reconnect to another location

Protected Member Functions

- void **fire** (const **decaf::lang::Exception** &ex)
Notify the listener of the thrown Exception.
- void **fire** (const **Pointer**< **Command** > &command)
Notify the listener of the new incoming Command.

Protected Attributes

- **Pointer**< **Transport** > **next**
The transport that this filter wraps around.

- **TransportListener * listener**

Listener of this transport.

6.708.1 Detailed Description

A filter on the transport layer. **Transport** (p.3066) filters implement the **Transport** (p.3066) interface and optionally delegate calls to another **Transport** (p.3066) object.

Since

1.0

6.708.2 Constructor & Destructor Documentation

6.708.2.1 **activemq::transport::TransportFilter::TransportFilter** (**const Pointer< Transport > & next**)

Constructor.

Parameters

next - the next **Transport** (p.3066) in the chain

6.708.2.2 **virtual activemq::transport::TransportFilter::~~TransportFilter** () [inline, virtual]

6.708.3 Member Function Documentation

6.708.3.1 **virtual void activemq::transport::TransportFilter::close** () **throw** (**decaf::io::IOException**) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException if an error occurs while closing the **Transport** (p.3066).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p.2617), **activemq::transport::inactivity::InactivityMonitor** (p.1625), **activemq::transport::tcp::TcpTransport** (p.2968), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p.2311).

6.708.3.2 **void activemq::transport::TransportFilter::fire** (**const Pointer< Command > & command**) [protected]

Notify the listener of the new incoming Command.

Parameters

command - the command to send to the listener

6.708.3.3 `void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & ex) [protected]`

Notify the listener of the thrown Exception.

Parameters

ex - the exception to send to listeners

6.708.3.4 `virtual std::string activemq::transport::TransportFilter::getRemoteAddress () const [inline, virtual]`

Returns

the remote address for this connection

6.708.3.5 `virtual TransportListener* activemq::transport::TransportFilter::getTransportListener () const [inline, virtual]`

Gets the observer of asynchronous exceptions from this transport.

Returns

The listener of transport events.

6.708.3.6 `virtual bool activemq::transport::TransportFilter::isClosed () const [inline, virtual]`

Has the **Transport** (p. 3066) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 3066)

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2968).

6.708.3.7 `virtual bool activemq::transport::TransportFilter::isConnected () const [inline, virtual]`

Is the **Transport** (p. 3066) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2969).

6.708.3.8 `virtual bool activemq::transport::TransportFilter::isFaultTolerant ()
const [inline, virtual]`

Is this **Transport** (p. 3066) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 3066) is fault tolerant.

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2969).

6.708.3.9 `virtual Transport* activemq::transport::TransportFilter::narrow (const
std::type_info & typeId) [virtual]`

Narrows down a Chain of Transports to a specific **Transport** (p. 3066) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId - The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

6.708.3.10 `virtual void activemq::transport::TransportFilter::onCommand (const
Pointer< Command > & command) [virtual]`

Event handler for the receipt of a command.

Parameters

command - the received command object.

Implements **activemq::transport::TransportListener** (p. 3081).

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2618), **activemq::transport::inactivity::InactivityMonitor** (p. 1626), **activemq::transport::logging::LoggingTransport** (p. 1921), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2311).

6.708.3.11 `virtual void activemq::transport::TransportFilter::oneway (const
Pointer< Command > & command) throw (decaf::io::IOException,
decaf::lang::exceptions::UnsupportedOperationException) [inline,
virtual]`

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command the command to be sent.

Exceptions

IOException if an exception occurs during writing of the command.

UnsupportedOperationException if this method is not implemented by this transport.

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2618), **activemq::transport::inactivity::InactivityMonitor** (p. 1626), **activemq::transport::logging::LoggingTransport** (p. 1922), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2311).

6.708.3.12 `virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & ex) [virtual]`

Event handler for an exception from a command transport.

Parameters

ex The exception to handle.

Implements **activemq::transport::TransportListener** (p. 3082).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1626).

6.708.3.13 `virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & uri) throw (decaf::io::IOException) [virtual]`

reconnect to another location

Parameters

uri

Exceptions

IOException on failure of if not supported

6.708.3.14 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Not supported by this class - throws an exception.

Parameters

command - The command that is sent as a request

timeout - The the time to wait for a response.

Exceptions

IOException

UnsupportedOperationException.

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 2619), `activemq::transport::logging::LoggingTransport` (p. 1922), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2312).

6.708.3.15 `virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]`

Not supported by this class - throws an exception.

Parameters

command the command that is sent as a request

Exceptions

IOException

UnsupportedOperationException.

Reimplemented in `activemq::transport::correlator::ResponseCorrelator` (p. 2618), `activemq::transport::logging::LoggingTransport` (p. 1922), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2312).

6.708.3.16 `virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * listener) [inline, virtual]`

Sets the observer of asynchronous exceptions from this transport.

Parameters

listener the listener of transport events.

6.708.3.17 `virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > & wireFormat) [inline, virtual]`

Sets the WireFormat instance to use.

Parameters

wireFormat The WireFormat the object used to encode / decode commands.

6.708.3.18 `virtual void activemq::transport::TransportFilter::start () throw (decaf::io::IOException) [virtual]`

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException if an error occurs or if this transport has already been closed.

Reimplemented in **activemq::transport::correlator::ResponseCorrelator** (p. 2619), and **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 2313).

6.708.3.19 `virtual void activemq::transport::TransportFilter::stop () throw (decaf::io::IOException) [virtual]`

Stops the **Transport** (p. 3066).

Exceptions

IOException if an error occurs while stopping the **Transport** (p. 3066).

6.708.3.20 `virtual void activemq::transport::TransportFilter::transportInterrupted () [virtual]`

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 3082).

6.708.3.21 `virtual void activemq::transport::TransportFilter::transportResumed () [virtual]`

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 3082).

6.708.4 Field Documentation

6.708.4.1 `TransportListener* activemq::transport::TransportFilter::listener [protected]`

Listener of this transport.

6.708.4.2 `Pointer<Transport> activemq::transport::TransportFilter::next [protected]`

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportFilter.h`

6.709 activemq::transport::TransportListener Class Reference

A listener of asynchronous exceptions from a command transport object.

```
#include <src/main/activemq/transport/TransportListener.h>
```

Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual `~TransportListener ()`
- virtual void `onCommand (const Pointer< Command > &command)=0`
Event handler for the receipt of a command.
- virtual void `onException (const decaf::lang::Exception &ex)=0`
Event handler for an exception from a command transport.
- virtual void `transportInterrupted ()=0`
The transport has suffered an interruption from which it hopes to recover.
- virtual void `transportResumed ()=0`
The transport has resumed after an interruption.

6.709.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

6.709.2 Constructor & Destructor Documentation

- 6.709.2.1** virtual `activemq::transport::TransportListener::~~TransportListener ()`
[inline, virtual]

6.709.3 Member Function Documentation

- 6.709.3.1** virtual void `activemq::transport::TransportListener::onCommand (const Pointer< Command > & command)` [pure virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 3066) deletes the command upon receipt.

Parameters

command the received command object.

Implemented in `activemq::core::ActiveMQConnection` (p. 209), `activemq::transport::correlator::ResponseCorrelator` (p. 2618), `activemq::transport::failover::FailoverTransportListener` (p. 1526), `activemq::transport::inactivity::InactivityMonitor` (p. 1626), `activemq::transport::logging::LoggingTransport` (p. 1921), `activemq::transport::mock::InternalCommandListener` (p. 1690), `activemq::transport::TransportFilter` (p. 3077), and `activemq::wireformat::openwire::OpenWireFormatNegotiator` (p. 2311).

6.709.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command transport.

Parameters

ex The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 209),
activemq::transport::failover::BackupTransport (p. 593), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1526), **ac-**
tivemq::transport::inactivity::InactivityMonitor (p. 1626), and **ac-**
tivemq::transport::TransportFilter (p. 3078).

6.709.3.3 virtual void activemq::transport::TransportListener::transportInterrupted () [pure virtual]

The transport has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 211),
activemq::transport::DefaultTransportListener (p. 1385), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1526), and **ac-**
tivemq::transport::TransportFilter (p. 3080).

6.709.3.4 virtual void activemq::transport::TransportListener::transportResumed () [pure virtual]

The transport has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 211),
activemq::transport::DefaultTransportListener (p. 1385), **ac-**
tivemq::transport::failover::FailoverTransportListener (p. 1526), and **ac-**
tivemq::transport::TransportFilter (p. 3080).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/TransportListener.h`

6.710 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 3066) Factories that are available to the client at runtime.

```
#include <src/main/activemq/transport/TransportRegistry.h>
```

Public Member Functions

- virtual `~TransportRegistry ()`
- `TransportFactory * findFactory (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)`

*Gets a Registered **TransportFactory** (p. 3071) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*

- void **registerFactory** (const std::string &name, **TransportFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **TransportFactory** (p. 3071) with this Registry.*

- void **unregisterFactory** (const std::string &name)

Unregisters the Factory with the given name and deletes that instance of the Factory.

- std::vector< std::string > **getTransportNames** () const

Retrieves a list of the names of all the Registered Transport's in this Registry.

Static Public Member Functions

- static **TransportRegistry & getInstance** ()

*Gets the single instance of the **TransportRegistry** (p. 3082).*

6.710.1 Detailed Description

Registry of all **Transport** (p. 3066) Factories that are available to the client at runtime. New Transport's must have a factory registered here before a connection attempt is made.

Since

3.0

6.710.2 Constructor & Destructor Documentation

- 6.710.2.1 virtual **activemq::transport::TransportRegistry::~TransportRegistry** ()
[virtual]

6.710.3 Member Function Documentation

- 6.710.3.1 **TransportFactory* activemq::transport::TransportRegistry::findFactory**
(const std::string & *name*) const throw (decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **TransportFactory** (p. 3071) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException if no factory is registered with that name.

6.710.3.2 `static TransportRegistry& activemq::transport::TransportRegistry::getInstance ()`
[static]

Gets the single instance of the **TransportRegistry** (p. 3082).

Returns

reference to the single instance of this Registry

6.710.3.3 `std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames () const`

Retrieves a list of the names of all the Registered Transport's in this Registry.

Returns

stl vector of strings with all the **Transport** (p. 3066) names registered.

6.710.3.4 `void activemq::transport::TransportRegistry::registerFactory (const std::string & name, TransportFactory * factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)`

Registers a new **TransportFactory** (p. 3071) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.710.3.5 `void activemq::transport::TransportRegistry::unregisterFactory (const std::string & name)`

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

- name* Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportRegistry.h**

6.711 decaf::net::UnknownHostException Class Reference

```
#include <src/main/decaf/net/UnknownHostException.h>
```

Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** () throw ()
Default Constructor.
- **UnknownHostException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownHostException** (const **UnknownHostException** &ex) throw ()
Copy Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException** (const std::exception *cause) throw ()
Constructor.
- **UnknownHostException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownHostException** * **clone** () const
Clones this exception.
- virtual ~**UnknownHostException** () throw ()

6.711.1 Constructor & Destructor Documentation

6.711.1.1 decaf::net::UnknownHostException::UnknownHostException () throw () [inline]

Default Constructor.

6.711.1.2 `decaf::net::UnknownHostException::UnknownHostException (const Exception & ex) throw () [inline]`

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.711.1.3 `decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References `decaf::lang::Exception::Exception()`.

6.711.1.4 `decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.711.1.5 `decaf::net::UnknownHostException::UnknownHostException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.711.1.6 `decaf::net::UnknownHostException::UnknownHostException (const char * file, const int lineNumber, const char * msg, ...) throw ()` [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.711.1.7 `virtual decaf::net::UnknownHostException::~~UnknownHostException () throw ()` [inline, virtual]

6.711.2 Member Function Documentation

6.711.2.1 `virtual UnknownHostException* decaf::net::UnknownHostException::clone () const` [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from `decaf::io::IOException` (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownHostException.h`

6.712 decaf::net::UnknownServiceException Class Reference

```
#include <src/main/decaf/net/UnknownServiceException.h>
```

Inheritance diagram for `decaf::net::UnknownServiceException`:

Public Member Functions

- `UnknownServiceException () throw ()`
Default Constructor.

- **UnknownServiceException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **UnknownServiceException** (const **UnknownServiceException** &ex) throw ()
Copy Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (const std::exception *cause) throw ()
Constructor.
- **UnknownServiceException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** * **clone** () const
Clones this exception.
- virtual ~**UnknownServiceException** () throw ()

6.712.1 Constructor & Destructor Documentation

6.712.1.1 decaf::net::UnknownServiceException::UnknownServiceException () throw () [inline]

Default Constructor.

6.712.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.712.1.3 decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

References decaf::lang::Exception::Exception().

6.712.1.4 `decaf::net::UnknownServiceException::UnknownServiceException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.712.1.5 `decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.712.1.6 `decaf::net::UnknownServiceException::UnknownServiceException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.712.1.7 `virtual decaf::net::UnknownServiceException::~UnknownServiceException () throw () [inline, virtual]`

6.712.2 Member Function Documentation

6.712.2.1 `virtual UnknownServiceException* decaf::net::UnknownServiceException::clone () const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/net/UnknownServiceException.h`

6.713 decaf::io::UnsupportedEncodingException Class Reference

Thrown when the the Character Encoding is not supported.

```
#include <src/main/decaf/io/UnsupportedEncodingException.h>
```

Inheritance diagram for decaf::io::UnsupportedEncodingException:

Public Member Functions

- **UnsupportedEncodingException** () throw ()
Default Constructor.
- **UnsupportedEncodingException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **UnsupportedEncodingException** (const **UnsupportedEncodingException** &ex) throw ()
Copy Constructor.
- **UnsupportedEncodingException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UnsupportedEncodingException** (const std::exception *cause) throw ()
Constructor.
- **UnsupportedEncodingException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UnsupportedEncodingException** * clone () const
Clones this exception.
- virtual ~**UnsupportedEncodingException** () throw ()

6.713.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since

1.0

6.713.2 Constructor & Destructor Documentation

6.713.2.1 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException () throw () [inline]`

Default Constructor.

