Creates and returns a new **ThreadFactory** (p. 2102) that expresses the default behavior for ThreadFactories used in **Executor** (p. 1004) classes.

The default factory create a new non-daemon thread with normal priority and a name whose value is equal to pool-N-thread-M, where N is the sequence number of this factory, and M is the sequence number of the thread created by this factory.

Returns

a new instance of the default thread factory used in **Executors** (p. 1005), the caller takes ownership of the returned pointer.

6.228.3.2 static ExecutorService* decaf::util::concurrent::Executors::newFixedThreadPool (int *nThreads*) [static]

Creates a new **ThreadPoolExecutor** (p. 2104) with a fixed number of threads to process incoming tasks.

The thread pool will use an unbounded queue to store pending tasks. At any given time the maximum threads in the pool will be equal to the number given to this factory method. If a thread in the pool dies a new one will be spawned to take its place in the pool. Tasks that are submitted when all pooled threads are busy will be held until a thread is freed if the pool has allocated its assigned number of threads already.

Parameters

nThreads	The number of threads to assign as the max for the new **ExecutorService** (p. 1008).

Returns

pointer to a new **ExecutorService** (p. 1008) that is owned by the caller.

Exceptions

IllegalArgumentException	if nThreads is less than or equal to zero.

6.228.3.3 static ExecutorService* decaf::util::concurrent::Executors::newFixedThreadPool (int *nThreads*, ThreadFactory * *threadFactory*) [static]

Creates a new **ThreadPoolExecutor** (p. 2104) with a fixed number of threads to process incoming tasks.

The thread pool will use an unbounded queue to store pending tasks. At any given time the maximum threads in the pool will be equal to the number given to this factory method. If a thread in the pool dies a new one will be spawned to take its place in the pool. Tasks that are submitted when all pooled threads are busy will be held until a thread is freed if the pool has allocated its assigned number of threads already.

Parameters

nThreads	The number of threads to assign as the max for the new **ExecutorService** (p. 1008).
threadFactory	Instance of a **ThreadFactory** (p. 2102) that will be used by the **Executor** (p. 1004) to spawn new worker threads. This parameter cannot be NULL.

Returns

pointer to a new **ExecutorService** (p. 1008) that is owned by the caller.

Exceptions

NullPointerException	if threadFactory is NULL.
IllegalArgumentException	if nThreads is less than or equal to zero.

  Returns whether this executor has been shutdown or not.
- virtual bool **isTerminated** () **const** =0

  Returns whether all tasks have completed after this executor was shut down.

6.229.1 Detailed Description

An **Executor** (p. 1004) that provides methods to manage termination and methods that can produce a **Future** (p. 1075) for tracking progress of one or more asynchronous tasks.

An **ExecutorService** (p. 1008) can be shut down, which will cause it to reject new tasks. Two different methods are provided for shutting down an **ExecutorService** (p. 1008). The **shutdown()** (p. 1009) method will allow previously submitted tasks to execute before terminating, while the **shutdownNow()** (p. 1010) method prevents waiting tasks from starting and attempts to stop currently executing tasks. Upon termination, an executor has no tasks actively executing, no tasks awaiting execution, and no new tasks can be submitted. An unused **ExecutorService** (p. 1008) should be shut down to allow reclamation of its resources.

Method submit extends base method **Executor.execute** (p. 1005)(**decaf.lang.Runnable** (p. 1792)) by creating and returning a **Future** (p. 1075) that can be used to cancel execution and/or wait for completion. Methods invokeAny and invokeAll perform the most commonly useful forms of bulk execution, executing a collection of tasks and then waiting for at least one, or all, to complete. (Class ExecutorCompletionService can be used to write customized variants of these methods.)

The **Executors** (p. 1005) class provides factory methods for the executor services provided in this package.

1.0

6.229.2 Constructor & Destructor Documentation

6.229.2.1 virtual decaf::util::concurrent::ExecutorService::~ExecutorService ( ) [inline, virtual]

6.229.3 Member Function Documentation

6.229.3.1 virtual bool decaf::util::concurrent::ExecutorService::awaitTermination (long long *timeout,* const TimeUnit & *unit*) [pure virtual]

The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion.

If the timeout period elapses before the executor reaches the terminated state then this method return false to indicate it has not terminated.

Parameters

timeout	The amount of time to wait before abandoning the wait for termination.
unit	The unit of time that the timeout value represents.

Returns

true if the executor terminated or false if the timeout expired.

Exceptions

InterruptedException	if this call is interrupted while awaiting termination.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2110).

6.229.3.2 virtual bool decaf::util::concurrent::ExecutorService::isShutdown ( ) const [pure virtual]

Returns whether this executor has been shutdown or not.

Returns

true if this executor has been shutdown.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2113).

6.229.3.3 virtual bool decaf::util::concurrent::ExecutorService::isTerminated ( ) const [pure virtual]

Returns whether all tasks have completed after this executor was shut down.

Returns

true if all tasks have completed after a request to shut down was made.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2113).

6.229.3.4 virtual void decaf::util::concurrent::ExecutorService::shutdown ( ) [pure virtual]

Performs an orderly shutdown of this **Executor** (p. 1004).

Previously queued tasks are allowed to complete but no new tasks are accepted for execution. Calling this method more than once has no affect on this executor.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2116).

6.229.3.5 virtual ArrayList<decaf::lang::Runnable*> decaf::util::concurrent::ExecutorService::shutdownNow ( ) [pure virtual]

Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 345) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.

There is no guarantee that this method will halt execution of currently executing tasks.

Returns

an **ArrayList** (p. 345) containing all Runnable instance that were still waiting to be executed by this class, call now owns those pointers.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2116).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ExecutorService.h**

6.230 activemq::transport::failover::FailoverTransport Class Reference

`#include <src/main/activemq/transport/failover/FailoverTransport.h>`

Inheritance diagram for activemq::transport::failover::FailoverTransport:

Public Member Functions

- **FailoverTransport** ()
- virtual ~**FailoverTransport** ()
- void **reconnect** (bool rebalance)

  *Indicates that the **Transport** (p. 2161) needs to reconnect to another URI in its list.*
- void **add** (**const** std::string &uri)

  Adds a New URI to the List of URIs this transport can Connect to.
- virtual void **addURI** (bool rebalance, **const List**< **URI** > &uris)

  *Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2161) is a composite of.*
- virtual void **removeURI** (bool rebalance, **const List**< **URI** > &uris)

  *Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2161) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2161) should result in that **Transport** (p. 2161) being disposed of.*
- virtual void **start** ()

  *Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.*
- virtual void **stop** ()

  *Stops the **Transport** (p. 2161).*
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual void **oneway** (**const Pointer**< **Command** > &command)

  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command)

  Sends the given command to the broker and then waits for the response.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command, unsigned int timeout)

Sends the given command to the broker and then waits for the response.

- virtual **Pointer**
  < **wireformat::WireFormat** > **getWireFormat** () **const**

  Gets the WireFormat instance that is in use by this transport.
- virtual void **setWireFormat** (**const Pointer**< **wireformat::WireFormat** > &wireFormat AMQCPP_UNUSED)
- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous events from this transport.
- virtual **TransportListener** * **getTransportListener** () **const**

  Gets the observer of asynchronous events from this transport.
- virtual bool **isFaultTolerant** () **const**

  *Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.*

- void **setConnectionInterruptProcessingComplete** (**const Pointer**< **commands::ConnectionId** > &connectionId)

Protected Member Functions

- void **restoreTransport** (**const Pointer**< **Transport** > &transport)

  *Given a **Transport** (p. 2161) restore the state of the Client's connection to the Broker using the data accumulated in the State Tracker.*
- void **handleTransportFailure** (**const decaf::lang::Exception** &error)

  *Called when this class' **TransportListener** (p. 2176) is notified of a Failure.*
- void **handleConnectionControl** (**const Pointer**< **Command** > &control)

  Called when the Broker sends a ConnectionControl command which could signal that this Client needs to reconnect in order to rebalance the connections on a Broker or the set of Known brokers has changed.

Friends

- class **FailoverTransportListener**

6.230.1 Constructor & Destructor Documentation

6.230.1.1 activemq::transport::failover::FailoverTransport::FailoverTransport ( )

6.230.1.2 virtual activemq::transport::failover::FailoverTransport::~FailoverTransport ( ) [virtual]

6.230.2 Member Function Documentation

6.230.2.1 void activemq::transport::failover::FailoverTransport::add (const std::string & *uri*)

Adds a New URI to the List of URIs this transport can Connect to.

Parameters

uri	A String version of a URI to add to the URIs to failover to.

6.230.2.2 virtual void activemq::transport::failover::FailoverTransport::addURI (bool *rebalance*, const List< URI > & *uris*) [virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2161) is a composite of.

Parameters

rebalance	Indicates if the addition should cause a forced reconnect or not.
uris	The new URI set to add to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 695).

6.230.2.3 virtual void activemq::transport::failover::FailoverTransport::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

6.230.2.4 long long activemq::transport::failover::FailoverTransport::getBackOffMultiplier ( ) const

6.230.2.5 int activemq::transport::failover::FailoverTransport::getBackupPoolSize ( ) const

6.230.2.6 long long activemq::transport::failover::FailoverTransport::getInitialReconnectDelay ( ) const

6.230.2.7 int activemq::transport::failover::FailoverTransport::getMaxCacheSize ( ) const

6.230.2.8 int activemq::transport::failover::FailoverTransport::getMaxReconnectAttempts ( ) const

6.230.2.9 long long activemq::transport::failover::FailoverTransport::getMaxReconnectDelay ( ) const

6.230.2.10 long long activemq::transport::failover::FailoverTransport::getReconnectDelay ( ) const

6.230.2.11 virtual std::string activemq::transport::failover::FailoverTransport::getRemoteAddress ( ) const [virtual]

Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2162).

6.230.2.12 int activemq::transport::failover::FailoverTransport::getStartupMaxReconnectAttempts ( ) const

6.230.2.13 long long activemq::transport::failover::FailoverTransport::getTimeout ( ) const

6.230.2.14 virtual TransportListener* activemq::transport::failover::FailoverTransport::getTransportListener ( ) const [virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implements **activemq::transport::Transport** (p. 2163).

6.230.2.15 virtual Pointer<wireformat::WireFormat> activemq::transport::failover::FailoverTransport::getWireFormat ( ) const [virtual]

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a WireFormat info instance.

Returns

The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2163).

6.230.2.16 void activemq::transport::failover::FailoverTransport::handleConnectionControl (const Pointer< Command > & *control*) [protected]

Called when the Broker sends a ConnectionControl command which could signal that this Client needs to reconnect in order to rebalance the connections on a Broker or the set of Known brokers has changed.

Parameters

control	The ConnectionControl command sent from the Broker.

6.230.2.17 void activemq::transport::failover::FailoverTransport::handleTransportFailure (const decaf::lang::Exception & *error*) [protected]

Called when this class' **TransportListener** (p. 2176) is notified of a Failure.

Parameters

error	- The CMS Exception that was thrown.

Exceptions

Exception	if an error occurs.

6.230.2.18 bool activemq::transport::failover::FailoverTransport::isBackup ( ) const

6.230.2.19 virtual bool activemq::transport::failover::FailoverTransport::isClosed ( ) const [virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Implements **activemq::transport::Transport** (p. 2163).

6.230.2.20 virtual bool activemq::transport::failover::FailoverTransport::isConnected ( ) const [virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2163).

6.230.2.21 virtual bool activemq::transport::failover::FailoverTransport::isFaultTolerant ( ) const [inline, virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2163).

6.230.2.22 bool activemq::transport::failover::FailoverTransport::isInitialized ( ) const

6.230.2.23 virtual bool activemq::transport::failover::FailoverTransport::isPending ( ) const [virtual]

Returns

true if there is a need for the iterate method to be called by this classes task runner.

Implements **activemq::threads::CompositeTask** (p. 692).

6.230.2.24 bool activemq::transport::failover::FailoverTransport::isRandomize ( ) const

6.230.2.25 bool activemq::transport::failover::FailoverTransport::isReconnectSupported ( ) const [virtual]

Returns

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.230.2.26 bool activemq::transport::failover::FailoverTransport::isTrackMessages ( ) const

6.230.2.27 bool activemq::transport::failover::FailoverTransport::isTrackTransactionProducers ( ) const

6.230.2.28 bool activemq::transport::failover::FailoverTransport::isUpdateURIsSupported ( ) const [virtual]

Returns

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.230.2.29 bool activemq::transport::failover::FailoverTransport::isUseExponentialBackOff ( ) const

6.230.2.30 virtual bool activemq::transport::failover::FailoverTransport::iterate ( ) [virtual]

Performs the actual Reconnect operation for the **FailoverTransport** (p. 1010), when a connection is made this method returns false to indicate it doesn't need to run again, otherwise it returns true to indicate its still trying to connect.

Returns

false to indicate a connection, true to indicate it needs to try again.

Implements **activemq::threads::Task** (p. 2073).

6.230.2.31 virtual Transport* activemq::transport::failover::FailoverTransport::narrow (const std::type_info & *typeId*) [virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId	- The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2164).

6.230.2.32 virtual void activemq::transport::failover::FailoverTransport::oneway (const Pointer< Command > & *command*) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2164).

6.230.2.33 void activemq::transport::failover::FailoverTransport::reconnect (bool *rebalance*)

Indicates that the **Transport** (p. 2161) needs to reconnect to another URI in its list.

Parameters

rebalance	Indicates if the current connection should be broken and reconnected.

6.230.2.34 virtual void activemq::transport::failover::FailoverTransport::reconnect (const decaf::net::URI & *uri*) [virtual]

reconnect to another location

Parameters

uri	The new URI to connect this **Transport** (p. 2161) to.

Exceptions

IOException	on failure or if reconnect is not supported.

Implements **activemq::transport::Transport** (p. 2165).

6.230.2.35 virtual void activemq::transport::failover::FailoverTransport::removeURI (bool *rebalance,* const List< URI > & *uris*) [virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2161) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2161) should result in that **Transport** (p. 2161) being disposed of.

Parameters

rebalance	Indicates if the removal should cause a forced reconnect or not.
uris	The new URI set to remove to the set this composite maintains.

Implements **activemq::transport::CompositeTransport** (p. 696).

6.230.2.36 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

6.230.2.37 virtual Pointer<Response> activemq::transport::failover::FailoverTransport::request (const Pointer< Command > & *command,* unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

6.230.2.38 void **activemq::transport::failover::FailoverTransport::restoreTransport** (const Pointer< **Transport** > & *transport*) [protected]

Given a **Transport** (p. 2161) restore the state of the Client's connection to the Broker using the data accumulated in the State Tracker.

Parameters

transport	The new **Transport** (p. 2161) connected to the Broker.

Exceptions

IOException	if an errors occurs while restoring the old state.

6.230.2.39 void **activemq::transport::failover::FailoverTransport::setBackOffMultiplier** (long long *value*)

6.230.2.40 void **activemq::transport::failover::FailoverTransport::setBackup** (bool *value*)

6.230.2.41 void **activemq::transport::failover::FailoverTransport::setBackupPoolSize** (int *value*)

6.230.2.42 void **activemq::transport::failover::FailoverTransport::setConnectionInterrupt-ProcessingComplete** (const Pointer< **commands::ConnectionId** > & *connectionId*)

6.230.2.43 void **activemq::transport::failover::FailoverTransport::setInitialized** (bool *value*)

6.230.2.44 void **activemq::transport::failover::FailoverTransport::setInitialReconnectDelay** (long long *value*)

6.230.2.45 void **activemq::transport::failover::FailoverTransport::setMaxCacheSize** (int *value*)

6.230.2.46 void **activemq::transport::failover::FailoverTransport::setMaxReconnectAttempts** (int *value*)

6.230.2.47 void **activemq::transport::failover::FailoverTransport::setMaxReconnectDelay** (long long *value*)

6.230.2.48 void **activemq::transport::failover::FailoverTransport::setRandomize** (bool *value*)

6.230.2.49 void **activemq::transport::failover::FailoverTransport::setReconnectDelay** (long long *value*)

6.230.2.50 void **activemq::transport::failover::FailoverTransport::setReconnectSupported** (bool *value*)

6.230.2.51 void **activemq::transport::failover::FailoverTransport::setStartupMaxReconnectAttempts** (int *value*)

6.230.2.52 void **activemq::transport::failover::FailoverTransport::setTimeout** (long long *value*)

6.230.2.53 void **activemq::transport::failover::FailoverTransport::setTrackMessages** (bool *value*)

6.230.2.54 void **activemq::transport::failover::FailoverTransport::setTrackTransactionProducers** (bool *value*)

6.230.2.55 virtual void **activemq::transport::failover::FailoverTransport::setTransportListener** (**TransportListener** * *listener*) [virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener	the listener of transport events.

Implements **activemq::transport::Transport** (p. 2166).

6.230.2.56 void activemq::transport::failover::FailoverTransport::setUpdateURIsSupported (bool *value*)

6.230.2.57 void activemq::transport::failover::FailoverTransport::setUseExponentialBackOff (bool *value*)

6.230.2.58 virtual void activemq::transport::failover::FailoverTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat *AMQCPP_UNUSED*) [inline, virtual]

6.230.2.59 virtual void activemq::transport::failover::FailoverTransport::start ( ) [virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Implements **activemq::transport::Transport** (p. 2166).

6.230.2.60 virtual void activemq::transport::failover::FailoverTransport::stop ( ) [virtual]

Stops the **Transport** (p. 2161).

Exceptions

IOException	if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 2167).

6.230.2.61 virtual void activemq::transport::failover::FailoverTransport::updateURIs (bool *rebalance,* const decaf::util::List< decaf::net::URI > & *uris*) [virtual]

Updates the set of URIs the **Transport** (p. 2161) can connect to.

If the **Transport** (p. 2161) doesn't support updating its URIs then an IOException is thrown.

Parameters

rebalance	Indicates if a forced reconnection should be performed as a result of the update.
uris	The new list of URIs that can be used for connection.

Exceptions

IOException	if an error occurs or updates aren't supported.

Implements **activemq::transport::Transport** (p. 2167).

6.230.3 Friends And Related Function Documentation

6.230.3.1 friend class FailoverTransportListener [friend]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransport.h**

6.231 activemq::transport::failover::FailoverTransportFactory Class Reference

Creates an instance of a **FailoverTransport** (p. 1010).

`#include <src/main/activemq/transport/failover/FailoverTransportFactory.h>`

Inheritance diagram for activemq::transport::failover::FailoverTransportFactory:

Public Member Functions

- virtual ~**FailoverTransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (**const decaf::net::URI** &location)

  *Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.*
- virtual **Pointer**< **Transport** > **createComposite** (**const decaf::net::URI** &location)

  *Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.*

Protected Member Functions

- virtual **Pointer**< **Transport** > **doCreateComposite** (**const decaf::net::URI** &location, **const decaf::util::-Properties** &properties)

  *Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.*

6.231.1 Detailed Description

Creates an instance of a **FailoverTransport** (p. 1010).

Since

3.0

6.231.2 Constructor & Destructor Documentation

6.231.2.1 virtual activemq::transport::failover::FailoverTransportFactory::~FailoverTransportFactory ( ) [inline, virtual]

6.231.3 Member Function Documentation

6.231.3.1 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.231.3.2 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.231.3.3 virtual Pointer<Transport> activemq::transport::failover::FailoverTransportFactory::doCreateComposite (const decaf::net::URI & *location,* const decaf::util::Properties & *properties*) [protected, virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to.
properties	- Properties to apply to the transport.

Returns

Pointer to a new **FailoverTransport** (p. 1010) instance.

Exceptions

ActiveMQexception	if an error occurs

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransportFactory.h**

6.232 activemq::transport::failover::FailoverTransportListener Class Reference

Utility class used by the **Transport** (p. 2161) to perform the work of responding to events from the active **Transport** (p. 2161).

`#include <src/main/activemq/transport/failover/FailoverTransportListener.h>`

Inheritance diagram for activemq::transport::failover::FailoverTransportListener:

Public Member Functions

- **FailoverTransportListener** (**FailoverTransport** ∗parent)
- virtual ∼**FailoverTransportListener** ()
- virtual void **onCommand** (**const Pointer**< **Command** > &command)

  Event handler for the receipt of a command.
- virtual void **onException** (**const decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()

  The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()

  The transport has resumed after an interruption.

6.232.1 Detailed Description

Utility class used by the **Transport** (p. 2161) to perform the work of responding to events from the active **Transport** (p. 2161).

Since

3.0

6.232.2 Constructor & Destructor Documentation

6.232.2.1 activemq::transport::failover::FailoverTransportListener::FailoverTransportListener (FailoverTransport ∗ *parent*)

6.232.2.2 virtual activemq::transport::failover::FailoverTransportListener::∼FailoverTransportListener ( ) [virtual]

6.232.3 Member Function Documentation

6.232.3.1 virtual void activemq::transport::failover::FailoverTransportListener::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2161) deletes the command upon receipt.

Parameters

command	the received command object.

Implements **activemq::transport::TransportListener** (p. 2177).

6.232.3.2 virtual void activemq::transport::failover::FailoverTransportListener::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

ex	The exception.

Implements **activemq::transport::TransportListener** (p. 2177).

6.232.3.3 virtual void activemq::transport::failover::FailoverTransportListener::transportInterrupted ( ) [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2178).

6.232.3.4 virtual void activemq::transport::failover::FailoverTransportListener::transportResumed ( ) [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2178).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**FailoverTransportListener.h**

6.233 activemq::core::FifoMessageDispatchChannel Class Reference

`#include <src/main/activemq/core/FifoMessageDispatchChannel.h>`

Inheritance diagram for activemq::core::FifoMessageDispatchChannel:

Public Member Functions

- **FifoMessageDispatchChannel** ()
- virtual ~**FifoMessageDispatchChannel** ()
- virtual void **enqueue** (**const Pointer**< **MessageDispatch** > &message)
  Add a Message to the Channel behind all pending message.
- virtual void **enqueueFirst** (**const Pointer**< **MessageDispatch** > &message)
  Add a message to the front of the Channel.
- virtual bool **isEmpty** () **const**
- virtual bool **isClosed** () **const**
- virtual bool **isRunning** () **const**
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)
  Used to get an enqueued message.
- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()
  Used to get an enqueued message if there is one queued right now.
- virtual **Pointer**< **MessageDispatch** > **peek** () **const**
  Peek in the Queue and return the first message in the Channel without removing it from the channel.
- virtual void **start** ()
  Starts dispatch of messages from the Channel.
- virtual void **stop** ()
  Stops dispatch of message from the Channel.
- virtual void **close** ()
  Close this channel no messages will be dispatched after this method is called.
- virtual void **clear** ()
  Clear the Channel, all pending messages are removed.
- virtual int **size** () **const**
- virtual std::vector< **Pointer**
  < **MessageDispatch** > > **removeAll** ()

Remove all messages that are currently in the Channel and return them as a list of Messages.

- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.

- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.

- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.233.1 Constructor & Destructor Documentation

6.233.1.1 activemq::core::FifoMessageDispatchChannel::FifoMessageDispatchChannel ( )

6.233.1.2 virtual activemq::core::FifoMessageDispatchChannel::~FifoMessageDispatchChannel ( ) [virtual]

6.233.2 Member Function Documentation

6.233.2.1 virtual void activemq::core::FifoMessageDispatchChannel::clear ( ) [virtual]

Clear the Channel, all pending messages are removed.

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.233.2.2 virtual void activemq::core::FifoMessageDispatchChannel::close ( ) [virtual]

Close this channel no messages will be dispatched after this method is called.

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.233.2.3 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::dequeue (long long *timeout*) [virtual]

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

ActiveMQException	

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.233.2.4 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::dequeueNoWait ( ) [virtual]

Used to get an enqueued message if there is one queued right now.

