/decaf/net/TcpSocket.h>
```

Inheritance diagram for decaf::net::TcpSocket:

Public Member Functions

- **TcpSocket** () throw (SocketException)
Construct a non-connected socket.
- **TcpSocket** (SocketHandle socketHandle)
Construct a connected or bound socket based on given socket handle.
- virtual ~**TcpSocket** ()
Releases the socket handle but not gracefully shut down the connection.
- **SocketHandle** getSocketHandle ()
Gets the handle for the socket.
- void **connect** (const char *host, int port, int timeout) throw (SocketException)
Connects to the specified destination.
- virtual void **connect** (const char *host, int port) throw (SocketException)
Connects to the specified destination.
- virtual bool **isConnected** () const
Indicates whether or not this socket is connected to a destination.
- virtual **io::InputStream** * getInputStream ()
Gets the InputStream for this socket.

- virtual **io::OutputStream * getOutputStream ()**
Gets the OutputStream for this socket.
- virtual **int getSoLinger () const throw (SocketException)**
Gets the linger time.
- virtual **void setSoLinger (int linger) throw (SocketException)**
Sets the linger time.
- virtual **bool getKeepAlive () const throw (SocketException)**
Gets the keep alive flag.
- virtual **void setKeepAlive (bool keepAlive) throw (SocketException)**
Enables/disables the keep alive flag.
- virtual **int getReceiveBufferSize () const throw (SocketException)**
Gets the receive buffer size.
- virtual **void setReceiveBufferSize (int size) throw (SocketException)**
Sets the receive buffer size.
- virtual **bool getReuseAddress () const throw (SocketException)**
Gets the reuse address flag.
- virtual **void setReuseAddress (bool reuse) throw (SocketException)**
Sets the reuse address flag.
- virtual **int getSendBufferSize () const throw (SocketException)**
Gets the send buffer size.
- virtual **void setSendBufferSize (int size) throw (SocketException)**
Sets the send buffer size.
- virtual **int getSoTimeout () const throw (SocketException)**
Gets the timeout for socket operations.
- virtual **void setSoTimeout (int timeout) throw (SocketException)**
Sets the timeout for socket operations.
- virtual **void close () throw (decaf::io::IOException)**
Closes this object and deallocates the appropriate resources.
- virtual **bool getTcpNoDelay () const throw (lang::Exception)**
Gets the Status of the TCP_NODELAY param for this socket as a Bool.
- virtual **void setTcpNoDelay (bool value) throw (lang::Exception)**
Sets the Status of the TCP_NODELAY param for this socket as a Bool.

Protected Member Functions

- void **checkResult** (apr_status_t value) const throw (SocketException)

6.673.1 Detailed Description

Platform-independent implementation of the socket interface.

6.673.2 Constructor & Destructor Documentation

6.673.2.1 decaf::net::TcpSocket::TcpSocket () throw (SocketException)

Construct a non-connected socket.

Exceptions

SocketException (p. 2793) thrown one windows if the static initialization call to WSAS-tartup was not successful.

6.673.2.2 decaf::net::TcpSocket::TcpSocket (SocketHandle socketHandle)

Construct a connected or bound socket based on given socket handle.

Parameters

socketHandle a socket handle to wrap in the object

6.673.2.3 virtual decaf::net::TcpSocket::~~TcpSocket () [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.673.3 Member Function Documentation

6.673.3.1 void decaf::net::TcpSocket::checkResult (apr_status_t value) const throw (SocketException) [protected]

6.673.3.2 virtual void decaf::net::TcpSocket::close () throw (decaf::io::IOException) [virtual]

Closes this object and deallocates the appropriate resources.

Exceptions

IOException

Implements **decaf::io::Closeable** (p. 951).

6.673.3.3 `void decaf::net::TcpSocket::connect (const char * host, int port, int timeout) throw (SocketException)`

Connects to the specified destination.

Closes this socket if connected to another destination.

Parameters

host The host of the server to connect to.

port The port of the server to connect to.

timeout of socket in microseconds

Exceptions

SocketException (p. 2793) Thrown if a failure occurred in the connect.

6.673.3.4 `virtual void decaf::net::TcpSocket::connect (const char * host, int port) throw (SocketException) [inline, virtual]`

Connects to the specified destination.

Closes this socket if connected to another destination.

Parameters

host The host of the server to connect to.

port The port of the server to connect to.

Exceptions

SocketException (p. 2793) Thrown if a failure occurred in the connect.

Implements `decaf::net::Socket` (p. 2787).

6.673.3.5 `virtual io::InputStream* decaf::net::TcpSocket::getInputStream () [virtual]`

Gets the InputStream for this socket.

Returns

The InputStream for this socket. NULL if not connected.

Implements `decaf::net::Socket` (p. 2788).

6.673.3.6 `virtual bool decaf::net::TcpSocket::getKeepAlive () const throw (SocketException) [virtual]`

Gets the keep alive flag.

Returns

True if keep alive is enabled.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2788).

6.673.3.7 `virtual io::OutputStream* decaf::net::TcpSocket::getOutputStream ()`
[virtual]

Gets the OutputStream for this socket.

Returns

the OutputStream for this socket. NULL if not connected.

Implements **decaf::net::Socket** (p. 2788).

6.673.3.8 `virtual int decaf::net::TcpSocket::getReceiveBufferSize () const throw (SocketException)` [virtual]

Gets the receive buffer size.

Returns

the receive buffer size in bytes.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2788).

6.673.3.9 `virtual bool decaf::net::TcpSocket::getReuseAddress () const throw (SocketException)` [virtual]

Gets the reuse address flag.

Returns

True if the address can be reused.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2789).

6.673.3.10 `virtual int decaf::net::TcpSocket::getSendBufferSize () const throw (SocketException)` [virtual]

Gets the send buffer size.

Returns

the size in bytes of the send buffer.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2789).

6.673.3.11 SocketHandle decaf::net::TcpSocket::getSocketHandle () [inline]

Gets the handle for the socket.

Returns

SocketHabler for this **Socket** (p. 2786), can be NULL

6.673.3.12 virtual int decaf::net::TcpSocket::getSoLinger () const throw (SocketException) [virtual]

Gets the linger time.

Returns

The linger time in seconds.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2789).

6.673.3.13 virtual int decaf::net::TcpSocket::getSoTimeout () const throw (SocketException) [virtual]

Gets the timeout for socket operations.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 2793) Thrown if unable to retrieve the information.

Implements **decaf::net::Socket** (p. 2790).

6.673.3.14 virtual bool decaf::net::TcpSocket::getTcpNoDelay () const throw (lang::Exception) [virtual]

Gets the Status of the TCP_NODELAY param for this socket as a Bool.

Returns

true if TCP_NODELAY is enabled

Exceptions

Exception

6.673.3.15 `virtual bool decaf::net::TcpSocket::isConnected () const [inline, virtual]`

Indicates whether or not this socket is connected to a destination.

Returns

true if connected

Implements **decaf::net::Socket** (p. 2790).

6.673.3.16 `virtual void decaf::net::TcpSocket::setKeepAlive (bool keepAlive) throw (SocketException) [virtual]`

Enables/disables the keep alive flag.

Parameters

keepAlive If true, enables the flag.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2790).

6.673.3.17 `virtual void decaf::net::TcpSocket::setReceiveBufferSize (int size) throw (SocketException) [virtual]`

Sets the receive buffer size.

Parameters

size Number of bytes to set the receive buffer to.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2790).

6.673.3.18 `virtual void decaf::net::TcpSocket::setReuseAddress (bool reuse) throw (SocketException) [virtual]`

Sets the reuse address flag.

Parameters

reuse If true, sets the flag.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements **decaf::net::Socket** (p. 2791).

6.673.3.19 `virtual void decaf::net::TcpSocket::setSendBufferSize (int size) throw (SocketException)` [virtual]

Sets the send buffer size.

Parameters

size The number of bytes to set the send buffer to.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements `decaf::net::Socket` (p. 2791).

6.673.3.20 `virtual void decaf::net::TcpSocket::setSoLinger (int linger) throw (SocketException)` [virtual]

Sets the linger time.

Parameters

linger The linger time in seconds. If 0, linger is off.

Exceptions

SocketException (p. 2793) if the operation fails.

Implements `decaf::net::Socket` (p. 2791).

6.673.3.21 `virtual void decaf::net::TcpSocket::setSoTimeout (int timeout) throw (SocketException)` [virtual]

Sets the timeout for socket operations.

Parameters

timeout The timeout in milliseconds for socket operations.

Exceptions

SocketException (p. 2793) Thrown if unable to set the information.

Implements `decaf::net::Socket` (p. 2792).

6.673.3.22 `virtual void decaf::net::TcpSocket::setTcpNoDelay (bool value) throw (lang::Exception)` [virtual]

Sets the Status of the TCP_NODELAY param for this socket as a Bool.

Parameters

value - true if TCP_NODELAY is to be enabled

Exceptions

Exception

The documentation for this class was generated from the following file:

- `src/main/decaf/net/TcpSocket.h`

6.674 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1709).