6.713.2.2 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const lang::Exception & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy

6.713.2.3 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.713.2.4 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.713.2.5 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException`
`(const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.713.2.6 `decaf::io::UnsupportedEncodingException::UnsupportedEncodingException`
`(const char * file, const int lineNumber, const char * msg, ...)`
`throw () [inline]`

Constructor.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

msg The message to report

... list of primitives that are formatted into the message

6.713.2.7 `virtual`
`decaf::io::UnsupportedEncodingException::~~UnsupportedEncodingException`
`() throw () [inline, virtual]`

6.713.3 Member Function Documentation

6.713.3.1 `virtual UnsupportedEncodingException* de-`
`caf::io::UnsupportedEncodingException::clone () const [inline,`
`virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from `decaf::io::IOException` (p. 1709).

The documentation for this class was generated from the following file:

- `src/main/decaf/io/UnsupportedEncodingException.h`

6.714 cms::UnsupportedOperationException Class Reference

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

```
#include <src/main/cms/UnsupportedOperationException.h>
```

Inheritance diagram for cms::UnsupportedOperationException:

Public Member Functions

6.715.1 Constructor & Destructor Documentation

6.715.1.1 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException () throw () [inline]

Default Constructor.

6.715.1.2 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 1476).

Parameters

ex An exception that should become this type of **Exception** (p. 1476)

6.715.1.3 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const UnsupportedOperationException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of **Exception** (p. 1476)

6.715.1.4 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const char * *file*, const int *lineNumber*, const std::exception *
cause, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.715.1.5 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause **Pointer** (p. 2343) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.715.1.6 decaf::lang::exceptions::UnsupportedOperationException::UnsupportedOperationException
(const char * *file*, const int *lineNumber*, const char * *msg*, ...)
throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.715.1.7 **virtual**
 `decaf::lang::exceptions::UnsupportedOperationException::~~UnsupportedOperationException`
 `() throw () [inline, virtual]`

6.715.2 Member Function Documentation

6.715.2.1 **virtual UnsupportedOperationException* decaf::lang::exceptions::UnsupportedOperationException::clone () const**
 `[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 1476) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 1479).

Reimplemented in **decaf::nio::ReadOnlyBufferException** (p. 2522).

The documentation for this class was generated from the following file:

- `src/main/decaf/lang/exceptions/UnsupportedOperationException.h`

6.716 decaf::net::URI Class Reference

This class represents an instance of a **URI** (p. 3096) as defined by RFC 2396.

6.716.1 Detailed Description

This class represents an instance of a **URI** (p. 3096) as defined by RFC 2396.

6.716.2 Constructor & Destructor Documentation

6.716.2.1 decaf::net::URI::URI ()

Default Constructor, same as calling a Constructor with all fields empty.

6.716.2.2 decaf::net::URI::URI (const URI & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3096) as a copy of another **URI** (p. 3096).

Parameters

uri - uri to copy

6.716.2.3 decaf::net::URI::URI (const std::string & *uri*) throw (URISyntaxException)

Constructs a **URI** (p. 3096) from the given string.

Parameters

uri - string uri to parse.

6.716.2.4 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *ssp*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3096) from the given components.

Parameters

scheme - the uri scheme

ssp - Scheme specific part

fragment - Fragment

6.716.2.5 decaf::net::URI::URI (const std::string & *scheme*, const std::string & *userInfo*, const std::string & *host*, int *port*, const std::string & *path*, const std::string & *query*, const std::string & *fragment*) throw (URISyntaxException)

Constructs a **URI** (p. 3096) from the given components.

Parameters

scheme - Scheme name

userInfo - User name and authorization information

host - Host name

port - Port number

path - Path

query - Query

fragment - Fragment

6.716.2.6 `decaf::net::URI::URI (const std::string & scheme, const std::string & host, const std::string & path, const std::string & fragment) throw (URISyntaxException)`

Constructs a **URI** (p. 3096) from the given components.

Parameters

scheme - Scheme name

host - Host name

path - Path

fragment - Fragment

6.716.2.7 `decaf::net::URI::URI (const std::string & scheme, const std::string & authority, const std::string & path, const std::string & query, const std::string & fragment) throw (URISyntaxException)`

Constructs a **URI** (p. 3096) from the given components.

Parameters

scheme - Scheme name

authority - Authority

path - Path

query - Query

fragment - Fragment

6.716.2.8 `virtual decaf::net::URI::~~URI () [inline, virtual]`

6.716.3 Member Function Documentation

6.716.3.1 `virtual int decaf::net::URI::compareTo (const URI & value) const [virtual]`

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value - the value to compare to this one.

Returns

zero if equal minus one if less than and one if greater than.

6.716.3.2 static URI decaf::net::URI::create (const std::string uri) throw (lang::exceptions::IllegalArgumentException) [static]

Creates a **URI** (p. 3096) by parsing the given string.

This convenience factory method works as if by invoking the `URI(string)` constructor; any **URISyntaxException** (p. 3122) thrown by the constructor is caught and wrapped in a new `IllegalArgumentException` object, which is then thrown.

Parameters

uri - **URI** (p. 3096) string to parse

Exceptions

IllegalArgumentException

6.716.3.3 virtual bool decaf::net::URI::equals (const URI & value) const [virtual]**Returns**

true if this value is considered equal to the passed value.

6.716.3.4 std::string decaf::net::URI::getAuthority () const**Returns**

the decoded authority component of this **URI** (p. 3096).

6.716.3.5 std::string decaf::net::URI::getFragment () const**Returns**

the decoded fragment component of this **URI** (p. 3096).

6.716.3.6 std::string decaf::net::URI::getHost () const**Returns**

the host component of this **URI** (p. 3096).

6.716.3.7 `std::string decaf::net::URI::getPath () const`**Returns**

the path component of this **URI** (p. 3096).

6.716.3.8 `int decaf::net::URI::getPort () const`**Returns**

the port component of this **URI** (p. 3096).

6.716.3.9 `std::string decaf::net::URI::getQuery () const`**Returns**

the query component of this **URI** (p. 3096).

6.716.3.10 `std::string decaf::net::URI::getRawAuthority () const`

Returns the raw authority component of this **URI** (p. 3096).

The authority component of a **URI** (p. 3096), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns

the raw authority component of the **URI** (p. 3096)

6.716.3.11 `std::string decaf::net::URI::getRawFragment () const`

Returns the raw fragment component of this **URI** (p. 3096).

The fragment component of a **URI** (p. 3096), if defined, only contains legal **URI** (p. 3096) characters.

Returns

the raw fragment component of this **URI** (p. 3096)

6.716.3.12 `std::string decaf::net::URI::getRawPath () const`

Returns the raw path component of this **URI** (p. 3096).

The path component of a **URI** (p. 3096), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns

the raw path component of this **URI** (p. 3096)

6.716.3.13 `std::string decaf::net::URI::getRawQuery () const`

Returns the raw query component of this **URI** (p. 3096).

The query component of a **URI** (p. 3096), if defined, only contains legal **URI** (p. 3096) characters.

Returns

the raw query component of the **URI** (p. 3096).

6.716.3.14 `std::string decaf::net::URI::getRawSchemeSpecificPart () const`

Returns the raw scheme-specific part of this **URI** (p. 3096).

The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 3096) only contains legal **URI** (p. 3096) characters.

Returns

the raw scheme special part of the uri

6.716.3.15 `std::string decaf::net::URI::getRawUserInfo () const`

Returns the raw user-information component of this **URI** (p. 3096).

The user-information component of a **URI** (p. 3096), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns

the raw user-information component of the **URI** (p. 3096)

6.716.3.16 `std::string decaf::net::URI::getScheme () const`**Returns**

the scheme component of this **URI** (p. 3096)

6.716.3.17 `std::string decaf::net::URI::getSchemeSpecificPart () const`

Returns the decoded scheme-specific part of this **URI** (p. 3096).

The string returned by this method is equal to that returned by the `getRawSchemeSpecificPart` method except that all sequences of escaped octets are decoded.

Returns

the raw scheme specific part of the uri.

6.716.3.18 `std::string decaf::net::URI::getUserInfo () const`**Returns**

the user info component of this **URI** (p. 3096)

6.716.3.19 `bool decaf::net::URI::isAbsolute () const`

Tells whether or not this **URI** (p. 3096) is absolute.

A **URI** (p. 3096) is absolute if, and only if, it has a scheme component.

Returns

true if, and only if, this **URI** (p. 3096) is absolute

6.716.3.20 `bool decaf::net::URI::isOpaque () const`

Tells whether or not this **URI** (p. 3096) is opaque.

A **URI** (p. 3096) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 3096) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns

true if, and only if, this **URI** (p. 3096) is opaque

6.716.3.21 `URI decaf::net::URI::normalize () const`

Normalizes this **URI**'s path.

If this **URI** (p. 3096) is opaque, or if its path is already in normal form, then this **URI** (p. 3096) is returned. Otherwise a new **URI** (p. 3096) is constructed that is identical to this **URI** (p. 3096) except that its path is computed by normalizing this **URI**'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed. 2. If a ".." segment is preceded by a non-"" segment then both of these segments are removed. This step is repeated until it is no longer applicable. 3. If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 3096) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 3096) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more "." segments if there were insufficient non-"" segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns

A **URI** (p. 3096) equivalent to this **URI** (p. 3096), but whose path is in normal form

**6.716.3.22 `virtual bool decaf::net::URI::operator< (const URI & value) const`
[virtual]**

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.716.3.23 `virtual bool decaf::net::URI::operator==(const URI & value) const`
[virtual]

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.716.3.24 `URI decaf::net::URI::parseServerAuthority () const throw (`
`URISyntaxException)`

Attempts to parse this URI's authority component, if defined, into user-information, host, and port components.

If this URI's authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 3096) has no authority component, this method simply returns this **URI** (p. 3096).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns

A **URI** (p. 3096) whose authority field has been parsed as a server-based authority

Exceptions

URISyntaxException (p. 3122) - If the authority component of this **URI** (p. 3096) is defined but cannot be parsed as a server-based authority.

6.716.3.25 `URI decaf::net::URI::relativize (const URI & uri) const`

Relativizes the given **URI** (p. 3096) against this **URI** (p. 3096).

The relativization of the given **URI** (p. 3096) against this **URI** (p. 3096) is computed as follows:

1. If either this **URI** (p. 3096) or the given **URI** (p. 3096) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 3096) is not a prefix of the path of the given **URI** (p. 3096), then the given **URI** (p. 3096) is returned.
2. Otherwise a new relative hierarchical **URI** (p. 3096) is constructed with query and fragment components taken from the given **URI** (p. 3096) and with a path component computed by removing this URI's path from the beginning of the given URI's path.

Parameters

uri - The **URI** (p. 3096) to be relativized against this **URI** (p. 3096)

Returns

The resulting **URI** (p. 3096)

6.716.3.26 URI decaf::net::URI::resolve (const std::string & *str*) const throw (lang::exceptions::IllegalArgumentException)

Constructs a new **URI** (p. 3096) by parsing the given string and then resolving it against this **URI** (p. 3096).

This convenience method works as if invoking it were equivalent to evaluating the expression `resolve(URI::create(str))`.

Parameters

str - The string to be parsed into a **URI** (p. 3096)

Returns

The resulting **URI** (p. 3096)

Exceptions

IllegalArgumentException - If the given string violates RFC 2396

6.716.3.27 URI decaf::net::URI::resolve (const URI & *uri*) const

Resolves the given **URI** (p. 3096) against this **URI** (p. 3096).

If the given **URI** (p. 3096) is already absolute, or if this **URI** (p. 3096) is opaque, then a copy of the given **URI** (p. 3096) is returned.

If the given URI's fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 3096) with the given fragment but with all other components equal to those of this **URI** (p. 3096) is returned. This allows a **URI** (p. 3096) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 3096).

Otherwise this method constructs a new hierarchical **URI** (p. 3096) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 3096) is constructed with this URI's scheme and the given URI's query and fragment components.
2. If the given **URI** (p. 3096) has an authority component then the new URI's authority and path are taken from the given **URI** (p. 3096).
3. Otherwise the new URI's authority component is copied from this **URI** (p. 3096), and its path is computed as follows:

1. If the given URI's path is absolute then the new URI's path is taken from the given **URI** (p. 3096).
2. Otherwise the given URI's path is relative, and so the new URI's path is computed by resolving the path of the given **URI** (p. 3096) against the path of this **URI** (p. 3096). This is done by concatenating all but the last segment of this URI's path, if any, with the given URI's path and then normalizing the result as if by invoking the `normalize` method.

The result of this method is absolute if, and only if, either this **URI** (p. 3096) is absolute or the given **URI** (p. 3096) is absolute.

Parameters

uri - The **URI** (p. 3096) to be resolved against this **URI** (p. 3096)

Returns

The resulting **URI** (p. 3096)

6.716.3.28 std::string decaf::net::URI::toString () const

Returns the content of this **URI** (p. 3096) as a string.

If this **URI** (p. 3096) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 3096) was created by normalization, resolution, or relativization, and so a string is constructed from this **URI**'s components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns

the string form of this **URI** (p. 3096)

6.716.3.29 URL decaf::net::URI::toURL () const throw (MalformedURLException, lang::exceptions::IllegalArgumentException)

Constructs a **URL** (p. 3133) from this **URI** (p. 3096).

This convenience method works as if invoking it were equivalent to evaluating the expression `new URL (p. 3133)(this.toString())` after first checking that this **URI** (p. 3096) is absolute.

Returns

A **URL** (p. 3133) constructed from this **URI** (p. 3096)

Exceptions

IllegalArgumentException - If this **URL** (p. 3133) is not absolute

MalformedURLException (p. 1968) - If a protocol handler for the **URL** (p. 3133) could not be found, or if some other error occurred while constructing the **URL** (p. 3133)

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URI.h`

6.717 decaf::internal::net::URIEncoderDecoder Class Reference

```

```

Public Member Functions

- **URIEncoderDecoder** ()
- virtual **~URIEncoderDecoder** ()

Static Public Member Functions

- static void **validate** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)

Validate a string by checking if it contains any characters other than:

- static void **validateSimple** (const std::string &s, const std::string &legal) throw (decaf::net::URISyntaxException)

Validate a string by checking if it contains any characters other than:

- static std::string **quoteIllegal** (const std::string &s, const std::string &legal)

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ".