If there is no waiting message than this method returns Null.

Returns

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.233.2.5 virtual void activemq::core::FifoMessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [virtual]

Add a Message to the Channel behind all pending message.

Parameters

message	- The message to add to the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.233.2.6 virtual void activemq::core::FifoMessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [virtual]

Add a message to the front of the Channel.

Parameters

message	- The Message to add to the front of the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.233.2.7 virtual bool activemq::core::FifoMessageDispatchChannel::isClosed ( ) const [inline, virtual]

Returns

has the Queue been closed.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.233.2.8 virtual bool activemq::core::FifoMessageDispatchChannel::isEmpty ( ) const [virtual]

Returns

true if there are no messages in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.233.2.9 virtual bool activemq::core::FifoMessageDispatchChannel::isRunning ( ) const [inline, virtual]

Returns

true if the Channel currently running and will dequeue message.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.10 virtual void activemq::core::FifoMessageDispatchChannel::lock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.233.2.11 virtual void activemq::core::FifoMessageDispatchChannel::notify ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.233.2.12 virtual void activemq::core::FifoMessageDispatchChannel::notifyAll ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.233.2.13 virtual Pointer<MessageDispatch> activemq::core::FifoMessageDispatchChannel::peek ( ) const [virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.14 virtual std::vector< Pointer<MessageDispatch> > activemq::core::FifoMessageDispatchChannel-::removeAll ( ) [virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.15 virtual int activemq::core::FifoMessageDispatchChannel::size ( ) const [virtual]

Returns

the number of Messages currently in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.16 virtual void activemq::core::FifoMessageDispatchChannel::start ( ) [virtual]

Starts dispatch of messages from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.17 virtual void activemq::core::FifoMessageDispatchChannel::stop ( ) [virtual]

Stops dispatch of message from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.233.2.18 virtual bool activemq::core::FifoMessageDispatchChannel::tryLock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.233.2.19 virtual void activemq::core::FifoMessageDispatchChannel::unlock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.233.2.20 virtual void activemq::core::FifoMessageDispatchChannel::wait ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.233.2.21 virtual void activemq::core::FifoMessageDispatchChannel::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.233.2.22 virtual void activemq::core::FifoMessageDispatchChannel::wait (long long *millisecs,* int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is

similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**FifoMessageDispatchChannel.h**

6.234 decaf::io::FileDescriptor Class Reference

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

`#include <src/main/decaf/io/FileDescriptor.h>`

Inheritance diagram for decaf::io::FileDescriptor:

Public Member Functions

- **FileDescriptor** ()
- virtual ~**FileDescriptor** ()
- void **sync** ()

  *Force any/all buffered data for this **FileDescriptor** (p. 1029) to be flushed to the underlying device.*
- bool **valid** ()

  Indicates whether the File Descriptor is valid.

Static Public Attributes

- static **FileDescriptor in**

  A handle to the standard input stream.
- static **FileDescriptor out**

  A handle to the standard output stream.
- static **FileDescriptor err**

  A handle to the standard error stream.

Protected Member Functions

- **FileDescriptor** (long value, bool **readonly**)

Protected Attributes

- long **descriptor**
- bool **readonly**

6.234.1 Detailed Description

This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.

Since

1.0

6.234.2 Constructor & Destructor Documentation

6.234.2.1 decaf::io::FileDescriptor::FileDescriptor (long *value,* bool *readonly*) [protected]

6.234.2.2 decaf::io::FileDescriptor::FileDescriptor ( )

6.234.2.3 virtual decaf::io::FileDescriptor::~FileDescriptor ( ) [virtual]

6.234.3 Member Function Documentation

6.234.3.1 void decaf::io::FileDescriptor::sync ( )

Force any/all buffered data for this **FileDescriptor** (p. 1029) to be flushed to the underlying device.

This method blocks until all data is flushed to the underlying device and is used to place the device into a known state. In the case of data that is buffered at a higher level such as a **BufferedOutputStream** (p. 461) the stream must first be flushed before this method can force the data to be sent to the output device.

6.234.3.2 bool decaf::io::FileDescriptor::valid ( )

Indicates whether the File Descriptor is valid.

Returns

true for a valid descriptor such as open socket or file, false otherwise.

6.234.4 Field Documentation

6.234.4.1 long decaf::io::FileDescriptor::descriptor [protected]

6.234.4.2 FileDescriptor decaf::io::FileDescriptor::err [static]

A handle to the standard error stream.

Usually, this file descriptor is not used directly, but rather via the output stream known as System::err.

6.234.4.3 FileDescriptor decaf::io::FileDescriptor::in [static]

A handle to the standard input stream.

Usually, this file descriptor is not used directly, but rather via the input stream known as System::in.

6.234.4.4 FileDescriptor decaf::io::FileDescriptor::out [static]

A handle to the standard output stream.

Usually, this file descriptor is not used directly, but rather via the output stream known as System::out.

6.234.4.5 bool decaf::io::FileDescriptor::readonly [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**FileDescriptor.h**

6.235 decaf::util::logging::Filter Class Reference

A **Filter** (p. 1031) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

`#include <src/main/decaf/util/logging/Filter.h>`

Public Member Functions

- virtual ~**Filter** ()
- virtual bool **isLoggable** (**const LogRecord** &record) **const** =0

  Check if a given log record should be published.

6.235.1 Detailed Description

A **Filter** (p. 1031) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.

Each **Logger** (p. 1312) and each **Handler** (p. 1085) can have a filter associated with it. The **Logger** (p. 1312) or **Handler** (p. 1085) will call the isLoggable method to check if a given **LogRecord** (p. 1333) should be published. If isLoggable returns false, the **LogRecord** (p. 1333) will be discarded.

6.235.2 Constructor & Destructor Documentation

6.235.2.1 virtual decaf::util::logging::Filter::~Filter ( ) [inline, virtual]

6.235.3 Member Function Documentation

6.235.3.1 virtual bool decaf::util::logging::Filter::isLoggable (const LogRecord & *record*) const [pure virtual]

Check if a given log record should be published.

Parameters

record	the **LogRecord** (p. 1333) to check.

Returns

true if the record is loggable.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Filter.h**

6.236 decaf::io::FilterInputStream Class Reference

A **FilterInputStream** (p. 1032) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

`#include <src/main/decaf/io/FilterInputStream.h>`

Inheritance diagram for decaf::io::FilterInputStream:

Public Member Functions

- **FilterInputStream** (**InputStream** ∗**inputStream**, bool **own**=false)

  *Constructor to create a wrapped **InputStream** (p. 1134).*
- virtual ∼**FilterInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs while closing the **InputStream** (p. 1134).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
  *The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

  Parameters

num	*The number of bytes to skip.*

Returns

total bytes skipped

Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.

  Parameters

readLimit	*The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then:
  - *If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.*
  - *If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

  If the method markSupported returns false, then:
  - *The call to reset may throw an **IOException** (p. 1198).*
  - *If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

  *The default implementation of this method throws an **IOException** (p. 1198).*

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual bool **markSupported** () **const**

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.

  Returns

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArray** (unsigned char ∗buffer, int size)
- virtual int **doReadArrayBounded** (unsigned char ∗buffer, int size, int offset, int length)
- virtual bool **isClosed** () **const**

Protected Attributes

- **InputStream** ∗ **inputStream**
- bool **own**
- volatile bool **closed**

6.236.1 Detailed Description

A **FilterInputStream** (p. 1032) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.

The class **FilterInputStream** (p. 1032) itself simply overrides all methods of **InputStream** (p. 1134) with versions that pass all requests to the contained input stream. Subclasses of **FilterInputStream** (p. 1032) may further override some of these methods and may also provide additional methods and fields.

6.236.2 Constructor & Destructor Documentation

6.236.2.1 decaf::io::FilterInputStream::FilterInputStream (InputStream * *inputStream,* bool *own* = `false`)

Constructor to create a wrapped **InputStream** (p. 1134).

Parameters

inputStream	The stream to wrap and filter.
own	Indicates if we own the stream object, defaults to false.

6.236.2.2 virtual decaf::io::FilterInputStream::~FilterInputStream ( ) [virtual]

6.236.3 Member Function Documentation

6.236.3.1 virtual int decaf::io::FilterInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

Reimplemented in **decaf::io::PushbackInputStream** (p. 1718), **decaf::util::zip::InflaterInputStream** (p. 1131), and **decaf::io::BufferedInputStream** (p. 459).

6.236.3.2 virtual void decaf::io::FilterInputStream::close ( ) [virtual]

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Reimplemented from **decaf::io::InputStream** (p. 1136).

Reimplemented in **decaf::util::zip::InflaterInputStream** (p. 1131), and **decaf::io::BufferedInputStream** (p. 459).

6.236.3.3 virtual int decaf::io::FilterInputStream::doReadArray (unsigned char * *buffer,* int *size*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.236.3.4 virtual int decaf::io::FilterInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

Reimplemented in **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::PushbackInputStream** (p. 1719), **decaf::io::BufferedInputStream** (p. 459), **decaf::util::zip::CheckedInputStream** (p. 626), and **activemq::io::-LoggingInputStream** (p. 1323).

6.236.3.5 virtual int decaf::io::FilterInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

Reimplemented in **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::PushbackInputStream** (p. 1719), **decaf::io::BufferedInputStream** (p. 460), **decaf::util::zip::CheckedInputStream** (p. 626), and **activemq::io::-LoggingInputStream** (p. 1323).

6.236.3.6 virtual bool decaf::io::FilterInputStream::isClosed ( ) const [protected, virtual]

Returns

true if this stream has been closed.

6.236.3.7 virtual void decaf::io::FilterInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::InputStream** (p. 1137).

Reimplemented in **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1132), and **decaf::io::BufferedInputStream** (p. 460).

6.236.3.8 virtual bool decaf::io::FilterInputStream::markSupported ( ) const [virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 1137).

Reimplemented in **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1132), and **decaf::io::BufferedInputStream** (p. 460).

6.236.3.9 virtual void decaf::io::FilterInputStream::reset ( ) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1140).

Reimplemented in **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1133), and **decaf::io::BufferedInputStream** (p. 460).

6.236.3.10 virtual long long decaf::io::FilterInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1140).

Reimplemented in **decaf::io::PushbackInputStream** (p. 1720), **decaf::util::zip::InflaterInputStream** (p. 1133), **decaf::io::BufferedInputStream** (p. 461), and **decaf::util::zip::CheckedInputStream** (p. 626).

6.236.4 Field Documentation

6.236.4.1 volatile bool decaf::io::FilterInputStream::closed [protected]

6.236.4.2 InputStream* decaf::io::FilterInputStream::inputStream [protected]

6.236.4.3 bool decaf::io::FilterInputStream::own [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**FilterInputStream.h**

6.237 decaf::io::FilterOutputStream Class Reference

This class is the superclass of all classes that filter output streams.

`#include <src/main/decaf/io/FilterOutputStream.h>`

Inheritance diagram for decaf::io::FilterOutputStream:

Public Member Functions

- **FilterOutputStream** (**OutputStream** ***outputStream**, bool **own**=false)

  Constructor, creates a wrapped output stream.
- virtual ~**FilterOutputStream** ()
- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

  The default implementation of this method does nothing.
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

Exceptions

IOException (p. 1198)	*if an error occurs while closing.*

The default implementation of this method does nothing.

- virtual std::string **toString** () **const**

  Output a String representation of this object.
  The default version of this method just prints the Class Name.

  Returns

  a string representation of the object.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)

- virtual void **doWriteArrayBounded** (**const** unsigned char *buffer, int size, int offset, int length)
- virtual bool **isClosed** () **const**

Protected Attributes

- **OutputStream** * **outputStream**
- bool **own**
- volatile bool **closed**

6.237.1 Detailed Description

This class is the superclass of all classes that filter output streams.

These streams sit on top of an already existing output stream (the underlying output stream) which it uses as its basic sink of data, but possibly transforming the data along the way or providing additional functionality.

The class **FilterOutputStream** (p. 1037) itself simply overrides all methods of **OutputStream** (p. 1600) with versions that pass all requests to the underlying output stream. Subclasses of **FilterOutputStream** (p. 1037) may further override some of these methods as well as provide additional methods and fields.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 1134) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataOutputStream (p. 860) os = new **DataOutputStream** (p. 860)(new **OutputStream()** (p. 1602), true)

6.237.2 Constructor & Destructor Documentation

6.237.2.1 decaf::io::FilterOutputStream::FilterOutputStream (OutputStream * *outputStream,* bool *own* = false)

Constructor, creates a wrapped output stream.

Parameters

outputStream	the **OutputStream** (p. 1600) to wrap
own	If true, this object will control the lifetime of the output stream that it encapsulates.

6.237.2.2 virtual decaf::io::FilterOutputStream::~FilterOutputStream ( ) [virtual]

6.237.3 Member Function Documentation

6.237.3.1 virtual void decaf::io::FilterOutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

The close method of **FilterOutputStream** (p. 1037) calls its flush method, and then calls the close method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 923).

6.237.3.2 virtual void decaf::io::FilterOutputStream::doWriteArray (const unsigned char * *buffer,* int *size*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 462).

6.237.3.3 virtual void decaf::io::FilterOutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 924), **decaf::io::DataOutputStream** (p. 862), **decaf::io::BufferedOutputStream** (p. 462), **decaf::util::zip::CheckedOutputStream** (p. 628), and **activemq-::io::LoggingOutputStream** (p. 1324).

6.237.3.4 virtual void decaf::io::FilterOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 1602).

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 924), **decaf::io::DataOutputStream** (p. 862), **decaf::io::BufferedOutputStream** (p. 463), **decaf::util::zip::CheckedOutputStream** (p. 628), and **activemq-::io::LoggingOutputStream** (p. 1324).

6.237.3.5 virtual void decaf::io::FilterOutputStream::flush ( ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

The default implementation of this method does nothing.

The flush method of **FilterOutputStream** (p. 1037) calls the flush method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 463).

6.237.3.6 virtual bool decaf::io::FilterOutputStream::isClosed ( ) const [protected, virtual]

Returns

true if this stream has been closed.

6.237.3.7 virtual std::string decaf::io::FilterOutputStream::toString ( ) const [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns

a string representation of the object.

The toString method of **FilterOutputStream** (p. 1037) calls the toString method of its underlying output stream.

Reimplemented from **decaf::io::OutputStream** (p. 1603).

6.237.4 Field Documentation

6.237.4.1 volatile bool decaf::io::FilterOutputStream::closed [protected]

6.237.4.2 OutputStream* decaf::io::FilterOutputStream::outputStream [protected]

6.237.4.3 bool decaf::io::FilterOutputStream::own [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/io/**FilterOutputStream.h**

6.238 decaf::lang::Float Class Reference

`#include <src/main/decaf/lang/Float.h>`

Inheritance diagram for decaf::lang::Float:

Public Member Functions

- **Float** (float value)
- **Float** (double value)
- **Float** (**const** std::string &value)
- virtual ~**Float** ()
- virtual int **compareTo** (**const Float** &f) **const**

  *Compares this **Float*** (p. *1040) instance with another.*
- bool **equals** (**const Float** &f) **const**
- virtual bool **operator==** (**const Float** &f) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Float** &f) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** float &f) **const**

*Compares this **Float** (p. 1040) instance with another.*

- bool **equals** (**const** float &f) **const**
- virtual bool **operator==** (**const** float &f) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** float &f) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.
- bool **isInfinite** () **const**
- bool **isNaN** () **const**

Static Public Member Functions

- static int **compare** (float f1, float f2)

  Compares the two specified double values.
- static int **floatToIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.
- static int **floatToRawIntBits** (float value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.
- static float **intBitsToFloat** (int bits)

  Returns the float value corresponding to a given bit representation.
- static bool **isInfinite** (float value)
- static bool **isNaN** (float value)
- static float **parseFloat** (**const** std::string &value)

  *Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1040).*
- static std::string **toHexString** (float value)

  Returns a hexadecimal string representation of the float argument.
- static std::string **toString** (float value)

  Returns a string representation of the float argument.
- static **Float valueOf** (float value)

  *Returns a **Float** (p. 1040) instance representing the specified float value.*
- static **Float valueOf** (**const** std::string &value)

  *Returns a **Float** (p. 1040) instance that wraps a primitive float which is parsed from the string value passed.*

Static Public Attributes

- static **const** int **SIZE** = 32

  The size in bits of the primitive int type.
- static **const** float **MAX_VALUE**

  The maximum value that the primitive type can hold.
- static **const** float **MIN_VALUE**

  The minimum value that the primitive type can hold.
- static **const** float **NaN**

  *Constant for the Not a **Number*** (p. *1543*) *Value.*
- static **const** float **POSITIVE_INFINITY**

  Constant for Positive Infinity.
- static **const** float **NEGATIVE_INFINITY**

  Constant for Negative Infinity.

6.238.1 Constructor & Destructor Documentation

6.238.1.1 decaf::lang::Float::Float (float *value*)

Parameters

value	- the primitive type to wrap

6.238.1.2 decaf::lang::Float::Float (double *value*)

Parameters

value	- the primitive type to wrap

6.238.1.3 decaf::lang::Float::Float (const std::string & *value*)

Parameters

value	- the string to convert to a primitive type to wrap

6.238.1.4 virtual decaf::lang::Float::~Float ( ) [inline, virtual]

6.238.2 Member Function Documentation

6.238.2.1 virtual unsigned char decaf::lang::Float::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.238.2.2 static int decaf::lang::Float::compare (float *f1*, float *f2*) [static]

Compares the two specified double values.

The sign of the integer value returned is the same as that of the integer that would be returned by the call: Float(f1).compareTo(Float(f2))

Parameters

f1	- the first double to compare
f2	- the second double to compare

Returns

the value 0 if d1 is numerically equal to f2; a value less than 0 if f1 is numerically less than f2; and a value greater than 0 if f1 is numerically greater than f2.

6.238.2.3 virtual int decaf::lang::Float::compareTo (const Float & *f*) const [virtual]

Compares this **Float** (p. 1040) instance with another.

Parameters

f	- the **Float** (p. 1040) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Float** > (p. 687).

6.238.2.4 virtual int decaf::lang::Float::compareTo (const float & *f*) const [virtual]

Compares this **Float** (p. 1040) instance with another.

Parameters

f	- the **Float** (p. 1040) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **float** > (p. 687).

6.238.2.5 virtual double decaf::lang::Float::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.238.2.6 bool decaf::lang::Float::equals (const Float & *f*) const [inline, virtual]

Parameters

f	- the **Float** (p. 1040) object to compare against.

Returns

true if the two **Float** (p. 1040) Objects have the same value.

Implements **decaf::lang::Comparable**< **Float** > (p. 688).

6.238.2.7 bool decaf::lang::Float::equals (const float & *f*) const [inline, virtual]

Parameters

f	- the **Float** (p. 1040) object to compare against.

Returns

true if the two **Float** (p. 1040) Objects have the same value.

Implements **decaf::lang::Comparable**< **float** > (p. 688).

6.238.2.8 static int decaf::lang::Float::floatToIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout.

Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is 0x7fc00000.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1045) method, will produce a floating-point value the same as the argument to floatToIntBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters

value	- the float to convert to int bits

Returns

the int that holds the float's value

6.238.2.9 static int decaf::lang::Float::floatToRawIntBits (float *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "single format" bit layout, preserving Not-a-Number (NaN) values.

Bit 31 (the bit that is selected by the mask 0x80000000) represents the sign of the floating-point number. Bits 30-23 (the bits that are selected by the mask 0x7f800000) represent the exponent. Bits 22-0 (the bits that are selected by the mask 0x007fffff) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7f800000. If the argument is negative infinity, the result is 0xff800000. If the argument is NaN, the result is the integer representing the actual NaN value. Unlike the floatToIntBits method, intToRawIntBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is an integer that, when given to the **intBitsToFloat(int)** (p. 1045) method, will produce a floating-point value the same as the argument to floatToRawIntBits.

Parameters

value	The float to convert to a raw int.

Returns

the raw int value of the float

6.238.2.10 virtual float decaf::lang::Float::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.238.2.11 static float decaf::lang::Float::intBitsToFloat (int *bits*) [static]

Returns the float value corresponding to a given bit representation.

The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "single format" bit layout.

If the argument is 0x7f800000, the result is positive infinity. If the argument is 0xff800000, the result is negative infinity. If the argument is any value in the range 0x7f800001 through 0x7fffffff or in the range 0xff800001 through 0xffffffff, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Float::floatToRawIntBits** (p. 1044) method.

Parameters

bits	- the bits of the float encoded as a float

Returns

a new float created from the int bits.

6.238.2.12 virtual int decaf::lang::Float::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.238.2.13 bool decaf::lang::Float::isInfinite ( ) const

Returns

true if the float is equal to positive infinity.

6.238.2.14 static bool decaf::lang::Float::isInfinite (float *value*) [static]

Parameters

value	- The float to check.

Returns

true if the float is equal to infinity.

6.238.2.15 bool decaf::lang::Float::isNaN ( ) const

Returns

true if the float is equal to NaN.

6.238.2.16 static bool decaf::lang::Float::isNaN (float *value*) [static]

Parameters

value	- The float to check.

Returns

true if the float is equal to NaN.

6.238.2.17 virtual long long decaf::lang::Float::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.238.2.18 virtual bool decaf::lang::Float::operator< (const Float & *f*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

f	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Float >** (p. 688).

6.238.2.19 virtual bool decaf::lang::Float::operator< (const float & *f*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

f	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 688).

6.238.2.20 virtual bool decaf::lang::Float::operator== (const Float & *f*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

f	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Float >** (p. 688).

6.238.2.21 virtual bool decaf::lang::Float::operator== (const float & *f*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

f	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< float >** (p. 688).

6.238.2.22 static float decaf::lang::Float::parseFloat (const std::string & *value*) [static]

Returns a new float initialized to the value represented by the specified string, as performed by the valueOf method of class **Float** (p. 1040).

Parameters

value	- the string to parse

Returns

a float parsed from the string

Exceptions

NumberFormatException	

6.238.2.23 virtual short decaf::lang::Float::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.238.2.24 static std::string decaf::lang::Float::toHexString (float *value*) [static]

Returns a hexadecimal string representation of the float argument.

All characters mentioned below are ASCII characters.

- If the argument is NaN, the result is the string "NaN".
  - Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a float value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1173) on the exponent value. o If m is a float value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters

value	- The float to convert to a string

Returns

the Hex formatted float string.

6.238.2.25 std::string decaf::lang::Float::toString ( ) const

Returns

this **Float** (p. 1040) Object as a **String** (p. 2031) Representation

6.238.2.26 static std::string decaf::lang::Float::toString (float *value*) [static]

Returns a string representation of the float argument.

All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1173).

Parameters

value	- The float to convert to a string

Returns

the formatted float string.

6.238.2.27 static Float decaf::lang::Float::valueOf (float *value*) [static]

Returns a **Float** (p. 1040) instance representing the specified float value.

Parameters

value	- float to wrap

Returns

new **Float** (p. 1040) instance wrapping the primitive value

6.238.2.28 static Float decaf::lang::Float::valueOf (const std::string & *value*) [static]

Returns a **Float** (p. 1040) instance that wraps a primitive float which is parsed from the string value passed.

Parameters

value	- the string to parse

Returns

a new **Float** (p. 1040) instance wrapping the float parsed from value

Exceptions

NumberFormatException	on error.

6.238.3 Field Documentation

6.238.3.1 const float decaf::lang::Float::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.238.3.2 const float decaf::lang::Float::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.238.3.3 const float decaf::lang::Float::NaN [static]

Constant for the Not a **Number** (p. 1543) Value.

6.238.3.4 const float decaf::lang::Float::NEGATIVE_INFINITY [static]

Constant for Negative Infinity.