```
#include <src/main/activemq/transport/tcp/TcpTransport.h>
```

Inheritance diagram for `activemq::transport::tcp::TcpTransport`:

Public Member Functions

- **TcpTransport** (const **decaf::util::Properties** &properties, const **Pointer**< **Transport** > &next)
Constructor.
- **TcpTransport** (const **decaf::net::URI** &uri, const **decaf::util::Properties** &properties, const **Pointer**< **Transport** > &next)
Constructor.
- virtual **~TcpTransport** ()
- virtual void **close** () throw (**decaf::io::IOException**)
Delegates to the superclass and then closes the socket.
- virtual bool **isFaultTolerant** () const
*Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const
*Is the **Transport** (p. 3066) Connected to its Broker.*
- virtual bool **isClosed** () const
*Has the **Transport** (p. 3066) been shutdown and no longer usable.*

6.674.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1709). The lower level transport should take care of managing stream reads and writes.

6.674.2 Constructor & Destructor Documentation

6.674.2.1 `activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::util::Properties & properties, const Pointer< Transport > & next)`

Constructor.

Parameters

properties the configuration properties for this transport

next the next transport in the chain

6.674.2.2 `activemq::transport::tcp::TcpTransport::TcpTransport (const decaf::net::URI & uri, const decaf::util::Properties & properties, const Pointer< Transport > & next)`

Constructor.

Parameters

uri - The URI containing the host to connect to.

properties the configuration properties for this transport

next the next transport in the chain

6.674.2.3 `virtual activemq::transport::tcp::TcpTransport::~~TcpTransport ()`
[virtual]

6.674.3 Member Function Documentation

6.674.3.1 `virtual void activemq::transport::tcp::TcpTransport::close () throw (decaf::io::IOException)` [virtual]

Delegates to the superclass and then closes the socket.

Exceptions

IOException if errors occur.

Reimplemented from `activemq::transport::TransportFilter` (p. 3075).

6.674.3.2 `virtual bool activemq::transport::tcp::TcpTransport::isClosed () const`
[inline, virtual]

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

Reimplemented from `activemq::transport::TransportFilter` (p. 3076).

6.674.3.3 virtual bool activemq::transport::tcp::TcpTransport::isConnected () const [inline, virtual]

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented from **activemq::transport::TransportFilter** (p. 3076).

6.674.3.4 virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant () const [inline, virtual]

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

Reimplemented from **activemq::transport::TransportFilter** (p. 3077).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransport.h**

6.675 activemq::transport::tcp::TcpTransportFactory Class Reference

Factory Responsible for creating the **TcpTransport** (p. 2967).

```
#include <src/main/activemq/transport/tcp/TcpTransportFactory.h>
```

Inheritance diagram for **activemq::transport::tcp::TcpTransportFactory**:

Public Member Functions

- virtual **~TcpTransportFactory** ()
- virtual **Pointer< Transport > create** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)
*Creates a fully configured **Transport** (p. 3066) instance which could be a chain of filters and transports.*
- virtual **Pointer< Transport > createComposite** (const **decaf::net::URI** &location) throw (exceptions::ActiveMQException)
*Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.*

Protected Member Functions

- virtual **Pointer< Transport > doCreateComposite** (const **decaf::net::URI** &location, const **Pointer< wireformat::WireFormat >** &wireFormat, const **decaf::util::Properties** &properties) throw (exceptions::ActiveMQException)

*Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.*

6.675.1 Detailed Description

Factory Responsible for creating the **TcpTransport** (p. 2967).

6.675.2 Constructor & Destructor Documentation

- 6.675.2.1** virtual
activemq::transport::tcp::TcpTransportFactory::~~TcpTransportFactory (
) [inline, virtual]

6.675.3 Member Function Documentation

- 6.675.3.1** virtual **Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create**
 (const **decaf::net::URI** & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a fully configured **Transport** (p. 3066) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3072).

- 6.675.3.2** virtual **Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite** (const **decaf::net::URI** & *location*) throw (exceptions::ActiveMQException) [virtual]

Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implements **activemq::transport::TransportFactory** (p. 3072).

6.675.3.3 `virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite (const decaf::net::URI & location, const Pointer< wireformat::WireFormat > & wireFormat, const decaf::util::Properties & properties) throw (exceptions::ActiveMQException)` [protected, virtual]

Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to.

wireFormat - the assigned WireFormat for the new **Transport** (p. 3066).

properties - Properties to apply to the transport.

Returns

new Pointer to a **TcpTransport** (p. 2967).

Exceptions

ActiveMQException if an error occurs

Gets the name of this topic.
- virtual void **destroy** ()=0 throw (CMSEException)
*Destroy's the Temporary **Destination** (p. 1387) at the Provider.*

6.677.1 Detailed Description

Defines a Temporary **Topic** (p. 3014) based **Destination** (p. 1387). A **TemporaryTopic** (p. 2973) is a special type of **Topic** (p. 3014) **Destination** (p. 1387) that can only be consumed from the **Connection** (p. 1052) which created it. TemporaryTopics are most commonly used as the reply to address for Message's that implement the request response pattern.

A **TemporaryTopic** (p. 2973) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 1052) that created it.

Since

1.0

6.677.2 Constructor & Destructor Documentation

6.677.2.1 virtual cms::TemporaryTopic::~~TemporaryTopic () [inline, virtual]

6.677.3 Member Function Documentation

6.677.3.1 virtual void cms::TemporaryTopic::destroy () throw (CMSEException) [pure virtual]

Destroy's the Temporary **Destination** (p. 1387) at the Provider.

Exceptions

CMSEException (p. 960)

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 503).

6.677.3.2 `virtual std::string cms::TemporaryTopic::getTopicName () const throw (CMSEException)` [pure virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

Implemented in `activemq::commands::ActiveMQTempTopic` (p. 504).

The documentation for this class was generated from the following file:

- `src/main/cms/TemporaryTopic.h`

6.678 cms::TextMessage Class Reference

Interface for a text message.

```
#include <src/main/cms/TextMessage.h>
```

Inheritance diagram for `cms::TextMessage`:

Public Member Functions

- `virtual ~TextMessage ()`
- `virtual std::string getText () const =0 throw (cms::CMSEException)`
Gets the message character buffer.
- `virtual void setText (const char *msg)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)`
Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- `virtual void setText (const std::string &msg)=0 throw (cms::MessageNotWriteableException, cms::CMSEException)`
Sets the message contents.

6.678.1 Detailed Description

Interface for a text message. A `TextMessage` (p. 2974) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a `TextMessage` (p. 2974) is received in Read-Only mode, any attempt to write to the `Message` (p. 2036) will result in a `MessageNotWritableException` being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since

1.0

6.678.2 Constructor & Destructor Documentation

6.678.2.1 virtual cms::TextMessage::~TextMessage () [inline, virtual]

6.678.3 Member Function Documentation

6.678.3.1 virtual std::string cms::TextMessage::getText () const throw (cms::CMSEException) [pure virtual]

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

6.678.3.2 virtual void cms::TextMessage::setText (const std::string & msg) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]

Sets the message contents.

Parameters

msg The message buffer.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode..

6.678.3.3 virtual void cms::TextMessage::setText (const char * msg) throw (cms::MessageNotWriteableException, cms::CMSEException) [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

msg The message buffer.

Exceptions

CMSEException (p. 960) - if an internal error occurs.

MessageNotWriteableException (p. 2188) - if the message is in read-only mode..

The documentation for this class was generated from the following file:

- `src/main/cms/TextMessage.h`

6.679 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p.2976)