- static std::string **encodeOthers** (const std::string &s)

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

- static std::string **decode** (const std::string &s)

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

6.717.1.2 virtual decaf::internal::net::URIEncoderDecoder::~~URIEncoderDecoder () [inline, virtual]

6.717.2 Member Function Documentation

6.717.2.1 static std::string decaf::internal::net::URIEncoderDecoder::decode (const std::string & s) [static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type using the UTF-8 encoding scheme.

" and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C \$%"

Parameters

s - The encoded string.

Returns

The decoded version.

6.717.2.2 static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers (const std::string & *s*) [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

They are converted into their hexadecimal value prepended by ”.

For example: Euro currency symbol -> "%E2%82%AC".

Parameters

s - the string to be converted

Returns

the converted string

6.717.2.3 static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal (const std::string & *s*, const std::string & *legal*) [static]

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexadecimal value prepended by ”.

For example: '#' -> 23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters

s - the string to be converted

legal - the characters allowed to be preserved in the string *s*

Returns

converted string

6.717.2.4 static void decaf::internal::net::URIEncoderDecoder::validate (const std::string & *s*, const std::string & *legal*) throw (decaf::net::URISyntaxException) [static]

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z') 2. numbers ('0'..'9') 3. characters in the legalset parameter 4. characters that are not ISO Control or are not ISO Space characters)

Parameters

s - the string to be validated

legal - the characters allowed in the string *s*

6.717.2.5 `static void decaf::internal::net::URIEncoderDecoder::validateSimple (const std::string & s, const std::string & legal) throw (decaf::net::URISyntaxException) [static]`

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter

Parameters

- s* - the string to be validated
- legal* - the characters allowed in the string *s*

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIEncoderDecoder.h`

6.718 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

```
#include <src/main/decaf/internal/net/URIHelper.h>
```

Public Member Functions

- **URIHelper** (const std::string &unreserved, const std::string &punct, const std::string &reserved, const std::string &someLegal, const std::string &allLegal)
*Setup the **URIHelper** (p. 3110) with values assigned to the various fields that are used in the validation process.*
- **URIHelper** ()
Sets up the filter strings with sane defaults.
- virtual **~URIHelper** ()
- **URIType** **parseURI** (const std::string &uri, bool forceServer) throw (decaf::net::URISyntaxException)
Parse the passed in URI.
- void **validateScheme** (const std::string &uri, const std::string &scheme, int index) throw (decaf::net::URISyntaxException)
Validate the schema portin of the URI.
- void **validateSsp** (const std::string &uri, const std::string &ssp, std::size_t index) throw (decaf::net::URISyntaxException)
Validate that the URI Ssp Segment contains no invalid encodings.
- void **validateAuthority** (const std::string &uri, const std::string &authority, std::size_t index) throw (decaf::net::URISyntaxException)
Validate that the URI Authority Segment contains no invalid encodings.

- void **validatePath** (const std::string &uri, const std::string &path, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (const std::string &uri, const std::string &query, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI Query Segment contains no invalid encodings.

- void **validateFragment** (const std::string &uri, const std::string &fragment, std::size_t index) throw (decaf::net::URISyntaxException)

Validate that the URI fragment contains no invalid encodings.

- **URIType parseAuthority** (bool forceServer, const std::string &authority) throw (decaf::net::URISyntaxException)

determine the host, port and user-info if the authority parses successfully to a server based authority

- void **validateUserinfo** (const std::string &uri, const std::string &userinfo, std::size_t index) throw (decaf::net::URISyntaxException)

Check the supplied user info for validity.

- bool **isValidHost** (bool forceServer, const std::string &host) throw (decaf::net::URISyntaxException)

distinguish between IPv4, IPv6, domain name and validate it based on its type

- bool **isValidDomainName** (const std::string &host)

Validates the string past to determine if it is a well formed domain name.

- bool **isValidIPv4Address** (const std::string &host)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

- bool **isValidIPv6Address** (const std::string &ipAddress)

Determines if the given address is valid according to the IPv6 spec.

- bool **isValidIPv4Word** (const std::string &word)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

- bool **isValidHexChar** (char c)

Determines if the given char is a valid Hex char.

6.718.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.718.2 Constructor & Destructor Documentation

6.718.2.1 `decaf::internal::net::URIHelper::URIHelper (const std::string & unreserved, const std::string & punct, const std::string & reserved, const std::string & someLegal, const std::string & allLegal)`

Setup the **URIHelper** (p.3110) with values assigned to the various fields that are used in the validation process.

The defaults are overridden by these values.

Parameters

unreserved - characters not reserved for use.

punct - allowable punctuation symbols.

reserved - characters not allowed for general use in the URI.

someLegal - characters that are legal in certain cases.

allLegal - characters that are always legal.

6.718.2.2 `decaf::internal::net::URIHelper::URIHelper ()`

Sets up the filter strings with sane defaults.

6.718.2.3 `virtual decaf::internal::net::URIHelper::~~URIHelper () [inline, virtual]`

6.718.3 Member Function Documentation

6.718.3.1 `bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & host)`

Validates the string past to determine if it is a well formed domain name.

Parameters

host - domain name to validate.

Returns

true if host is well formed.

6.718.3.2 `bool decaf::internal::net::URIHelper::isValidHexChar (char c)`

Determines if the given char is a valid Hex char.

Valid chars are A-F (upper or lower case) and 0-9.

Parameters

c - char to inspect

Returns

true if c is a valid hex char.

6.718.3.3 bool decaf::internal::net::URIHelper::isValidHost (bool *forceServer*, const std::string & *host*) throw (decaf::net::URISyntaxException)

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters

forceServer - true if the forceServer mode should be active.

host - Host string to validate.

Returns

true if the host value is a valid domain name.

Exceptions

URISyntaxException if the host is invalid and forceServer is true.

6.718.3.4 bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & *word*)

Check if the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters

word - string value to check.

Returns

true if the word is a valid IPv4 word.

6.718.3.5 bool decaf::internal::net::URIHelper::isValidIP6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters

ipAddress - string ip address value to validate.

Returns

true if the address string is valid.

6.718.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX where X is any number 0-9.

and XXX is not greater than 255.

Parameters

host - IPv4 address string to parse.

Returns

true if host is a well formed IPv4 address.

6.718.3.7 `URIType decaf::internal::net::URIHelper::parseAuthority (bool forceServer, const std::string & authority) throw (decaf::net::URISyntaxException)`

determine the host, port and user-info if the authority parses successfully to a server based authority

behavior in error cases: if *forceServer* is true, throw `URISyntaxException` with the proper diagnostic messages. if *forceServer* is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where `URISyntaxException` is thrown regardless of the *forceServer* parameter e.g. mal-formed ipv6 address

Parameters

forceServer

authority

Returns

a `URIType` (p. 3126) instance containing the parsed data.

Exceptions

URISyntaxException

6.718.3.8 `URIType decaf::internal::net::URIHelper::parseURI (const std::string & uri, bool forceServer) throw (decaf::net::URISyntaxException)`

Parse the passed in URI.

Parameters

uri - the URI to Parse

forceServer - if true invalid URI data throws an Exception

Returns

a `URIType` (p. 3126) instance containing the parsed data.

Exceptions

URISyntaxException if *forceServer* is true and the URI is invalid.

6.718.3.9 `void decaf::internal::net::URIHelper::validateAuthority (const
std::string & uri, const std::string & authority, std::size_t index)
throw (decaf::net::URISyntaxException)`

Validate that the URI Authority Segment contains no invalid encodings.

Parameters

uri - the full uri.

authority - the Authority to check.

index - position in the uri where Authority starts.

Exceptions

URISyntaxException if the fragment has errors.

6.718.3.10 `void decaf::internal::net::URIHelper::validateFragment (const
std::string & uri, const std::string & fragment, std::size_t index)
throw (decaf::net::URISyntaxException)`

Validate that the URI fragment contains no invalid encodings.

Parameters

uri - the full uri.

fragment - the fragment to check.

index - position in the uri where fragment starts.

Exceptions

URISyntaxException if the fragment has errors.

6.718.3.11 `void decaf::internal::net::URIHelper::validatePath (const std::string
& uri, const std::string & path, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Path Segment contains no invalid encodings.

Parameters

uri - the full uri.

path - the path to check.

index - position in the uri where path starts.

Exceptions

URISyntaxException if the fragment has errors.

6.718.3.12 `void decaf::internal::net::URIHelper::validateQuery (const std::string & uri, const std::string & query, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Query Segment contains no invalid encodings.

Parameters

uri - the full uri.

query - the query to check.

index - position in the uri where fragment starts.

Exceptions

URISyntaxException if the fragment has errors.

6.718.3.13 `void decaf::internal::net::URIHelper::validateScheme (const std::string & uri, const std::string & scheme, int index) throw (decaf::net::URISyntaxException)`

Validate the schema portin of the URI.

Parameters

uri - the URI to check.

scheme - the schema section of the URI.

index - index in uri where schema starts.

Exceptions

URISyntaxException if the fragment has errors.

6.718.3.14 `void decaf::internal::net::URIHelper::validateSsp (const std::string & uri, const std::string & ssp, std::size_t index) throw (decaf::net::URISyntaxException)`

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters

uri - the full uri.

ssp - the SSP to check.

index - position in the uri where Ssp starts.

Exceptions

URISyntaxException if the fragment has errors.

```
6.718.3.15 void decaf::internal::net::URIHelper::validateUserinfo ( const
std::string & uri, const std::string & userinfo, std::size_t index )
throw ( decaf::net::URISyntaxException )
```

Check the supplied user info for validity.

Parameters

uri - the uri to parse.

userinfo - supplied user info

index - index into the URI string where the data is located.

Returns

true if valid

Exceptions

URISyntaxException if an error occurs

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/URIHelper.h

6.719 activemq::transport::failover::URIPool Class Reference

```
#include <src/main/activemq/transport/failover/URIPool.h>
```

Public Member Functions

- **URIPool** ()
Create an Empty URI Pool.
- **URIPool** (const decaf::util::List< URI > &uris)
Creates a new URI Pool using the given list as the initial Free List.
- virtual ~**URIPool** ()
- **URI** **getURI** () throw (decaf::lang::exceptions::NoSuchElementException)
Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.
- void **addURI** (const URI &uri)
*Adds a URI to the free list, callers that have previously taken one using the **getURI** method should always return the URI when they close the resource that was connected to that URI.*
- void **addURIs** (const StlList< URI > &uris)
Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

- **void removeURI** (const **URI** &uri)
Remove a given URI from the Free List.
- **bool isRandomize** () const
Is the URI that is given randomly picked from the pool or is each one taken in sequence.
- **void setRandomize** (bool value)
Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.719.1 Constructor & Destructor Documentation

6.719.1.1 **activemq::transport::failover::URIPool::URIPool** ()

Create an Empty URI Pool.

6.719.1.2 **activemq::transport::failover::URIPool::URIPool** (const **decaf::util::List**< **URI** > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters

uris - List of URI to place in the Pool.

6.719.1.3 **virtual activemq::transport::failover::URIPool::~~URIPool** () [virtual]

6.719.2 Member Function Documentation

6.719.2.1 **void activemq::transport::failover::URIPool::addURI** (const **URI** & *uri*)

Adds a URI to the free list, callers that have previously taken one using the **getURI** method should always return the URI when they close the resource that was connected to that URI.

Parameters

uri - a URI previously taken from the pool.

6.719.2.2 **void activemq::transport::failover::URIPool::addURIs** (const **StlList**< **URI** > & *uris*)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters

uris - List of URIs to add into the Pool.

6.719.2.3 URI activemq::transport::failover::URIPool::getURI () throw (decaf::lang::exceptions::NoSuchElementException)

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a `NoSuchElementException`.

Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns

the next free URI in the Pool.

Exceptions

NoSuchElementException if there are none free currently.

6.719.2.4 bool activemq::transport::failover::URIPool::isRandomize () const [inline]

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns

true if URI gets are random.

6.719.2.5 void activemq::transport::failover::URIPool::removeURI (const URI & uri)

Remove a given URI from the Free List.

Parameters

uri - the URI to find and remove from the free list

6.719.2.6 void activemq::transport::failover::URIPool::setRandomize (bool value) [inline]

Sets if the URIs that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters

value - true indicates URI gets are random.

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/failover/URIPool.h`

6.720 activemq::util::URISupport Class Reference

```
#include <src/main/activemq/util/URISupport.h>
```

Static Public Member Functions

- static void **parseURL** (const std::string &URI, **decaf::util::Properties** &properties) throw (decaf::lang::exceptions::IllegalArgumentException)

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

- static **CompositeData** **parseComposite** (const **URI** &uri) throw (decaf::net::URISyntaxException)

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

- static **decaf::util::Properties** **parseQuery** (std::string query) throw (decaf::lang::exceptions::IllegalArgumentException)

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static void **parseQuery** (std::string query, **decaf::util::Properties** *properties) throw (decaf::lang::exceptions::IllegalArgumentException)

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

- static std::string **createQueryString** (const **Properties** &options) throw (decaf::net::URISyntaxException)

Given a properties object create a string that can be appended to a URI as a valid Query string.

6.720.1 Member Function Documentation

- ### 6.720.1.1 static std::string activemq::util::URISupport::createQueryString (const **Properties** & *options*) throw (decaf::net::URISyntaxException) [static]

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters

options Properties object containing key / value query values.

Returns

a valid URI query string.

Exceptions

URISyntaxException if the string in the Properties object can't be encoded into a valid URI Query string.

6.720.1.2 static `CompositeData` `activemq::util::URISupport::parseComposite` (`const URI & uri`) throw (`decaf::net::URISyntaxException`) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uriN)?param1=value1, each of the composite URIs is stored in the CompositeData's internal list.

Parameters

uri - The Composite URI to parse.

Returns

a new `CompositeData` (p. 1013) object with the parsed data

Exceptions

URISyntaxException if the URI is not well formed.

6.720.1.3 static void `activemq::util::URISupport::parseQuery` (`std::string query`, `decaf::util::Properties * properties`) throw (`decaf::lang::exceptions::IllegalArgumentException`) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query - the query string to parse.

properties - object pointer to get the parsed output.

Exceptions

IllegalArgumentException if the Query string is not well formed.