6.238.3.5 const float decaf::lang::Float::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.238.3.6 const int decaf::lang::Float::SIZE = 32 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Float.h**

6.239 decaf::internal::nio::FloatArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/FloatArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::FloatArrayBuffer:

Public Member Functions

- **FloatArrayBuffer** (int size, bool readOnly=false)

  *Creates a **FloatArrayBuffer** (p. 1050) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **FloatArrayBuffer** (float ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **FloatArrayBuffer** (p. 1050) object that wraps the given array.*
- **FloatArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int **capacity**, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **FloatArrayBuffer** (**const FloatArrayBuffer** &other)

  *Create a **FloatArrayBuffer** (p. 1050) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual ∼**FloatArrayBuffer** ()
- virtual float ∗ **array** ()

Returns the float array that backs this buffer (optional operation).
Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 451).*

Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual **FloatBuffer** * **asReadOnlyBuffer** () **const**

Creates a new, read-only float buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only float buffer which the caller then owns.

- virtual **FloatBuffer** & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **FloatBuffer** (p. 1058).*

Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **FloatBuffer** * **duplicate** ()

Creates a new float buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new float **Buffer** (p. 451) which the caller owns.*

- virtual float **get** ()

  Relative get method.
  Reads the value at this buffer's current position, and then increments the position.

  Returns

  the float at the current position.

  Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return.*

- virtual float **get** (int index) **const**

  Absolute get method.
  Reads the value at the given index.

  Parameters

index	*The index in the **Buffer** (p. 451) where the float is to be read*

  Returns

  the float that is located at the given index

  Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit*

- virtual bool **hasArray** () **const**

  Tells whether or not this buffer is backed by an accessible float array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

  Returns

  true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () **const**

  Tells whether or not this buffer is read-only.

  Returns

  true if, and only if, this buffer is read-only.

- virtual **FloatBuffer** & **put** (float value)

  Writes the given floats into this buffer at the current position, and then increments the position.

  Parameters

value	*The floats value to be written.*

  Returns

  a reference to this buffer.

  Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **FloatBuffer** & **put** (int index, float value)

  Writes the given floats into this buffer at the given index.

  Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The floats to write.*

  Returns

  a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **FloatBuffer** * **slice** () **const**

  *Creates a new **FloatBuffer** (p. 1058) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the newly create **FloatBuffer** (p. 1058) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **FloatArrayBuffer** (p. 1050) as Read-Only.*

6.239.1 Constructor & Destructor Documentation

6.239.1.1 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **FloatArrayBuffer** (p. 1050) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.239.1.2 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (float * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **FloatArrayBuffer** (p. 1050) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.239.1.3 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *capacity*, bool *readOnly* = false)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **FloatArrayBuffer** (p. 1050) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.239.1.4 decaf::internal::nio::FloatArrayBuffer::FloatArrayBuffer (const FloatArrayBuffer & *other*)

Create a **FloatArrayBuffer** (p. 1050) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **FloatArrayBuffer** (p. 1050) this one is to mirror.

6.239.1.5 virtual decaf::internal::nio::FloatArrayBuffer::~FloatArrayBuffer ( ) [virtual]

6.239.2 Member Function Documentation

6.239.2.1 virtual float* decaf::internal::nio::FloatArrayBuffer::array ( ) [virtual]

Returns the float array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1060).

6.239.2.2 virtual int decaf::internal::nio::FloatArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::FloatBuffer** (p. 1061).

6.239.2.3 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only float buffer which the caller then owns.

Implements **decaf::nio::FloatBuffer** (p. 1061).

6.239.2.4 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **FloatBuffer** (p. 1058).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1061).

6.239.2.5 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::duplicate ( ) [virtual]

Creates a new float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new float **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1062).

6.239.2.6 virtual float decaf::internal::nio::FloatArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the float at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implements **decaf::nio::FloatBuffer** (p. 1062).

6.239.2.7 virtual float decaf::internal::nio::FloatArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the float is to be read

Returns

the float that is located at the given index

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit

Implements **decaf::nio::FloatBuffer** (p. 1062).

6.239.2.8 virtual bool decaf::internal::nio::FloatArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible float array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::FloatBuffer** (p. 1064).

6.239.2.9 virtual bool decaf::internal::nio::FloatArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.239.2.10 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (float *value*) [virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters

value	The floats value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::FloatBuffer** (p. 1065).

6.239.2.11 virtual FloatBuffer& decaf::internal::nio::FloatArrayBuffer::put (int *index*, float *value*) [virtual]

Writes the given floats into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The floats to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::FloatBuffer** (p. 1066).

6.239.2.12 virtual void decaf::internal::nio::FloatArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **FloatArrayBuffer** (p. 1050) as Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.239.2.13 virtual FloatBuffer* decaf::internal::nio::FloatArrayBuffer::slice ( ) const [virtual]

Creates a new **FloatBuffer** (p. 1058) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **FloatBuffer** (p. 1058) which the caller owns.

Implements **decaf::nio::FloatBuffer** (p. 1066).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**FloatArrayBuffer.h**

6.240 decaf::nio::FloatBuffer Class Reference

This class defines four categories of operations upon float buffers:

`#include <src/main/decaf/nio/FloatBuffer.h>`

Inheritance diagram for decaf::nio::FloatBuffer:

Public Member Functions

- virtual ~**FloatBuffer** ()
- virtual std::string **toString** () **const**
- virtual float * **array** ()=0

  Returns the float array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **FloatBuffer** ∗ **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only float buffer that shares this buffer's content.
- virtual **FloatBuffer** & **compact** ()=0

  Compacts this buffer.
- virtual **FloatBuffer** ∗ **duplicate** ()=0

  Creates a new float buffer that shares this buffer's content.
- virtual float **get** ()=0

  Relative get method.
- virtual float **get** (int index) **const** =0

  Absolute get method.
- **FloatBuffer** & **get** (std::vector< float > buffer)

  Relative bulk get method.
- **FloatBuffer** & **get** (float ∗buffer, int size, int offset, int length)

  Relative bulk get method.
- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible float array.
- **FloatBuffer** & **put** (**FloatBuffer** &src)

  This method transfers the floats remaining in the given source buffer into this buffer.
- **FloatBuffer** & **put** (**const** float ∗buffer, int size, int offset, int length)

  This method transfers floats into this buffer from the given source array.
- **FloatBuffer** & **put** (std::vector< float > &buffer)

  This method transfers the entire content of the given source floats array into this buffer.
- virtual **FloatBuffer** & **put** (float value)=0

  Writes the given floats into this buffer at the current position, and then increments the position.
- virtual **FloatBuffer** & **put** (int index, float value)=0

  Writes the given floats into this buffer at the given index.
- virtual **FloatBuffer** ∗ **slice** () **const** =0

  *Creates a new **FloatBuffer** (p. 1058) whose content is a shared subsequence of this buffer's content.*

Static Public Member Functions

- static **FloatBuffer** ∗ **allocate** (int **capacity**)

  Allocates a new Double buffer.
- static **FloatBuffer** ∗ **wrap** (float ∗**array**, int size, int offset, int length)

  *Wraps the passed buffer with a new **FloatBuffer** (p. 1058).*
- static **FloatBuffer** ∗ **wrap** (std::vector< float > &buffer)

  *Wraps the passed STL float Vector in a **FloatBuffer** (p. 1058).*

Protected Member Functions

- **FloatBuffer** (int **capacity**)

  *Creates a **FloatBuffer** (p. 1058) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.240.1 Detailed Description

This class defines four categories of operations upon float buffers:

o Absolute and relative get and put methods that read and write single floats; o Relative bulk get methods that transfer contiguous sequences of floats from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of floats from a float array or some other float buffer into this buffer o Methods for compacting, duplicating, and slicing a float buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing float array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.240.2 Constructor & Destructor Documentation

6.240.2.1 decaf::nio::FloatBuffer::FloatBuffer (int *capacity*) [protected]

Creates a **FloatBuffer** (p. 1058) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size and limit of the **Buffer** (p. 451) in floats.

Exceptions

IllegalArguementException	if capacity is negative.

6.240.2.2 virtual decaf::nio::FloatBuffer::~FloatBuffer ( ) [inline, virtual]

6.240.3 Member Function Documentation

6.240.3.1 static FloatBuffer* decaf::nio::FloatBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Double buffer in floats.

Returns

the **FloatBuffer** (p. 1058) that was allocated, caller owns.

6.240.3.2 virtual float* decaf::nio::FloatBuffer::array ( ) [pure virtual]

Returns the float array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1054).

6.240.3.3 virtual int decaf::nio::FloatBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1055).

6.240.3.4 virtual FloatBuffer* decaf::nio::FloatBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only float buffer which the caller then owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1055).

6.240.3.5 virtual FloatBuffer& decaf::nio::FloatBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **FloatBuffer** (p. 1058).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1055).

6.240.3.6 virtual int decaf::nio::FloatBuffer::compareTo (const FloatBuffer & *value*) const [virtual]

6.240.3.7 virtual FloatBuffer* decaf::nio::FloatBuffer::duplicate ( ) [pure virtual]

Creates a new float buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new float **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1056).

6.240.3.8 virtual bool decaf::nio::FloatBuffer::equals (const FloatBuffer & *value*) const [virtual]

6.240.3.9 virtual float decaf::nio::FloatBuffer::get ( ) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the float at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1056).

6.240.3.10 virtual float decaf::nio::FloatBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the float is to be read

Returns

the float that is located at the given index

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1056).

6.240.3.11 FloatBuffer& decaf::nio::FloatBuffer::get (std::vector< float > *buffer*)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length floats remaining in this buffer

6.240.3.12 FloatBuffer& decaf::nio::FloatBuffer::get (float * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method.

This method transfers floats from this buffer into the given destination array. If there are fewer floats remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length floats from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the passed in buffer.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length floats remaining in this buffer
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.240.3.13 virtual bool decaf::nio::FloatBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible float array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1057).

6.240.3.14 virtual bool decaf::nio::FloatBuffer::operator< (const FloatBuffer & *value*) const [virtual]

6.240.3.15 virtual bool decaf::nio::FloatBuffer::operator== (const FloatBuffer & *value*) const [virtual]

6.240.3.16 FloatBuffer& decaf::nio::FloatBuffer::put (FloatBuffer & *src*)

This method transfers the floats remaining in the given source buffer into this buffer.

If there are more floats remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no floats are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() floats from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take floats from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining floats in the source buffer
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.240.3.17 FloatBuffer& decaf::nio::FloatBuffer::put (const float * *buffer,* int *size,* int *offset,* int *length*)

This method transfers floats into this buffer from the given source array.

If there are more floats to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no floats are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which floats are to be read.
size	The size of the passed in buffer.
offset	The offset within the array of the first float to be read.
length	The number of floats to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.240.3.18 FloatBuffer& decaf::nio::FloatBuffer::put (std::vector< float > & *buffer*)

This method transfers the entire content of the given source floats array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **FloatBuffer** (p. 1058)

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

6.240.3.19 virtual FloatBuffer& decaf::nio::FloatBuffer::put (float *value*) [pure virtual]

Writes the given floats into this buffer at the current position, and then increments the position.

Parameters

value	The floats value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1057).

6.240.3.20 virtual FloatBuffer& decaf::nio::FloatBuffer::put (int *index,* float *value*) [pure virtual]

Writes the given floats into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The floats to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1057).

6.240.3.21 virtual FloatBuffer* decaf::nio::FloatBuffer::slice ( ) const [pure virtual]

Creates a new **FloatBuffer** (p. 1058) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **FloatBuffer** (p. 1058) which the caller owns.

Implemented in **decaf::internal::nio::FloatArrayBuffer** (p. 1058).

6.240.3.22 virtual std::string decaf::nio::FloatBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.240.3.23 static FloatBuffer* decaf::nio::FloatBuffer::wrap (float * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **FloatBuffer** (p. 1058).

The new buffer will be backed by the given float array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the array that was passed in.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **FloatBuffer** (p. 1058) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.240.3.24 static FloatBuffer* decaf::nio::FloatBuffer::wrap (std::vector< float > & *buffer*) [static]

Wraps the passed STL float Vector in a **FloatBuffer** (p. 1058).

The new buffer will be backed by the given float array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	- The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **FloatBuffer** (p. 1058) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**FloatBuffer.h**

6.241 decaf::io::Flushable Class Reference

A **Flushable** (p. 1067) is a destination of data that can be flushed.

`#include <src/main/decaf/io/Flushable.h>`

Inheritance diagram for decaf::io::Flushable:

Public Member Functions

- virtual ~**Flushable** ()
- virtual void **flush** ()=0

  Flushes this stream by writing any buffered output to the underlying stream.

6.241.1 Detailed Description

A **Flushable** (p. 1067) is a destination of data that can be flushed.

The flush method is invoked to write any buffered output to the underlying stream.

Since

1.0

6.241.2 Constructor & Destructor Documentation

6.241.2.1 virtual decaf::io::Flushable::~Flushable ( ) [inline, virtual]

6.241.3 Member Function Documentation

6.241.3.1 virtual void decaf::io::Flushable::flush ( ) [pure virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Implemented in **decaf::io::BufferedOutputStream** (p. 463), **decaf::io::FilterOutputStream** (p. 1039), **decaf::io::OutputStreamWriter** (p. 1608), **decaf::io::OutputStream** (p. 1602), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1963).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**Flushable.h**

6.242 activemq::commands::FlushCommand Class Reference

`#include <src/main/activemq/commands/FlushCommand.h>`

Inheritance diagram for activemq::commands::FlushCommand:

Public Member Functions

- **FlushCommand** ()
- virtual ~**FlushCommand** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **FlushCommand** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure*** (p. *877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure*** (p. *877) passed in to this one, and returns if they are equivalent.*
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_FLUSHCOMMAND** = 15

6.242.1 Constructor & Destructor Documentation

6.242.1.1 activemq::commands::FlushCommand::FlushCommand ( )

6.242.1.2 virtual activemq::commands::FlushCommand::∼FlushCommand ( ) [virtual]

6.242.2 Member Function Documentation

6.242.2.1 virtual FlushCommand∗ activemq::commands::FlushCommand::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.242.2.2 virtual void activemq::commands::FlushCommand::copyDataStructure (const DataStructure ∗ *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.242.2.3 virtual bool activemq::commands::FlushCommand::equals (const DataStructure ∗ *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.242.2.4 virtual unsigned char activemq::commands::FlushCommand::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.242.2.5 virtual std::string activemq::commands::FlushCommand::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.242.2.6 virtual Pointer<Command> activemq::commands::FlushCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.242.3 Field Documentation

6.242.3.1 const unsigned char activemq::commands::FlushCommand::ID_FLUSHCOMMAND = 15 [static]

The documentation for this class was generated from the following file:

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1070).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/FlushCommandMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller:

Public Member Functions

- **FlushCommandMarshaller** ()
- virtual ~**FlushCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.243.1 Detailed Description

Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1070).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.243.2 Constructor & Destructor Documentation

6.243.2.1 activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::FlushCommandMarshaller ( ) [inline]

6.243.2.2 virtual activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::~FlushCommandMarshaller ( ) [inline, virtual]

6.243.3 Member Function Documentation

6.243.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.243.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.243.3.3 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.243.3.4 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.243.3.5 virtual int activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.243.3.6 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.243.3.7 virtual void activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

6.244 decaf::util::logging::Formatter Class Reference

A **Formatter** (p. 1074) provides support for formatting LogRecords.

`#include <src/main/decaf/util/logging/Formatter.h>`

Inheritance diagram for decaf::util::logging::Formatter:

Public Member Functions

- virtual ~**Formatter** ()
- virtual std::string **format** (**const LogRecord** &record) **const** =0

  Format the given log record and return the formatted string.
- virtual std::string **formatMessage** (**const LogRecord** &record) **const**

  Format the message string from a log record.
- virtual std::string **getHead** (**const Handler** *handler **DECAF_UNUSED**)

  Return the header string for a set of formatted records.
- virtual std::string **getTail** (**const Handler** *handler **DECAF_UNUSED**)

  Return the tail string for a set of formatted records.

6.244.1 Detailed Description

A **Formatter** (p. 1074) provides support for formatting LogRecords.

Typically each logging **Handler** (p. 1085) will have a **Formatter** (p. 1074) associated with it. The **Formatter** (p. 1074) takes a **LogRecord** (p. 1333) and converts it to a string.

Some formatters (such as the **XMLFormatter** (p. 2287)) need to wrap head and tail strings around a set of formatted records. The getHeader and getTail methods can be used to obtain these strings.

6.244.2 Constructor & Destructor Documentation

6.244.2.1 virtual decaf::util::logging::Formatter::~Formatter ( ) [inline, virtual]

6.244.3 Member Function Documentation

6.244.3.1 virtual std::string decaf::util::logging::Formatter::format (const LogRecord & *record*) const [pure virtual]

Format the given log record and return the formatted string.

Parameters

record	The Log Record to Format

Returns

the formatted record.

Implemented in **decaf::util::logging::XMLFormatter** (p. 2288), and **decaf::util::logging::SimpleFormatter** (p. 1892).

6.244.3.2 virtual std::string decaf::util::logging::Formatter::formatMessage (const LogRecord & *record*) const [virtual]

Format the message string from a log record.

Parameters

record	The Log Record to Format

Returns

the formatted message

6.244.3.3 virtual std::string decaf::util::logging::Formatter::getHead (const Handler *handler *DECAF_UNUSED*) [inline, virtual]

Return the header string for a set of formatted records.

In the default implementation this method should return empty string.

Parameters

handler	The target handler, can be NULL.

Returns

the head string.

6.244.3.4 virtual std::string decaf::util::logging::Formatter::getTail (const Handler *handler *DECAF_UNUSED*) [inline, virtual]

Return the tail string for a set of formatted records.

In the default implementation this method should return empty string

Parameters

handler	the target handler, can be null

Returns

the tail string

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Formatter.h**

6.245 decaf::util::concurrent::Future< V > Class Template Reference

A **Future** (p. 1075) represents the result of an asynchronous computation.

`#include <src/main/decaf/util/concurrent/Future.h>`

Public Member Functions

- virtual ~**Future** ()

- virtual bool **cancel** (bool mayInterruptIfRunning)=0

  Attempts to cancel execution of this task.
- virtual bool **isCancelled** () **const** =0

  Returns true if this task was canceled before it completed normally.
- virtual bool **isDone** () **const** =0

  Returns true if this task completed.
- virtual V **get** ()=0

  Waits if necessary for the computation to complete, and then retrieves its result.
- virtual V **get** (long long timeout, **const TimeUnit** &unit)=0

  Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

6.245.1 Detailed Description

template<typename V>class decaf::util::concurrent::Future< V >

A **Future** (p. 1075) represents the result of an asynchronous computation.

Methods are provided to check if the computation is complete, to wait for its completion, and to retrieve the result of the computation. The result can only be retrieved using method get when the computation has completed, blocking if necessary until it is ready. Cancellation is performed by the cancel method. Additional methods are provided to determine if the task completed normally or was canceled. Once a computation has completed, the computation cannot be canceled. If you would like to use a **Future** (p. 1075) for the sake of cancellability but not provide a usable result, you can declare types of the form Future<void*> and return null as a result of the underlying task.

6.245.2 Constructor & Destructor Documentation

6.245.2.1 template<typename V > virtual decaf::util::concurrent::Future< V >::~Future ( ) [inline, virtual]

6.245.3 Member Function Documentation

6.245.3.1 template<typename V > virtual bool decaf::util::concurrent::Future< V >::cancel (bool *mayInterruptIfRunning*) [pure virtual]

Attempts to cancel execution of this task.

This attempt will fail if the task has already completed, has already been canceled, or could not be canceled for some other reason. If successful, and this task has not started when cancel is called, this task should never run. If the task has already started, then the mayInterruptIfRunning parameter determines whether the thread executing this task should be interrupted in an attempt to stop the task.

After this method returns, subsequent calls to **isDone()** (p. 1077) will always return true. Subsequent calls to **isCancelled()** (p. 1077) will always return true if this method returned true.

Parameters

mayInterruptIfRunning	- true if the thread executing this task should be interrupted; otherwise, in-progress tasks are allowed to complete.

Returns

false if the task could not be canceled, typically because it has already completed normally; true otherwise

6.245.3.2 template<typename V > virtual V decaf::util::concurrent::Future< V >::get ( ) [pure virtual]

Waits if necessary for the computation to complete, and then retrieves its result.

Returns

the computed result.

Exceptions

CancellationException *(p. 580)*	- if the computation was canceled
ExecutionException *(p. 1002)*	- if the computation threw an exception
InterruptedException	- if the current thread was interrupted while waiting

6.245.3.3 template<typename V > virtual V decaf::util::concurrent::Future< V >::get (long long *timeout,* const TimeUnit & *unit*) [pure virtual]

Waits if necessary for at most the given time for the computation to complete, and then retrieves its result, if available.

Parameters

timeout	- the maximum time to wait
unit	- the time unit of the timeout argument

Returns

the computed result

Exceptions

CancellationException *(p. 580)*	- if the computation was canceled
ExecutionException *(p. 1002)*	- if the computation threw an exception
InterruptedException	- if the current thread was interrupted while waiting
TimeoutException *(p. 2120)*	- if the wait timed out

6.245.3.4 template<typename V > virtual bool decaf::util::concurrent::Future< V >::isCancelled ( ) const [pure virtual]

Returns true if this task was canceled before it completed normally.

Returns

true if this task was canceled before it completed

6.245.3.5 template<typename V > virtual bool decaf::util::concurrent::Future< V >::isDone ( ) const [pure virtual]

Returns true if this task completed.

Completion may be due to normal termination, an exception, or cancellation -- in all of these cases, this method will return true.

Returns

true if this task completed

The documentation for this class was generated from the following file:

6.246 activemq::transport::correlator::FutureResponse Class Reference

A container that holds a response object.

`#include <src/main/activemq/transport/correlator/FutureResponse.h>`

Public Member Functions

- **FutureResponse** ()
- virtual ~**FutureResponse** ()
- virtual **const Pointer**< **Response** > & **getResponse** () **const**

  Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** ()
- virtual **const Pointer**< **Response** > & **getResponse** (unsigned int timeout) **const**

  Getters for the response property.
- virtual **Pointer**< **Response** > & **getResponse** (unsigned int timeout)
- virtual void **setResponse** (**const Pointer**< **Response** > &response)

  Setter for the response property.

6.246.1 Detailed Description

A container that holds a response object.

Callers of the getResponse method will block until a response has been receive unless they call the getRepsonse that takes a timeout.

6.246.2 Constructor & Destructor Documentation

6.246.2.1 activemq::transport::correlator::FutureResponse::FutureResponse ( ) [inline]

6.246.2.2 virtual activemq::transport::correlator::FutureResponse::~FutureResponse ( ) [inline, virtual]

6.246.3 Member Function Documentation

6.246.3.1 virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse ( ) const [inline, virtual]

Getters for the response property.

Infinite Wait.

Returns

the response object for the request

6.246.3.2 virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse ( ) [inline, virtual]

6.246.3.3 virtual const Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int *timeout*) const [inline, virtual]

Getters for the response property.

Timed Wait.

Parameters

timeout	- time to wait in milliseconds

Returns

the response object for the request

6.246.3.4 virtual Pointer<Response>& activemq::transport::correlator::FutureResponse::getResponse (unsigned int *timeout*) [inline, virtual]

6.246.3.5 virtual void activemq::transport::correlator::FutureResponse::setResponse (const Pointer< Response > & *response*) [inline, virtual]

Setter for the response property.

Parameters

response	the response object for the request.