```
#include <src/main/decaf/util/concurrent/ThreadFactory.h>
```

Public Member Functions

- virtual `~ThreadFactory()`
- virtual `decaf::lang::Thread * newThread (decaf::lang::Runnable *r)=0`
Constructs a new Thread.

6.679.1 Detailed Description

public interface **ThreadFactory** (p.2976) An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

```
class SimpleThreadFactory : public ThreadFactory (p.2976) { public: Thread* newThread(
Runnable* r ) { return new Thread(r); } }
```

The `Executors.defaultThreadFactory()` method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

Since

1.0

6.679.2 Constructor & Destructor Documentation

6.679.2.1 virtual `decaf::util::concurrent::ThreadFactory::~~ThreadFactory ()`
`[inline, virtual]`

6.679.3 Member Function Documentation

6.679.3.1 virtual `decaf::lang::Thread* decaf::util::concurrent::ThreadFactory::newThread (decaf::lang::Runnable * r)` `[pure virtual]`

Constructs a new Thread.

Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters

- r* A pointer to a Runnable instance to be executed by new Thread instance returned.

Returns

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadFactory.h**

6.680 decaf::lang::ThreadGroup Class Reference

```
#include <src/main/decaf/lang/ThreadGroup.h>
```

Public Member Functions

- ThreadGroup** ()
- virtual **~ThreadGroup** ()

6.680.1 Detailed Description

Since

1.0

6.680.2 Constructor & Destructor Documentation

6.680.2.1 decaf::lang::ThreadGroup::ThreadGroup ()

6.680.2.2 virtual decaf::lang::ThreadGroup::~~ThreadGroup () [virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**ThreadGroup.h**

6.681 decaf::util::concurrent::ThreadPool Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

```
#include <src/main/decaf/util/concurrent/ThreadPool.h>
```

Inheritance diagram for decaf::util::concurrent::ThreadPool:

Public Types

- typedef std::pair< **lang::Runnable** *, **TaskListener** * > **Task**

Public Member Functions

- **ThreadPool ()**
- virtual **~ThreadPool ()**
- virtual void **queueTask (Task task)** throw (lang::Exception)
Queue (p. 2507) a task to be completed by one of the Pooled Threads.
- virtual **Task deQueueTask ()** throw (lang::Exception)
DeQueue a task to be completed by one of the Pooled Threads.
- virtual std::size_t **getPoolSize ()** const
Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.
- virtual std::size_t **getBacklog ()** const
Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.
- virtual void **reserve (std::size_t size)**
Ensures that there is at least the specified number of Threads allocated to the pool.
- virtual std::size_t **getMaxThreads ()** const
Get the Max Number of Threads this Pool can contain.
- virtual void **setMaxThreads (std::size_t maxThreads)**
Sets the Max number of threads this pool can contain.
- virtual std::size_t **getBlockSize ()** const
Gets the Max number of threads that can be allocated at a time when new threads are needed.
- virtual void **setBlockSize (std::size_t blockSize)**
Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.
- virtual std::size_t **getFreeThreadCount ()** const
Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.
- virtual void **onTaskStarted (PooledThread *thread)**
Called by a pooled thread when it is about to begin executing a new task.
- virtual void **onTaskCompleted (PooledThread *thread)**
Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.
- virtual void **onTaskException (PooledThread *thread, lang::Exception &ex)**
*Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2364) is now no longer running.*

Static Public Member Functions

- static **ThreadPool** * **getInstance** ()
Return the one and only Thread Pool instance.

Static Public Attributes

- static const size_t **DEFAULT_MAX_POOL_SIZE** = 10
- static const size_t **DEFAULT_MAX_BLOCK_SIZE** = 3

6.681.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks. The Thread Pool has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the **Runnable** interface and one of the worker threads will execute it in its thread context.

6.681.2 Member Typedef Documentation

- 6.681.2.1** `typedef std::pair<lang::Runnable*, TaskListener*>`
 `decaf::util::concurrent::ThreadPool::Task`

6.681.3 Constructor & Destructor Documentation

- 6.681.3.1** `decaf::util::concurrent::ThreadPool::ThreadPool ()`
- 6.681.3.2** `virtual decaf::util::concurrent::ThreadPool::~~ThreadPool ()` [virtual]

6.681.4 Member Function Documentation

- 6.681.4.1** `virtual Task decaf::util::concurrent::ThreadPool::deQueueTask ()`
 `throw (lang::Exception)` [virtual]

DeQueue a task to be completed by one of the Pooled Threads.

A caller of this method will block until there is something in the tasks queue, therefore care must be taken when calling this function. Normally clients of **ThreadPool** (p. 2977) don't use this, only the **PooledThread** (p. 2364) objects owned by this **ThreadPool** (p. 2977).

Returns

object that derives from **Runnable**

Exceptions

ActiveMQException

6.681.4.2 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBacklog ()`
`const [inline, virtual]`

Returns the current backlog of items in the tasks queue, this is how much work is still waiting to get done.

Returns

number of outstanding tasks.

6.681.4.3 `virtual std::size_t decaf::util::concurrent::ThreadPool::getBlockSize ()`
`const [inline, virtual]`

Gets the Max number of threads that can be allocated at a time when new threads are needed.

Returns

max Thread Block Size

6.681.4.4 `virtual std::size_t decaf::util::concurrent::ThreadPool::getFreeThreadCount ()`
`const [inline, virtual]`

Returns the current number of available threads in the pool, threads that are performing a user task are considered unavailable.

This value could change immediately after calling as Threads could finish right after and be available again. This is informational only.

Returns

total free threads

6.681.4.5 `static ThreadPool* decaf::util::concurrent::ThreadPool::getInstance ()`
`[static]`

Return the one and only Thread Pool instance.

Returns

The Thread Pool Pointer

6.681.4.6 `virtual std::size_t decaf::util::concurrent::ThreadPool::getMaxThreads ()`
`const [inline, virtual]`

Get the Max Number of Threads this Pool can contain.

Returns

max size

6.681.4.7 `virtual std::size_t decaf::util::concurrent::ThreadPool::getPoolSize ()`
`const` [inline, virtual]

Returns the current number of Threads in the Pool, this is how many there are now, not how many are active or the max number that might exist.

Returns

integer number of threads in existence.

6.681.4.8 `virtual void decaf::util::concurrent::ThreadPool::onTaskCompleted (`
`PooledThread * thread)` [virtual]

Called by a pooled thread when it has completed a task and is going back to waiting for another task to run, this will increment the free threads counter.

Parameters

thread Pointer the the Pooled Thread that is making this call.

Implements `decaf::util::concurrent::PooledThreadListener` (p. 2367).

6.681.4.9 `virtual void decaf::util::concurrent::ThreadPool::onTaskException (`
`PooledThread * thread, lang::Exception & ex)` [virtual]

Called by a pooled thread when it has encountered an exception while running a user task, after receiving this notification the callee should assume that the **PooledThread** (p. 2364) is now no longer running.

Parameters

thread Pointer to the Pooled Thread that is making this call

ex The Exception that occurred.

Implements `decaf::util::concurrent::PooledThreadListener` (p. 2367).

6.681.4.10 `virtual void decaf::util::concurrent::ThreadPool::onTaskStarted (`
`PooledThread * thread)` [virtual]

Called by a pooled thread when it is about to begin executing a new task.

This will decrement the available threads counter so that this object knows when there are no more free threads and must create new ones.

Parameters

thread Pointer to the Pooled Thread that is making this call

Implements `decaf::util::concurrent::PooledThreadListener` (p. 2367).

6.681.4.11 `virtual void decaf::util::concurrent::ThreadPool::queueTask (Task task) throw (lang::Exception)` [virtual]

Queue (p. 2507) a task to be completed by one of the Pooled Threads.

tasks are serviced as soon as a `PooledThread` (p. 2364) is available to run it.

Parameters

task object that derives from Runnable

Exceptions

ActiveMQException

6.681.4.12 `virtual void decaf::util::concurrent::ThreadPool::reserve (std::size_t size)` [virtual]

Ensures that there is at least the specified number of Threads allocated to the pool.

If the size is greater than the MAX number of threads in the pool, then only MAX threads are reserved. If the size is smaller than the number of threads currently in the pool, than nothing is done.

Parameters

size the number of threads to reserve.

6.681.4.13 `virtual void decaf::util::concurrent::ThreadPool::setBlockSize (std::size_t blockSize)` [virtual]

Sets the Max number of Threads that can be allocated at a time when the Thread Pool determines that more Threads are needed.

Parameters

blockSize Max Thread Block Size

6.681.4.14 `virtual void decaf::util::concurrent::ThreadPool::setMaxThreads (std::size_t maxThreads)` [virtual]

Sets the Max number of threads this pool can contain.

if this value is smaller than the current size of the pool nothing is done.

Parameters

maxThreads total number of threads that can be pooled

6.681.5 Field Documentation

6.681.5.1 `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_BLOCK_SIZE = 3` [static]

6.681.5.2 `const size_t decaf::util::concurrent::ThreadPool::DEFAULT_MAX_POOL_SIZE = 10` [static]

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/ThreadPool.h`

6.682 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