6.720.1.4 static `decaf::util::Properties` `activemq::util::URISupport::parseQuery` (`std::string query`) throw (`decaf::lang::exceptions::IllegalArgumentException`) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query The query string to parse and extract the encoded properties.

Returns

Properties object with the parsed output.

Exceptions

IllegalArgumentException if the Query string is not well formed.

6.720.1.5 `static void activemq::util::URISupport::parseURL (const
std::string & URI, decaf::util::Properties & properties) throw (
decaf::lang::exceptions::IllegalArgumentException) [static]`

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters

URI a Broker URI to parse

properties a Properties object to set the parsed values in

Exceptions

IllegalArgumentException if the passed URI is invalid

- `src/main/activemq/util/URISupport.h`

6.721 decaf::net::URISyntaxException Class Reference

`#include <src/main/decaf/net/URISyntaxException.h>`

Inheritance diagram for `decaf::net::URISyntaxException`:

Public Member Functions

- **URISyntaxException** () throw ()
Default Constructor.
- **URISyntaxException** (const Exception &ex) throw ()
Conversion Constructor from some other Exception.
- **URISyntaxException** (const **URISyntaxException** &ex) throw ()
Copy Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const std::exception *cause) throw ()
Constructor.
- **URISyntaxException** (const char *file, const int lineNumber, const char *msg DECAF_ -
UNUSED) throw ()
Constructor - Initializes the file name and line number where this message occurred.

- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (const char *file, const int lineNumber, const std::string &input, const std::string &reason, std::size_t index) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- virtual **URISyntaxException * clone** () const
Clones this exception.
- virtual **~URISyntaxException** () throw ()
- std::string **getInput** () const
- std::string **getReason** () const
- std::size_t **getIndex** () const

6.721.1 Constructor & Destructor Documentation

6.721.1.1 decaf::net::URISyntaxException::URISyntaxException () throw () [inline]

Default Constructor.

6.721.1.2 decaf::net::URISyntaxException::URISyntaxException (const Exception & ex) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex An exception that should become this type of Exception

6.721.1.3 decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & ex) throw () [inline]

Copy Constructor.

Parameters

ex An exception that should become this type of Exception

6.721.1.4 decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
cause The exception that was the cause for this one to be thrown.
msg The message to report
... list of primitives that are formatted into the message

6.721.1.5 `decaf::net::URISyntaxException::URISyntaxException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.721.1.6 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const char *msg DECAF_UNUSED) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs
lineNumber The line number where the exception occurred.
msg The message to report
... list of primitives that are formatted into the message

6.721.1.7 `decaf::net::URISyntaxException::URISyntaxException (const char * file, const int lineNumber, const std::string & input, const std::string & reason) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file The file name where exception occurs.
lineNumber The line number where the exception occurred.
input The **URL** (p.3133) that caused the exception.
reason The reason for the failure.

6.721.1.8 `decaf::net::URISyntaxException::URISyntaxException (const char *
file, const int lineNumber, const std::string & input, const std::string
& reason, std::size_t index) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

input The input **URI** (p. 3096) that caused the exception

reason The reason for the failure.

index The index in the **URI** (p. 3096) string where the error occurred.

6.721.1.9 `virtual decaf::net::URISyntaxException::~~URISyntaxException ()
throw () [inline, virtual]`

6.721.2 Member Function Documentation

6.721.2.1 `virtual URISyntaxException* decaf::net::URISyntaxException::clone (
) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 1479).

6.721.2.2 `std::size_t decaf::net::URISyntaxException::getIndex () const
[inline]`

Returns

the index in the input string where the error occurred or -1

6.721.2.3 `std::string decaf::net::URISyntaxException::getInput () const
[inline]`

Returns

the Input string that cause this exception or ""

6.721.2.4 `std::string decaf::net::URISyntaxException::getReason () const` [inline]

Returns

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URISyntaxException.h`

6.722 `decaf::internal::net::URIType` Class Reference

Basic type object that holds data that composes a given URI.

```
#include <src/main/decaf/internal/net/URIType.h>
```

Public Member Functions

- **URIType** (const std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () const
*Gets the source URI string that was parsed to obtain this **URIType** (p. 3126) instance and the resulting data,.*
- void **setSource** (const std::string &source)
*Sets the source URI string that was parsed to obtain this **URIType** (p. 3126) instance and the resulting data,.*
- std::string **getScheme** () const
Gets the Scheme of the URI, e.g.
- void **setScheme** (const std::string &scheme)
Sets the Scheme of the URI, e.g.
- std::string **getSchemeSpecificPart** () const
Gets the Scheme Specific Part of the URI.
- void **setSchemeSpecificPart** (const std::string &schemeSpecificPart)
Sets the Scheme Specific Part of the URI.
- std::string **getAuthority** () const
Gets the Authority of the URI.
- void **setAuthority** (const std::string &authority)
Sets the Authority of the URI.
- std::string **getUserInfo** () const
Gets the user info part of the URI, e.g.

- void **setUserInfo** (const std::string &userinfo)
Sets the user info part of the URI, e.g.
- std::string **getHost** () const
Gets the Host name part of the URI.
- void **setHost** (const std::string &host)
Sets the Host name part of the URI.
- int **getPort** () const
Gets the port part of the URI.
- void **setPort** (int port)
Sets the port part of the URI.
- std::string **getPath** () const
Gets the Path part of the URI.
- void **setPath** (const std::string &path)
Sets the Path part of the URI.
- std::string **getQuery** () const
Gets the Query part of the URI.
- void **setQuery** (const std::string &query)
Sets the Query part of the URI.
- std::string **getFragment** () const
Gets the Fragment part of the URI.
- void **setFragment** (const std::string &fragment)
Sets the Fragment part of the URI.
- bool **isOpaque** () const
Gets if the URI is Opaque.
- void **setOpaque** (bool opaque)
Sets if the URI is Opaque.
- bool **isAbsolute** () const
Gets if the URI is Absolute.
- void **setAbsolute** (bool absolute)
Sets if the URI is Absolute.
- bool **isServerAuthority** () const
Gets if the URI is a Server Authority.
- void **setServerAuthority** (bool serverAuthority)

Sets if the URI is a Server Authority.

- **bool isValid () const**
Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.
- **void setValid (bool valid)**
Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.722.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.722.2 Constructor & Destructor Documentation

6.722.2.1 `decaf::internal::net::URIType::URIType (const std::string & source)`
[inline]

6.722.2.2 `decaf::internal::net::URIType::URIType ()` [inline]

6.722.2.3 `virtual decaf::internal::net::URIType::~~URIType ()` [inline, virtual]

6.722.3 Member Function Documentation

6.722.3.1 `std::string decaf::internal::net::URIType::getAuthority () const`
[inline]

Gets the Authority of the URI.

Returns

Authority part string.

6.722.3.2 `std::string decaf::internal::net::URIType::getFragment () const`
[inline]

Gets the Fragment part of the URI.

Returns

Fragment part string.

6.722.3.3 `std::string decaf::internal::net::URIType::getHost () const` [inline]

Gets the Host name part of the URI.

Returns

Host name part string.

6.722.3.4 `std::string decaf::internal::net::URIType::getPath () const [inline]`

Gets the Path part of the URI.

Returns

Path part string.

6.722.3.5 `int decaf::internal::net::URIType::getPort () const [inline]`

Gets the port part of the URI.

Returns

port part string, -1 if not set.

6.722.3.6 `std::string decaf::internal::net::URIType::getQuery () const [inline]`

Gets the Query part of the URI.

Returns

Query part string.

6.722.3.7 `std::string decaf::internal::net::URIType::getScheme () const [inline]`

Gets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Returns

scheme part string.

6.722.3.8 `std::string decaf::internal::net::URIType::getSchemeSpecificPart () const [inline]`

Gets the Scheme Specific Part of the URI.

Returns

scheme specific part string.

6.722.3.9 `std::string decaf::internal::net::URIType::getSource () const [inline]`

Gets the source URI string that was parsed to obtain this **URIType** (p.3126) instance and the resulting data,.

Returns

the source URI string

6.722.3.10 `std::string decaf::internal::net::URIType::getUserInfo () const`
[inline]

Gets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Returns

user info part string.

6.722.3.11 `bool decaf::internal::net::URIType::isAbsolute () const` [inline]

Gets if the URI is Absolute.

Returns

true if Absolute.

6.722.3.12 `bool decaf::internal::net::URIType::isOpaque () const` [inline]

Gets if the URI is Opaque.

Returns

true if opaque.

6.722.3.13 `bool decaf::internal::net::URIType::isServerAuthority () const`
[inline]

Gets if the URI is a Server Authority.

Returns

true if Server Authority.

6.722.3.14 `bool decaf::internal::net::URIType::isValid () const` [inline]

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns

true if the **URIType** (p. 3126) contains valid data.

6.722.3.15 `void decaf::internal::net::URIType::setAbsolute (bool absolute)`
[inline]

Sets if the URI is Absolute.

Parameters

absolute - true if Absolute.

6.722.3.16 void decaf::internal::net::URIType::setAuthority (const std::string & *authority*) [inline]

Sets the Authority of the URI.

Parameters

authority Authority part string.

6.722.3.17 void decaf::internal::net::URIType::setFragment (const std::string & *fragment*) [inline]

Sets the Fragment part of the URI.

Parameters

fragment - Fragment part string.

6.722.3.18 void decaf::internal::net::URIType::setHost (const std::string & *host*) [inline]

Sets the Host name part of the URI.

Parameters

host - Host name part string.

6.722.3.19 void decaf::internal::net::URIType::setOpaque (bool *opaque*) [inline]

Sets if the URI is Opaque.

Parameters

opaque true if opaque.

6.722.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*) [inline]

Sets the Path part of the URI.

Parameters

path - Path part string.

6.722.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URI.

Parameters

port - port part string, -1 if not set.

6.722.3.22 `void decaf::internal::net::URIType::setQuery (const std::string & query) [inline]`

Sets the Query part of the URI.

Parameters

query - Query part string.

6.722.3.23 `void decaf::internal::net::URIType::setScheme (const std::string & scheme) [inline]`

Sets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Parameters

scheme - scheme part string.

6.722.3.24 `void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & schemeSpecificPart) [inline]`

Sets the Scheme Specific Part of the URI.

Parameters

schemeSpecificPart - scheme specific part string.

6.722.3.25 `void decaf::internal::net::URIType::setServerAuthority (bool serverAuthority) [inline]`

Sets if the URI is a Server Authority.

Parameters

serverAuthority - true if Server Authority.

6.722.3.26 `void decaf::internal::net::URIType::setSource (const std::string & source) [inline]`

Sets the source URI string that was parsed to obtain this **URIType** (p. 3126) instance and the resulting data,.

Parameters

source - the source URI string

6.722.3.27 `void decaf::internal::net::URIType::setUserInfo (const std::string & userinfo) [inline]`

Sets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Parameters

userinfo - user info part string.

6.722.3.28 `void decaf::internal::net::URIType::setValid (bool valid) [inline]`

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters

valid - true if the **URIType** (p. 3126) contains valid data.

The documentation for this class was generated from the following file:

- `src/main/decaf/internal/net/URIType.h`

6.723 decaf::net::URL Class Reference

Class **URL** (p. 3133) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

```
#include <src/main/decaf/net/URL.h>
```

Public Member Functions

- **URL** ()
- **URL** (const std::string &url)
- virtual ~**URL** ()

6.723.1 Detailed Description

Class **URL** (p. 3133) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web. A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

<http://www.ksc.nasa.gov/facts/internet/url-primer.html>

In general, a **URL** (p. 3133) can be broken into several parts. The previous example of a **URL** (p. 3133) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named `www.ksc.nasa.gov`. The information on that host machine is named `/facts/internet/url-primer.html`. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 3133) is called the path component.

A **URL** (p. 3133) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

```
http://www.ksc.nasa.gov:80/facts/internet/url-primer.html
```

The syntax of **URL** (p. 3133) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 3096)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports scope_ids. The syntax and usage of scope_ids is described here.

A **URL** (p. 3133) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

```
http://www.apache.org/cms/index.html#chapter1
```

This fragment is not technically part of the **URL** (p. 3133). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag chapter1 attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 3133). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 3133):

```
http://www.apache.org/cms/index.html
```

contained within it the relative **URL** (p. 3133):

```
FAQ.html
```

it would be a shorthand for:

```
http://www.apache.org/cms/FAQ.html
```

The relative **URL** (p. 3133) need not specify all the components of a **URL** (p. 3133). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 3133). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 3133) class does not itself encode or decode any **URL** (p. 3133) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 3133), and also to decode any escaped fields, that are returned from **URL** (p. 3133). Furthermore, because **URL** (p. 3133) has no knowledge of **URL** (p. 3133) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 3133). For example, the two URLs:

```
http://foo.com/hello world/ and http://foo.com/hello%20world
```

would be considered not equal to each other.

Note, the **URI** (p. 3096) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 3096), and to convert between these two classes using **toURI()** and **URI.toURL()** (p. 3107).

The **URLEncoder** (p. 3136) and **URLDecoder** (p. 3135) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

6.723.2 Constructor & Destructor Documentation

6.723.2.1 decaf::net::URL::URL ()

6.723.2.2 decaf::net::URL::URL (const std::string & *url*)

6.723.2.3 virtual decaf::net::URL::~~URL () [inline, virtual]

The documentation for this class was generated from the following file:

```
#include <src/main/decaf/net/URLDecoder.h>
```

Public Member Functions

- virtual ~URLDecoder ()

Static Public Member Functions

- static std::string **decode** (const std::string &value)
Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.

6.724.1 Constructor & Destructor Documentation

6.724.1.1 virtual decaf::net::URLDecoder::~~URLDecoder () [inline, virtual]

6.724.2 Member Function Documentation

6.724.2.1 static std::string decaf::net::URLDecoder::decode (const std::string & *value*) [static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.

'+' will be converted to space, " and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

Parameters

value - string The encoded string.

Returns

The decoded version as a string.

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLDecoder.h`

6.725 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

Public Member Functions

- `virtual ~URLEncoder ()`

Static Public Member Functions

- `static std::string encode (const std::string &value)`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

6.725.1 Constructor & Destructor Documentation

6.725.1.1 `virtual decaf::net::URLEncoder::~~URLEncoder () [inline, virtual]`

6.725.2 Member Function Documentation

6.725.2.1 `static std::string decaf::net::URLEncoder::encode (const std::string &value) [static]`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexadecimal value prepended by ".