6.247 decaf::security::GeneralSecurityException Class Reference

`#include <src/main/decaf/security/GeneralSecurityException.h>`

Inheritance diagram for decaf::security::GeneralSecurityException:

Public Member Functions

- **GeneralSecurityException** () throw ()

  Default Constructor.
- **GeneralSecurityException** (**const decaf::lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **GeneralSecurityException** (**const GeneralSecurityException** &ex) throw ()

  Copy Constructor.
- **GeneralSecurityException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **GeneralSecurityException** (**const** std::exception ∗**cause**) throw ()

Constructor.

- **GeneralSecurityException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **GeneralSecurityException** * **clone** () **const**

  Clones this exception.
- virtual ~**GeneralSecurityException** () throw ()

6.247.1 Constructor & Destructor Documentation

6.247.1.1 decaf::security::GeneralSecurityException::GeneralSecurityException ( ) throw () [inline]

Default Constructor.

6.247.1.2 decaf::security::GeneralSecurityException::GeneralSecurityException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.247.1.3 decaf::security::GeneralSecurityException::GeneralSecurityException (const GeneralSecurityException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.247.1.4 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.247.1.5 decaf::security::GeneralSecurityException::GeneralSecurityException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.247.1.6 decaf::security::GeneralSecurityException::GeneralSecurityException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.247.1.7 virtual decaf::security::GeneralSecurityException::~GeneralSecurityException ( ) throw () [inline, virtual]

6.247.2 Member Function Documentation

6.247.2.1 virtual GeneralSecurityException* decaf::security::GeneralSecurityException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::lang::Exception** (p. 992).

Reimplemented in **decaf::security::NoSuchProviderException** (p. 1541), **decaf::security::NoSuchAlgorithmException** (p. 1537), **decaf::security::SignatureException** (p. 1891), **decaf::security::InvalidKeyException** (p. 1193), **decaf::security::KeyException** (p. 1242), **decaf::security::KeyManagementException** (p. 1245), **decaf::security::cert::CertificateExpiredException** (p. 590), **decaf::security::cert::CertificateNotYetValidException** (p. 591), **decaf::security::cert::CertificateParsingException** (p. 593), **decaf::security::cert::CertificateEncodingException** (p. 587), and **decaf::security::cert::CertificateException** (p. 588).

- void **reportError** (**const** std::string &message, **decaf::lang::Exception** ∗ex, int **code**)

  *Protected convenience method to report an error to this **Handler** (p. 1085)'s **ErrorManager** (p. 988).*

6.251.1 Detailed Description

A **Handler** (p. 1085) object takes log messages from a **Logger** (p. 1312) and exports them.

It might for example, write them to a console or write them to a file, or send them to a network logging service, or forward them to an OS log, or whatever.

A **Handler** (p. 1085) can be disabled by doing a setLevel(**Level.OFF** (p. 1257)) and can be re-enabled by doing a setLevel with an appropriate level.

Handler (p. 1085) classes typically use **LogManager** (p. 1327) properties to set default values for the **Handler** (p. 1085)'s **Filter** (p. 1031), **Formatter** (p. 1074), and **Level** (p. 1253). See the specific documentation for each concrete **Handler** (p. 1085) class.

6.251.2 Constructor & Destructor Documentation

6.251.2.1 decaf::util::logging::Handler::Handler ( )

6.251.2.2 virtual decaf::util::logging::Handler::~Handler ( ) [virtual]

6.251.3 Member Function Documentation

6.251.3.1 virtual void decaf::util::logging::Handler::flush ( ) [pure virtual]

Flush the **Handler** (p. 1085)'s output, clears any buffers.

Implemented in **decaf::util::logging::StreamHandler** (p. 2019).

6.251.3.2 virtual ErrorManager* decaf::util::logging::Handler::getErrorManager ( ) [inline, virtual]

Gets the **ErrorManager** (p. 988) used by this **Handler** (p. 1085).

Returns

ErrorManager (p. 988) derived pointer or NULL.

6.251.3.3 virtual Filter* decaf::util::logging::Handler::getFilter ( ) [inline, virtual]

Gets the **Filter** (p. 1031) that this **Handler** (p. 1085) uses to filter Log Records.

Returns

Filter (p. 1031) derived instance

6.251.3.4 virtual Formatter* decaf::util::logging::Handler::getFormatter ( ) [inline, virtual]

Gets the **Formatter** (p. 1074) used by this **Handler** (p. 1085).

Returns

Filter (p. 1031) derived instance

6.251.3.5 virtual Level decaf::util::logging::Handler::getLevel ( ) [inline, virtual]

Get the log level specifying which message levels will be logged by this **Handler** (p. 1085).

Returns

Level (p. 1253) enumeration value

6.251.3.6 virtual bool decaf::util::logging::Handler::isLoggable (const LogRecord & *record*) const [virtual]

Check if this **Handler** (p. 1085) would actually log a given **LogRecord** (p. 1333).

This method checks if the **LogRecord** (p. 1333) has an appropriate **Level** (p. 1253) and whether it satisfies any **Filter** (p. 1031). It also may make other **Handler** (p. 1085) specific checks that might prevent a handler from logging the **LogRecord** (p. 1333).

Parameters

record	**LogRecord** (p. 1333) to check

Reimplemented in **decaf::util::logging::StreamHandler** (p. 2019).

6.251.3.7 virtual void decaf::util::logging::Handler::publish (const LogRecord & *record*) [pure virtual]

Publish the Log Record to this **Handler** (p. 1085).

Parameters

record	The Log Record to Publish

Implemented in **decaf::util::logging::StreamHandler** (p. 2019), and **decaf::util::logging::ConsoleHandler** (p. 769).

6.251.3.8 void decaf::util::logging::Handler::reportError (const std::string & *message*, decaf::lang::Exception * *ex*, int *code*) [protected]

Protected convenience method to report an error to this **Handler** (p. 1085)'s **ErrorManager** (p. 988).

Parameters

message	- a descriptive string (may be empty)
ex	- an exception (may be NULL)
code	- an error code defined in **ErrorManager** (p. 988)

6.251.3.9 virtual void decaf::util::logging::Handler::setErrorManager (ErrorManager * *errorManager*) [virtual]

Sets the **Formatter** (p. 1074) used by this **Handler** (p. 1085).

The **ErrorManager** (p. 988)'s "error" method will be invoked if any errors occur while using this **Handler** (p. 1085).

Parameters

errorManager	**ErrorManager** (p. 988) derived instance

6.251.3.10 virtual void decaf::util::logging::Handler::setFilter (Filter * *filter*) [inline, virtual]

Sets the **Filter** (p. 1031) that this **Handler** (p. 1085) uses to filter Log Records.

For each call of publish the **Handler** (p. 1085) will call this **Filter** (p. 1031) (if it is non-null) to check if the **LogRecord** (p. 1333) should be published or discarded.

Parameters

filter	**Filter** (p. 1031) derived instance

6.251.3.11 virtual void decaf::util::logging::Handler::setFormatter (Formatter * *formatter*) [virtual]

Sets the **Formatter** (p. 1074) used by this **Handler** (p. 1085).

Some Handlers may not use Formatters, in which case the **Formatter** (p. 1074) will be remembered, but not used.

Parameters

formatter	**Filter** (p. 1031) derived instance

6.251.3.12 virtual void decaf::util::logging::Handler::setLevel (const Level & *value*) [inline, virtual]

Set (p. 1857) the log level specifying which message levels will be logged by this **Handler** (p. 1085).

The intention is to allow developers to turn on voluminous logging, but to limit the messages that are sent to certain Handlers.

Parameters

value	**Level** (p. 1253) enumeration value

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Handler.h**

6.252 decaf::internal::util::HexStringParser Class Reference

`#include <src/main/decaf/internal/util/HexStringParser.h>`

Public Member Functions

- **HexStringParser** (int exponentWidth, int mantissaWidth)

  Create a new HexParser.
- virtual ~**HexStringParser** ()
- long long **parse** (**const** std::string &hexString)

  Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Static Public Member Functions

- static double **parseDouble** (**const** std::string &hexString)
- static float **parseFloat** (**const** std::string &hexString)

6.252.1 Constructor & Destructor Documentation

6.252.1.1 decaf::internal::util::HexStringParser::HexStringParser (int *exponentWidth,* int *mantissaWidth*)

Create a new HexParser.

Parameters

exponentWidth	- Width of the exponent for the type to parse
mantissaWidth	- Width of the mantissa for the type to parse

6.252.1.2 virtual decaf::internal::util::HexStringParser::~HexStringParser ( ) [inline, virtual]

6.252.2 Member Function Documentation

6.252.2.1 long long decaf::internal::util::HexStringParser::parse (const std::string & *hexString*)

Parses a hex string using the specs given in the constructor and returns a long long with the bits of the parsed string, the caller can then convert those to a float or doulbe as needed.

Parameters

hexString	- string to parse

Returns

the bits parsed from the string

6.252.2.2 static double decaf::internal::util::HexStringParser::parseDouble (const std::string & *hexString*) [static]

6.252.2.3 static float decaf::internal::util::HexStringParser::parseFloat (const std::string & *hexString*) [static]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**HexStringParser.h**

6.253 activemq::wireformat::openwire::utils::HexTable Class Reference

The **HexTable** (p. 1089) class maps hexidecimal strings to the value of an index into the table, i.e.

`#include <src/main/activemq/wireformat/openwire/utils/HexTable.h>`

Public Member Functions

- **HexTable** ()
- virtual ~**HexTable** ()
- virtual **const** std::string & **operator[]** (std::size_t index)

  Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.
- virtual **const** std::string & **operator[]** (std::size_t index) **const**
- virtual std::size_t **size** () **const**

  Returns the max size of this Table.

6.253.1 Detailed Description

The **HexTable** (p. 1089) class maps hexidecimal strings to the value of an index into the table, i.e.

the class will return "FF" for the index 255 in the table.

6.253.2 Constructor & Destructor Documentation

6.253.2.1 activemq::wireformat::openwire::utils::HexTable::HexTable ( )

6.253.2.2 virtual activemq::wireformat::openwire::utils::HexTable::~HexTable ( ) [inline, virtual]

6.253.3 Member Function Documentation

6.253.3.1 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) [virtual]

Index operator for this Table, will throw an exception if the index requested is out of bounds for this table.

Parameters

index	The index of the value in the table to fetch.

Returns

string containing the hex value if the index

Exceptions

IndexOutOfBounds-Exception	if the index exceeds the table size.

6.253.3.2 virtual const std::string& activemq::wireformat::openwire::utils::HexTable::operator[] (std::size_t *index*) const [virtual]

6.253.3.3 virtual std::size_t activemq::wireformat::openwire::utils::HexTable::size ( ) const [inline, virtual]

Returns the max size of this Table.

Returns

an integer size value for the table.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/**HexTable.h**

6.254 decaf::net::HttpRetryException Class Reference

`#include <src/main/decaf/net/HttpRetryException.h>`

Inheritance diagram for decaf::net::HttpRetryException:

Public Member Functions

- **HttpRetryException** () throw ()

  Default Constructor.
- **HttpRetryException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **HttpRetryException** (**const HttpRetryException** &ex) throw ()

  Copy Constructor.
- **HttpRetryException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **HttpRetryException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **HttpRetryException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **HttpRetryException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**HttpRetryException** () throw ()

6.254.1 Constructor & Destructor Documentation

6.254.1.1 decaf::net::HttpRetryException::HttpRetryException ( ) throw () [inline]

Default Constructor.

6.254.1.2 decaf::net::HttpRetryException::HttpRetryException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.254.1.3 decaf::net::HttpRetryException::HttpRetryException (const HttpRetryException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.254.1.4 decaf::net::HttpRetryException::HttpRetryException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.

cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.254.1.5 decaf::net::HttpRetryException::HttpRetryException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.254.1.6 decaf::net::HttpRetryException::HttpRetryException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.254.1.7 virtual decaf::net::HttpRetryException::~HttpRetryException ( ) throw () [inline, virtual]

6.254.2 Member Function Documentation

6.254.2.1 virtual HttpRetryException* decaf::net::HttpRetryException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**HttpRetryException.h**

6.255 activemq::util::IdGenerator Class Reference

`#include <src/main/activemq/util/IdGenerator.h>`

Public Member Functions

- **IdGenerator** ()
- **IdGenerator** (**const** std::string &prefix)
- virtual ~**IdGenerator** ()
- std::string **generateId** () **const**

Static Public Member Functions

- static std::string **getHostname** ()

  Since the initialization of this object results in the retrieval of the machine's host name we can quickly return it here.
- static std::string **getSeedFromId** (**const** std::string &id)

  Gets the seed value from a Generated Id, the count portion is removed.
- static long long **getSequenceFromId** (**const** std::string &id)

  Gets the count value from a Generated Id, the seed portion is removed.
- static int **compare** (**const** std::string &id1, **const** std::string &id2)

  Compares two generated id values.

Friends

- class **activemq::library::ActiveMQCPP**

6.255.1 Constructor & Destructor Documentation

6.255.1.1 activemq::util::IdGenerator::IdGenerator ( )

6.255.1.2 activemq::util::IdGenerator::IdGenerator (const std::string & *prefix*)

6.255.1.3 virtual activemq::util::IdGenerator::~IdGenerator ( ) [virtual]

6.255.2 Member Function Documentation

6.255.2.1 static int activemq::util::IdGenerator::compare (const std::string & *id1*, const std::string & *id2*) [static]

Compares two generated id values.

Parameters

id1	The first id to compare, or left hand side.
id2	The second id to compare, or right hand side.

Returns

zero if ids are equal or positove if id1 $>$ id2...

6.255.2.2 std::string activemq::util::IdGenerator::generateId ( ) const

Returns

a newly generated unique id.

6.255.2.3 static std::string activemq::util::IdGenerator::getHostname ( ) [static]

Since the initialization of this object results in the retrieval of the machine's host name we can quickly return it here.

Returns

the previously retrieved host name.

6.255.2.4 static std::string activemq::util::IdGenerator::getSeedFromId (const std::string & *id*) [static]

Gets the seed value from a Generated Id, the count portion is removed.

Returns

the seed portion of the Id, minus the count value.

6.255.2.5 static long long activemq::util::IdGenerator::getSequenceFromId (const std::string & *id*) [static]

Gets the count value from a Generated Id, the seed portion is removed.

Returns

the sequence count portion of the id, minus the seed value.

`#include <src/main/decaf/lang/exceptions/IndexOutOfBoundsException.h>`

Inheritance diagram for decaf::lang::exceptions::IndexOutOfBoundsException:

Public Member Functions

- **IndexOutOfBoundsException** () throw ()

  Default Constructor.
- **IndexOutOfBoundsException** (**const Exception** &ex) throw ()

  *Conversion Constructor from some other **Exception*** (p. *990).*
- **IndexOutOfBoundsException** (**const IndexOutOfBoundsException** &ex) throw ()

  Copy Constructor.
- **IndexOutOfBoundsException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **IndexOutOfBoundsException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **IndexOutOfBoundsException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- virtual **IndexOutOfBoundsException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**IndexOutOfBoundsException** () throw ()

6.262.1 Constructor & Destructor Documentation

6.262.1.1 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException ( ) throw () [inline]

Default Constructor.

6.262.1.2 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.262.1.3 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const IndexOutOfBoundsException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.262.1.4 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.262.1.5 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.262.1.6 decaf::lang::exceptions::IndexOutOfBoundsException::IndexOutOfBoundsException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.262.1.7 virtual decaf::lang::exceptions::IndexOutOfBoundsException::~IndexOutOfBoundsException ( ) throw () [inline, virtual]

6.262.2 Member Function Documentation

6.262.2.1 virtual IndexOutOfBoundsException* decaf::lang::exceptions::IndexOutOfBoundsException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**IndexOutOfBoundsException.h**

6.263.2 Member Function Documentation

6.263.2.1 virtual InetAddress∗ decaf::net::Inet4Address::clone ( ) const [virtual]

Returns a newly allocated copy of this **InetAddress** (p. 1113).

The caller owns the resulting copy and must delete it.

Returns

a new **InetAddress** (p. 1113) instance that is a copy of this one, caller owns.

Reimplemented from **decaf::net::InetAddress** (p. 1115).

6.263.2.2 virtual bool decaf::net::Inet4Address::isAnyLocalAddress ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is a valid wildcard address.

Returns

true if the address is a wildcard address.

Reimplemented from **decaf::net::InetAddress** (p. 1117).

6.263.2.3 virtual bool decaf::net::Inet4Address::isLinkLocalAddress ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is a valid link local address.

Returns

true if the address is a link local address.

Reimplemented from **decaf::net::InetAddress** (p. 1117).

6.263.2.4 virtual bool decaf::net::Inet4Address::isLoopbackAddress ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is a valid loopback address.

Returns

true if the address is a loopback address.

Reimplemented from **decaf::net::InetAddress** (p. 1117).

6.263.2.5 virtual bool decaf::net::Inet4Address::isMCGlobal ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Global scope.

Returns

true if the address is Multicast and has Global scope.

Reimplemented from **decaf::net::InetAddress** (p. 1117).

6.263.2.6 virtual bool decaf::net::Inet4Address::isMCLinkLocal ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Link Local scope.

Returns

true if the address is Multicast and has Link Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1117).

6.263.2.7 virtual bool decaf::net::Inet4Address::isMCNodeLocal ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Node Local scope.

Returns

true if the address is Multicast and has Node Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1118).

6.263.2.8 virtual bool decaf::net::Inet4Address::isMCOrgLocal ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Organization scope.

Returns

true if the address is Multicast and has Organization scope.

Reimplemented from **decaf::net::InetAddress** (p. 1118).

6.263.2.9 virtual bool decaf::net::Inet4Address::isMCSiteLocal ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Site Local scope.

Returns

true if the address is Multicast and has Site Local scope.

Reimplemented from **decaf::net::InetAddress** (p. 1118).

6.263.2.10 virtual bool decaf::net::Inet4Address::isMulticastAddress ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is a valid Multicast address.

Returns

true if the address is a Multicast address.

Reimplemented from **decaf::net::InetAddress** (p. 1118).

6.263.2.11 virtual bool decaf::net::Inet4Address::isSiteLocalAddress ( ) const [virtual]

Check if this **InetAddress** (p. 1113) is a valid site local address.

Returns

true if the address is a site local address.

Reimplemented from **decaf::net::InetAddress** (p. 1118).

6.265.1 Detailed Description

Represents an IP address.

Since

1.0

6.265.2 Constructor & Destructor Documentation

6.265.2.1 decaf::net::InetAddress::InetAddress ( ) [protected]

6.265.2.2 decaf::net::InetAddress::InetAddress (const unsigned char * *ipAddress,* int *numBytes*) [protected]

6.265.2.3 decaf::net::InetAddress::InetAddress (const std::string & *hostname,* const unsigned char * *ipAddress,* int *numBytes*) [protected]

6.265.2.4 virtual decaf::net::InetAddress::~InetAddress ( ) [virtual]

6.265.3 Member Function Documentation

6.265.3.1 static unsigned int decaf::net::InetAddress::bytesToInt (const unsigned char * bytes, int start) [static, protected]

Converts the bytes in an address array to an int starting from the value start treating the start value as the high order byte.

Parameters

bytes	The array of bytes to convert to an int.
start	The index in the array to treat as the high order byte.

Returns

an unsigned int that represents the address value.

6.265.3.2 virtual InetAddress* decaf::net::InetAddress::clone ( ) const [virtual]

Returns a newly allocated copy of this **InetAddress** (p. 1113).

The caller owns the resulting copy and must delete it.

Returns

a new **InetAddress** (p. 1113) instance that is a copy of this one, caller owns.

Reimplemented in **decaf::net::Inet4Address** (p. 1109), and **decaf::net::Inet6Address** (p. 1112).

6.265.3.3 virtual decaf::lang::ArrayPointer<unsigned char> decaf::net::InetAddress::getAddress ( ) const [virtual]

Returns the Raw IP address in Network byte order.

The returned address is a copy of the bytes contained in this **InetAddress** (p. 1113).

Returns

and ArrayPointer containing the raw bytes of the network address.

6.265.3.4 static InetAddress decaf::net::InetAddress::getAnyAddress ( ) [static, protected]

6.265.3.5 static InetAddress decaf::net::InetAddress::getByAddress (const unsigned char * bytes, int numBytes) [static]

Given a raw IP Address in byte array form, create and return a new **InetAddress** (p. 1113) instance.

An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns

a copy of an **InetAddress** (p. 1113) that represents the given byte array address.

Exceptions

UnknownHostException *(p. 2181)*	if the address array length is invalid.

6.265.3.6 static InetAddress decaf::net::InetAddress::getByAddress (const std::string & *hostname,* const unsigned char * *bytes,* int *numBytes*) [static]

Given a host name and IPAddress return a new **InetAddress** (p. 1113).

There is no name service checking or address validation done on the provided host name. The host name can either be machine name or the text based representation of the IP Address.

An IPV4 address must be only four bytes in length and an IPV6 address must be 16 bytes in length.

Returns

a copy of an **InetAddress** (p. 1113) that represents the given byte array address.

Exceptions

UnknownHostException *(p. 2181)*	if the address array length is invalid.

6.265.3.7 virtual std::string decaf::net::InetAddress::getHostAddress ( ) const [virtual]

Returns a textual representation of the IP Address.

Returns

the string form of the IP Address.

6.265.3.8 virtual std::string decaf::net::InetAddress::getHostName ( ) const [virtual]

Get the host name associated with this **InetAddress** (p. 1113) instance.

If a host name was set upon construction then that value is returned, otherwise a reverse name lookup with be performed to attempt to get the host name associated with the set IP Address. If the host name cannot be resolved the textual representation of the IP Address is returned instead.

Returns

the name of the host associated with this set IP Address.

6.265.3.9 static InetAddress decaf::net::InetAddress::getLocalHost ( ) [static]

Gets an **InetAddress** (p. 1113) that is the local host address.

If the localhost value cannot be resolved than the **InetAddress** (p. 1113) for Loopback is returned.

Returns

a new **InetAddress** (p. 1113) object that contains the local host address.

Exceptions

UnknownHostException *(p. 2181)*	if the address for local host is not found.

6.265.3.10 static InetAddress decaf::net::InetAddress::getLoopbackAddress ( ) [static, protected]

6.265.3.11 virtual bool decaf::net::InetAddress::isAnyLocalAddress ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is a valid wildcard address.

Returns

true if the address is a wildcard address.

Reimplemented in **decaf::net::Inet4Address** (p. 1109).

6.265.3.12 virtual bool decaf::net::InetAddress::isLinkLocalAddress ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is a valid link local address.

Returns

true if the address is a link local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1110).

6.265.3.13 virtual bool decaf::net::InetAddress::isLoopbackAddress ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is a valid loopback address.

Returns

true if the address is a loopback address.

Reimplemented in **decaf::net::Inet4Address** (p. 1110).

6.265.3.14 virtual bool decaf::net::InetAddress::isMCGlobal ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Global scope.

Returns

true if the address is Multicast and has Global scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1110).

6.265.3.15 virtual bool decaf::net::InetAddress::isMCLinkLocal ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Link Local scope.

Returns

true if the address is Multicast and has Link Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1110).

6.265.3.16 virtual bool decaf::net::InetAddress::isMCNodeLocal ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Node Local scope.

Returns

true if the address is Multicast and has Node Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1110).

6.265.3.17 virtual bool decaf::net::InetAddress::isMCOrgLocal ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Organization scope.

Returns

true if the address is Multicast and has Organization scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1111).

6.265.3.18 virtual bool decaf::net::InetAddress::isMCSiteLocal ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is Multicast and has Site Local scope.

Returns

true if the address is Multicast and has Site Local scope.

Reimplemented in **decaf::net::Inet4Address** (p. 1111).

6.265.3.19 virtual bool decaf::net::InetAddress::isMulticastAddress ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is a valid Multicast address.