```
#include <src/main/decaf/lang/Throwable.h>
```

Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual **~Throwable** () throw ()
- virtual std::string **getMessage** () const =0
Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.
- virtual const std::exception * **getCause** () const =0
Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (const std::exception *cause)=0
Initializes the contained cause exception with the one given.
- virtual void **setMark** (const char *file, const int lineNumber)=0
Adds a file/line number to the stack trace.
- virtual **Throwable** * **clone** () const =0
Clones this exception.
- virtual std::vector< std::pair< std::string, int > > **getStackTrace** () const =0
Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () const =0
Prints the stack trace to std::err.

- virtual void **printStackTrace** (std::ostream &stream) const =0

Prints the stack trace to the given output stream.

- virtual std::string **getStackTraceString** () const =0

Gets the stack trace as one contiguous string.

6.682.1 Detailed Description

This class represents an error that has occurred. All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 1476) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 2983) can wrap another **Throwable** (p. 2983) as the cause if the error being thrown. The user can inspect the cause by calling **getCause**, the pointer returned is the property of the **Throwable** (p. 2983) instance and will be deleted when it is deleted or goes out of scope.

Since

1.0

6.682.2 Constructor & Destructor Documentation

6.682.2.1 **decaf::lang::Throwable::Throwable** () throw () [inline]

6.682.2.2 **virtual decaf::lang::Throwable::~~Throwable** () throw () [inline, virtual]

6.682.3 Member Function Documentation

6.682.3.1 **virtual Throwable* decaf::lang::Throwable::clone** () const [pure virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p. 1476) object

Implemented in **activemq::exceptions::ActiveMQException** (p. 271), **activemq::exceptions::BrokerException** (p. 691), **decaf::io::EOFException** (p. 1476), **decaf::io::InterruptedIOException** (p. 1695), **decaf::io::IOException** (p. 1709), **decaf::io::UnsupportedEncodingException** (p. 3092), **decaf::io::UTFDataFormatException** (p. 3141), **decaf::lang::Exception** (p. 1479), **decaf::lang::exceptions::ClassCastException** (p. 950), **decaf::lang::exceptions::IllegalArgumentException** (p. 1615), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1618), **decaf::lang::exceptions::IllegalStateException** (p. 1620), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1624), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1629), **de-**

cafe::util::concurrent::ExecutionException (p. 1509), **de-**
cafe::util::concurrent::RejectedExecutionException (p. 2535), and **de-**
cafe::util::concurrent::TimeoutException (p. 2989).

6.682.3.2 `virtual const std::exception* decaf::lang::Throwable::getCause () const` [pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 1480).

6.682.3.3 `virtual std::string decaf::lang::Throwable::getMessage () const` [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value `cause.getMessage` is then returned.

Returns

string errors message

Implemented in **decaf::lang::Exception** (p. 1480).

6.682.3.4 `virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace () const` [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 1480).

6.682.3.5 **virtual std::string decaf::lang::Throwable::getStackTraceString () const**
[pure virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 1481).

6.682.3.6 **virtual void decaf::lang::Throwable::initCause (const std::exception *
cause)** [pure virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

cause The exception that was the cause of this one.

Implemented in **decaf::lang::Exception** (p. 1481).

6.682.3.7 **virtual void decaf::lang::Throwable::printStackTrace () const** [pure
virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 1481).

6.682.3.8 **virtual void decaf::lang::Throwable::printStackTrace (std::ostream &
stream) const** [pure virtual]

Prints the stack trace to the given output stream.

Parameters

stream the target output stream.

Implemented in **decaf::lang::Exception** (p. 1481).

6.682.3.9 **virtual void decaf::lang::Throwable::setMark (const char * file, const
int lineNumber)** [pure virtual]

Adds a file/line number to the stack trace.

Parameters

- file* The name of the file calling this method (use `__FILE__`).
- lineNumber* The line number in the calling file (use `__LINE__`).

Implemented in **decaf::lang::Exception** (p. 1482).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/Throwable.h`

6.683 decaf::util::concurrent::TimeoutException Class Reference

```
#include <src/main/decaf/util/concurrent/TimeoutException.h>
```

Inheritance diagram for `decaf::util::concurrent::TimeoutException`:

Public Member Functions

- **TimeoutException** () throw ()
Default Constructor.
- **TimeoutException** (const **decaf::lang::Exception** &ex) throw ()
Conversion Constructor from some other Exception.
- **TimeoutException** (const **TimeoutException** &ex) throw ()
Copy Constructor.
- **TimeoutException** (const std::exception *cause) throw ()
Constructor.
- **TimeoutException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **TimeoutException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException** * clone () const
Clones this exception.
- virtual ~**TimeoutException** () throw ()

6.683.1 Constructor & Destructor Documentation

6.683.1.1 decaf::util::concurrent::TimeoutException::TimeoutException () throw () [inline]

Default Constructor.

6.683.1.2 `decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.683.1.3 `decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex The exception to copy from.

References `decaf::lang::Exception::Exception()`.

6.683.1.4 `decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.683.1.5 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The string message to report

... list of primitives that are formatted into the message

6.683.1.6 `decaf::util::concurrent::TimeoutException::TimeoutException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The string message to report

... list of primitives that are formatted into the message

6.683.1.7 `virtual decaf::util::concurrent::TimeoutException::~~TimeoutException () throw ()` [inline, virtual]

6.683.2 Member Function Documentation

6.683.2.1 `virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone () const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new **TimeoutException** (p.2987) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p.1479).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/concurrent/TimeoutException.h`

6.684 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

```
#include <src/main/decaf/util/Timer.h>
```

Public Member Functions

- **Timer** ()
- virtual **~Timer** ()
- void **cancel** ()

Terminates this timer, discarding any currently scheduled tasks.

- `std::size_t purge ()`

Removes all canceled tasks from this timer's task queue.

- `void schedule (TimerTask *task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for execution after the specified delay.

- `void schedule (const decaf::lang::Pointer< TimerTask > &task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for execution after the specified delay.

- `void schedule (TimerTask *task, const Date &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for execution at the specified time.

- `void schedule (const decaf::lang::Pointer< TimerTask > &task, const Date &time) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for execution at the specified time.

- `void schedule (TimerTask *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- `void schedule (const decaf::lang::Pointer< TimerTask > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

- `void schedule (TimerTask *task, const Date &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- `void schedule (const decaf::lang::Pointer< TimerTask > &task, const Date &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

- void **scheduleAtFixedRate** (**TimerTask** *task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (const decaf::lang::Pointer< **TimerTask** > &task, long long delay, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

- void **scheduleAtFixedRate** (**TimerTask** *task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

- void **scheduleAtFixedRate** (const decaf::lang::Pointer< **TimerTask** > &task, const **Date** &firstTime, long long period) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.684.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread. Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 2989) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 2989) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 2989) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the wait(long) method.

Since

1.0

6.684.2 Constructor & Destructor Documentation

6.684.2.1 `decaf::util::Timer::Timer ()`

6.684.2.2 `virtual decaf::util::Timer::~~Timer () [virtual]`

6.684.3 Member Function Documentation

6.684.3.1 `void decaf::util::Timer::cancel ()`

Terminates this timer, discarding any currently scheduled tasks.

Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the run method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.684.3.2 `std::size_t decaf::util::Timer::purge ()`

Removes all canceled tasks from this timer's task queue.

Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 2989) to destroy the **TimerTask** (p. 3000) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to $n + c \log n$, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p. 2989) object that has no scheduled tasks without error.

Returns

the number of tasks removed from the queue.

6.684.3.3 `void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & task, long long delay) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)`

Schedules the specified task for execution after the specified delay.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