For example: '#' -> 23

In addition, spaces are substituted by '+'

Parameters

value - the string to be converted

Returns

the converted string

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLEncoder.h`

6.726 activemq::util::Usage Class Reference

```
#include <src/main/activemq/util/Usage.h>
```

Inheritance diagram for activemq::util::Usage:

Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`
*Waits forever for more space to be returned to this **Usage** (p. 3137) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`
*Waits for more space to be returned to this **Usage** (p. 3137) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`
Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void `increaseUsage (unsigned long long value)=0`
Increases the usage by the value amount.
- virtual void `decreaseUsage (unsigned long long value)=0`
Decreases the usage by the value amount.
- virtual bool `isFull () const =0`
*Returns true if this **Usage** (p. 3137) instance is full, i.e.*

6.726.1 Constructor & Destructor Documentation

6.726.1.1 virtual `activemq::util::Usage::~Usage ()` [inline, virtual]

6.726.2 Member Function Documentation

6.726.2.1 virtual void `activemq::util::Usage::decreaseUsage (unsigned long long value)` [pure virtual]

Decreases the usage by the value amount.

Parameters

value Amount of space to return to the pool

Implemented in `activemq::util::MemoryUsage` (p. 2016).

6.726.2.2 `virtual void activemq::util::Usage::enqueueUsage (unsigned long long value)` [pure virtual]

Tries to increase the usage by *value* amount but blocks if this object is currently full.

Parameters

value Amount of usage in bytes to add.

Implemented in `activemq::util::MemoryUsage` (p. 2016).

6.726.2.3 `virtual void activemq::util::Usage::increaseUsage (unsigned long long value)` [pure virtual]

Increases the usage by the *value* amount.

Parameters

value Amount of usage to add.

Implemented in `activemq::util::MemoryUsage` (p. 2017).

6.726.2.4 `virtual bool activemq::util::Usage::isFull () const` [pure virtual]

Returns true if this `Usage` (p. 3137) instance is full, i.e.

`Usage` (p. 3137) $\geq 100\%$

Returns

true if `Usage` (p. 3137) is at the Full point.

Implemented in `activemq::util::MemoryUsage` (p. 2017).

6.726.2.5 `virtual void activemq::util::Usage::waitForSpace (unsigned int timeout)` [pure virtual]

Waits for more space to be returned to this `Usage` (p. 3137) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout The time to wait for more space.

Implemented in `activemq::util::MemoryUsage` (p. 2017).

6.726.2.6 `virtual void activemq::util::Usage::waitForSpace ()` [pure virtual]

Waits forever for more space to be returned to this `Usage` (p. 3137) Manager.

Implemented in `activemq::util::MemoryUsage` (p. 2017).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/Usage.h`

6.727 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

```
#include <src/main/decaf/io/UTFDataFormatException.h>
```

Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()
Default Constructor.
- **UTFDataFormatException** (const lang::Exception &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const UTFDataFormatException &ex) throw ()
Copy Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const std::exception *cause, const char *msg,...) throw ()
Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (const std::exception *cause) throw ()
Constructor.
- **UTFDataFormatException** (const char *file, const int lineNumber, const char *msg,...) throw ()
Constructor.
- virtual **UTFDataFormatException** * clone () const
Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.727.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since

1.0

6.727.2 Constructor & Destructor Documentation

6.727.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException () throw () [inline]

Default Constructor.

6.727.2.2 `decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy

6.727.2.3 `decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & ex) throw () [inline]`

Copy Constructor.

Parameters

ex the exception to copy, which is an instance of this type

6.727.2.4 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const std::exception * cause, const char * msg, ...) throw () [inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file The file name where exception occurs

lineNumber The line number where the exception occurred.

cause The exception that was the cause for this one to be thrown.

msg The message to report

... list of primitives that are formatted into the message

6.727.2.5 `decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * cause) throw () [inline]`

Constructor.

Parameters

cause Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.727.2.6 `decaf::io::UTFDataFormatException::UTFDataFormatException (const char * file, const int lineNumber, const char * msg, ...) throw () [inline]`

Constructor.

Parameters

- file* The file name where exception occurs
- lineNumber* The line number where the exception occurred.
- msg* The message to report
- ... list of primitives that are formatted into the message

6.727.2.7 virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException () throw () [inline, virtual]

6.727.3 Member Function Documentation

6.727.3.1 virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone () const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1709).

The documentation for this class was generated from the following file:

- src/main/decaf/io/UTFDataFormatException.h

6.728 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 3141)).

```
#include <src/main/decaf/util/UUID.h>
```

Inheritance diagram for decaf::util::UUID:

Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)
*Constructs a new **UUID** (p. 3141) using the specified data.*
- virtual ~**UUID** ()
- virtual int **compareTo** (const **UUID** &value) const
*Compare the given **UUID** (p. 3141) to this one.*
- virtual bool **equals** (const **UUID** &value) const

*Compares this **UUID** (p. 3141) to the one given, returns true if they are equal.*

- virtual bool **operator==** (const **UUID** &value) const
Compares equality between this object and the one passed.
- virtual bool **operator<** (const **UUID** &value) const
Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual std::string **toString** () const
*Returns a String object representing this **UUID** (p. 3141).*
- virtual long long **getLeastSignificantBits** () const
- virtual long long **getMostSignificantBits** () const
- virtual long long **node** () throw (lang::exceptions::UnsupportedOperationException)
*The node value associated with this **UUID** (p. 3141).*
- virtual long long **timestamp** () throw (lang::exceptions::UnsupportedOperationException)
*The timestamp value associated with this **UUID** (p. 3141).*
- virtual int **clockSequence** () throw (lang::exceptions::UnsupportedOperationException)
*The clock sequence value associated with this **UUID** (p. 3141).*
- virtual int **variant** () throw (lang::exceptions::UnsupportedOperationException)
*The variant number associated with this **UUID** (p. 3141).*
- virtual int **version** () throw (lang::exceptions::UnsupportedOperationException)
*The version number associated with this **UUID** (p. 3141).*

Static Public Member Functions

- static **UUID** **randomUUID** ()
*Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3141).*
- static **UUID** **nameUUIDFromBytes** (const std::vector< char > &name)

- static **UUID** **nameUUIDFromBytes** (const char *name, std::size_t size)
*Static factory to retrieve a type 3 (name based) **UUID** (p. 3141) based on the specified byte array.*
- static **UUID** **fromString** (const std::string &name) throw (lang::exceptions::IllegalArgumentException)
*Creates a **UUID** (p. 3141) from the string standard representation as described in the **toString()** (p. 3147) method.*

6.728.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 3141)). A **UUID** (p. 3141) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 3141) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 3141) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFFFF0000 time_mid 0x000000000000F000 version
0x00000000000000FF time_hi
```

The least significant long consists of the following unsigned fields:

```
0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFFFF node
```

The variant field contains a value which identifies the layout of the **UUID** (p. 3141). The bit layout described above is valid only for a **UUID** (p. 3141) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 3141). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.728.2 Constructor & Destructor Documentation

6.728.2.1 decaf::util::UUID::UUID (long long *mostSigBits*, long long *leastSigBits*)

Constructs a new **UUID** (p. 3141) using the specified data.

mostSigBits is used for the most significant 64 bits of the **UUID** (p. 3141) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 3141).

Parameters

mostSigBits

leastSigBits

6.728.2.2 virtual decaf::util::UUID::~~UUID () [virtual]

6.728.3 Member Function Documentation

6.728.3.1 virtual int decaf::util::UUID::clockSequence () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The clock sequence value associated with this **UUID** (p. 3141).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 3141). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 3141).

The clockSequence value is only meaningful in a time-based **UUID** (p. 3141), which has version type 1. If this **UUID** (p. 3141) is not a time-based **UUID** (p. 3141) then this method throws `UnsupportedOperationException`.

Returns

the clockSequence associated with a V1 **UUID** (p. 3141)

Exceptions

`UnsupportedOperationException`

6.728.3.2 `virtual int decaf::util::UUID::compareTo (const UUID & value) const`
[virtual]

Compare the given **UUID** (p. 3141) to this one.

Parameters

value - the **UUID** (p. 3141) to compare to

6.728.3.3 `virtual bool decaf::util::UUID::equals (const UUID & value) const`
[virtual]

Compares this **UUID** (p. 3141) to the one given, returns true if they are equal.

Parameters

value - the **UUID** (p. 3141) to compare to.

Returns

true if UUIDs are the same.

6.728.3.4 `static UUID decaf::util::UUID::fromString (const std::string & name)`
`throw (lang::exceptions::IllegalArgumentException) [static]`

Creates a **UUID** (p. 3141) from the string standard representation as described in the `toString()` (p. 3147) method.

Parameters

name - a string to be used to construct a **UUID** (p. 3141).

Returns

type 3 **UUID** (p. 3141)

6.728.3.5 `virtual long long decaf::util::UUID::getLeastSignificantBits () const`
[virtual]

Returns

the most significant 64 bits of this **UUID**'s 128 bit value.

6.728.3.6 `virtual long long decaf::util::UUID::getMostSignificantBits () const`
[virtual]

Returns

the most significant 64 bits of this UUID's 128 bit value.

6.728.3.7 `static UUID decaf::util::UUID::nameUUIDFromBytes (const`
`std::vector< char > & name)` [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3141) based on the specified byte array.

Parameters

name - a byte array to be used to construct a **UUID** (p. 3141).

Returns

type 3 **UUID** (p. 3141)

6.728.3.8 `static UUID decaf::util::UUID::nameUUIDFromBytes (const char *`
`name, std::size_t size)` [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3141) based on the specified byte array.

Parameters

name - a byte array to be used to construct a **UUID** (p. 3141).

size - the size of the byte array, or number of bytes to use.

Returns

type 3 **UUID** (p. 3141)

6.728.3.9 `virtual long long decaf::util::UUID::node () throw (`
`lang::exceptions::UnsupportedOperationException)` [virtual]

The node value associated with this **UUID** (p. 3141).

The 48 bit node value is constructed from the node field of this **UUID** (p. 3141). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 3141) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 3141), which has version type 1. If this **UUID** (p. 3141) is not a time-based **UUID** (p. 3141) then this method throws `UnsupportedOperationException`.

Returns

the node value of this **UUID** (p. 3141)

Exceptions

UnsupportedOperationException

6.728.3.10 `virtual bool decaf::util::UUID::operator< (const UUID & value)
const [virtual]`

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.728.3.11 `virtual bool decaf::util::UUID::operator== (const UUID & value)
const [virtual]`

Compares equality between this object and the one passed.

Parameters

value - the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.728.3.12 `static UUID decaf::util::UUID::randomUUID () [static]`

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3141).

The **UUID** (p. 3141) is generated using a cryptographically strong pseudo random number generator.

Returns

type 4 **UUID** (p. 3141)

6.728.3.13 `virtual long long decaf::util::UUID::timestamp () throw (
lang::exceptions::UnsupportedOperationException) [virtual]`

The timestamp value associated with this **UUID** (p. 3141).

The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 3141). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 3141), which has version type 1. If this **UUID** (p. 3141) is not a time-based **UUID** (p. 3141) then this method throws `UnsupportedOperationException`.

Returns

the timestamp associated with a V1 **UUID** (p. 3141)

Exceptions

UnsupportedOperationException

6.728.3.14 virtual std::string decaf::util::UUID::toString () const [virtual]

Returns a String object representing this **UUID** (p. 3141).

UUID's are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns

formatted string for this **UUID** (p. 3141)

6.728.3.15 virtual int decaf::util::UUID::variant () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The variant number associated with this **UUID** (p. 3141).

The variant number describes the layout of the **UUID** (p. 3141). The variant number has the following meaning:

* 0 Reserved for NCS backward compatibility * 2 The Leach-Salz variant (used by this class) * 6 Reserved, Microsoft Corporation backward compatibility * 7 Reserved for future definition

Returns

the variant associated with a V1 **UUID** (p. 3141)

Exceptions

UnsupportedOperationException

6.728.3.16 virtual int decaf::util::UUID::version () throw (lang::exceptions::UnsupportedOperationException) [virtual]

The version number associated with this **UUID** (p. 3141).

The version number describes how this **UUID** (p. 3141) was generated. The version number has the following meaning:

* 1 Time-based **UUID** (p. 3141) * 2 DCE security **UUID** (p. 3141) * 3 Name-based **UUID** (p. 3141) * 4 Randomly generated **UUID** (p. 3141)

Returns

the version associated with a V1 **UUID** (p. 3141)

Exceptions

UnsupportedOperationException

The documentation for this class was generated from the following file:

6.729 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

```
#include <src/main/activemq/wireformat/WireFormat.h>
```

Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual `~WireFormat ()`
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0
throw (**decaf::io::IOException**)
Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer**< **commands::Command** > **unmarshal** (const **activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0
throw (**decaf::io::IOException**)
Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version)=0
Set the Version.
- virtual int **getVersion** () const =0
Get the Version.
- virtual bool **hasNegotiator** () const =0
*Returns true if this **WireFormat** (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.*
- virtual bool **inReceive** () const =0
Indicates if the WireFormat object is in the process of receiving a message.
- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0 throw (**decaf::lang::exceptions::UnsupportedOperationException**)
If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.729.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

Version

Revision:

1.1

6.729.2 Constructor & Destructor Documentation

6.729.2.1 virtual `activemq::wireformat::WireFormat::~WireFormat ()` [inline, virtual]

6.729.3 Member Function Documentation

6.729.3.1 virtual `Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > & transport) throw (decaf::lang::exceptions::UnsupportedOperationException)` [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters

transport - the Transport to Wrap the Negotiator around.

Returns

new instance of a **WireFormatNegotiator** (p. 3182) as a **Pointer<Transport>** (p. 2343).

Exceptions

UnsupportedOperationException if the **WireFormat** (p. 3148) doesn't have a Negotiator.

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2300), and `activemq::wireformat::stomp::StompWireFormat` (p. 2884).

6.729.3.2 virtual `int activemq::wireformat::WireFormat::getVersion () const` [pure virtual]

Get the Version.

Returns

the version of the wire format

Implemented in `activemq::wireformat::openwire::OpenWireFormat` (p. 2302), and `activemq::wireformat::stomp::StompWireFormat` (p. 2884).

6.729.3.3 `virtual bool activemq::wireformat::WireFormat::hasNegotiator () const` [pure virtual]

Returns true if this **WireFormat** (p. 3148) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 3148) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2302), and **activemq::wireformat::stomp::StompWireFormat** (p. 2885).

6.729.3.4 `virtual bool activemq::wireformat::WireFormat::inReceive () const` [pure virtual]

Indicates if the WireFormat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 3148) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 3148) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns

true if the **WireFormat** (p. 3148) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2302), and **activemq::wireformat::stomp::StompWireFormat** (p. 2885).

6.729.3.5 `virtual void activemq::wireformat::WireFormat::marshal (const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out) throw (decaf::io::IOException)` [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command The Command to Marshal

transport The Transport that called this method.

out The output stream to write the command to.

Exceptions

IOException

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2304), and **activemq::wireformat::stomp::StompWireFormat** (p. 2885).

6.729.3.6 virtual void activemq::wireformat::WireFormat::setVersion (int *version*) [pure virtual]

Set the Version.

Parameters

version the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2306), and **activemq::wireformat::stomp::StompWireFormat** (p. 2885).

6.729.3.7 virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) throw (decaf::io::IOException) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

transport - Pointer to the transport that is making this request.

in - the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2308), and **activemq::wireformat::stomp::StompWireFormat** (p. 2886).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormat.h**

6.730 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 3151) is the interface that all **WireFormatFactory** (p. 3151) classes must extend.