Returns

true if the address is a Multicast address.

Reimplemented in **decaf::net::Inet4Address** (p. 1111).

6.265.3.20 virtual bool decaf::net::InetAddress::isSiteLocalAddress ( ) const [inline, virtual]

Check if this **InetAddress** (p. 1113) is a valid site local address.

Returns

true if the address is a site local address.

Reimplemented in **decaf::net::Inet4Address** (p. 1111).

6.265.3.21 virtual std::string decaf::net::InetAddress::toString ( ) const [virtual]

Returns a string representation of the **InetAddress** (p. 1113) in the form 'hostname / ipaddress'.

If the hostname is not resolved than it appears as empty.

Returns

string value of this **InetAddress** (p. 1113).

  Resets deflater so that a new set of input data can be processed.
- void **end** ()

  Closes the decompressor and discards any unprocessed input.

6.268.1 Detailed Description

This class uncompresses data that was compressed using the *DEFLATE* algorithm (see `specification`).

Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **InflaterInputStream** (p. 1128) and its descendants.

The typical usage of a **Inflater** (p. 1121) outside this package consists of a specific call to one of its constructors before being passed to an instance of **InflaterInputStream** (p. 1128).

InflaterInputStream (p. 1128)
Deflater (p. 913)

Since

1.0

6.268.2 Constructor & Destructor Documentation

6.268.2.1 decaf::util::zip::Inflater::Inflater ( )

Creates a new decompressor.

This constructor defaults the inflater to use the ZLIB header and checksum fields.

6.268.2.2 decaf::util::zip::Inflater::Inflater (bool *nowrap*)

Creates a new decompressor.

If the parameter 'nowrap' is true then the ZLIB header and checksum fields will not be used. This provides compatibility with the compression format used by both GZIP and PKZIP.

Note: When using the 'nowrap' option it is also necessary to provide an extra "dummy" byte as input. This is required by the ZLIB native library in order to support certain optimizations.

6.268.2.3 virtual decaf::util::zip::Inflater::~Inflater ( ) [virtual]

6.268.3 Member Function Documentation

6.268.3.1 void decaf::util::zip::Inflater::end ( )

Closes the decompressor and discards any unprocessed input.

This method should be called when the decompressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Inflater** (p. 1121) object is undefined.

6.268.3.2 void decaf::util::zip::Inflater::finish ( )

When called, indicates that decompression should end with the current contents of the input buffer.

6.268.3.3 bool decaf::util::zip::Inflater::finished ( ) const

Returns

true if the end of the compressed data output stream has been reached.

6.268.3.4 long long decaf::util::zip::Inflater::getAdler ( ) const

Returns

the ADLER-32 value of the uncompressed data.

Exceptions

IllegalStateException	if in the end state.

6.268.3.5 long long decaf::util::zip::Inflater::getBytesRead ( ) const

Returns

the total number of compressed bytes input so far.

Exceptions

IllegalStateException	if in the end state.

6.268.3.6 long long decaf::util::zip::Inflater::getBytesWritten ( ) const

Returns

the total number of decompressed bytes output so far.

Exceptions

IllegalStateException	if in the end state.

6.268.3.7 int decaf::util::zip::Inflater::getRemaining ( ) const

Returns the total number of bytes remaining in the input buffer.

This can be used to find out what bytes still remain in the input buffer after decompression has finished.

Returns

the total number of bytes remaining in the input buffer

6.268.3.8 int decaf::util::zip::Inflater::inflate (unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1125) or **needsDictionary()** (p. 1125) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer	The Buffer to write the compressed data to.
size	The size of the buffer passed in.
offset	The position in the Buffer to start writing at.
length	The maximum number of byte of data to write.

Exceptions

NullPointerException	if buffer is NULL.
IllegalStateException	if in the end state.
IndexOutOfBounds-Exception	if the offset + length $>$ size of the buffer.
DataFormatException *(p. 834)*	if the compressed data format is invalid.

6.268.3.9 int decaf::util::zip::Inflater::inflate (std::vector< unsigned char > & *buffer,* int *offset,* int *length*)

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1125) or **needsDictionary()** (p. 1125) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer	The Buffer to write the compressed data to.
offset	The position in the Buffer to start writing at.
length	The maximum number of byte of data to write.

Exceptions

IllegalStateException	if in the end state.
IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
DataFormatException *(p. 834)*	if the compressed data format is invalid.

6.268.3.10 int decaf::util::zip::Inflater::inflate (std::vector< unsigned char > & *buffer*)

Uncompresses bytes into specified buffer.

Returns actual number of bytes uncompressed. A return value of 0 indicates that **needsInput()** (p. 1125) or **needsDictionary()** (p. 1125) should be called in order to determine if more input data or a preset dictionary is required. In the latter case, **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary required.

Parameters

buffer	The Buffer to write the compressed data to.

Exceptions

IllegalStateException	if in the end state.
DataFormatException *(p. 834)*	if the compressed data format is invalid.

6.268.3.11 bool decaf::util::zip::Inflater::needsDictionary ( ) const

Returns

true if a preset dictionary is needed for decompression.

6.268.3.12 bool decaf::util::zip::Inflater::needsInput ( ) const

Returns

true if the input data buffer is empty and **setInput()** (p. 1127) should be called in order to provide more input

6.268.3.13 void decaf::util::zip::Inflater::reset ( )

Resets deflater so that a new set of input data can be processed.

Keeps current decompression level and strategy settings.

Exceptions

IllegalStateException	if in the end state.

6.268.3.14 void decaf::util::zip::Inflater::setDictionary (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p. 1124) returns 0 and **needsDictionary()** (p. 1125) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer	The Buffer to read in for decompression.
size	The size of the buffer passed in.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length $>$ size of the buffer.
IllegalStateException	if in the end state.
IllegalArgumentException	if the given dictionary doesn't match thre required dictionaries checksum value.

6.268.3.15 void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*)

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p. 1124) returns 0 and **needsDictionary()** (p. 1125) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer	The Buffer to read in for decompression.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBounds-Exception	if the offset + length $>$ size of the buffer.
IllegalStateException	if in the end state.
IllegalArgumentException	if the given dictionary doesn't match thre required dictionaries checksum value.

6.268.3.16 void decaf::util::zip::Inflater::setDictionary (const std::vector< unsigned char > & *buffer*)

Sets the preset dictionary to the given array of bytes.

Should be called when **inflate()** (p. 1124) returns 0 and **needsDictionary()** (p. 1125) returns true indicating that a preset dictionary is required. The method **getAdler()** (p. 1123) can be used to get the Adler-32 value of the dictionary needed.

Parameters

buffer	The Buffer to read in for decompression.

Exceptions

IllegalStateException	if in the end state.
IllegalArgumentException	if the given dictionary doesn't match the required dictionaries checksum value.

6.268.3.17 void decaf::util::zip::Inflater::setInput (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1125) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for decompression.
size	The size of the buffer passed in.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.268.3.18 void decaf::util::zip::Inflater::setInput (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*)

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1125) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for decompression.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.268.3.19 void decaf::util::zip::Inflater::setInput (const std::vector< unsigned char > & *buffer*)

Sets input data for decompression.

This should be called whenever **needsInput()** (p. 1125) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for decompression.

Exceptions

IllegalStateException	if in the end state.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Inflater.h**

6.269 decaf::util::zip::InflaterInputStream Class Reference

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

`#include <src/main/decaf/util/zip/InflaterInputStream.h>`

Inheritance diagram for decaf::util::zip::InflaterInputStream:

Public Member Functions

- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, bool **own**=false)

  Create an instance of this class with a default inflater and buffer size.
- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, **Inflater** ∗**inflater**, bool **own**=false, bool **ownInflater**=false)

  *Creates a new **InflaterInputStream** (p. 1128) with a user supplied **Inflater** (p. 1121) and a default buffer size.*
- **InflaterInputStream** (**decaf::io::InputStream** ∗**inputStream**, **Inflater** ∗**inflater**, int bufferSize, bool **own**=false, bool **ownInflater**=false)

  *Creates a new DeflateOutputStream with a user supplied **Inflater** (p. 1121) and specified buffer size.*
- virtual ∼**InflaterInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs while closing the **InputStream** (p. 1134).*

- virtual long long **skip** (long long num)

Skips over and discards n bytes of data from this input stream.
The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
The skip method of ***InputStream*** *(*p. *1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	*The number of bytes to skip.*

Returns

total bytes skipped

Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.

  Parameters

readLimit	*The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then:
  - *If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an* ***IOException*** *(*p. *1198) might be thrown.*
  - *If such an* ***IOException*** *(*p. *1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

  If the method markSupported returns false, then:
  - *The call to reset may throw an* ***IOException*** *(*p. *1198).*
  - *If an* ***IOException*** *(*p. *1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

  The default implementation of this method throws an ***IOException*** *(*p. *1198).*

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual bool **markSupported** () **const**

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.

  Returns

  true if this stream instance supports marks

Protected Member Functions

- virtual void **fill** ()

  Fills the input buffer with the next chunk of data.

Static Protected Attributes

- static **const** int **DEFAULT_BUFFER_SIZE**

6.269.1 Detailed Description

A FilterInputStream that decompresses data read from the wrapped InputStream instance.

Since

1.0

6.269.2 Constructor & Destructor Documentation

6.269.2.1 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream,* bool *own =* `false`)

Create an instance of this class with a default inflater and buffer size.

Parameters

inputStream	The InputStream instance to wrap.
own	Should this Filter take ownership of the InputStream pointer (defaults to false).

6.269.2.2 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream,* Inflater * *inflater,* bool *own =* `false`, bool *ownInflater =* `false`)

Creates a new **InflaterInputStream** (p. 1128) with a user supplied **Inflater** (p. 1121) and a default buffer size.

When the user supplied a **Inflater** (p. 1121) instance the **InflaterInputStream** (p. 1128) does not take ownership of the **Inflater** (p. 1121) pointer unless the ownInflater parameter is set to true, otherwise the caller is still responsible for deleting the **Inflater** (p. 1121).

Parameters

inputStream	The InputStream instance to wrap.
inflater	The user supplied **Inflater** (p. 1121) to use for decompression. (
own	Should this filter take ownership of the InputStream pointer (default is false).
ownInflater	Should the filter take ownership of the passed **Inflater** (p. 1121) object (default is false).

Exceptions

NullPointerException	if the **Inflater** (p. 1121) given is NULL.

6.269.2.3 decaf::util::zip::InflaterInputStream::InflaterInputStream (decaf::io::InputStream * *inputStream,* Inflater * *inflater,* int *bufferSize,* bool *own* = `false`, bool *ownInflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Inflater** (p. 1121) and specified buffer size.

When the user supplied a **Inflater** (p. 1121) instance the **InflaterInputStream** (p. 1128) does not take ownership of the **Inflater** (p. 1121) pointer unless the ownInflater parameter is set to true, otherwise the caller is still responsible for deleting the **Inflater** (p. 1121).

Parameters

inputStream	The InputStream instance to wrap.
inflater	The user supplied **Inflater** (p. 1121) to use for decompression.
bufferSize	The size of the input buffer.
own	Should this filter take ownership of the InputStream pointer (default is false).
ownInflater	Should the filter take ownership of the passed **Inflater** (p. 1121) object (default is false).

Exceptions

NullPointerException	if the **Inflater** (p. 1121) given is NULL.
IllegalArgumentException	if the bufferSize value is zero.

6.269.2.4 virtual decaf::util::zip::InflaterInputStream::~InflaterInputStream ( ) [virtual]

6.269.3 Member Function Documentation

6.269.3.1 virtual int decaf::util::zip::InflaterInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Until EOF this method always returns 1, thereafter it always returns 0.

Reimplemented from **decaf::io::FilterInputStream** (p. 1034).

6.269.3.2 virtual void decaf::util::zip::InflaterInputStream::close ( ) [virtual]

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Closes any resources associated with this **InflaterInputStream** (p. 1128).

Reimplemented from **decaf::io::FilterInputStream** (p. 1034).

6.269.3.3 virtual int decaf::util::zip::InflaterInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.269.3.4 virtual int decaf::util::zip::InflaterInputStream::doReadByte ( ) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.269.3.5 virtual void decaf::util::zip::InflaterInputStream::fill ( ) [protected, virtual]

Fills the input buffer with the next chunk of data.

Exceptions

IOException	if an I/O error occurs.

6.269.3.6 virtual void decaf::util::zip::InflaterInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Does nothing.

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.269.3.7 virtual bool decaf::util::zip::InflaterInputStream::markSupported ( ) const [virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Always returns false.

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.269.3.8 virtual void decaf::util::zip::InflaterInputStream::reset ( ) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Always throws an IOException when called.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

6.269.3.9 virtual long long decaf::util::zip::InflaterInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Skips the specified amount of uncompressed input data.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

6.269.4 Field Documentation

6.269.4.1 bool decaf::util::zip::InflaterInputStream::atEOF [protected]

6.269.4.2 std::vector<unsigned char> decaf::util::zip::InflaterInputStream::buff [protected]

The buffer to hold chunks of data read from the stream before inflation.

6.269.4.3 const int decaf::util::zip::InflaterInputStream::DEFAULT_BUFFER_SIZE [static, protected]

6.269.4.4 Inflater* decaf::util::zip::InflaterInputStream::inflater [protected]

The **Inflater** (p. 1121) instance to use.

6.269.4.5 int decaf::util::zip::InflaterInputStream::length [protected]

The amount of data currently stored in the input buffer.

6.269.4.6 bool decaf::util::zip::InflaterInputStream::ownInflater [protected]

The documentation for this class was generated from the following file:

6.270 decaf::io::InputStream Class Reference

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

`#include <src/main/decaf/io/InputStream.h>`

Inheritance diagram for decaf::io::InputStream:

Public Member Functions

- **InputStream** ()
- virtual ~**InputStream** ()
- virtual void **close** ()

  *Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.*
- virtual void **mark** (int readLimit)

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.

- virtual bool **markSupported** () **const**

  Determines if this input stream supports the mark and reset methods.

- virtual int **available** () **const**

  Indicates the number of bytes available.

- virtual int **read** ()

  Reads a single byte from the buffer.

- virtual int **read** (unsigned char ∗buffer, int size)

  Reads up to size bytes of data from the input stream into an array of bytes.

- virtual int **read** (unsigned char ∗buffer, int size, int offset, int length)

  Reads up to length bytes of data from the input stream into an array of bytes.

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.

- virtual std::string **toString** () **const**

  Output a String representation of this object.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual int **doReadByte** ()=0
- virtual int **doReadArray** (unsigned char ∗buffer, int size)
- virtual int **doReadArrayBounded** (unsigned char ∗buffer, int size, int offset, int length)

6.270.1 Detailed Description

A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.

Since

1.0

6.270.2 Constructor & Destructor Documentation

6.270.2.1 decaf::io::InputStream::InputStream ( )

6.270.2.2 virtual decaf::io::InputStream::~InputStream ( ) [virtual]

6.270.3 Member Function Documentation

6.270.3.1 virtual int decaf::io::InputStream::available ( ) const [inline, virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs.

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 530), **decaf::io::PushbackInputStream** (p. 1718), **decaf::util::zip::InflaterInputStream** (p. 1131), **decaf::io::BufferedInputStream** (p. 459), **decaf::io::BlockingByteArrayInputStream** (p. 415), **decaf::io::FilterInputStream** (p. 1034), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2083), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1581), and **decaf::internal::io::StandardInputStream** (p. 1961).

6.270.3.2 virtual void decaf::io::InputStream::close ( ) [virtual]

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Implements **decaf::io::Closeable** (p. 633).

Reimplemented in **decaf::util::zip::InflaterInputStream** (p. 1131), **decaf::io::BufferedInputStream** (p. 459), **decaf::io::BlockingByteArrayInputStream** (p. 416), **decaf::io::FilterInputStream** (p. 1034), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2084), and **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1581).

6.270.3.3 virtual int decaf::io::InputStream::doReadArray (unsigned char * *buffer*, int *size*) [protected, virtual]

Reimplemented in **decaf::io::FilterInputStream** (p. 1035).

6.270.3.4 virtual int decaf::io::InputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 530), **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::PushbackInputStream** (p. 1719), **decaf::io::BufferedInputStream** (p. 459), **decaf::io::FilterInputStream** (p. 1035), **decaf::io::BlockingByteArrayInputStream** (p. 416), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2084), **decaf::util::zip::CheckedInputStream** (p. 626), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1582), and **activemq::io::LoggingInputStream** (p. 1323).

6.270.3.5 virtual int decaf::io::InputStream::doReadByte ( ) [protected, pure virtual]

Implemented in **decaf::io::ByteArrayInputStream** (p. 531), **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::PushbackInputStream** (p. 1719), **decaf::io::BufferedInputStream** (p. 460), **decaf::io::FilterInputStream** (p. 1035), **decaf::io::BlockingByteArrayInputStream** (p. 416), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2084), **decaf::util::zip::CheckedInputStream** (p. 626), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1582), **activemq::io::LoggingInputStream** (p. 1323), and **decaf::internal::io::StandardInputStream** (p. 1962).

6.270.3.6 virtual void decaf::io::InputStream::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.270.3.7 virtual void decaf::io::InputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 531), **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::BufferedInputStream** (p. 460), and **decaf::io::FilterInputStream** (p. 1035).

6.270.3.8 virtual bool decaf::io::InputStream::markSupported ( ) const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 531), **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1132), **decaf::io::BufferedInputStream** (p. 460), and **decaf::io::FilterInputStream** (p. 1035).

6.270.3.9 virtual void decaf::io::InputStream::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.270.3.10 virtual void decaf::io::InputStream::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.270.3.11 virtual int decaf::io::InputStream::read ( ) [virtual]

Reads a single byte from the buffer.

The value byte is returned as an int in the range 0 to 255. If no byte is available because the end of the stream has been reached, the value -1 is returned. This method blocks until input data is available, the end of the stream is detected, or an exception is thrown.

The default implementation of this method calls the internal virtual method doReadByte which is a pure virtual method and must be overridden by all subclasses.

Returns

The next byte or -1 if the end of stream is reached.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

6.270.3.12 virtual int decaf::io::InputStream::read (unsigned char * *buffer,* int *size*) [virtual]

Reads up to size bytes of data from the input stream into an array of bytes.

An attempt is made to read as many as size bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If size is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

This method called the protected virtual method doReadArray which by default is the same as calling read(buffer, size, 0, size). Subclasses can customize the behavior of this method by overriding the doReadArray method to provide a better performing read operation.

Parameters

buffer	The target buffer to write the read in data to.
size	The size in bytes of the target buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	if buffer passed is NULL.

6.270.3.13 virtual int decaf::io::InputStream::read (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Reads up to length bytes of data from the input stream into an array of bytes.

An attempt is made to read as many as length bytes, but a smaller number may be read. The number of bytes actually read is returned as an integer.

This method blocks until input data is available, end of file is detected, or an exception is thrown.

If length is zero, then no bytes are read and 0 is returned; otherwise, there is an attempt to read at least one byte. If no byte is available because the stream is at end of file, the value -1 is returned; otherwise, at least one byte is read and stored into b.

The first byte read is stored into element b[off], the next one into b[off+1], and so on. The number of bytes read is, at most, equal to length. Let k be the number of bytes actually read; these bytes will be stored in elements b[off] through b[off+k-1], leaving elements b[offset+k] through b[offset+length-1] unaffected.

In every case, elements b[0] through b[offset] and elements b[offset+length] through b[b.length-1] are unaffected.

This method called the protected virtual method doReadArrayBounded which simply calls the method **doReadByte()** (p. 1137) repeatedly. If the first such call results in an **IOException** (p. 1198), that exception is returned. If any subsequent call to **doReadByte()** (p. 1137) results in a **IOException** (p. 1198), the exception is caught and treated as if it were end of file; the bytes read up to that point are stored into the buffer and the number of bytes read before the exception occurred is returned. The default implementation of this method blocks until the requested amount of input data has been read, end of file is detected, or an exception is thrown. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

buffer	The target buffer to write the read in data to.
size	The size in bytes of the target buffer.
offset	The position in the buffer to start inserting the read in data.
length	The maximum number of bytes that should be read into buffer.

Returns

The number of bytes read or -1 if EOF is detected

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs.
NullPointerException	if buffer passed is NULL.
IndexOutOfBounds-Exception	if length $>$ size - offset.

6.270.3.14 virtual void decaf::io::InputStream::reset ( ) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs.

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 531), **decaf::io::PushbackInputStream** (p. 1719), **decaf::util::zip::InflaterInputStream** (p. 1133), **decaf::io::BufferedInputStream** (p. 460), and **decaf::io::FilterInputStream** (p. 1036).

6.270.3.15 virtual long long decaf::io::InputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one

possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented in **decaf::io::ByteArrayInputStream** (p. 532), **decaf::io::PushbackInputStream** (p. 1720), **decaf::util::zip::InflaterInputStream** (p. 1133), **decaf::io::BufferedInputStream** (p. 461), **decaf::io::BlockingByteArrayInputStream** (p. 416), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2084), **decaf::io::FilterInputStream** (p. 1036), **decaf::util::zip::CheckedInputStream** (p. 626), and **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1582).

6.270.3.16 virtual std::string decaf::io::InputStream::toString ( ) const [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns

a string representation of the object.

6.270.3.17 virtual bool decaf::io::InputStream::tryLock ( ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.270.3.18 virtual void decaf::io::InputStream::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.270.3.19 virtual void decaf::io::InputStream::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.270.3.20 virtual void decaf::io::InputStream::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.270.3.21 virtual void decaf::io::InputStream::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStream.h**

6.271 decaf::io::InputStreamReader Class Reference

An **InputStreamReader** (p. 1142) is a bridge from byte streams to character streams.

`#include <src/main/decaf/io/InputStreamReader.h>`

Inheritance diagram for decaf::io::InputStreamReader:

Public Member Functions

- **InputStreamReader** (**InputStream** ∗stream, bool own=false)

  *Create a new **InputStreamReader** (p. 1142) that wraps the given **InputStream** (p. 1134).*
- virtual ∼**InputStreamReader** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual bool **ready** () **const**

  Tells whether this stream is ready to be read.

Protected Member Functions

- virtual int **doReadArrayBounded** (char ∗buffer, int size, int offset, int length)

  Override this method to customize the functionality of the method read(unsigned char∗ buffer, int size, int offset, int length).
- virtual void **checkClosed** () **const**

6.271.1 Detailed Description

An **InputStreamReader** (p. 1142) is a bridge from byte streams to character streams.

For top efficiency, consider wrapping an **InputStreamReader** (p. 1142) within a BufferedReader. For example:

BufferedReader∗ in = new BufferedReader(new **InputStreamReader** (p. 1142)(System.in, false), true);

OutputStreamWriter (p. 1606)

Since

1.0

6.271.2 Constructor & Destructor Documentation

6.271.2.1 decaf::io::InputStreamReader::InputStreamReader (InputStream * *stream,* bool *own* = false)

Create a new **InputStreamReader** (p. 1142) that wraps the given **InputStream** (p. 1134).

Parameters

stream	The **InputStream** (p. 1134) to read from. (cannot be null).
own	Does this object own the passed **InputStream** (p. 1134) (defaults to false).

Exceptions

NullPointerException	if the passed **InputStream** (p. 1134) is NULL.

6.271.2.2 virtual decaf::io::InputStreamReader::~InputStreamReader ( ) [virtual]

6.271.3 Member Function Documentation

6.271.3.1 virtual void decaf::io::InputStreamReader::checkClosed ( ) const [protected, virtual]

6.271.3.2 virtual void decaf::io::InputStreamReader::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

6.271.3.3 virtual int decaf::io::InputStreamReader::doReadArrayBounded (char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Override this method to customize the functionality of the method read(unsigned char* buffer, int size, int offset, int length).