```
6.684.3.4 void decaf::util::Timer::schedule ( const decaf::lang::Pointer<
TimerTask > & task, long long delay, long long period
) throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.5 void decaf::util::Timer::schedule ( TimerTask * task,
const Date & firstTime, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long long)` is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if `time.getTime()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.6 void decaf::util::Timer::schedule ( TimerTask * task, const Date
& time ) throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

Parameters

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.7 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task*, const Date & *firstTime*, long long *period*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.684.3.8 void decaf::util::Timer::schedule (TimerTask * *task*, long long *delay*) throw (decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalStateException)

Schedules the specified task for execution after the specified delay.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its TimerTask's once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled

only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, or timer was cancelled.

```
6.684.3.9 void decaf::util::Timer::schedule ( TimerTask * task, long long delay,
long long period ) throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.10 void decaf::util::Timer::schedule ( const decaf::lang::Pointer<
TimerTask > & task, const Date & time )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

Parameters

task - task to be scheduled.

time - time at which task is to be executed.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if time.getTime() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.11 void decaf::util::Timer::scheduleAtFixedRate ( TimerTask
* task, long long delay, long long period )
throw ( decaf::lang::exceptions::NullPointerException,
decaf::lang::exceptions::IllegalArgumentException,
decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at

a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.12 void decaf::util::Timer::scheduleAtFixedRate ( const
               decaf::lang::Pointer< TimerTask > & task, long long delay, long
               long period ) throw ( decaf::lang::exceptions::NullPointerException,
               decaf::lang::exceptions::IllegalArgumentException,
               decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

delay - delay in milliseconds before task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if delay is negative, or delay + System.currentTimeMillis() is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.13 void decaf::util::Timer::scheduleAtFixedRate ( const
    decaf::lang::Pointer< TimerTask > & task, const
    Date & firstTime, long long period ) throw
    ( decaf::lang::exceptions::NullPointerException,
    decaf::lang::exceptions::IllegalArgumentException,
    decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if `time.getTime()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

```
6.684.3.14 void decaf::util::Timer::scheduleAtFixedRate ( TimerTask
    * task, const Date & firstTime, long long period )
    throw ( decaf::lang::exceptions::NullPointerException,
    decaf::lang::exceptions::IllegalArgumentException,
    decaf::lang::exceptions::IllegalStateException )
```

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 3000) pointer is considered to be owned by the **Timer** (p. 2989) class once it has been scheduled, the **Timer** (p. 2989) will destroy its **TimerTask**'s once they have been cancelled or the **Timer** (p. 2989) itself is cancelled. A **TimerTask** (p. 3000) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2989) and the caller should ensure that the **TimerTask** (p. 3000) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 3000) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying `Object.wait(long)` is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task - task to be scheduled.

firstTime - First time at which task is to be executed.

period - time in milliseconds between successive task executions.

Exceptions

NullPointerException - if the **TimerTask** (p. 3000) value is Null.

IllegalArgumentException - if `time.getTime()` is negative.

IllegalStateException - if task was already scheduled or cancelled, timer was cancelled, or timer thread terminated.

6.685.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 2989).

Since

1.0

6.685.2 Constructor & Destructor Documentation

6.685.2.1 decaf::util::TimerTask::TimerTask ()

6.685.2.2 virtual decaf::util::TimerTask::~~TimerTask () [inline, virtual]

6.685.3 Member Function Documentation

6.685.3.1 bool decaf::util::TimerTask::cancel ()

Cancels this timer task.

If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.685.3.2 `long long decaf::util::TimerTask::getWhen () const` [protected]

6.685.3.3 `bool decaf::util::TimerTask::isScheduled () const` [protected]

6.685.3.4 `long long decaf::util::TimerTask::scheduledExecutionTime () const`

Returns the scheduled execution time of the most recent actual execution of this task.

(If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

```
void run() (p. 2642) { if( System::currentTimeMillis() - scheduledExecutionTime() (p. 3002)
>= MAX_TARDINESS) return; // Too late; skip this execution. // Perform the task }
```

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 1380). The return value is undefined if the task has yet to commence its first execution.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/TimerTask.h`

6.686 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

```
#include <src/main/decaf/internal/util/TimerTaskHeap.h>
```

Public Member Functions

- **TimerTaskHeap** ()
- virtual **~TimerTaskHeap** ()
- **Pointer< TimerTask > peek** ()
Peeks at the Head of the Heap, returns the task with the nearest scheduled run time.
- bool **isEmpty** () const
- std::size_t **size** () const
- void **insert** (const **Pointer< TimerTask >** &task)
Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.
- void **remove** (std::size_t pos)
Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.
- void **reset** ()
Clear all contents from the heap.
- void **adjustMinimum** ()
Resorts the heap starting at the top.
- std::size_t **deleteIfCancelled** ()
Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a cancellation of a large number of tasks the user can perform this purge.
- std::size_t **find** (const **Pointer< TimerTask >** &task) const
Searches the heap for the specified TimerTask element and returns its position in the heap.

6.686.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since

1.0

6.686.2 Constructor & Destructor Documentation

6.686.2.1 decaf::internal::util::TimerTaskHeap::TimerTaskHeap ()

6.686.2.2 virtual decaf::internal::util::TimerTaskHeap::~~TimerTaskHeap ()
 [virtual]

6.686.3 Member Function Documentation

6.686.3.1 void decaf::internal::util::TimerTaskHeap::adjustMinimum ()

Resorts the heap starting at the top.

6.686.3.2 `std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled ()`

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a cancellation of a large number of tasks the user can perform this purge.

Returns

the number of task that were removed from the heap because they were cancelled.

6.686.3.3 `std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & task) const`

Searches the heap for the specified TimerTask element and returns its position in the heap.

Returns the unsigned equivalent of -1 if the element is not found.

Returns

the position in the Heap where the Task is stored, or npos.

6.686.3.4 `void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & task)`

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters

task The TimerTask to insert into the heap.

6.686.3.5 `bool decaf::internal::util::TimerTaskHeap::isEmpty () const`**Returns**

true if the heap is empty.

6.686.3.6 `Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ()`

Peeks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.686.3.7 `void decaf::internal::util::TimerTaskHeap::remove (std::size_t pos)`

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters

pos The position at which to remove the TimerTask and begin a resort of the heap.

6.686.3.8 void decaf::internal::util::TimerTaskHeap::reset ()

Clear all contents from the heap.

6.686.3.9 std::size_t decaf::internal::util::TimerTaskHeap::size () const

Returns

the size of the heap.

6.687.1 Detailed Description

A **TimeUnit** (p. 3005) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units. A **TimeUnit** (p. 3005) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 3005) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

```
Lock (p. 1903) lock = ...; if ( lock.tryLock( 50, TimeUnit::MILLISECONDS (p. 3013) ) ) ...
```

while this code will timeout in 50 seconds:

```
Lock (p. 1903) lock = ...; if ( lock.tryLock( 50, TimeUnit::SECONDS (p. 3014) ) ) ...
```

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 3005).

6.687.2 Constructor & Destructor Documentation

6.687.2.1 `decaf::util::concurrent::TimeUnit::TimeUnit (int index, const std::string & name)` [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters

index - Index into the Time Unit set.

name - Name of the unit type being represented.

6.687.2.2 `virtual decaf::util::concurrent::TimeUnit::~~TimeUnit ()` [inline, virtual]

6.687.3 Member Function Documentation

6.687.3.1 `virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & value) const` [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation `sgn(expression)` designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure `sgn(x.compareTo(y)) == -sgn(y.compareTo(x))` for all `x` and `y`. (This implies that `x.compareTo(y)` must throw an exception iff `y.compareTo(x)` throws an exception.)

The implementor must also ensure that the relation is transitive: `(x.compareTo(y)>0 && y.compareTo(z)>0)` implies `x.compareTo(z)>0`.

Finally, the implementor must ensure that `x.compareTo(y)==0` implies that `sgn(x.compareTo(z)) == sgn(y.compareTo(z))`, for all `z`.

It is strongly recommended, but not strictly required that `(x.compareTo(y)==0) == (x.equals(y))`. Generally speaking, any class that implements the `Comparable` interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

value - the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

6.687.3.2 `long long decaf::util::concurrent::TimeUnit::convert (long long sourceDuration, const TimeUnit & sourceUnit) const`

Convert the given time duration in the given unit to this unit.

Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to `Long.MIN_VALUE` if negative or `Long.MAX_VALUE` if positive.

For example, to convert 10 minutes to milliseconds, use: `TimeUnit.MILLISECONDS.convert(10L, TimeUnit.MINUTES)` (p. 3013))

Parameters

sourceDuration - Duration value to convert.

sourceUnit - Unit type of the source duration.

Returns

the converted duration in this unit, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

6.687.3.3 `virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & value) const [virtual]`

Returns

true if this value is considered equal to the passed value.

6.687.3.4 virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.687.3.5 virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.687.3.6 void decaf::util::concurrent::TimeUnit::sleep (long long *timeout*) const throw (decaf::lang::exceptions::InterruptedException)

Perform a Thread.sleep using this unit.

This is a convenience method that converts time arguments into the form required by the Thread.sleep method.

Parameters

timeout the minimum time to sleep

See also

Thread::sleep

6.687.3.7 void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * *thread*, long long *timeout*) throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)

Perform a timed Thread.join using this time unit.

This is a convenience method that converts time arguments into the form required by the Thread.join method.

Parameters

thread the thread to wait for

timeout the maximum time to wait

Exceptions

InterruptedException if interrupted while waiting.

NullPointerException if the thread object is null.

See also

Thread::join(long long, long long)

6.687.3.8 `void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * obj, long long timeout) const throw (decaf::lang::exceptions::InterruptedException, decaf::lang::exceptions::NullPointerException)`

Perform a timed `Object.wait` using this time unit.

This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking poll method (see `BlockingQueue.poll` (p. ??)) using:

```
Object poll( long long timeout, const TimeUnit& unit )
    throw( InterruptedException ) {

    while( empty ) {
        unit.timedWait(this, timeout);
        ...
    }
}
```

Parameters

obj the object to wait on

timeout the maximum time to wait.

Exceptions

InterruptedException if interrupted while waiting.

NullPointerException if the `Synchronizable` (p. 2930) object is null.

See also

Synchronizable::wait(long long, long long)

6.687.3.9 `long long decaf::util::concurrent::TimeUnit::toDays (long long duration) const [inline]`

Equivalent to `DAYS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3008)

6.687.3.10 `long long decaf::util::concurrent::TimeUnit::toHours (long long duration) const [inline]`

Equivalent to `HOURS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3008)

6.687.3.11 `long long decaf::util::concurrent::TimeUnit::toMicros (long long duration) const [inline]`

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

`convert` (p. 3008)

6.687.3.12 `long long decaf::util::concurrent::TimeUnit::toMillis (long long duration) const [inline]`

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

`convert` (p. 3008)

6.687.3.13 `long long decaf::util::concurrent::TimeUnit::toMinutes (long long duration) const [inline]`

Equivalent to `MINUTES.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3008)

6.687.3.14 `long long decaf::util::concurrent::TimeUnit::toNanos (long long duration) const [inline]`

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

`convert` (p. 3008)

6.687.3.15 `long long decaf::util::concurrent::TimeUnit::toSeconds (long long duration) const [inline]`

Equivalent to `SECONDS.convert(duration, this)`.

Parameters

duration the duration

Returns

the converted duration.

See also

`convert` (p. 3008)

6.687.3.16 `virtual std::string decaf::util::concurrent::TimeUnit::toString () const`
[virtual]

Converts the **TimeUnit** (p. 3005) type to the Name of the **TimeUnit** (p. 3005).

Returns

String name of the **TimeUnit** (p. 3005)

6.687.3.17 `static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf`
(`const std::string & name`) `throw (de-`
`cafe::lang::exceptions::IllegalArgumentException)`
[static]

Returns the **TimeUnit** (p. 3005) constant of this type with the specified name.

The string must match exactly an identifier used to declare an **TimeUnit** (p. 3005) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters

name The Name of the **TimeUnit** (p. 3005) constant to be returned.

Returns

A constant reference to the **TimeUnit** (p. 3005) Constant with the given name.

Exceptions

IllegalArgumentException if this enum type has no constant with the specified name

6.690.3 Member Function Documentation

6.690.3.1 `virtual TransactionId* ac-
tivemq::commands::TransactionId::cloneDataStructure (
) const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.690.3.2 `virtual int activemq::commands::TransactionId::compareTo (const
TransactionId & value) const [virtual]`

6.690.3.3 `virtual void activemq::commands::TransactionId::copyDataStructure (
const DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.690.3.4 `virtual bool activemq::commands::TransactionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

6.690.3.5 `virtual bool activemq::commands::TransactionId::equals (const TransactionId & value) const` [virtual]

6.690.3.6 `virtual unsigned char activemq::commands::TransactionId::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaller share.

Returns

new **DataStructure** (p. 1372) type copy.

6.690.3.7 `virtual bool activemq::commands::TransactionId::operator< (const TransactionId & value) const` [virtual]

6.690.3.8 `TransactionId& activemq::commands::TransactionId::operator= (const TransactionId & other)`

- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (**decaf::io::IOException**)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)

Write a object instance to data output stream.

6.691.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 3018). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.691.2 Constructor & Destructor Documentation

6.691.2.1 `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::TransactionIdMarshaller () [inline]`

6.691.2.2 `virtual
activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::~~TransactionIdMarshaller () [inline, virtual]`

6.691.3 Member Function Documentation

6.691.3.1 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1880), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 3199).

6.691.3.2 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException) [virtual]`

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1880), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3199).

6.691.3.3 `virtual int activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

Reimplemented in **activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller** (p. 1880), and **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller** (p. 3199).

6.691.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1881), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 3200).

6.691.3.5 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs) throw (decaf::io::IOException) [virtual]`

Un-marshall an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

Reimplemented in `activemq::wireformat::openwire::marshal::v2::LocalTransactionIdMarshaller` (p. 1881), and `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller` (p. 3200).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v2/TransactionIdMarshaller.h`

6.692 `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` Class Reference

Marshaling code for Open Wire Format for `TransactionIdMarshaller` (p. 3022).

```
#include <src/main/activemq/wireformat/openwire/marshal/v1/TransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller`:

Public Member Functions

- `TransactionIdMarshaller ()`
- `virtual ~TransactionIdMarshaller ()`
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`

Un-marshal an object instance from the data input stream.

- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut, utils::BooleanStream *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataOutputStream *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.692.2 Constructor & Destructor Documentation

6.692.2.1 activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::TransactionIdMarshaller () [inline]

6.692.2.2 virtual activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::~~TransactionIdMarshaller () [inline, virtual]

6.692.3 Member Function Documentation

6.692.3.1 virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1892), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3211).

6.692.3.2 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1892), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3211).

6.692.3.3 `virtual int activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1892), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3211).

6.692.3.4 virtual void `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightMarshal2`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
* `dataStructure`, `decaf::io::DataOutputStream * dataOut`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

Reimplemented in `activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller` (p. 1893), and `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller` (p. 3212).

6.692.3.5 virtual void `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller::tightUnmarshal`
(`OpenWireFormat * wireFormat`, `commands::DataStructure`
* `dataStructure`, `decaf::io::DataInputStream * dataIn`,
`utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

Reimplemented in **activemq::wireformat::openwire::marshal::v1::LocalTransactionIdMarshaller** (p. 1893), and **activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller** (p. 3212).