```
#include <src/main/activemq/wireformat/WireFormatFactory.h>
```

Inheritance diagram for activemq::wireformat::WireFormatFactory:

Public Member Functions

- virtual `~WireFormatFactory()`
- virtual `Pointer<WireFormat> createWireFormat (const decaf::util::Properties &properties)=0` throw (decaf::lang::exceptions::IllegalStateException)
*Creates a new **WireFormat** (p. 3148) Object passing it a set of properties from which it can obtain any optional settings.*

6.730.1 Detailed Description

The **WireFormatFactory** (p. 3151) is the interface that all **WireFormatFactory** (p. 3151) classes must extend. The Factory creates a **WireFormat** (p. 3148) Object based on the properties that are set in the passed **Properties** object.

6.730.2 Constructor & Destructor Documentation

- 6.730.2.1** `virtual activemq::wireformat::WireFormatFactory::~~WireFormatFactory ()` [inline, virtual]

6.730.3 Member Function Documentation

- 6.730.3.1** `virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & properties)` throw (decaf::lang::exceptions::IllegalStateException) [pure virtual]

Creates a new **WireFormat** (p. 3148) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties - the Properties for this **WireFormat** (p. 3148)

Returns

Pointer to a new instance of a **WireFormat** (p. 3148) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2309), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 2887).

The documentation for this class was generated from the following file:

6.731 activemq::commands::WireFormatInfo Class Reference

```
#include <src/main/activemq/commands/WireFormatInfo.h>
```

Inheritance diagram for `activemq::commands::WireFormatInfo`:

Public Member Functions

- **WireFormatInfo** ()
- virtual **~WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () const
Get the unique identifier that this object and its own Marshaler share.
- virtual **DataStructure** * **cloneDataStructure** () const
Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (const **DataStructure** *src)
Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () const
*Returns a string containing the information for this **DataStructure** (p. 1372) such as its type and value of its elements.*
- virtual bool **equals** (const **DataStructure** *value) const
*Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent.*
- virtual bool **isMarshalAware** () const
Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual **decaf::lang::Pointer**< **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor) throw (**exceptions::ActiveMQException**)
Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- int **getVersion** () const
Get the current Wireformat Version.
- void **setVersion** (int version)
Set the current Wireformat Version.
- long long **getMaxInactivityDuration** () const
Returns the currently configured Max Inactivity duration.
- void **setMaxInactivityDuration** (long long maxInactivityDuration)
Sets the Max inactivity duration value.
- long long **getMaxInactivityDurationInitialDelay** () const
Returns the currently configured Max Inactivity Initial Delay duration.
- void **setMaxInactivityDurationInitialDelay** (long long maxInactivityDurationInitialDelay)
Sets the Max inactivity initial delay duration value.
- bool **isStackTraceEnabled** () const

Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)
Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () const
Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)
Sets if the tcpNoDelayEnabled flag is on.
- bool **isCacheEnabled** () const
Checks if the cacheEnabled flag is on.
- void **setCacheEnabled** (bool cacheEnabled)
Sets if the cacheEnabled flag is on.
- int **getCacheSize** () const
Gets the Cache Size setting.
- void **setCacheSize** (int value)
Sets the Cache Size setting.
- bool **isTightEncodingEnabled** () const
Checks if the tightEncodingEnabled flag is on.
- void **setTightEncodingEnabled** (bool tightEncodingEnabled)
Sets if the tightEncodingEnabled flag is on.
- bool **isSizePrefixDisabled** () const
Checks if the sizePrefixDisabled flag is on.
- void **setSizePrefixDisabled** (bool sizePrefixDisabled)
Sets if the sizePrefixDisabled flag is on.
- const std::vector< unsigned char > & **getMagic** () const
Get the Magic field.
- void **setMagic** (const std::vector< unsigned char > &magic)
Sets the value of the magic field.
- const std::vector< unsigned char > & **getMarshalledProperties** () const
Get the marshalledProperties field.
- void **setMarshalledProperties** (const std::vector< unsigned char > &marshalledProperties)
Sets the value of the marshalledProperties field.
- virtual const **util::PrimitiveMap** & **getProperties** () const
*Gets the Properties for this **Command** (p. 991).*

- virtual **util::PrimitiveMap** & **getProperties** ()
*Gets the Properties for this **Command** (p. 991).*
- virtual void **setProperties** (const **util::PrimitiveMap** &map)
*Sets the Properties for this **Command** (p. 991).*
- bool **isValid** () const
*Determines if we think this is a Valid **WireFormatInfo** (p. 3152) command.*
- virtual bool **isWireFormatInfo** () const
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat **AMQCPP_** - **UNUSED**) throw (**decaf::io::IOException**)
Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** *wireFormat **AMQCPP_** - **UNUSED**) throw (**decaf::io::IOException**)
Called after unmarshaling is started to cleanup the object being unmarshaled.

Static Public Attributes

- static const unsigned char **ID_WIREFORMATINFO** = 1

6.731.1 Constructor & Destructor Documentation

- 6.731.1.1 **activemq::commands::WireFormatInfo::WireFormatInfo** ()
- 6.731.1.2 **virtual activemq::commands::WireFormatInfo::~~WireFormatInfo** ()
[virtual]

6.731.2 Member Function Documentation

- 6.731.2.1 **virtual void activemq::commands::WireFormatInfo::afterUnmarshal** (**wireformat::WireFormat** *wireFormat **AMQCPP_** **UNUSED**) throw (**decaf::io::IOException**) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat - the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 660).

- 6.731.2.2 **virtual void activemq::commands::WireFormatInfo::beforeMarshal** (**wireformat::WireFormat** *wireFormat **AMQCPP_** **UNUSED**) throw (**decaf::io::IOException**) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

Parameters

wireFormat - the wire formatting controller

Reimplemented from `activemq::commands::BaseDataStructure` (p. 660).

6.731.2.3 `virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure () const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements `activemq::commands::DataStructure` (p. 1373).

6.731.2.4 `virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure * src) [virtual]`

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.731.2.5 `virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure * value) const [virtual]`

Compares the `DataStructure` (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

Reimplemented from `activemq::commands::BaseCommand` (p. 598).

6.731.2.6 `int activemq::commands::WireFormatInfo::getCacheSize () const`

Gets the Cache Size setting.

Returns

currently set cache size.

6.731.2.7 `virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType () const`
[virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataStructure** (p. 1372) type copy.

Implements **activemq::commands::DataStructure** (p. 1375).

6.731.2.8 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic () const`
[inline]

Get the Magic field.

Returns

const reference to a `std::vector<char>`

6.731.2.9 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties () const`
[inline]

Get the marshalledProperties field.

Returns

const reference to a `std::vector<char>`

6.731.2.10 `long long activemq::commands::WireFormatInfo::getMaxInactivityDuration () const`

Returns the currently configured Max Inactivity duration.

Returns

the set inactivity duration value.

6.731.2.11 `long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitalDelay () const`

Returns the currently configured Max Inactivity Intial Delay duration.

Returns

the set inactivity duration initial delay value.

6.731.2.12 `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ()`
[inline, virtual]

Gets the Properties for this **Command** (p. 991).

Returns

the Properties object for this **Command** (p. 991).

6.731.2.13 `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ()`
`const` [inline, virtual]

Gets the Properties for this **Command** (p. 991).

Returns

the Properties object for this **Command** (p. 991).

6.731.2.14 `int activemq::commands::WireFormatInfo::getVersion () const`
[inline]

Get the current Wireformat Version.

Returns

int that identifies the version

6.731.2.15 `bool activemq::commands::WireFormatInfo::isCacheEnabled () const`

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.731.2.16 `virtual bool activemq::commands::WireFormatInfo::isMarshalAware () const` [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 662).

6.731.2.17 `bool activemq::commands::WireFormatInfo::isSizePrefixDisabled () const`

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.731.2.18 `bool activemq::commands::WireFormatInfo::isStackTraceEnabled () const`

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.731.2.19 `bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled () const`

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.731.2.20 `bool activemq::commands::WireFormatInfo::isTightEncodingEnabled () const`

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.731.2.21 `bool activemq::commands::WireFormatInfo::isValid () const`

Determines if we think this is a Valid **WireFormatInfo** (p. 3152) command.

Returns

true if its valid.

6.731.2.22 `virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo () const [inline, virtual]`

Returns

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 602).

6.731.2.23 `void activemq::commands::WireFormatInfo::setCacheEnabled (bool cacheEnabled)`

Sets if the `cacheEnabled` flag is on.

Parameters

cacheEnabled - true to turn flag is on

6.731.2.24 `void activemq::commands::WireFormatInfo::setCacheSize (int value)`

Sets the Cache Size setting.

Parameters

value - value to set to the cache size.

6.731.2.25 `void activemq::commands::WireFormatInfo::setMagic (const std::vector< unsigned char > & magic) [inline]`

Sets the value of the magic field.

Parameters

magic - const std::vector<char>

6.731.2.26 `void activemq::commands::WireFormatInfo::setMarshaledProperties (const std::vector< unsigned char > & marshalledProperties) [inline]`

Sets the value of the marshalledProperties field.

Parameters

marshalledProperties The Byte Array vector that contains the marshaled form of the Message (p. 2018) properties, this is the data sent over the wire.

6.731.2.27 `void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long maxInactivityDuration)`

Sets the Max inactivity duration value.

Parameters

maxInactivityDuration - max time a client can be inactive.

6.731.2.28 `void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitialDelay (long long maxInactivityDurationInitialDelay)`

Sets the Max inactivity initial delay duration value.

Parameters

maxInactivityDurationInitialDelay - time before the inactivity delay is checked.

6.731.2.29 `virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & map) [inline, virtual]`

Sets the Properties for this **Command** (p. 991).

Parameters

map - PrimitiveMap to copy

6.731.2.30 `void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool sizePrefixDisabled)`

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefixDisabled - true to turn flag is on

6.731.2.31 `void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool stackTraceEnabled)`

Sets if the stackTraceEnabled flag is on.

Parameters

stackTraceEnabled - ture to turn flag is on

6.731.2.32 `void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool tcpNoDelayEnabled)`

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelayEnabled - ture to turn flag is on

6.731.2.33 `void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool tightEncodingEnabled)`

Sets if the `tightEncodingEnabled` flag is on.

Parameters

tightEncodingEnabled - true to turn flag is on

6.731.2.34 `void activemq::commands::WireFormatInfo::setVersion (int version) [inline]`

Set the current Wireformat Version.

Parameters

version - int that identifies the version

6.731.2.35 `virtual std::string activemq::commands::WireFormatInfo::toString () const [virtual]`

Returns a string containing the information for this **DataStructure** (p.1372) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from `activemq::commands::BaseCommand` (p.602).

6.731.2.36 `virtual decaf::lang::Pointer<commands::Command> activemq::commands::WireFormatInfo::visit (activemq::state::CommandVisitor * visitor) throw (exceptions::ActiveMQException) [virtual]`

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper `processXXX` method in the visitor.

Returns

a **Response** (p.2611) to the visitor being called or NULL if no response.

Implements `activemq::commands::Command` (p.995).

6.731.3 Field Documentation

6.731.3.1 `const unsigned char activemq::commands::WireFormatInfo::ID_WIREFORMATINFO = 1 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/WireFormatInfo.h`

6.732 activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3163).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/WireFormatInfoMarshaller.h>
```

Get the Data Structure Type that identifies this Marshaller.
- virtual void **tightUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual int **tightMarshal1** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write the booleans that this object uses to a BooleanStream.
- virtual void **tightMarshal2** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)
Write a object instance to data output stream.
- virtual void **looseUnmarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)
Un-marshal an object instance from the data input stream.
- virtual void **looseMarshal** (OpenWireFormat *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)
Write a object instance to data output stream.

6.732.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3163). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.732.2 Constructor & Destructor Documentation

6.732.2.1 `activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::WireFormatInfoMarshaller()` [inline]

6.732.2.2 `virtual activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller()` [inline, virtual]

6.732.3 Member Function Documentation

6.732.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::createObject() const` [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.732.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::getDataStructureType() const` [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.732.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseMarshal(OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.732.3.4 virtual void `activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseUnmarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `decaf::io::DataInputStream * dataIn`) throw (`decaf::io::IOException`) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1348).

6.732.3.5 virtual int `activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal` (`OpenWireFormat * wireFormat`, `commands::DataStructure * dataStructure`, `utils::BooleanStream * bs`) throw (`decaf::io::IOException`) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1354).

6.732.3.6 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1360).

6.732.3.7 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.
bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1366).