All subclasses must override this method to provide the basic **Reader** (p. 1734) functionality.

Implements **decaf::io::Reader** (p. 1735).

6.271.3.4 virtual bool decaf::io::InputStreamReader::ready ( ) const [virtual]

Tells whether this stream is ready to be read.

Returns

True if the next **read()** (p. 1737) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::Reader** (p. 1738).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InputStreamReader.h**

6.272 decaf::internal::nio::IntArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/IntArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::IntArrayBuffer:

Public Member Functions

- **IntArrayBuffer** (int size, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1144) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **IntArrayBuffer** (int ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1144) object that wraps the given array.*
- **IntArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **IntArrayBuffer** (**const IntArrayBuffer** &other)

  *Create a **IntArrayBuffer** (p. 1144) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual ∼**IntArrayBuffer** ()
- virtual int ∗ **array** ()

  Returns the int array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  *the array that backs this **Buffer** (p. 451).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The offset into the backing array where index zero starts.

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual **IntBuffer** ∗ **asReadOnlyBuffer** () **const**

Creates a new, read-only int buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

- virtual **IntBuffer** & **compact** ()

Compacts this buffer.
*The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

*a reference to this **IntBuffer** (p. 1152)*

Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **IntBuffer** ∗ **duplicate** ()

Creates a new int buffer that shares this buffer's content.
The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new int **Buffer** (p. 451) which the caller owns.*

- virtual int **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return.*

- virtual int **get** (int index) **const**

Absolute get method.
Reads the value at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the int is to be read.*

Returns

the int that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or index is negative.*

- virtual bool **hasArray** () **const**

Tells whether or not this buffer is backed by an accessible int array.
If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () **const**

  Tells whether or not this buffer is read-only.

  Returns

  true if, and only if, this buffer is read-only.

- virtual **IntBuffer** & **put** (int value)

  Writes the given integer into this buffer at the current position, and then increments the position.

  Parameters

value	*The integer value to be written.*

  Returns

  a reference to this buffer.

  Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **IntBuffer** & **put** (int index, int value)

  Writes the given ints into this buffer at the given index.

  Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The ints to write.*

  Returns

  a reference to this buffer.

  Exceptions

IndexOutOfBoundsException	*- If index greater than the buffer's limit minus the size of the type being written, or the index is negative.*
ReadOnlyBufferException (p. 1739)	*- If this buffer is read-only.*

- virtual **IntBuffer** ∗ **slice** () **const**

  *Creates a new **IntBuffer** (p. 1152) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the newly create **IntBuffer** (p. 1152) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **IntArrayBuffer** (p. 1144) as Read-Only.*

6.272.1 Constructor & Destructor Documentation

6.272.1.1 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1144) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.272.1.2 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (int * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1144) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.272.1.3 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **IntArrayBuffer** (p. 1144) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.272.1.4 decaf::internal::nio::IntArrayBuffer::IntArrayBuffer (const IntArrayBuffer & *other*)

Create a **IntArrayBuffer** (p. 1144) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **IntArrayBuffer** (p. 1144) this one is to mirror.

6.272.1.5 virtual decaf::internal::nio::IntArrayBuffer::~IntArrayBuffer ( ) [virtual]

6.272.2 Member Function Documentation

6.272.2.1 virtual int* decaf::internal::nio::IntArrayBuffer::array ( ) [virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1155).

6.272.2.2 virtual int decaf::internal::nio::IntArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::IntBuffer** (p. 1155).

6.272.2.3 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implements **decaf::nio::IntBuffer** (p. 1155).

6.272.2.4 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **IntBuffer** (p. 1152)

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1156).

6.272.2.5 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::duplicate ( ) [virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1156).

6.272.2.6 virtual int decaf::internal::nio::IntArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implements **decaf::nio::IntBuffer** (p. 1156).

6.272.2.7 virtual int decaf::internal::nio::IntArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the int is to be read.

Returns

the int that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::IntBuffer** (p. 1157).

6.272.2.8 virtual bool decaf::internal::nio::IntArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::IntBuffer** (p. 1158).

6.272.2.9 virtual bool decaf::internal::nio::IntArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.272.2.10 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *value*) [virtual]

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters

value	The integer value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1159).

6.272.2.11 virtual IntBuffer& decaf::internal::nio::IntArrayBuffer::put (int *index,* int *value*) [virtual]

Writes the given ints into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The ints to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	- If index greater than the buffer's limit minus the size of the type being written, or the index is negative.
ReadOnlyBufferException *(p. 1739)*	- If this buffer is read-only.

Implements **decaf::nio::IntBuffer** (p. 1160).

6.272.2.12 virtual void decaf::internal::nio::IntArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **IntArrayBuffer** (p. 1144) as Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.272.2.13 virtual IntBuffer* decaf::internal::nio::IntArrayBuffer::slice ( ) const [virtual]

Creates a new **IntBuffer** (p. 1152) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer,

and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **IntBuffer** (p. 1152) which the caller owns.

Implements **decaf::nio::IntBuffer** (p. 1160).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**IntArrayBuffer.h**

6.273 decaf::nio::IntBuffer Class Reference

This class defines four categories of operations upon int buffers:

`#include <src/main/decaf/nio/IntBuffer.h>`

Inheritance diagram for decaf::nio::IntBuffer:

Public Member Functions

- virtual ~**IntBuffer** ()
- virtual std::string **toString** () **const**
- virtual int * **array** ()=0

  Returns the int array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **IntBuffer** * **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only int buffer that shares this buffer's content.
- virtual **IntBuffer** & **compact** ()=0

  Compacts this buffer.
- virtual **IntBuffer** * **duplicate** ()=0

  Creates a new int buffer that shares this buffer's content.
- virtual int **get** ()=0

  Relative get method.
- virtual int **get** (int index) **const** =0

  Absolute get method.
- **IntBuffer** & **get** (std::vector< int > buffer)

  Relative bulk get method.
- **IntBuffer** & **get** (int *buffer, int size, int offset, int length)

  Relative bulk get method.
- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible int array.
- **IntBuffer** & **put** (**IntBuffer** &src)

  This method transfers the ints remaining in the given source buffer into this buffer.
- **IntBuffer** & **put** (**const** int *buffer, int size, int offset, int length)

  This method transfers ints into this buffer from the given source array.
- **IntBuffer** & **put** (std::vector< int > &buffer)

  This method transfers the entire content of the given source ints array into this buffer.
- virtual **IntBuffer** & **put** (int value)=0

Writes the given integer into this buffer at the current position, and then increments the position.

- virtual **IntBuffer** & **put** (int index, int value)=0

  Writes the given ints into this buffer at the given index.

- virtual **IntBuffer** * **slice** () **const** =0

  *Creates a new **IntBuffer** (p. 1152) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (**const IntBuffer** &value) **const**

- virtual bool **equals** (**const IntBuffer** &value) **const**

- virtual bool **operator==** (**const IntBuffer** &value) **const**

- virtual bool **operator<** (**const IntBuffer** &value) **const**

Static Public Member Functions

- static **IntBuffer** * **allocate** (int **capacity**)

  Allocates a new Double buffer.

- static **IntBuffer** * **wrap** (int ***array**, int size, int offset, int length)

  *Wraps the passed buffer with a new **IntBuffer** (p. 1152).*

- static **IntBuffer** * **wrap** (std::vector< int > &buffer)

  *Wraps the passed STL int Vector in a **IntBuffer** (p. 1152).*

Protected Member Functions

- **IntBuffer** (int **capacity**)

  *Creates a **IntBuffer** (p. 1152) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.273.1 Detailed Description

This class defines four categories of operations upon int buffers:

o Absolute and relative get and put methods that read and write single ints; o Relative bulk get methods that transfer contiguous sequences of ints from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of ints from a int array or some other int buffer into this buffer o Methods for compacting, duplicating, and slicing a int buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing int array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.273.2 Constructor & Destructor Documentation

6.273.2.1 decaf::nio::IntBuffer::IntBuffer (int *capacity*) [protected]

Creates a **IntBuffer** (p. 1152) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size and limit of the **Buffer** (p. 451) in integers.

Exceptions

IllegalArguementException	if capacity is negative.

6.273.2.2 virtual decaf::nio::IntBuffer::~IntBuffer ( ) [inline, virtual]

6.273.3 Member Function Documentation

6.273.3.1 static IntBuffer* decaf::nio::IntBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Double buffer in integers.

Returns

the **IntBuffer** (p. 1152) that was allocated, caller owns.

6.273.3.2 virtual int* decaf::nio::IntBuffer::array ( ) [pure virtual]

Returns the int array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1148).

6.273.3.3 virtual int decaf::nio::IntBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1149).

6.273.3.4 virtual IntBuffer* decaf::nio::IntBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only int buffer which the caller then owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1149).

6.273.3.5 virtual IntBuffer& decaf::nio::IntBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **IntBuffer** (p. 1152)

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1149).

6.273.3.6 virtual int decaf::nio::IntBuffer::compareTo (const IntBuffer & *value*) const [virtual]

6.273.3.7 virtual IntBuffer* decaf::nio::IntBuffer::duplicate ( ) [pure virtual]

Creates a new int buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new int **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1150).

6.273.3.8 virtual bool decaf::nio::IntBuffer::equals (const IntBuffer & *value*) const [virtual]

6.273.3.9 virtual int decaf::nio::IntBuffer::get ( ) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the int at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1150).

6.273.3.10 virtual int decaf::nio::IntBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the int is to be read.

Returns

the int that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1150).

6.273.3.11 IntBuffer& decaf::nio::IntBuffer::get (std::vector< int > *buffer*)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length ints remaining in this buffer.

6.273.3.12 IntBuffer& decaf::nio::IntBuffer::get (int * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method.

This method transfers ints from this buffer into the given destination array. If there are fewer ints remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length ints from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the buffer that was passed in.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length ints remaining in this buffer.
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.273.3.13 virtual bool decaf::nio::IntBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible int array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1151).

6.273.3.14 virtual bool decaf::nio::IntBuffer::operator< (const IntBuffer & *value*) const [virtual]

6.273.3.15 virtual bool decaf::nio::IntBuffer::operator== (const IntBuffer & *value*) const [virtual]

6.273.3.16 IntBuffer& decaf::nio::IntBuffer::put (IntBuffer & *src*)

This method transfers the ints remaining in the given source buffer into this buffer.

If there are more ints remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no ints are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() ints from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take ints from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining ints in the source buffer.
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.273.3.17 IntBuffer& decaf::nio::IntBuffer::put (const int * *buffer,* int *size,* int *offset,* int *length*)

This method transfers ints into this buffer from the given source array.

If there are more ints to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no ints are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which integers are to be read.
size	The size of the buffer passed.
offset	The offset within the array of the first char to be read.
length	The number of integers to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.273.3.18 IntBuffer& decaf::nio::IntBuffer::put (std::vector< int > & *buffer*)

This method transfers the entire content of the given source ints array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **IntBuffer** (p. 1152).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.273.3.19 virtual IntBuffer& decaf::nio::IntBuffer::put (int *value*) [pure virtual]

Writes the given integer into this buffer at the current position, and then increments the position.

Parameters

value	The integer value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1151).

6.273.3.20 virtual IntBuffer& decaf::nio::IntBuffer::put (int *index,* int *value*) [pure virtual]

Writes the given ints into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The ints to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	- If index greater than the buffer's limit minus the size of the type being written, or the index is negative.
ReadOnlyBufferException *(p. 1739)*	- If this buffer is read-only.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1151).

6.273.3.21 virtual IntBuffer* decaf::nio::IntBuffer::slice ( ) const [pure virtual]

Creates a new **IntBuffer** (p. 1152) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **IntBuffer** (p. 1152) which the caller owns.

Implemented in **decaf::internal::nio::IntArrayBuffer** (p. 1152).

6.273.3.22 virtual std::string decaf::nio::IntBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.273.3.23 static IntBuffer* decaf::nio::IntBuffer::wrap (int * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **IntBuffer** (p. 1152).

The new buffer will be backed by the given int array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the passed in array.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **IntBuffer** (p. 1152) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.273.3.24 static IntBuffer* decaf::nio::IntBuffer::wrap (std::vector< int > & *buffer*) [static]

Wraps the passed STL int Vector in a **IntBuffer** (p. 1152).

The new buffer will be backed by the given int array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **IntBuffer** (p. 1152) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**IntBuffer.h**

6.274 decaf::lang::Integer Class Reference

`#include <src/main/decaf/lang/Integer.h>`

Inheritance diagram for decaf::lang::Integer:

Public Member Functions

- **Integer** (int value)
- **Integer** (**const** std::string &value)

  *Constructs a new **Integer** (p. 1161) and attempts to convert the given string to an int value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted int.*
- virtual ~**Integer** ()
- virtual int **compareTo** (**const Integer** &i) **const**

  *Compares this **Integer** (p. 1161) instance with another.*
- bool **equals** (**const Integer** &i) **const**
- virtual bool **operator==** (**const Integer** &i) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Integer** &i) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** int &i) **const**

*Compares this **Integer** (p. 1161) instance with another.*

- bool **equals** (**const** int &i) **const**
- virtual bool **operator==** (**const** int &i) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** int &i) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.

Static Public Member Functions

- static **Integer decode** (**const** std::string &value)

  *Decodes a **String** (p. 2031) into a **Integer** (p. 1161).*
- static int **reverseBytes** (int value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.
- static int **reverse** (int value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.
- static int **parseInt** (**const** std::string &s, int radix)

  Parses the string argument as a signed int in the radix specified by the second argument.
- static int **parseInt** (**const** std::string &s)

  Parses the string argument as a signed decimal int.
- static **Integer valueOf** (int value)

  *Returns a **Integer** (p. 1161) instance representing the specified int value.*
- static **Integer valueOf** (**const** std::string &value)

  *Returns a **Integer** (p. 1161) object holding the value given by the specified std::string.*
- static **Integer valueOf** (**const** std::string &value, int radix)

  *Returns a **Integer** (p. 1161) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*
- static int **bitCount** (int value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static std::string **toString** (int value)

  *Converts the int to a **String** (p. 2031) representation.*
- static std::string **toString** (int value, int radix)

  Returns a string representation of the first argument in the radix specified by the second argument.
- static std::string **toHexString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 8.

- static std::string **toBinaryString** (int value)

  Returns a string representation of the integer argument as an unsigned integer in base 2.
- static int **highestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.
- static int **lowestOneBit** (int value)

  Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (int value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.
- static int **numberOfTrailingZeros** (int value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.
- static int **rotateLeft** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.
- static int **rotateRight** (int value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.
- static int **signum** (int value)

  Returns the signum function of the specified int value.

Static Public Attributes

- static **const** int **SIZE** = 32

  The size in bits of the primitive int type.
- static **const** int **MAX_VALUE** = (int)0x7FFFFFFF

  The maximum value that the primitive type can hold.
- static **const** int **MIN_VALUE** = (int)0x80000000

  The minimum value that the primitive type can hold.

6.274.1 Constructor & Destructor Documentation

6.274.1.1 decaf::lang::Integer::Integer (int *value*)

Parameters

value	The primitive value to wrap in an **Integer** (p. 1161) instance.

6.274.1.2 decaf::lang::Integer::Integer (const std::string & *value*)

Constructs a new **Integer** (p. 1161) and attempts to convert the given string to an int value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted int.

Parameters

value	The string to convert to a primitive type to wrap.

Exceptions

NumberFormatException	if the string is not a a valid integer.

6.274.1.3 virtual decaf::lang::Integer::~Integer ( ) [inline, virtual]

6.274.2 Member Function Documentation

6.274.2.1 static int decaf::lang::Integer::bitCount (int *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value	- the int to count

Returns

the number of one-bits in the two's complement binary representation of the specified int value.

6.274.2.2 virtual unsigned char decaf::lang::Integer::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.274.2.3 virtual int decaf::lang::Integer::compareTo (const Integer & *i*) const [virtual]

Compares this **Integer** (p. 1161) instance with another.

Parameters

i	- the **Integer** (p. 1161) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Integer** > (p. 687).

6.274.2.4 virtual int decaf::lang::Integer::compareTo (const int & *i*) const [virtual]

Compares this **Integer** (p. 1161) instance with another.

Parameters

i	- the **Integer** (p. 1161) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **int** > (p. 687).

6.274.2.5 static Integer decaf::lang::Integer::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2031) into a **Integer** (p. 1161).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2031) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value	- The string to decode

Returns

a **Integer** (p. 1161) object containing the decoded value

Exceptions

NumberFomatException	if the string is not formatted correctly.

6.274.2.6 virtual double decaf::lang::Integer::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.274.2.7 bool decaf::lang::Integer::equals (const Integer & *i*) const [inline, virtual]

Parameters

i	- the **Integer** (p. 1161) object to compare against.

Returns

true if the two **Integer** (p. 1161) Objects have the same value.

Implements **decaf::lang::Comparable**< **Integer** > (p. 688).

6.274.2.8 bool decaf::lang::Integer::equals (const int & *i*) const [inline, virtual]

Parameters

i	- the **Integer** (p. 1161) object to compare against.

Returns

true if the two **Integer** (p. 1161) Objects have the same value.

Implements **decaf::lang::Comparable**< **int** > (p. 688).

6.274.2.9 virtual float decaf::lang::Integer::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.274.2.10 static int decaf::lang::Integer::highestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value	- the int to be inspected

Returns

an int value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.274.2.11 virtual int decaf::lang::Integer::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.274.2.12 virtual long long decaf::lang::Integer::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.274.2.13 static int decaf::lang::Integer::lowestOneBit (int *value*) [static]

Returns an int value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value	- the int to be inspected

Returns

an int value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.274.2.14 static int decaf::lang::Integer::numberOfLeadingZeros (int *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

```
* floor( log2(x)) = 31 - numberOfLeadingZeros(x)
* ceil( log2(x)) = 32 - numberOfLeadingZeros(x - 1)
```

Parameters

value	- the int to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.274.2.15 static int decaf::lang::Integer::numberOfTrailingZeros (int *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value.

Returns 32 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value	- the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified int value, or 32 if the value is equal to zero.

6.274.2.16 virtual bool decaf::lang::Integer::operator< (const Integer & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Integer >** (p. 688).

6.274.2.17 virtual bool decaf::lang::Integer::operator< (const int & *i*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

i	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< int >** (p. 688).

6.274.2.18 virtual bool decaf::lang::Integer::operator== (const Integer & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

i	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Integer >** (p. 688).

6.274.2.19 virtual bool decaf::lang::Integer::operator== (const int & *i*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

i	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **int** > (p. 688).

6.274.2.20 static int decaf::lang::Integer::parseInt (const std::string & *s*, int *radix*) [static]

Parses the string argument as a signed int in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 595) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs:

- The first argument is null or is a string of length zero.
- The radix is either smaller than **Character.MIN_RADIX** (p. 599) or larger than **Character.MAX_RADIX** (p. 599).
- Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1.
- The value represented by the string is not a value of type int.

Parameters

s	- the **String** (p. 2031) containing the int representation to be parsed
radix	- the radix to be used while parsing s

Returns

the int represented by the string argument in the specified radix.

Exceptions

NumberFormatException	- If **String** (p. 2031) does not contain a parsable int.

6.274.2.21 static int decaf::lang::Integer::parseInt (const std::string & *s*) [static]

Parses the string argument as a signed decimal int.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting int value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseInteger(const std::string, int) method.

Parameters

s	- **String** (p. 2031) to convert to a int

Returns

the converted int value

Exceptions

NumberFormatException	if the string is not a int.

6.274.2.22 static int decaf::lang::Integer::reverse (int *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified int value.

Parameters

value	- the value whose bits are to be reversed

Returns

the reversed bits int.

6.274.2.23 static int decaf::lang::Integer::reverseBytes (int *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified int value.

Parameters

value	- the int whose bytes we are to reverse

Returns

the reversed int.

6.274.2.24 static int decaf::lang::Integer::rotateLeft (int *value,* int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value	- the int to be inspected
distance	- the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value left by the specified number of bits.

6.274.2.25 static int decaf::lang::Integer::rotateRight (int *value,* int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation

distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters

value	- the int to be inspected
distance	- the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified int value right by the specified number of bits.

6.274.2.26 virtual short decaf::lang::Integer::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.274.2.27 static int decaf::lang::Integer::signum (int *value*) [static]

Returns the signum function of the specified int value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value	- the int to be inspected

Returns

the signum function of the specified int value.

6.274.2.28 static std::string decaf::lang::Integer::toBinaryString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 2.

The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character.

The characters '0' and '1' are used as binary digits.

Parameters

value	- the int to be translated to a binary string

Returns

the unsigned int value as a binary string

6.274.2.29 static std::string decaf::lang::Integer::toHexString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

```
0123456789abcdef
```

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters

value	- the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.274.2.30 static std::string decaf::lang::Integer::toOctalString (int *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 8.

The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

```
01234567
```

Parameters

value	- the int to be translated to an Octal string

Returns

the unsigned int value as a Octal string

6.274.2.31 std::string decaf::lang::Integer::toString ( ) const

Returns

this **Integer** (p. 1161) Object as a **String** (p. 2031) Representation

Referenced by decaf::util::ArrayList< E >::toString().

6.274.2.32 static std::string decaf::lang::Integer::toString (int *value*) [static]

Converts the int to a **String** (p. 2031) representation.

Parameters

value	The int to convert to a `std::string` instance.

Returns

string representation

6.274.2.33 static std::string decaf::lang::Integer::toString (int *value,* int *radix*) [static]

Returns a string representation of the first argument in the radix specified by the second argument.

If the radix is smaller than **Character.MIN_RADIX** (p. 599) or larger than **Character.MAX_RADIX** (p. 599), then the radix 10 is used instead.

If the first argument is negative, the first element of the result is the ASCII minus character '-'. If the first argument is not negative, no sign character appears in the result.

The remaining characters of the result represent the magnitude of the first argument. If the magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the magnitude will not be the zero character. The following ASCII characters are used as digits:

0123456789abcdefghijklmnopqrstuvwxyz

Parameters

value	- the int to convert to a string
radix	- the radix to format the string in

Returns

an int formatted to the string value of the radix given.

6.274.2.34 static Integer decaf::lang::Integer::valueOf (int *value*) [inline, static]

Returns a **Integer** (p. 1161) instance representing the specified int value.

Parameters

value	- the int to wrap

Returns

the new **Integer** (p. 1161) object wrapping value.

6.274.2.35 static Integer decaf::lang::Integer::valueOf (const std::string & *value*) [static]

Returns a **Integer** (p. 1161) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal int, exactly as if the argument were given to the parseInt(std::string) method. The result is a **Integer** (p. 1161) object that represents the int value specified by the string.

Parameters

value	- std::string to parse as base 10

Returns

new **Integer** (p. 1161) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a decimal int.

6.274.2.36 static Integer decaf::lang::Integer::valueOf (const std::string & *value,* int *radix*) [static]

Returns a **Integer** (p. 1161) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed int in the radix specified by the second argument, exactly as if the argument were given to the parseInt(std::string, int) method. The result is a **Integer** (p. 1161) object that represents the int value specified by the string.

Parameters

value	- std::string to parse as base (radix)
radix	- base of the string to parse.

Returns

new **Integer** (p. 1161) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a valid int.

6.274.3 Field Documentation

6.274.3.1 const int decaf::lang::Integer::MAX_VALUE = (int)0x7FFFFFFF [static]

The maximum value that the primitive type can hold.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo().

6.274.3.2 const int decaf::lang::Integer::MIN_VALUE = (int)0x80000000 [static]

The minimum value that the primitive type can hold.