6.696 activemq::commands::TransactionInfo Class Reference

```
#include <src/main/activemq/commands/TransactionInfo.h>
```

Inheritance diagram for **activemq::commands::TransactionInfo**:

Public Member Functions

- **TransactionInfo** ()
- virtual **~TransactionInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaller share.
- virtual **TransactionInfo * cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this object's members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual const **Pointer**< **ConnectionId** > & **getConnectionId** () const
- virtual **Pointer**< **ConnectionId** > & **getConnectionId** ()
- virtual void **setConnectionId** (const **Pointer**< **ConnectionId** > &connectionId)
- virtual const **Pointer**< **TransactionId** > & **getTransactionId** () const
- virtual **Pointer**< **TransactionId** > & **getTransactionId** ()
- virtual void **setTransactionId** (const **Pointer**< **TransactionId** > &transactionId)
- virtual unsigned char **getType** () const
- virtual void **setType** (unsigned char type)
- virtual bool **isTransactionInfo** () const
- virtual **Pointer**< **Command** > **visit** (activemq::state::CommandVisitor *visitor)
throw (exceptions::ActiveMQException)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static const unsigned char **ID_TRANSACTIONINFO** = 7

Protected Member Functions

- **TransactionInfo** (const **TransactionInfo** &)
- **TransactionInfo** & **operator=** (const **TransactionInfo** &)

Protected Attributes

- **Pointer**< **ConnectionId** > **connectionId**
- **Pointer**< **TransactionId** > **transactionId**
- unsigned char **type**

6.696.1 Constructor & Destructor Documentation

6.696.1.1 **activemq::commands::TransactionInfo::TransactionInfo** (const **TransactionInfo** &) [inline, protected]

6.696.1.2 **activemq::commands::TransactionInfo::TransactionInfo** ()

6.696.1.3 **virtual activemq::commands::TransactionInfo::~~TransactionInfo** () [virtual]

6.696.2 Member Function Documentation

6.696.2.1 **virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure** () const [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1373).

6.696.2.2 **virtual void activemq::commands::TransactionInfo::copyDataStructure** (const **DataStructure** * *src*) [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.696.2.3 `virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * value) const` [virtual]

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 598).

6.696.2.4 `virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ()` [virtual]

6.696.2.5 `virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId () const` [virtual]

6.696.2.6 `virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType () const` [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.696.2.7 `virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId () const` [virtual]

6.696.2.8 `virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ()` [virtual]

6.696.2.9 `virtual unsigned char activemq::commands::TransactionInfo::getType () const` [virtual]

6.696.2.10 `virtual bool activemq::commands::TransactionInfo::isTransactionInfo () const` [inline, virtual]

Returns

an answer of true to the **isTransactionInfo()** (p. 3039) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.696.2.11 `TransactionInfo& activemq::commands::TransactionInfo::operator= (const TransactionInfo &)` [inline, protected]
- 6.696.2.12 `virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & connectionId)` [virtual]
- 6.696.2.13 `virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & transactionId)` [virtual]
- 6.696.2.14 `virtual void activemq::commands::TransactionInfo::setType (unsigned char type)` [virtual]
- 6.696.2.15 `virtual std::string activemq::commands::TransactionInfo::toString () const` [virtual]

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

- 6.696.2.16 `virtual Pointer<Command> activemq::commands::TransactionInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException)` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 2611) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p.995).

6.696.3 Field Documentation

- 6.696.3.1 `Pointer<ConnectionId> activemq::commands::TransactionInfo::connectionId` [protected]
- 6.696.3.2 `const unsigned char activemq::commands::TransactionInfo::ID_TRANSACTIONINFO = 7` [static]
- 6.696.3.3 `Pointer<TransactionId> activemq::commands::TransactionInfo::transactionId` [protected]
- 6.696.3.4 `unsigned char activemq::commands::TransactionInfo::type` [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/TransactionInfo.h

6.697 activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3041).

```
#include <src/main/activemq/wireformat/openwire/marshal/v5/TransactionInfoMarshaller.h>
```

Inheritance diagram for activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller:

Public Member Functions

- **TransactionInfoMarshaller** ()
- virtual **~TransactionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.697.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3041). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.697.2 Constructor & Destructor Documentation

6.697.2.1 `activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::TransactionInfoMarshaller () [inline]`

6.697.2.2 `virtual activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::~~TransactionInfoMarshaller () [inline, virtual]`

6.697.3 Member Function Documentation

6.697.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.697.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.697.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 624).

6.697.3.4 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::looseUnmarshal
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure** *
dataStructure, **decaf::io::DataInputStream** * *dataIn*) throw (**decaf::io::IOException**) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 625).

6.697.3.5 virtual int ac-
tivemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal1
(**OpenWireFormat** * *wireFormat*, **commands::DataStructure**
* *dataStructure*, **utils::BooleanStream** * *bs*) throw (**decaf::io::IOException**) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller** (p. 626).

```

6.697.3.6 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightMarshal2
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataOutputStream * dataOut,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 628).

```

6.697.3.7 virtual void ac-
    tivemq::wireformat::openwire::marshal::v5::TransactionInfoMarshaller::tightUnmarshal
    ( OpenWireFormat * wireFormat, commands::DataStructure
    * dataStructure, decaf::io::DataInputStream * dataIn,
    utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]

```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::BaseCommandMarshaller` (p. 629).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/TransactionInfoMarshaller.h`

6.698 activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for `TransactionInfoMarshaller` (p. 3044).

#include <src/main/activemq/wireformat/openwire/marshal/v3/TransactionInfoMarshaller.h>

Inheritance diagram for activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller:

Public Member Functions

- **TransactionInfoMarshaller** ()
- virtual **~TransactionInfoMarshaller** ()
- virtual **commands::DataStructure * createObject** () const
Creates a new instance of this marshalable type.
- virtual unsigned char **getDataStructureType** () const
Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataInputStream *dataIn**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**, **utils::BooleanStream *bs**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.698.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3044). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.698.2 Constructor & Destructor Documentation

6.698.2.1 `activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.698.2.2 `virtual activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.698.3 Member Function Documentation

6.698.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.698.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.698.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut)` throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 604).

6.698.3.4 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 605).

6.698.3.5 virtual int activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller** (p. 606).

6.698.3.6 virtual void activemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 608).

```
6.698.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::BaseCommandMarshaller` (p. 609).

The documentation for this class was generated from the following file:

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.699.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3048). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.699.2 Constructor & Destructor Documentation

6.699.2.1 `activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.699.2.2 `virtual activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.699.3 Member Function Documentation

6.699.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.699.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.699.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 611).

6.699.3.4 virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 612).

6.699.3.5 virtual int activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller** (p. 613).

6.699.3.6 virtual void activemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 614).

```
6.699.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::BaseCommandMarshaller` (p. 615).

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3052). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.700.2 Constructor & Destructor Documentation

6.700.2.1 `activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.700.2.2 `virtual activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.700.3 Member Function Documentation

6.700.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.700.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.700.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 618).

6.700.3.4 virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 619).

6.700.3.5 virtual int activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller** (p. 620).

6.700.3.6 virtual void activemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 621).

```
6.700.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v4::BaseCommandMarshaller` (p. 622).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v4/TransactionInfoMarshaller.h`

6.701 `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller` Class Reference

Marshaling code for Open Wire Format for `TransactionInfoMarshaller` (p. 3056).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/TransactionInfoMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller`:

Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (**OpenWireFormat *wireFormat**, **commands::DataStructure *dataStructure**, **decaf::io::DataOutputStream *dataOut**) throw (**decaf::io::IOException**)
Write a object instance to data output stream.

6.701.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 3056). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.701.2 Constructor & Destructor Documentation

6.701.2.1 `activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::TransactionInfoMarshaller()` [inline]

6.701.2.2 `virtual activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::~~TransactionInfoMarshaller()` [inline, virtual]

6.701.3 Member Function Documentation

6.701.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::createObject()` const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.701.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::getDataStructureType()` const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.701.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 631).

6.701.3.4 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 632).

6.701.3.5 virtual int activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 633).

6.701.3.6 virtual void activemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

- wireFormat* - describes the wire format of the broker
- dataStructure* - Object to be marshaled
- dataOut* - BinaryReader that provides that data sink
- bs* - BooleanStream stream used to pack bits from the wire.

Exceptions

- IOException* if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 634).

```
6.701.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::TransactionInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

- wireFormat* - describes the wire format of the broker.
- dataStructure* - Object to be un-marshaled.
- dataIn* - BinaryReader that provides that data.
- bs* - BooleanStream stream used to unpack bits from the wire.

Exceptions

- IOException* if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::BaseCommandMarshaller` (p. 635).

Performs a take.

6.704.1 Detailed Description

template<typename E> class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using nodes within nodes rather than marked pointers. The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.704.2 Constructor & Destructor Documentation

6.704.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue () [inline]

Node class for **TransferQueue** (p. 3062).

Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.704.2.2 template<typename E > virtual decaf::internal::util::concurrent::TransferQueue< E >::~~TransferQueue () [inline, virtual]

6.704.3 Member Function Documentation

6.704.3.1 template<typename E > virtual void decaf::internal::util::concurrent::TransferQueue< E >::transfer (E * *e*, bool *timed*, long long *nanos*) throw (decaf::util::concurrent::TimeoutException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Performs a put.

Parameters

e the item to be handed to a consumer;

timed if this operation should timeout

nanos the timeout, in nanoseconds

Exceptions

TimeoutException if the operation timed out waiting for the consumer to accept the item offered.

InterruptedException if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3062).