The documentation for this class was generated from the following file:

6.733.2.2 `virtual activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.733.3 Member Function Documentation

6.733.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.733.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.733.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.733.3.4 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.733.3.5 virtual int activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.733.3.6 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.733.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.734.3 Member Function Documentation

6.734.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.734.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.734.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.734.3.4 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.734.3.5 virtual int activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.734.3.6 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.734.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

6.735.2.2 `virtual activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller () [inline, virtual]`

6.735.3 Member Function Documentation

6.735.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::createObject () const [virtual]`

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.735.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.735.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.735.3.4 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.735.3.5 virtual int activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.735.3.6 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.735.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

Returns

new DataStructure object pointer caller owns it.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1331).

6.736.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::getDataStructureType () const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.736.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException) [virtual]`

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1342).

6.736.3.4 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1348).

6.736.3.5 virtual int activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1354).

6.736.3.6 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1360).

```
6.736.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1366).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**WireFormatInfoMarshaller.h**

6.737 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 3182) which allows a **WireFormat** (p. 3148) to.

```
#include <src/main/activemq/wireformat/WireFormatNegotiator.h>
```

Inheritance diagram for **activemq::wireformat::WireFormatNegotiator**:

Public Member Functions

- **WireFormatNegotiator** (const **Pointer**< **transport::Transport** > &next)
Constructor.
- virtual ~**WireFormatNegotiator** ()

6.737.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 3182) which allows a **WireFormat** (p. 3148) to.

6.737.2 Constructor & Destructor Documentation

- 6.737.2.1** **activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator** (
const **Pointer**< **transport::Transport** > & *next*) [inline]

Constructor.

Parameters

next - the next Transport in the chain

- 6.737.2.2** virtual
activemq::wireformat::WireFormatNegotiator::~~WireFormatNegotiator (
) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatNegotiator.h**

6.738 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 3148) Factories that are available to the client at runtime.

```
#include <src/main/activemq/wireformat/WireFormatRegistry.h>
```

Public Member Functions

- virtual ~**WireFormatRegistry** ()
- **WireFormatFactory** * **findFactory** (const std::string &name) const throw (decaf::lang::exceptions::NoSuchElementException)
*Gets a Registered **WireFormatFactory** (p. 3151) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- void **registerFactory** (const std::string &name, **WireFormatFactory** *factory) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

*Registers a new **WireFormatFactory** (p. 3151) with this Registry.*

- void **unregisterFactory** (const std::string &name)
Unregisters the Factory with the given name and deletes that instance of the Factory.
- std::vector< std::string > **getWireFormatNames** () const
Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()
*Gets the single instance of the **WireFormatRegistry** (p. 3183).*

6.738.1 Detailed Description

Registry of all **WireFormat** (p. 3148) Factories that are available to the client at runtime. New WireFormat's must have a factory registered here before a connection attempt is made.

Since

3.0

6.738.2 Constructor & Destructor Documentation

- 6.738.2.1** virtual
activemq::wireformat::WireFormatRegistry::~~WireFormatRegistry ()
[virtual]

6.738.3 Member Function Documentation

- 6.738.3.1** WireFormatFactory* ac-
tivemq::wireformat::WireFormatRegistry::findFactory
(const std::string & *name*) const throw (
decaf::lang::exceptions::NoSuchElementException)

Gets a Registered **WireFormatFactory** (p. 3151) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException if no factory is registered with that name.

6.738.3.2 static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance () [static]

Gets the single instance of the **WireFormatRegistry** (p. 3183).

Returns

reference to the single instance of this Registry

6.738.3.3 std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames () const

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

Returns

stl vector of strings with all the **WireFormat** (p. 3148) names registered.

6.738.3.4 void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & *name*, WireFormatFactory * *factory*) throw (decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException)

Registers a new **WireFormatFactory** (p. 3151) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name The name of the new Factory to register.

factory The new Factory to add to the Registry.

Exceptions

IllegalArgumentException is name is the empty string.

NullPointerException if the Factory is Null.

6.738.3.5 void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

name Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatRegistry.h**

6.739 activemq::transport::inactivity::WriteChecker Class Reference

Runnable class used by the {}.

```
#include <src/main/activemq/transport/inactivity/WriteChecker.h>
```

Inheritance diagram for `activemq::transport::inactivity::WriteChecker`:

Public Member Functions

- **WriteChecker** (**InactivityMonitor** *parent)
- virtual ~**WriteChecker** ()
- virtual void **run** ()

Run method - called by the Thread class in the context of the thread.

6.739.1 Detailed Description

Runnable class used by the {}.

See also

InactivityMonitor (p. 1624)} to make periodic writes to the underlying **transport** (p. 74) if no other write activity is going on in order to more quickly detect failures of the connection to the broker.

Since

3.1.0

6.739.2 Constructor & Destructor Documentation

6.739.2.1 `activemq::transport::inactivity::WriteChecker::WriteChecker (InactivityMonitor * parent)`

6.739.2.2 `virtual activemq::transport::inactivity::WriteChecker::~~WriteChecker ()` [virtual]

6.739.3 Member Function Documentation

6.739.3.1 `virtual void activemq::transport::inactivity::WriteChecker::run ()` [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 2642).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/inactivity/WriteChecker.h`

6.740 decaf::io::Writer Class Reference

```
#include <src/main/decaf/io/Writer.h>
```

Public Member Functions

- virtual `~Writer ()`
- virtual void `setOutputStream (OutputStream *os)=0`
Sets the target output stream.
- virtual `OutputStream * getOutputStream ()=0`
Gets the target output stream.
- virtual void `write (const unsigned char *buffer, std::size_t count)=0` throw (`IOException`, `lang::exceptions::NullPointerException`)
Writes a byte array to the output stream.
- virtual void `writeByte (unsigned char v)=0` throw (`IOException`)
Writes a byte to the output stream.

6.740.1 Constructor & Destructor Documentation

6.740.1.1 virtual `decaf::io::Writer::~~Writer ()` [inline, virtual]

6.740.2 Member Function Documentation

6.740.2.1 virtual `OutputStream* decaf::io::Writer::getOutputStream ()` [pure virtual]

Gets the target output stream.

Returns

the output stream currently being used

6.740.2.2 virtual void `decaf::io::Writer::setOutputStream (OutputStream * os)` [pure virtual]

Sets the target output stream.

Parameters

os The provided Outputstream to use to write to.

6.740.2.3 `virtual void decaf::io::Writer::write (const unsigned char
* buffer, std::size_t count) throw (IOException,
lang::exceptions::NullPointerException) [pure virtual]`

Writes a byte array to the output stream.

Parameters

- buffer* a byte array
- count* the number of bytes in the array to write.

Exceptions

IOException (p. 1707) thrown if an error occurs.

6.740.2.4 `virtual void decaf::io::Writer::writeByte (unsigned char v) throw (IOException) [pure virtual]`

Writes a byte to the output stream.

Parameters

- v* The value to be written.

Exceptions

IOException (p. 1707) thrown if an error occurs.

The documentation for this class was generated from the following file:

[virtual]`

6.743.3 Member Function Documentation

6.743.3.1 `virtual XATransactionId* ac-
tivemq::commands::XATransactionId::cloneDataStructure
() const [virtual]`

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

6.743.3.2 `virtual int activemq::commands::XATransactionId::compareTo (const
XATransactionId & value) const [virtual]`

6.743.3.3 `virtual void activemq::commands::XATransactionId::copyDataStructure (const
DataStructure * src) [virtual]`

Copy the contents of the passed object into this object's members, overwriting any existing data.

Parameters

src - Source Object

6.743.3.4 `virtual bool activemq::commands::XATransactionId::equals (const
DataStructure * value) const [virtual]`

Compares the **DataStructure** (p. 1372) passed in to this one, and returns if they are equivalent. Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if DataStructure's are Equal.

- 6.743.3.5** virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & *value*) const [virtual]
- 6.743.3.6** virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () const [virtual]
- 6.743.3.7** virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier () [virtual]
- 6.743.3.8** virtual unsigned char activemq::commands::XATransactionId::getDataStructureType () const [virtual]

Get the unique identifier that this object and its own Marshaler share.

Returns

new **DataSet** (p. 1372) type copy.

- 6.743.3.9 virtual int activemq::commands::XATransactionId::getFormatId ()
 const [virtual]

- 6.743.3.10 virtual const std::vector<unsigned char>& ac-
 tivemq::commands::XATransactionId::getGlobalTransactionId ()

6.744 activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for `XATransactionIdMarshaller` (p. 3197).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/XATransactionIdMarshaller.h>
```

Inheritance diagram for `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller`:

Public Member Functions

- `XATransactionIdMarshaller ()`
- `virtual ~XATransactionIdMarshaller ()`
- `virtual commands::DataStructure * createObject () const`
Creates a new instance of this marshalable type.
- `virtual unsigned char getDataStructureType () const`
Get the Data Structure Type that identifies this Marshaler.
- `virtual void tightUnmarshal (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, decaf::io::DataInputStream *dataIn, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Un-marshal an object instance from the data input stream.
- `virtual int tightMarshal1 (OpenWireFormat *wireFormat, commands::DataStructure *dataStructure, utils::BooleanStream *bs) throw (decaf::io::IOException)`
Write the booleans that this object uses to a BooleanStream.

- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs) throw (decaf::io::IOException)

Write a object instance to data output stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn) throw (decaf::io::IOException)

Un-marshal an object instance from the data input stream.

- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut) throw (decaf::io::IOException)

Write a object instance to data output stream.

6.744.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3197). NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.744.2 Constructor & Destructor Documentation

6.744.2.1 **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::XATransactionIdMarshaller** () [inline]

6.744.2.2 virtual **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::~~XATransactionIdMarshaller** () [inline, virtual]

6.744.3 Member Function Documentation

6.744.3.1 virtual **commands::DataStructure*** **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::createObject** () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.744.3.2 virtual unsigned char **activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::getDataStructureType** () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements `activemq::wireformat::openwire::marshal::DataStreamMarshaller` (p. 1336).

6.744.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut) throw (decaf::io::IOException)` [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3020).

6.744.3.4 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn) throw (decaf::io::IOException)` [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3020).

6.744.3.5 `virtual int activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, utils::BooleanStream * bs) throw (decaf::io::IOException)` [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3021).

```
6.744.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker
dataStructure - Object to be marshaled
dataOut - BinaryReader that provides that data sink
bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller` (p. 3021).

```
6.744.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.
dataStructure - Object to be un-marshaled.
dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3022).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/XATransactionIdMarshaller.h

6.745 activemq::wireformat::openwire::marshal::v3::XATransactionIdMa Class Reference

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3201).

```

6.745.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::createObject () const [virtual]

Creates a new instance of this marshalable type.

Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1331).

6.745.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::getDataStructureType () const [virtual]

Get the Data Structure Type that identifies this Marshaler.

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.745.3.3 virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3034).

6.745.3.4 virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3035).

6.745.3.5 virtual int activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3035).

```
6.745.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller` (p. 3036).

```
6.745.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3036).

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3024).

```
6.747.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller` (p. 3025).

```
6.747.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3025).

Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1336).

6.748.3.3 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseMarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataOutputStream * *dataOut*) throw (decaf::io::IOException) [virtual]

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryWriter that provides that data sink

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3031).

6.748.3.4 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, decaf::io::DataInputStream * *dataIn*) throw (decaf::io::IOException) [virtual]

Un-marshal an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataIn - BinaryReader that provides that data source

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3031).

6.748.3.5 virtual int activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *dataStructure*, utils::BooleanStream * *bs*) throw (decaf::io::IOException) [virtual]

Write the booleans that this object uses to a BooleanStream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

bs - BooleanStream stream used to pack bits from the wire.

Returns

int value indicating the size of the marshaled object.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3032).

```
6.748.3.6 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataOutputStream * dataOut,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

Parameters

wireFormat - describes the wire format of the broker

dataStructure - Object to be marshaled

dataOut - BinaryReader that provides that data sink

bs - BooleanStream stream used to pack bits from the wire.

Exceptions

IOException if an error occurs during the marshal.

Reimplemented from `activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller` (p. 3032).

```
6.748.3.7 virtual void ac-
tivemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure
* dataStructure, decaf::io::DataInputStream * dataIn,
utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

Parameters

wireFormat - describes the wire format of the broker.

dataStructure - Object to be un-marshaled.

dataIn - BinaryReader that provides that data.

bs - BooleanStream stream used to unpack bits from the wire.

Exceptions

IOException if an error occurs during the unmarshal.

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3033).

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/openwire/marshal/v5/XATransactionIdMarshaller.h`

Chapter 7

File Documentation

7.1 src/main/activemq/cmsutil/CachedConsumer.h File Reference

```
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedConsumer**
A cached message consumer contained within a pooled session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.2 src/main/activemq/cmsutil/CachedProducer.h File Reference

```
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::CachedProducer**
A cached message producer contained within a pooled session.

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.3 src/main/activemq/cmsutil/CmsAccessor.h File Reference

```
#include <cms/ConnectionFactory.h>
#include <activemq/cmsutil/ResourceLifecycleManager.h>
#include <activemq/util/Config.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
```

Data Structures

- class **activemq::cmsutil::CmsAccessor**

*Base class for **activemq.cmsutil.CmsTemplate** (p. 969) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1103) to operate on.*

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **activemq::cmsutil**

7.4 src/main/activemq/cmsutil/CmsDestinationAccessor.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsAccessor.h>
#include <activemq/cmsutil/DynamicDestinationResolver.h>
```

Data Structures

- class **activemq::cmsutil::CmsDestinationAccessor**

*Extends the **CmsAccessor** (p. 954) to add support for resolving destination names.*

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.5 src/main/activemq/cmsutil/CmsTemplate.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsDestinationAccessor.h>
#include <activemq/cmsutil/SessionCallback.h>
#include <activemq/cmsutil/ProducerCallback.h>
#include <activemq/cmsutil/SessionPool.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <cms/ConnectionFactory.h>
#include <cms/DeliveryMode.h>
#include <string>
```

Data Structures

- class **activemq::cmsutil::CmsTemplate**
CmsTemplate (p. 969) simplifies performing synchronous CMS operations.
- class **activemq::cmsutil::CmsTemplate::ProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::SendExecutor**
- class **activemq::cmsutil::CmsTemplate::ReceiveExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveReceiveExecutor**

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.6 src/main/activemq/cmsutil/DestinationResolver.h File Reference

```
#include <cms/Session.h>
```

```
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DestinationResolver**
*Resolves a CMS destination name to a *Destination*.*

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.7 src/main/activemq/cmsutil/DynamicDestinationResolver.h File Reference

```
#include <activemq/cmsutil/DestinationResolver.h>  
#include <cms/Session.h>  
#include <decaf/util/StlMap.h>  
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::DynamicDestinationResolver**
*Resolves a CMS destination name to a *Destination*.*
- class **activemq::cmsutil::DynamicDestinationResolver::SessionResolver**
Manages maps of names to topics and queues for a single session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.8 src/main/activemq/cmsutil/MessageCreator.h File Reference

```
#include <cms/Session.h>
```

```
#include <cms/Message.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::MessageCreator**
Creates the user-defined message to be sent by the `CmsTemplate` (p. 969).