6.274.3.3 const int decaf::lang::Integer::SIZE = 32 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Integer.h**

6.275 activemq::commands::IntegerResponse Class Reference

`#include <src/main/activemq/commands/IntegerResponse.h>`

Inheritance diagram for activemq::commands::IntegerResponse:

Public Member Functions

- **IntegerResponse** ()
- virtual ~**IntegerResponse** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **IntegerResponse** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual int **getResult** () **const**
- virtual void **setResult** (int **result**)

Static Public Attributes

- static **const** unsigned char **ID_INTEGERRESPONSE** = 34

Protected Attributes

- int **result**

6.275.1 Constructor & Destructor Documentation

6.275.1.1 activemq::commands::IntegerResponse::IntegerResponse ( )

6.275.1.2 virtual activemq::commands::IntegerResponse::~IntegerResponse ( ) [virtual]

6.275.2 Member Function Documentation

6.275.2.1 virtual IntegerResponse* activemq::commands::IntegerResponse::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 1782).

6.275.2.2 virtual void activemq::commands::IntegerResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 1782).

6.275.2.3 virtual bool activemq::commands::IntegerResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.275.2.4 virtual unsigned char activemq::commands::IntegerResponse::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 1783).

6.275.2.5 virtual int activemq::commands::IntegerResponse::getResult ( ) const [virtual]

6.275.2.6 virtual void activemq::commands::IntegerResponse::setResult (int *result*) [virtual]

6.275.2.7 virtual std::string activemq::commands::IntegerResponse::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.275.3 Field Documentation

6.275.3.1 const unsigned char activemq::commands::IntegerResponse::ID_INTEGERRESPONSE = 34 [static]

6.275.3.2 int activemq::commands::IntegerResponse::result [protected]

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.276.1 Detailed Description

Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p. 1177).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.276.2 Constructor & Destructor Documentation

6.276.2.1 activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::IntegerResponseMarshaller ( ) [inline]

6.276.2.2 virtual activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::~IntegerResponseMarshaller ( ) [inline, virtual]

6.276.3 Member Function Documentation

6.276.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1789).

6.276.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.276.3.3 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.276.3.4 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.276.3.5 virtual int activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.276.3.6 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.276.3.7 virtual void activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1792).

6.278 activemq::transport::mock::InternalCommandListener Class Reference

Listens for Commands sent from the **MockTransport** (p. 1509).

`#include <src/main/activemq/transport/mock/InternalCommandListener.h>`

Inheritance diagram for activemq::transport::mock::InternalCommandListener:

Public Member Functions

- **InternalCommandListener** ()
- virtual ~**InternalCommandListener** ()
- void **setTransport** (**MockTransport** *transport)
- void **setResponseBuilder** (**const Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual void **onCommand** (**const Pointer**< **Command** > &command)

  Event handler for the receipt of a command.
- void **run** ()

  Default implementation of the run method - does nothing.

6.278.1 Detailed Description

Listens for Commands sent from the **MockTransport** (p. 1509).

This class processes all outbound commands and sends responses that are constructed by calling the Protocol provided **ResponseBuilder** (p. 1784) and getting a set of Commands to send back into the **MockTransport** (p. 1509) as incoming Commands and Responses.

6.278.2 Constructor & Destructor Documentation

6.278.2.1 activemq::transport::mock::InternalCommandListener::InternalCommandListener ( )

6.278.2.2 virtual activemq::transport::mock::InternalCommandListener::~InternalCommandListener ( ) [virtual]

6.278.3 Member Function Documentation

6.278.3.1 virtual void activemq::transport::mock::InternalCommandListener::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2161) deletes the command upon receipt.

Parameters

command	The received command object.

Implements **activemq::transport::TransportListener** (p. 2177).

6.278.3.2 void activemq::transport::mock::InternalCommandListener::run ( ) [virtual]

Default implementation of the run method - does nothing.

Reimplemented from **decaf::lang::Thread** (p. 2100).

6.278.3.3 void activemq::transport::mock::InternalCommandListener::setResponseBuilder (const Pointer< ResponseBuilder > & *responseBuilder*) [inline]

6.278.3.4 void activemq::transport::mock::InternalCommandListener::setTransport (MockTransport * *transport*) [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**InternalCommandListener.h**

6.279 decaf::lang::exceptions::InterruptedException Class Reference

`#include <src/main/decaf/lang/exceptions/InterruptedException.h>`

Inheritance diagram for decaf::lang::exceptions::InterruptedException:

Public Member Functions

- **InterruptedException** () throw ()

  Default Constructor.
- **InterruptedException** (**const Exception** &ex) throw ()

  *Conversion Constructor from some other **Exception** (p. 990).*
- **InterruptedException** (**const InterruptedException** &ex) throw ()

  Copy Constructor.
- **InterruptedException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **InterruptedException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **InterruptedException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**InterruptedException** () throw ()

6.279.1 Constructor & Destructor Documentation

6.279.1.1 decaf::lang::exceptions::InterruptedException::InterruptedException ( ) throw () [inline]

Default Constructor.

6.279.1.2 decaf::lang::exceptions::InterruptedException::InterruptedException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.279.1.3 decaf::lang::exceptions::InterruptedException::InterruptedException (const InterruptedException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.279.1.4 decaf::lang::exceptions::InterruptedException::InterruptedException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.279.1.5 decaf::lang::exceptions::InterruptedException::InterruptedException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.279.1.6 decaf::lang::exceptions::InterruptedException::InterruptedException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.279.1.7 virtual decaf::lang::exceptions::InterruptedException::~InterruptedException ( ) throw () [inline, virtual]

6.279.2 Member Function Documentation

6.279.2.1 virtual InterruptedException* decaf::lang::exceptions::InterruptedException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InterruptedException.h**

6.280 decaf::io::InterruptedIOException Class Reference

  Copy Constructor.
- **InterruptedIOException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **InterruptedIOException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **InterruptedIOException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor.
- virtual **InterruptedIOException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**InterruptedIOException** () throw ()

6.280.1 Constructor & Destructor Documentation

6.280.1.1 decaf::io::InterruptedIOException::InterruptedIOException ( ) throw () [inline]

Default Constructor.

6.280.1.2 decaf::io::InterruptedIOException::InterruptedIOException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.280.1.3 decaf::io::InterruptedIOException::InterruptedIOException (const InterruptedIOException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.280.1.4 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.280.1.5 decaf::io::InterruptedIOException::InterruptedIOException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.280.1.6 decaf::io::InterruptedIOException::InterruptedIOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.280.1.7 virtual decaf::io::InterruptedIOException::~InterruptedIOException ( ) throw () [inline, virtual]

6.280.2 Member Function Documentation

6.280.2.1 virtual InterruptedIOException* decaf::io::InterruptedIOException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1200).

Reimplemented in **decaf::net::SocketTimeoutException** (p. 1934).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**InterruptedIOException.h**

6.281 cms::InvalidClientIdException Class Reference

This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

- **InvalidDestinationException** (**const** std::string &message, **const** std::exception ∗cause, **const** std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ∼**InvalidDestinationException** () throw ()

6.282.1 Detailed Description

This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Since

1.3

6.282.2 Constructor & Destructor Documentation

6.282.2.1 cms::InvalidDestinationException::InvalidDestinationException ( )

6.282.2.2 cms::InvalidDestinationException::InvalidDestinationException (const InvalidDestinationException & *ex*)

6.282.2.3 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message*)

6.282.2.4 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message,* const std::exception ∗ *cause*)

6.282.2.5 cms::InvalidDestinationException::InvalidDestinationException (const std::string & *message,* const std::exception ∗ *cause,* const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.282.2.6 virtual cms::InvalidDestinationException::∼InvalidDestinationException ( ) throw () [virtual]

The documentation for this class was generated from the following file:

- src/main/cms/**InvalidDestinationException.h**

6.283 decaf::security::InvalidKeyException Class Reference

`#include <src/main/decaf/security/InvalidKeyException.h>`

Inheritance diagram for decaf::security::InvalidKeyException:

Public Member Functions

- **InvalidKeyException** () throw ()

  Default Constructor.
- **InvalidKeyException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **InvalidKeyException** (**const InvalidKeyException** &ex) throw ()

  Copy Constructor.
- **InvalidKeyException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **InvalidKeyException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **InvalidKeyException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occured.
- virtual **InvalidKeyException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**InvalidKeyException** () throw ()

6.283.1 Constructor & Destructor Documentation

6.283.1.1 decaf::security::InvalidKeyException::InvalidKeyException ( ) throw () [inline]

Default Constructor.

6.283.1.2 decaf::security::InvalidKeyException::InvalidKeyException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.283.1.3 decaf::security::InvalidKeyException::InvalidKeyException (const InvalidKeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.283.1.4 decaf::security::InvalidKeyException::InvalidKeyException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.283.1.5 decaf::security::InvalidKeyException::InvalidKeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.283.1.6 decaf::security::InvalidKeyException::InvalidKeyException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.283.1.7 virtual decaf::security::InvalidKeyException::~InvalidKeyException ( ) throw () [inline, virtual]

6.283.2 Member Function Documentation

6.283.2.1 virtual InvalidKeyException* decaf::security::InvalidKeyException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1242).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**InvalidKeyException.h**

6.284 decaf::nio::InvalidMarkException Class Reference

`#include <src/main/decaf/nio/InvalidMarkException.h>`

Inheritance diagram for decaf::nio::InvalidMarkException:

Public Member Functions

- **InvalidMarkException** () throw ()

  Default Constructor.
- **InvalidMarkException** (**const lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **InvalidMarkException** (**const InvalidMarkException** &ex) throw ()

  Copy Constructor.
- **InvalidMarkException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **InvalidMarkException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **InvalidMarkException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **InvalidMarkException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**InvalidMarkException** () throw ()

6.284.1 Constructor & Destructor Documentation

6.284.1.1 decaf::nio::InvalidMarkException::InvalidMarkException ( ) throw () [inline]

Default Constructor.

6.284.1.2 decaf::nio::InvalidMarkException::InvalidMarkException (const lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	The Exception whose state data is to be copied into this Exception.

6.284.1.3 decaf::nio::InvalidMarkException::InvalidMarkException (const InvalidMarkException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The Exception whose state data is to be copied into this Exception.

6.284.1.4 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.284.1.5 decaf::nio::InvalidMarkException::InvalidMarkException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.284.1.6 decaf::nio::InvalidMarkException::InvalidMarkException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.284.1.7 virtual decaf::nio::InvalidMarkException::~InvalidMarkException ( ) throw () [inline, virtual]

6.284.2 Member Function Documentation

6.284.2.1 virtual InvalidMarkException* decaf::nio::InvalidMarkException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new Exception instance that is a copy of this Exception.

Reimplemented from **decaf::lang::exceptions::IllegalStateException** (p. 1101).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**InvalidMarkException.h**

6.285 cms::InvalidSelectorException Class Reference

- virtual ∼**InvalidStateException** () throw ()

6.286.1 Constructor & Destructor Documentation

6.286.1.1 decaf::lang::exceptions::InvalidStateException::InvalidStateException ( ) throw () [inline]

Default Constructor.

6.286.1.2 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.286.1.3 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const InvalidStateException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.286.1.4 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.286.1.5 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.286.1.6 decaf::lang::exceptions::InvalidStateException::InvalidStateException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.286.1.7 virtual decaf::lang::exceptions::InvalidStateException::~InvalidStateException ( ) throw () [inline, virtual]

6.286.2 Member Function Documentation

6.286.2.1 virtual InvalidStateException* decaf::lang::exceptions::InvalidStateException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**InvalidStateException.h**

6.287 decaf::io::IOException Class Reference

`#include <src/main/decaf/io/IOException.h>`

Inheritance diagram for decaf::io::IOException:

  Clones this exception.
- virtual ∼**IOException** () throw ()

6.287.1 Constructor & Destructor Documentation

6.287.1.1 decaf::io::IOException::IOException ( ) throw () [inline]

Default Constructor.

6.287.1.2 decaf::io::IOException::IOException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.287.1.3 decaf::io::IOException::IOException (const IOException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.287.1.4 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.287.1.5 decaf::io::IOException::IOException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.287.1.6 decaf::io::IOException::IOException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.287.1.7 virtual decaf::io::IOException::~IOException ( ) throw () [inline, virtual]

6.287.2 Member Function Documentation

6.287.2.1 virtual IOException* decaf::io::IOException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 992).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 1574), **decaf::net::BindException** (p. 413), **decaf::net::ConnectException** (p. 724), **decaf::io::UTFDataFormatException** (p. 2230), **decaf::io::UnsupportedEncodingException** (p. 2187), **decaf::net::HttpRetryException** (p. 1092), **decaf::net::MalformedURLException** (p. 1371), **decaf::net::NoRouteToHostException** (p. 1534), **decaf::net::PortUnreachableException** (p. 1634), **decaf::net::ProtocolException** (p. 1715), **decaf::net::SocketTimeoutException** (p. 1934), **decaf::net::UnknownHostException** (p. 2183), **decaf::net::UnknownServiceException** (p. 2185), **decaf::util::zip::ZipException** (p. 2292), **decaf::io::EOFException** (p. 988), **decaf::io::InterruptedIOException** (p. 1189), and **decaf::net::SocketException** (p. 1916).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**IOException.h**

6.288 activemq::transport::IOTransport Class Reference

Implementation of the **Transport** (p. 2161) interface that performs marshaling of commands to IO streams.

`#include <src/main/activemq/transport/IOTransport.h>`

Inheritance diagram for activemq::transport::IOTransport:

Public Member Functions

- **IOTransport** ()

  Default Constructor.
- **IOTransport** (**const Pointer**< **wireformat::WireFormat** > &wireFormat)

  *Create an instance of this **Transport** (p. 2161) and assign its WireFormat instance at creation time.*
- virtual ~**IOTransport** ()
- virtual void **setInputStream** (**decaf::io::DataInputStream** *is)

  *Sets the stream from which this **Transport** (p. 2161) implementation will read its data.*
- virtual void **setOutputStream** (**decaf::io::DataOutputStream** *os)

  *Sets the stream to which this **Transport** (p. 2161) implementation will write its data.*
- virtual void **oneway** (**const Pointer**< **Command** > &command)

  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command)

  Sends the given command to the broker and then waits for the response.

  Parameters

command	*the command to be sent.*

  Returns

  the response from the broker.

  Exceptions

IOException	*if an exception occurs during the read of the command.*
UnsupportedOperationException	*if this method is not implemented by this transport.*

- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.

Parameters

command	*The command to be sent.*
timeout	*The time to wait for this response.*

Returns

the response from the broker.

Exceptions

IOException	*if an exception occurs during the read of the command.*
UnsupportedOperation-Exception	*if this method is not implemented by this transport.*

- virtual **Pointer** < **wireformat::WireFormat** > **getWireFormat** () **const**

  Gets the WireFormat instance that is in use by this transport.
- virtual void **setWireFormat** (**const Pointer**< **wireformat::WireFormat** > &wireFormat)

  Sets the WireFormat instance to use.
- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous events from this transport.
- virtual **TransportListener** * **getTransportListener** () **const**

  Gets the observer of asynchronous events from this transport.
- virtual void **start** ()

  *Starts the **Transport*** (p. *2161), the send methods of a **Transport*** (p. *2161) will throw an exception if used before the **Transport*** (p. *2161) is started.*
- virtual void **stop** ()

  *Stops the **Transport*** (p. *2161).*
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual **Transport** * **narrow** (**const** std::type_info &typeId)

  *Narrows down a Chain of Transports to a specific **Transport*** (p. *2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () **const**

  *Is this **Transport*** (p. *2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () **const**

  *Is the **Transport*** (p. *2161) Connected to its Broker.*
- virtual bool **isClosed** () **const**

  *Has the **Transport*** (p. *2161) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () **const**
- virtual bool **isReconnectSupported** () **const**
- virtual bool **isUpdateURIsSupported** () **const**
- virtual void **updateURIs** (bool rebalance AMQCPP_UNUSED, **const decaf::util::List**< **decaf::net::URI** > &uris AMQCPP_UNUSED)
- virtual void **reconnect** (**const decaf::net::URI** &uri AMQCPP_UNUSED)

- virtual void **run** ()

  Runs the polling thread.

6.288.1 Detailed Description

Implementation of the **Transport** (p. 2161) interface that performs marshaling of commands to IO streams.

This class does not implement the request method, it only handles oneway messages. A thread polls on the input stream for in-coming commands. When a command is received, the command listener is notified. The polling thread is not started until the start method is called. The close method will close the associated streams. Close can be called explicitly by the user, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

6.288.2 Constructor & Destructor Documentation

6.288.2.1 activemq::transport::IOTransport::IOTransport ( )

Default Constructor.

6.288.2.2 activemq::transport::IOTransport::IOTransport (const Pointer< wireformat::WireFormat > & *wireFormat*)

Create an instance of this **Transport** (p. 2161) and assign its WireFormat instance at creation time.

Parameters

wireFormat	Data encoder / decoder to use when reading and writing.

6.288.2.3 virtual activemq::transport::IOTransport::~IOTransport ( ) [virtual]

6.288.3 Member Function Documentation

6.288.3.1 virtual void activemq::transport::IOTransport::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

6.288.3.2 virtual std::string activemq::transport::IOTransport::getRemoteAddress ( ) const [inline, virtual]

Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2162).

6.288.3.3 virtual TransportListener* activemq::transport::IOTransport::getTransportListener ( ) const [inline, virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implements **activemq::transport::Transport** (p. 2163).

6.288.3.4 virtual Pointer<wireformat::WireFormat> activemq::transport::IOTransport::getWireFormat ( ) const [inline, virtual]

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a WireFormat info instance.

Returns

The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2163).

6.288.3.5 virtual bool activemq::transport::IOTransport::isClosed ( ) const [inline, virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Implements **activemq::transport::Transport** (p. 2163).

6.288.3.6 virtual bool activemq::transport::IOTransport::isConnected ( ) const [inline, virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2163).

6.288.3.7 virtual bool activemq::transport::IOTransport::isFaultTolerant ( ) const [inline, virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2163).

6.288.3.8 virtual bool activemq::transport::IOTransport::isReconnectSupported ( ) const [inline, virtual]

Returns

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.288.3.9 virtual bool activemq::transport::IOTransport::isUpdateURIsSupported ( ) const [inline, virtual]

Returns

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.288.3.10 virtual Transport* activemq::transport::IOTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId	- The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2164).

6.288.3.11 virtual void activemq::transport::IOTransport::oneway (const Pointer< Command > & *command*) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2164).

6.288.3.12 virtual void activemq::transport::IOTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) [inline, virtual]

This method does nothing in this subclass.

6.288.3.13 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > & *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

This method always thrown an UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 2165).

6.288.3.14 virtual Pointer<Response> activemq::transport::IOTransport::request (const Pointer< Command > & *command,* unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

This method always thrown an UnsupportedOperationException.

Implements **activemq::transport::Transport** (p. 2165).

6.288.3.15 virtual void activemq::transport::IOTransport::run ( ) [virtual]

Runs the polling thread.

Implements **decaf::lang::Runnable** (p. 1793).

6.288.3.16 virtual void activemq::transport::IOTransport::setInputStream (decaf::io::DataInputStream * *is*) [inline, virtual]

Sets the stream from which this **Transport** (p. 2161) implementation will read its data.

Parameters

is	The InputStream that will be read from by this object.

6.288.3.17 virtual void activemq::transport::IOTransport::setOutputStream (decaf::io::DataOutputStream * *os*) [inline, virtual]

Sets the stream to which this **Transport** (p. 2161) implementation will write its data.

Parameters

os	The OuputStream that will be written to by this object.

6.288.3.18 virtual void activemq::transport::IOTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener	the listener of transport events.

Implements **activemq::transport::Transport** (p. 2166).

6.288.3.19 virtual void activemq::transport::IOTransport::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters

wireFormat	The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2166).

6.288.3.20 virtual void activemq::transport::IOTransport::start ( ) [virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Implements **activemq::transport::Transport** (p. 2166).

6.288.3.21 virtual void activemq::transport::IOTransport::stop ( ) [virtual]

Stops the **Transport** (p. 2161).

Exceptions

IOException	if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 2167).

6.288.3.22 virtual void activemq::transport::IOTransport::updateURIs (bool rebalance *AMQCPP_UNUSED*, const decaf::util::List< decaf::net::URI > &uris *AMQCPP_UNUSED*) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Iterable.h**

6.290 decaf::util::Iterator< E > Class Template Reference

Defines an object that can be used to iterate over the elements of a collection.

`#include <src/main/decaf/util/Iterator.h>`

Inheritance diagram for decaf::util::Iterator< E >:

Public Member Functions

- virtual ~**Iterator** ()
- virtual E **next** ()=0

  Returns the next element in the iteration.
- virtual bool **hasNext** () **const** =0

  Returns true if the iteration has more elements.
- virtual void **remove** ()=0

  Removes from the underlying collection the last element returned by the iterator (optional operation).

6.290.1 Detailed Description

template<typename E>class decaf::util::Iterator< E >

Defines an object that can be used to iterate over the elements of a collection.

The iterator provides a way to access and remove elements with well defined semantics.

6.290.2 Constructor & Destructor Documentation

6.290.2.1 template<typename E> virtual decaf::util::Iterator< E >::~Iterator ( ) [inline, virtual]

6.290.3 Member Function Documentation

6.290.3.1 template<typename E> virtual bool decaf::util::Iterator< E >::hasNext ( ) const [pure virtual]

Returns true if the iteration has more elements.

Returns false if the next call to next would result in an **NoSuchElementException** (p. 1537) to be thrown.

Returns

true if there are more elements available for iteration.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 356).

6.290.3.2 template<typename E> virtual E decaf::util::Iterator< E >::next ( ) [pure virtual]

Returns the next element in the iteration.

Calling this method repeatedly until the **hasNext()** (p. 1209) method returns false will return each element in the underlying collection exactly once.

Returns

the next element in the iteration of elements.

Exceptions

NoSuchElementException *(p. 1537)*	if the iteration has no more elements.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 357).

6.290.3.3 template<typename E> virtual void decaf::util::Iterator< E >::remove ( ) [pure virtual]

Removes from the underlying collection the last element returned by the iterator (optional operation).

This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions

UnsupportedOperation-Exception	if the remove operation is not supported by this **Iterator** (p. 1209).
IllegalStateException	if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 358).