```

6.704.3.2  template<typename E > virtual E*
             decaf::internal::util::concurrent::TransferQueue< E
             >::transfer ( bool timed, long long nanos )
             throw ( decaf::util::concurrent::TimeoutException,
             decaf::lang::exceptions::InterruptedException ) [inline, virtual]

```

Performs a take.

Parameters

timed if this operation should timeout
nanos the timeout, in nanoseconds

Returns

the item provided or received;

Exceptions

TimeoutException if the operation timed out waiting for the producer to offer an item.
InterruptedException if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 3062).

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/util/concurrent/TransferQueue.h`

6.705 decaf::internal::util::concurrent::TransferStack< E > Class Template Reference

```
#include <src/main/decaf/internal/util/concurrent/TransferStack.h>
```

*Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const =0
*Is the **Transport** (p. 3066) Connected to its Broker.*
- virtual bool **isClosed** () const =0
*Has the **Transport** (p. 3066) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () const =0
- virtual void **reconnect** (const **decaf::net::URI** &uri)=0 throw (**decaf::io::IOException**)
reconnect to another location

6.706.1 Detailed Description

Interface for a transport layer for command objects. Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 3066) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 3066) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.706.2 Constructor & Destructor Documentation

- 6.706.2.1** virtual **activemq::transport::Transport::~~Transport** () [inline, virtual]

6.706.3 Member Function Documentation

- 6.706.3.1** virtual std::string **activemq::transport::Transport::getRemoteAddress** () const [pure virtual]

Returns

the remote address for this connection

Implemented in **activemq::transport::mock::MockTransport** (p. 2231).

6.706.3.2 `virtual TransportListener* activemq::transport::Transport::getTransportListener () const [pure virtual]`

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implemented in `activemq::transport::mock::MockTransport` (p. 2231).

6.706.3.3 `virtual bool activemq::transport::Transport::isClosed () const [pure virtual]`

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

Implemented in `activemq::transport::mock::MockTransport` (p. 2232).

6.706.3.4 `virtual bool activemq::transport::Transport::isConnected () const [pure virtual]`

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

Implemented in `activemq::transport::mock::MockTransport` (p. 2232).

6.706.3.5 `virtual bool activemq::transport::Transport::isFaultTolerant () const [pure virtual]`

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

Implemented in `activemq::transport::mock::MockTransport` (p. 2232).

6.706.3.6 `virtual Transport* activemq::transport::Transport::narrow (const std::type_info & typeId) [pure virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::mock::MockTransport** (p. 2233).

Referenced by **activemq::transport::failover::FailoverTransport::narrow()**.

6.706.3.7 `virtual void activemq::transport::Transport::oneway (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2233).

6.706.3.8 `virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & uri) throw (decaf::io::IOException) [pure virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.706.3.9 `virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [pure virtual]`

Sends the given command to the broker and then waits for the response.

Parameters

command the command to be sent.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2234).

```
6.706.3.10  virtual Pointer<Response> activemq::transport::Transport::request  
              ( const Pointer< Command > & command, unsigned  
                int timeout ) throw ( decaf::io::IOException,  
                decaf::lang::exceptions::UnsupportedOperationException ) [pure  
                virtual]
```

Sends the given command to the broker and then waits for the response.

Parameters

command - The command to be sent.

timeout - The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException if an exception occurs during the read of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2234).

```
6.706.3.11  virtual void activemq::transport::Transport::setTransportListener (   
              TransportListener * listener ) [pure virtual]
```

Sets the observer of asynchronous events from this transport.

Parameters

listener the listener of transport events.

Implemented in **activemq::transport::mock::MockTransport** (p. 2236).

```
6.706.3.12  virtual void activemq::transport::Transport::setWireFormat ( const  
              Pointer< wireformat::WireFormat > & wireFormat ) [pure virtual]
```

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.706.3.13 virtual void activemq::transport::Transport::start () throw (decaf::io::IOException) [pure virtual]

Starts the **Transport** (p. 3066), the send methods of a **Transport** (p. 3066) will throw an exception if used before the **Transport** (p. 3066) is started.

Exceptions

IOException if and error occurs while starting the **Transport** (p. 3066).

Implemented in **activemq::transport::mock::MockTransport** (p. 2236).

6.706.3.14 virtual void activemq::transport::Transport::stop () throw (decaf::io::IOException) [pure virtual]

Stops the **Transport** (p. 3066).

Exceptions

IOException if an error occurs while stopping the transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 2236).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**Transport.h**

6.707 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

```
#include <src/main/activemq/transport/TransportFactory.h>
```

Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual ~**TransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)
*Creates a fully configured **Transport** (p. 3066) instance which could be a chain of filters and transports.*
- virtual **Pointer**< **Transport** > **createComposite** (const **decaf::net::URI** &location)=0 throw (exceptions::ActiveMQException)
*Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.*

6.707.1 Detailed Description

Defines the interface for Factories that create **Transports** or **TransportFilters**. The factory should be able to create either a completely configured **Transport** (p. 3066) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since

3.0

6.707.2 Constructor & Destructor Documentation

6.707.2.1 `virtual activemq::transport::TransportFactory::~~TransportFactory ()`
[inline, virtual]

6.707.3 Member Function Documentation

6.707.3.1 `virtual Pointer<Transport> activemq::transport::TransportFactory::create (const decaf::net::URI & location) throw (exceptions::ActiveMQException)`
[pure virtual]

Creates a fully configured **Transport** (p. 3066) instance which could be a chain of filters and transports.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implemented in `activemq::transport::failover::FailoverTransportFactory` (p. 1524), `activemq::transport::mock::MockTransportFactory` (p. 2238), and `activemq::transport::tcp::TcpTransportFactory` (p. 2970).

6.707.3.2 `virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & location) throw (exceptions::ActiveMQException)` [pure virtual]

Creates a slimed down **Transport** (p. 3066) instance which can be used in composite transport instances.

Parameters

location - URI location to connect to plus any properties to assign.

Exceptions

ActiveMQException if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1524), **activemq::transport::mock::MockTransportFactory** (p. 2238), and **activemq::transport::tcp::TcpTransportFactory** (p. 2970).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFactory.h`

6.708 activemq::transport::TransportFilter Class Reference

A filter on the transport layer.

```
#include <src/main/activemq/transport/TransportFilter.h>
```

Inheritance diagram for `activemq::transport::TransportFilter`:

Public Member Functions

- **TransportFilter** (const **Pointer**< **Transport** > &next)
Constructor.
- virtual **~TransportFilter** ()
- virtual void **onCommand** (const **Pointer**< **Command** > &command)
Event handler for the receipt of a command.
- virtual void **onException** (const **decaf::lang::Exception** &ex)
Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()
The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()
The transport has resumed after an interruption.
- virtual void **oneway** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual **Pointer**< **Response** > **request** (const **Pointer**< **Command** > &command, unsigned int timeout) throw (**decaf::io::IOException**, **decaf::lang::exceptions::UnsupportedOperationException**)
Not supported by this class - throws an exception.
- virtual void **setTransportListener** (**TransportListener** *listener)
Sets the observer of asynchronous exceptions from this transport.

- virtual **TransportListener** * **getTransportListener** () const
Gets the observer of asynchronous exceptions from this transport.
- virtual void **setWireFormat** (const **Pointer**< **wireformat::WireFormat** > &wireFormat)
Sets the WireFormat instance to use.
- virtual void **start** () throw (decaf::io::IOException)
Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **stop** () throw (decaf::io::IOException)
*Stops the **Transport** (p. 3066).*
- virtual void **close** () throw (decaf::io::IOException)
Stops the polling thread and closes the streams.
- virtual **Transport** * **narrow** (const std::type_info &typeId)
*Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () const
*Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () const
*Is the **Transport** (p. 3066) Connected to its Broker.*
- virtual bool **isClosed** () const
*Has the **Transport** (p. 3066) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () const
- virtual void **reconnect** (const **decaf::net::URI** &uri) throw (decaf::io::IOException)