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.9 src/main/activemq/cmsutil/PooledSession.h File Reference

```
#include <cms/Session.h>
#include <decaf/util/StlMap.h>
#include <activemq/cmsutil/CachedProducer.h>
#include <activemq/cmsutil/CachedConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::PooledSession**
A pooled session object that wraps around a delegate session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.10 src/main/activemq/cmsutil/ProducerCallback.h File Reference

```
#include <cms/Session.h>
```

```
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ProducerCallback**
Callback for sending a message to a CMS destination.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.11 src/main/activemq/cmsutil/ResourceLifecycleManager.h File Reference

```
#include <cms/Connection.h>
#include <cms/Session.h>
#include <cms/Destination.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::ResourceLifecycleManager**
Manages the lifecycle of a set of CMS resources.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.12 src/main/activemq/cmsutil/SessionCallback.h File Reference

```
#include <cms/Session.h>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionCallback**
Callback for executing any number of operations on a provided CMS Session.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.13 src/main/activemq/cmsutil/SessionPool.h File Reference

```
#include <activemq/cmsutil/PooledSession.h>
#include <decaf/util/concurrent/Mutex.h>
#include <cms/Connection.h>
#include <list>
#include <activemq/util/Config.h>
```

Data Structures

- class **activemq::cmsutil::SessionPool**
A pool of CMS sessions from the same connection and with the same acknowledge mode.

Namespaces

- namespace **activemq**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::cmsutil**

7.14 src/main/activemq/commands/ActiveMQBlobMessage.h File Reference

Defines

- `#define AMQ_CATCH_RETHROW(type)`
Macro for catching and re-throwing an exception of a given type.
- `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`
Macro for catching an exception of one type and then re-throwing as another type.
- `#define AMQ_CATCHALL_THROW(type)`
A catch-all that throws a known exception.
- `#define AMQ_CATCHALL_NOTHROW()`
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- `#define AMQ_CATCH_NOTHROW(type)`
Macro for catching and re-throwing an exception of a given type.

7.99.1 Define Documentation

7.99.1.1 `#define AMQ_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.99.1.2 #define AMQ_CATCH_NOTHROW(type)**Value:**

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. `ActiveMQException`).

7.99.1.3 #define AMQ_CATCH_RETHROW(type)**Value:**

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. `ActiveMQException`).

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.99.1.4 #define AMQ_CATCHALL_NOTHROW()**Value:**

```
catch( ... ){ \
    activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.99.1.5 `#define AMQ_CATCHALL_THROW(type)`

Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

type the type of exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

7.100 `src/main/decaf/lang/exceptions/ExceptionDefines.h` File Reference

Defines

- `#define DECAF_CATCH_RETHROW(type)`
Macro for catching and rethrowing an exception of a given type.
- `#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`
Macro for catching an exception of one type and then rethrowing as another type.
- `#define DECAF_CATCHALL_THROW(type)`
A catch-all that throws a known exception.
- `#define DECAF_CATCHALL_NOTHROW()`
A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- `#define DECAF_CATCH_NOTHROW(type)`
Macro for catching and rethrowing an exception of a given type.

7.100.1 Define Documentation

7.100.1.1 `#define DECAF_CATCH_EXCEPTION_CONVERT(sourceType, targetType)`

Value:

```
catch( sourceType& ex ){ \
    targetType target( &ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters

sourceType the type of the exception to be caught.

targetType the type of the exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add().

7.100.1.2 #define DECAF_CATCH_NOTHROW(*type*)

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. Exception).

Referenced by decaf::io::FilterInputStream::~~FilterInputStream(), decaf::io::FilterOutputStream::~~FilterOutputStream(), and decaf::util::logging::StreamHandler::~~StreamHandler().

7.100.1.3 #define DECAF_CATCH_RETHROW(*type*)

Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type The type of the exception to throw (e.g. Exception).

Referenced by decaf::util::PriorityQueue< E >::add(), decaf::io::FilterInputStream::available(), decaf::io::FilterOutputStream::close(), decaf::io::FilterInputStream::close(), decaf::io::FilterOutputStream::flush(), decaf::util::concurrent::Lock::lock(), decaf::util::concurrent::Lock::Lock(), decaf::util::logging::StreamHandler::publish(), decaf::io::FilterInputStream::read(), decaf::io::FilterInputStream::reset(), decaf::io::FilterInputStream::skip(), decaf::util::concurrent::Lock::unlock(), decaf::io::FilterOutputStream::write(), and decaf::util::concurrent::Lock::~~Lock().

7.100.1.4 #define DECAF_CATCHALL_NOTHROW()

Value:

```
catch( ... ){ \
    lang::Exception ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by `decaf::io::FilterInputStream::mark()`, `decaf::io::FilterInputStream::markSupported()`, `decaf::io::FilterInputStream::~~FilterInputStream()`, `decaf::io::FilterOutputStream::~~FilterOutputStream()`, and `decaf::util::logging::StreamHandler::~~StreamHandler()`.

7.100.1.5 `#define DECAF_CATCHALL_THROW(type)`

Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

Parameters

type the type of exception to be thrown.

Referenced by `decaf::util::PriorityQueue< E >::add()`, `decaf::io::FilterInputStream::available()`, `decaf::io::FilterOutputStream::close()`, `decaf::io::FilterInputStream::close()`, `decaf::io::FilterOutputStream::flush()`, `decaf::util::concurrent::Lock::lock()`, `decaf::util::concurrent::Lock::Lock()`, `decaf::util::logging::StreamHandler::publish()`, `decaf::io::FilterInputStream::read()`, `decaf::io::FilterInputStream::reset()`, `decaf::io::FilterInputStream::skip()`, `decaf::util::concurrent::Lock::unlock()`, `decaf::io::FilterOutputStream::write()`, and `decaf::util::concurrent::Lock::~~Lock()`.

#include <decaf/util/Map.h>
#include <decaf/util/List.h>
```

Data Structures

- class **activemq::util::PrimitiveValueNode**
Class that wraps around a single value of one of the many types.
- union **activemq::util::PrimitiveValueNode::PrimitiveValue**
Define a union type comprised of the various types.

Namespaces

- namespace **activemq**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.492 src/main/cms/Closeable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Closeable**
Interface for a class that implements the close method.

Namespaces

- namespace **cms**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.493 src/main/decaf/io/Closeable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::Closeable**
Interface for a class that implements the close method.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.494 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

Data Structures

- class **cms::CMSException**

CMS API Exception that is the base for all exceptions thrown from CMS classes.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.495 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

Data Structures

- class **cms::CMSProperties**

Interface for a Java-like properties object.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.496 src/main/cms/CMSSecurityException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::CMSSecurityException**

This exception must be thrown when a provider rejects a user name/password submitted by a client.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.497 src/main/cms/Connection.h File Reference

```
#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stopable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

Data Structures

- class **cms::Connection**

The client's connection to its provider.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.498 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/Connection.h>
#include <cms/CMSException.h>
#include <string>
```

Data Structures

- class **cms::ConnectionFactory**

*Defines the interface for a factory that creates connection objects, the **Connection** (p. 1052) objects returned implement the **CMS Connection** (p. 1052) interface and hide the CMS Provider specific implementation details behind that interface.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.499 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ConnectionMetaData**

*A **ConnectionMetaData** (p. 1154) object provides information describing the **Connection** (p. 1052) object.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.500 src/main/cms/DeliveryMode.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::DeliveryMode**

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.501 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

Data Structures

- class **cms::Destination**

*A **Destination** (p. 1387) object encapsulates a provider-specific address.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.502 src/main/cms/ExceptionListener.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ExceptionListener**

*If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1483) that is registered with the **Connection** (p. 1052).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.503 src/main/cms/IllegalStateException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::IllegalStateException**

This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.504 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::IllegalStateException**

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.505 src/main/cms/InvalidClientIdException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidClientIdException**

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.506 src/main/cms/InvalidDestinationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidDestinationException**

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.507 src/main/cms/InvalidSelectorException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidSelectorException**

This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.508 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::MapMessage**

*A **MapMessage** (p. 1982) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.509 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
```

Data Structures

- class **cms::MessageConsumer**

*A client uses a **MessageConsumer** (p. 2080) to received messages from a destination.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.510 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSEException.h>
```

Data Structures

- class **cms::MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2892) or **BytesMessage** (p. 874) is being read.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.511 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSEException.h>
```

Data Structures

- class **cms::MessageFormatException**

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.512 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageListener**

A MessageListener (p. 2165) object is used to receive asynchronously delivered messages.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.513 src/main/cms/MessageNotReadableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotReadableException**

This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.514 src/main/cms/MessageNotWriteableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotWriteableException**

This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.515 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/InvalidDestinationException.h>
#include <cms/MessageFormatException.h>
#include <cms/UnsupportedOperationException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

*A client uses a **MessageProducer** (p. 2189) object to send messages to a **Destination** (p. 1387).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.516 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.517 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.518 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::util::Queue< E >**

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::util**

7.519 src/main/cms/QueueBrowser.h File Reference

```
#include <vector>
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 2510) without removing them.*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.520 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>

#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**

*Defines a Temporary **Topic** (p. 3014) based **Destination** (p. 1387).*

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.526 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::TextMessage**

Interface for a text message.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.527 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**

An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.528 src/main/cms/UnsupportedOperationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::UnsupportedOperationException**

This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.529 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

Namespaces

7.530 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>  
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**
Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.531 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>  
#include <decaf/lang/Runtime.h>  
#include <memory>  
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**
Handles APR initialization and termination.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.532 **src/main/decaf/internal/io/StandardErrorOutputStream.h** File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
#include <decaf/util/concurrent/Mutex.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**
Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**
Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**
- namespace **decaf::internal::io**

#include <decaf/nio/IntBuffer.h>
#include <decaf/nio/LongBuffer.h>
```

Data Structures

- class **decaf::internal::nio::ByteBuffer**

This class defines six categories of operations upon byte buffers:

Namespaces

```
#include <decaf/internal/util/ByteArrayAdapter.h>
```

Data Structures

- class **decaf::internal::nio::ByteArrayPerspective**

This class extends `ByteArray` to create a reference counted byte array that can be held and used by several different `ByteBuffers` and allow them to know on destruction whose job it is to delete the perspective.

Defines

- **#define WAIT_INFINITE 0xFFFFFFFF**
The synchronized macro defines a mechanism for synchronizing a section of code.
- **#define synchronized(W)**

7.685.1 Define Documentation

7.685.1.1 #define synchronized(W)

Value:

```
if(false){}
    else
        for( decaf::util::concurrent::Lock lock_W(W);
            lock_W.isLocked(); lock_W.unlock() )
```

7.685.1.2 `#define WAIT_INFINITE 0xFFFFFFFF`

The synchronized macro defines a mechanism for synchronizing a section of code.

The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compilers restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

```
somefunction() { synchronized(X) (p. 3620) { // Do something that needs synchronizing. } }
```

7.686 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference

7.723.1 Define Documentation

7.723.1.1 `#define LOGDECAF_DEBUG(logger, message)`
`logger.debug(__FILE__, __LINE__, message);`

7.723.1.2 `#define LOGDECAF_DEBUG_1(logger, message, value)`

Value:

```

;          \
{          \
    std::ostream ostream;          \
    ostream << message << value;    \
    logger.debug(__FILE__, __LINE__, ostream.str()); \
}

```

7.723.1.3 `#define LOGDECAF_DECLARE(loggerName)` static
`decaf::util::logging::SimpleLogger loggerName;`

7.723.1.4 `#define LOGDECAF_DECLARE_LOCAL(loggerName)`
`decaf::util::logging::Logger loggerName;`

7.723.1.5 `#define LOGDECAF_ERROR(logger, message)`
`logger.error(__FILE__, __LINE__, message);`

7.723.1.6 `#define LOGDECAF_FATAL(logger, message)`
`logger.fatal(__FILE__, __LINE__, message);`

7.723.1.7 `#define LOGDECAF_INFO(logger, message)`
`logger.info(__FILE__, __LINE__, message);`

7.723.1.8 `#define LOGDECAF_INITIALIZE(loggerName,
className, loggerFamily)` `decaf::util::logging::SimpleLogger`
`className::loggerName(loggerFamily);`

7.723.1.9 `#define LOGDECAF_WARN(logger, message)`
`logger.warn(__FILE__, __LINE__, message);`

#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/UnsupportedOperationException.h>
#include <memory>
```

Data Structures

- class **decaf::util::PriorityQueue**< E >
An unbounded priority queue based on a binary heap algorithm.
- class **decaf::util::PriorityQueue**< E >::PriorityQueueIterator
- class **decaf::util::PriorityQueue**< E >::ConstPriorityQueueIterator

#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/ListIterator.h>
#include <decaf/util/List.h>
```

Data Structures

- class **decaf::util::StlList< E >**
List (p. 1865) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.
- class **decaf::util::StlList< E >::StlListIterator**
- class **decaf::util::StlList< E >::ConstStlListIterator**

Namespaces

#include <map>
#include <vector>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/util/concurrent/Synchronizable.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/util/Map.h>
```

Data Structures

- class **decaf::util::StlMap< K, V, COMPARATOR >**
Map (p. 1970) template that wraps around a `std::map` to provide a more user-friendly interface and to provide common functions that do not exist in `std::map`.

Namespaces

- namespace **decaf**

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