The documentation for this class was generated from the following file:

- **Pointer< MessageAck > messageAck**

6.291.1 Constructor & Destructor Documentation

6.291.1.1 activemq::commands::JournalQueueAck::JournalQueueAck ( )

6.291.1.2 virtual activemq::commands::JournalQueueAck::~JournalQueueAck ( ) [virtual]

6.291.2 Member Function Documentation

6.291.2.1 virtual JournalQueueAck* activemq::commands::JournalQueueAck::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.291.2.2 virtual void activemq::commands::JournalQueueAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.291.2.3 virtual bool activemq::commands::JournalQueueAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.291.2.4 virtual unsigned char activemq::commands::JournalQueueAck::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.291.2.5 virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination ( ) const [virtual]

6.291.2.6 virtual Pointer<ActiveMQDestination>& activemq::commands::JournalQueueAck::getDestination ( ) [virtual]

6.291.2.7 virtual const Pointer<MessageAck>& activemq::commands::JournalQueueAck::getMessageAck ( ) const [virtual]

6.291.2.8 virtual Pointer<MessageAck>& activemq::commands::JournalQueueAck::getMessageAck ( ) [virtual]

6.291.2.9 virtual void activemq::commands::JournalQueueAck::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.291.2.10 virtual void activemq::commands::JournalQueueAck::setMessageAck (const Pointer< MessageAck > & *messageAck*) [virtual]

6.291.2.11 virtual std::string activemq::commands::JournalQueueAck::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.291.3 Field Documentation

6.291.3.1 Pointer<ActiveMQDestination> activemq::commands::JournalQueueAck::destination [protected]

6.291.3.2 const unsigned char activemq::commands::JournalQueueAck::ID_JOURNALQUEUEACK = 52 [static]

6.291.3.3 Pointer<MessageAck> activemq::commands::JournalQueueAck::messageAck [protected]

Public Member Functions

- **JournalQueueAckMarshaller** ()
- virtual ~**JournalQueueAckMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.292.1 Detailed Description

Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1213).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.292.2 Constructor & Destructor Documentation

6.292.2.1 activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::JournalQueueAckMarshaller ( ) [inline]

6.292.2.2 virtual activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::~JournalQueueAckMarshaller ( ) [inline, virtual]

6.292.3 Member Function Documentation

6.292.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.292.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.292.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.292.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.292.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.292.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.292.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalQueueAckMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.293.1.2 virtual activemq::commands::JournalTopicAck::~JournalTopicAck ( ) [virtual]

6.293.2 Member Function Documentation

6.293.2.1 virtual JournalTopicAck* activemq::commands::JournalTopicAck::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.293.2.2 virtual void activemq::commands::JournalTopicAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.293.2.3 virtual bool activemq::commands::JournalTopicAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.293.2.4 virtual const std::string& activemq::commands::JournalTopicAck::getClientId ( ) const [virtual]

6.293.2.5 virtual std::string& activemq::commands::JournalTopicAck::getClientId ( ) [virtual]

6.293.2.6 virtual unsigned char activemq::commands::JournalTopicAck::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.293.2.7 virtual const Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination ( ) const [virtual]

6.293.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::JournalTopicAck::getDestination ( ) [virtual]

6.293.2.9 virtual const Pointer<MessageId>& activemq::commands::JournalTopicAck::getMessageId ( ) const [virtual]

6.293.2.10 virtual Pointer<MessageId>& activemq::commands::JournalTopicAck::getMessageId ( ) [virtual]

6.293.2.11 virtual long long activemq::commands::JournalTopicAck::getMessageSequenceId ( ) const [virtual]

6.293.2.12 virtual const std::string& activemq::commands::JournalTopicAck::getSubscritionName ( ) const [virtual]

6.293.2.13 virtual std::string& activemq::commands::JournalTopicAck::getSubscritionName ( ) [virtual]

6.293.2.14 virtual const Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId ( ) const [virtual]

6.293.2.15 virtual Pointer<TransactionId>& activemq::commands::JournalTopicAck::getTransactionId ( ) [virtual]

6.293.2.16 virtual void activemq::commands::JournalTopicAck::setClientId (const std::string & *clientId*) [virtual]

6.293.2.17 virtual void activemq::commands::JournalTopicAck::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.293.2.18 virtual void activemq::commands::JournalTopicAck::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.293.2.19 virtual void activemq::commands::JournalTopicAck::setMessageSequenceId (long long *messageSequenceId*) [virtual]

6.293.2.20 virtual void activemq::commands::JournalTopicAck::setSubscritionName (const std::string & *subscritionName*) [virtual]

6.293.2.21 virtual void activemq::commands::JournalTopicAck::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.293.2.22 virtual std::string activemq::commands::JournalTopicAck::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.293.3 Field Documentation

6.293.3.1 std::string activemq::commands::JournalTopicAck::clientId [protected]

6.293.3.2 Pointer<ActiveMQDestination> activemq::commands::JournalTopicAck::destination [protected]

6.294.2 Constructor & Destructor Documentation

6.294.2.1 activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::JournalTopicAckMarshaller ( ) [inline]

6.294.2.2 virtual activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::~JournalTopicAckMarshaller ( ) [inline, virtual]

6.294.3 Member Function Documentation

6.294.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.294.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.294.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.294.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.294.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.294.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.294.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTopicAckMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.295.1.2 virtual activemq::commands::JournalTrace::~JournalTrace ( ) [virtual]

6.295.2 Member Function Documentation

6.295.2.1 virtual JournalTrace* activemq::commands::JournalTrace::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.295.2.2 virtual void activemq::commands::JournalTrace::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.295.2.3 virtual bool activemq::commands::JournalTrace::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.295.2.4 virtual unsigned char activemq::commands::JournalTrace::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.295.2.5 virtual const std::string& activemq::commands::JournalTrace::getMessage ( ) const [virtual]

6.295.2.6 virtual std::string& activemq::commands::JournalTrace::getMessage ( ) [virtual]

6.296.3 Member Function Documentation

6.296.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.296.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.296.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.296.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.296.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.296.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.296.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTraceMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.298.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.298.3.3 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.298.3.4 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.298.3.5 virtual int activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.298.3.6 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.298.3.7 virtual void activemq::wireformat::openwire::marshal::generated::JournalTransactionMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**JournalTransactionMarshaller.h**

6.299 activemq::commands::KeepAliveInfo Class Reference

`#include <src/main/activemq/commands/KeepAliveInfo.h>`

Inheritance diagram for activemq::commands::KeepAliveInfo:

Public Member Functions

- **KeepAliveInfo** ()
- virtual ∼**KeepAliveInfo** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **KeepAliveInfo** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual bool **isKeepAliveInfo** () **const**
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_KEEPALIVEINFO** = 10

6.299.1 Constructor & Destructor Documentation

6.299.1.1 activemq::commands::KeepAliveInfo::KeepAliveInfo ( )

6.299.1.2 virtual activemq::commands::KeepAliveInfo::∼KeepAliveInfo ( ) [virtual]

6.299.2 Member Function Documentation

6.299.2.1 virtual KeepAliveInfo* activemq::commands::KeepAliveInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.299.2.2 virtual void activemq::commands::KeepAliveInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.299.2.3 virtual bool activemq::commands::KeepAliveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.299.2.4 virtual unsigned char activemq::commands::KeepAliveInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.299.2.5 virtual bool activemq::commands::KeepAliveInfo::isKeepAliveInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isKeepAliveInfo()** (p. 1235) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.299.2.6 virtual std::string activemq::commands::KeepAliveInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.299.2.7 virtual Pointer<Command> activemq::commands::KeepAliveInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.299.3 Field Documentation

6.300.3 Member Function Documentation

6.300.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.300.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.300.3.3 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.300.3.4 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.300.3.5 virtual int activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.300.3.6 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.300.3.7 virtual void activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**KeepAliveInfoMarshaller.h**

6.301 decaf::security::Key Class Reference

The **Key** (p. 1239) interface is the top-level interface for all keys.

`#include <src/main/decaf/security/Key.h>`

Inheritance diagram for decaf::security::Key:

Public Member Functions

- virtual ~**Key** ()
- virtual std::string **getAlgorithm** () **const** =0

  Returns the standard algorithm name for this key.
- virtual void **getEncoded** (std::vector< unsigned char > &output) **const** =0

  Provides the key in its primary encoding format, or nothing if this key does not support encoding.
- virtual std::string **getFormat** () **const** =0

  Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

6.301.1 Detailed Description

The **Key** (p. 1239) interface is the top-level interface for all keys.

It defines the functionality shared by all key objects. All keys have three characteristics:

An Algorithm

This is the key algorithm for that key. The key algorithm is usually an encryption or asymmetric operation algorithm (such as DSA or RSA), which will work with those algorithms and with related algorithms (such as MD5 with RSA, SHA-1 with RSA, Raw DSA, etc.) The name of the algorithm of a key is obtained using the getAlgorithm method.

An Encoded Form

This is an external encoded form for the key used when a standard representation of the key is needed outside the application, as when transmitting the key to some other party. The key is encoded according to a standard format (such as X.509 SubjectPublicKeyInfo or PKCS#8), and is returned using the getEncoded method. Note: The syntax of the ASN.1 type SubjectPublicKeyInfo is defined as follows:

SubjectPublicKeyInfo ::= SEQUENCE {

algorithm AlgorithmIdentifier,

subjectPublicKey BIT STRING }

AlgorithmIdentifier ::= SEQUENCE {

algorithm OBJECT IDENTIFIER,

parameters ANY DEFINED BY algorithm OPTIONAL }

For more information, see RFC 2459: Internet X.509 Public **Key** (p. 1239) Infrastructure Certificate and CRL Profile.

A Format

This is the name of the format of the encoded key. It is returned by the getFormat method.

6.301.2 Constructor & Destructor Documentation

6.301.2.1 virtual decaf::security::Key::~Key ( ) [inline, virtual]

6.301.3 Member Function Documentation

6.301.3.1 virtual std::string decaf::security::Key::getAlgorithm ( ) const [pure virtual]

Returns the standard algorithm name for this key.

For example, "DSA" would indicate that this key is a DSA key.

Returns

the name of the algorithm associated with this key.

6.301.3.2 virtual void decaf::security::Key::getEncoded (std::vector< unsigned char > & *output*) const [pure virtual]

Provides the key in its primary encoding format, or nothing if this key does not support encoding.

Parameters

output	Receives the encoded key, or nothing if the key does not support encoding.

6.301.3.3 virtual std::string decaf::security::Key::getFormat ( ) const [pure virtual]

Returns the name of the primary encoding format of this key, or an empty string if this key does not support encoding.

The primary encoding format is named in terms of the appropriate ASN.1 data format, if an ASN.1 specification for this key exists. For example, the name of the ASN.1 data format for public keys is SubjectPublicKeyInfo, as defined by the X.509 standard; in this case, the returned format is "X.509". Similarly, the name of the ASN.1 data format for private keys is PrivateKeyInfo, as defined by the PKCS #8 standard; in this case, the returned format is "PKCS#8".

Returns

the primary encoding format of the key.

The documentation for this class was generated from the following file:

- src/main/decaf/security/**Key.h**

6.302 decaf::security::KeyException Class Reference

`#include <src/main/decaf/security/KeyException.h>`

Inheritance diagram for decaf::security::KeyException:

Public Member Functions

- **KeyException** () throw ()

  Default Constructor.
- **KeyException** (**const decaf::lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **KeyException** (**const KeyException** &ex) throw ()

  Copy Constructor.
- **KeyException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **KeyException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **KeyException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **KeyException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**KeyException** () throw ()

6.302.1 Constructor & Destructor Documentation

6.302.1.1 decaf::security::KeyException::KeyException ( ) throw () [inline]

Default Constructor.

6.302.1.2 decaf::security::KeyException::KeyException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.302.1.3 decaf::security::KeyException::KeyException (const KeyException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.302.1.4 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.302.1.5 decaf::security::KeyException::KeyException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.302.1.6 decaf::security::KeyException::KeyException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.302.1.7 virtual decaf::security::KeyException::~KeyException ( ) throw () [inline, virtual]

6.302.2 Member Function Documentation

6.302.2.1 virtual KeyException* decaf::security::KeyException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1081).

Reimplemented in **decaf::security::InvalidKeyException** (p. 1193), and **decaf::security::KeyManagementException** (p. 1245).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**KeyException.h**

6.303 decaf::security::KeyManagementException Class Reference

`#include <src/main/decaf/security/KeyManagementException.h>`

Inheritance diagram for decaf::security::KeyManagementException:

Public Member Functions

- **KeyManagementException** () throw ()

  Constructor.
- **KeyManagementException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **KeyManagementException** * **clone** () **const**
  Clones this exception.
- virtual ~**KeyManagementException** () throw ()

6.303.1 Constructor & Destructor Documentation

6.303.1.1 decaf::security::KeyManagementException::KeyManagementException ( ) throw () [inline]

Default Constructor.

6.303.1.2 decaf::security::KeyManagementException::KeyManagementException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.303.1.3 decaf::security::KeyManagementException::KeyManagementException (const KeyManagementException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.303.1.4 decaf::security::KeyManagementException::KeyManagementException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.303.1.5 decaf::security::KeyManagementException::KeyManagementException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.303.1.6 decaf::security::KeyManagementException::KeyManagementException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.303.1.7 virtual decaf::security::KeyManagementException::~KeyManagementException ( ) throw ()

`[inline, virtual]`

6.303.2 Member Function Documentation

6.303.2.1 virtual KeyManagementException* decaf::security::KeyManagementException::clone ( ) const

`[inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::KeyException** (p. 1242).

The documentation for this class was generated from the following file:

- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.305.1 Detailed Description

Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1247).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.305.2 Constructor & Destructor Documentation

6.305.2.1 activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::LastPartialCommandMarshaller ( ) [inline]

6.305.2.2 virtual activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::~LastPartialCommandMarshaller ( ) [inline, virtual]

6.305.3 Member Function Documentation

6.305.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1612).

6.305.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1612).

6.305.3.3 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1612).

6.305.3.4 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1612).

6.305.3.5 virtual int activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1613).

6.305.3.6 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1613).

6.305.3.7 virtual void activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller** (p. 1614).

- virtual int **compare** (**const** E &o1, **const** E &o2) **const**

  Compares its two arguments for order.

6.306.1 Detailed Description

template<typename E>class decaf::util::comparators::Less< E >

Simple **Less** (p. 1250) **Comparator** (p. 689) that compares to elements to determine if the first is less than the second.

This can be used in **Collection** (p. 660) classes to sort elements according to their natural ordering. By design the **Comparator** (p. 689)'s compare function return more information about comparison than the STL binary function's boolean compare operator. In this case the compare method will return

Since

1.0

6.306.2 Constructor & Destructor Documentation

6.306.2.1 template<typename E > decaf::util::comparators::Less< E >::Less ( ) [inline]

6.306.2.2 template<typename E > virtual decaf::util::comparators::Less< E >::~Less ( ) [inline, virtual]

6.306.3 Member Function Documentation

6.306.3.1 template<typename E > virtual int decaf::util::comparators::Less< E >::compare (const E & *o1,* const E & *o2*) const [inline, virtual]

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that sgn(compare(x, y)) == -sgn(compare(y, x)) for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: ((compare(x, y)>0) && (compare(y, z)>0)) implies compare(x, z)>0.

Finally, the implementer must ensure that compare(x, y)==0 implies that sgn(compare(x, z))==sgn(compare(y, z)) for all z.

It is generally the case, but not strictly required that (compare(x, y)==0) == (x == y)). Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

o1	The first object to be compared
o2	The second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implements **decaf::util::Comparator**< E > (p. 689).

6.306.3.2 template<typename E > virtual bool decaf::util::comparators::Less< E >::operator() (const E & *left,* const E & *right*) const [inline, virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 689) to be passed to an STL **Map** (p. 1371) for use as the sorting criteria.

Parameters

left	The Left hand side operand.
right	The Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implements **decaf::util::Comparator< E >** (p. 690).

  ALL indicates that all messages should be logged.

Protected Member Functions

- **Level** (**const** std::string &name, int value)

  *Create a named **Level** (p. 1253) with a given integer value.*

6.309.1 Detailed Description

The **Level** (p. 1253) class defines a set of standard logging levels that can be used to control logging output.

The logging **Level** (p. 1253) objects are ordered and are specified by ordered integers. Enabling logging at a given level also enables logging at all higher levels.

Clients should normally use the predefined **Level** (p. 1253) constants such as **Level.SEVERE** (p. 1257).

The levels in descending order are:

- SEVERE (highest value)
  - WARNING
  - INFO
  - DEBUG
  - CONFIG
  - FINE
  - FINER
  - FINEST (lowest value)

In addition there is a level OFF that can be used to turn off logging, and a level ALL that can be used to enable logging of all messages.

It is possible for third parties to define additional logging levels by subclassing **Level** (p. 1253). In such cases subclasses should take care to chose unique integer level values.

Since

1.0

6.309.2 Constructor & Destructor Documentation

6.309.2.1 decaf::util::logging::Level::Level (const std::string & *name,* int *value*) [protected]

Create a named **Level** (p. 1253) with a given integer value.

Parameters

name	Name of the level, e.g. SEVERE
value	Unique integer value of this level, e.g. 100

6.309.2.2 virtual decaf::util::logging::Level::~Level ( ) [virtual]

6.309.3 Member Function Documentation

6.309.3.1 virtual int decaf::util::logging::Level::compareTo (const Level & *value*) const [virtual]

6.309.3.2 virtual bool decaf::util::logging::Level::equals (const Level & *value*) const [virtual]

6.309.3.3 std::string decaf::util::logging::Level::getName ( ) const [inline]

Returns

the name of this **Level** (p. 1253) instance.

6.309.3.4 int decaf::util::logging::Level::intValue ( ) const [inline]

Returns

the integer value of this level instance.

6.309.3.5 virtual bool decaf::util::logging::Level::operator< (const Level & *value*) const [virtual]

6.309.3.6 virtual bool decaf::util::logging::Level::operator== (const Level & *value*) const [virtual]

6.309.3.7 static Level decaf::util::logging::Level::parse (const std::string & *name*) [static]

Parse a level name string into a **Level** (p. 1253).

The argument string may consist of either a level name or an integer value.

For example:

- "SEVERE"
  - "1000"

Parameters

name	- The name or int value of the desired **Level** (p. 1253)

Returns

the parsed **Level** (p. 1253) value, passing in a level name that is an int value that is not one of the known **Level** (p. 1253) values will result in a new **Level** (p. 1253) that has been initialized with that int value and name as the string form of the int.

Exceptions

IllegalArgumentException	if the value is not valid, validity means that the string is either a valid int (between Integer-::MIN_VALUE and Integer::MAX_VALUE or is one of the known level names.

6.309.3.8 std::string decaf::util::logging::Level::toString ( ) const [inline]

Returns

the string value of this **Level** (p. 1253), e.g. "SEVERE".

6.309.4 Field Documentation

6.309.4.1 const Level decaf::util::logging::Level::ALL [static]

ALL indicates that all messages should be logged.

This level is initialized to Integer::MIN_VALUE.

6.309.4.2 const Level decaf::util::logging::Level::CONFIG [static]

CONFIG is a message level for static configuration messages.

CONFIG messages are intended to provide a variety of static configuration information, to assist in debugging problems that may be associated with particular configurations. For example, CONFIG message might include the CPU type, the System properties, etc. This level is initialized to 600.

6.309.4.3 const Level decaf::util::logging::Level::DEBUG [static]

DEBUG is a level for more verbose informative messages.

DEBUG messages are intended to provide a more detailed message intended for use by developers in tracking the behavior of a client. DEBUG messages typically contain more implementation specific information that might not be significant to end users or system admins. This level is initialized to 700.

6.309.4.4 const Level decaf::util::logging::Level::FINE [static]

FINE is a message level providing tracing information.

All of FINE, FINER, and FINEST are intended for relatively detailed tracing. The exact meaning of the three levels will vary between subsystems, but in general, FINEST should be used for the most detailed output, FINER for somewhat less detailed output, and FINE for the lowest volume (and most important) messages.

In general the FINE level should be used for information that will be broadly interesting to developers who do not have a specialized interest in the specific subsystem.

FINE messages might include things like minor (recoverable) failures. Issues indicating potential performance problems are also worth logging as FINE. This level is initialized to 500.

6.309.4.5 const Level decaf::util::logging::Level::FINER [static]

FINER indicates a fairly detailed tracing message.

By default logging calls for entering, returning, or throwing an exception are traced at this level. This level is initialized to 400.

6.309.4.6 const Level decaf::util::logging::Level::FINEST [static]

FINEST indicates a highly detailed tracing message.

This level is initialized to 300.

6.309.4.7 const Level decaf::util::logging::Level::INFO [static]

INFO is a message level for informational messages.

Typically INFO messages will be written to the console or its equivalent. So the INFO level should only be used for reasonably significant messages that will make sense to end users and system admins. This level is initialized to 800.

6.309.4.8 const Level decaf::util::logging::Level::INHERIT [static]

NULL is a special level that indicates that the **Logger** (p. 1312) should get its **Level** (p. 1253) from its parent **Logger** (p. 1312), the value is initialized as zero.

6.309.4.9 const Level decaf::util::logging::Level::OFF [static]

OFF is a special level that can be used to turn off logging.

This level is initialized to Integer::MAX_VALUE

6.309.4.10 const Level decaf::util::logging::Level::SEVERE [static]

SEVERE is a message level indicating a serious failure.

In general SEVERE messages should describe events that are of considerable importance and which will prevent normal program execution. They should be reasonably intelligible to end users and to system administrators. This level is initialized to 1000.

6.309.4.11 const Level decaf::util::logging::Level::WARNING [static]

WARNING is a message level indicating a potential problem.

In general WARNING messages should describe events that will be of interest to end users or system managers, or which indicate potential problems. This level is initialized to 900.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**Level.h**

6.310 decaf::util::concurrent::LinkedBlockingQueue< E > Class Template Reference

A **BlockingQueue** (p. 417) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.

`#include <src/main/decaf/util/concurrent/LinkedBlockingQueue.h>`

Inheritance diagram for decaf::util::concurrent::LinkedBlockingQueue< E >:

Data Structures

- class **LinkedIterator**
- class **QueueNode**
- class **TotalLock**

Public Member Functions

- **LinkedBlockingQueue** ()

  Create a new instance with a Capacity of Integer::MAX_VALUE.
- **LinkedBlockingQueue** (int capacity)

  Create a new instance with the given initial capacity value.
- **LinkedBlockingQueue** (**const Collection**< E > &collection)

  *Create a new instance with a Capacity of Integer::MAX_VALUE and adds all the values contained in the specified collection to this **Queue** (p. 1723).*
- virtual ~**LinkedBlockingQueue** ()
- **LinkedBlockingQueue**< E > & **operator=** (**const LinkedBlockingQueue**< E > &queue)
- **LinkedBlockingQueue**< E > & **operator=** (**const Collection**< E > &collection)
- virtual int **size** () **const**

  Returns the number of elements in this collection.
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

  This implementation repeatedly invokes poll until it returns false.
- virtual int **remainingCapacity** () **const**

  Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.
- virtual void **put** (**const** E &value)

  Inserts the specified element into this queue, waiting if necessary for space to become available.
- virtual bool **offer** (**const** E &value, long long timeout, **const TimeUnit** &unit)

  Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
- virtual bool **offer** (**const** E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.
- virtual E **take** ()

  Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.
- virtual bool **poll** (E &result, long long timeout, **const TimeUnit** &unit)

  Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.
- virtual bool **poll** (E &result)

  Gets and removes the element in the head of the queue.
- virtual bool **peek** (E &result) **const**

  Gets but not removes the element in the head of the queue.
- virtual bool **remove** (**const** E &value)

Removes a single instance of the specified element from the collection.
More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	*The reference to the element to remove from this* ***Collection*** *(p. 660).*

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the* ***Collection*** *(p. 660) is a container of pointers and does not allow NULL values.*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual std::vector< E > **toArray** () **const**

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(p. 660).*
- virtual std::string **toString** () **const**
- virtual int **drainTo** (**Collection**< E > &c)

  Removes all available elements from this queue and adds them to the given collection.
- virtual int **drainTo** (**Collection**< E > &sink, int maxElements)

  Removes at most the given number of available elements from this queue and adds them to the given collection.
- virtual **decaf::util::Iterator** < E > * **iterator** ()
- virtual **decaf::util::Iterator** < E > * **iterator** () **const**

6.310.1 Detailed Description

template<typename E>class decaf::util::concurrent::LinkedBlockingQueue< E >

A **BlockingQueue** (p. 417) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.

Elements are inserted and removed in FIFO order. The internal structure of the queue is based on a linked nodes which provides for better performance over their array based versions but the performance is less predictable.

The capacity bound of this class default to Integer::MAX_VALUE.

Since

1.0

6.310.2 Constructor & Destructor Documentation

6.310.2.1 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue ( ) [inline]

Create a new instance with a Capacity of Integer::MAX_VALUE.

6.310.2.2 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue (int *capacity*) [inline]

Create a new instance with the given initial capacity value.

Parameters

capacity	The initial capacity value to assign to this **Queue** (p. 1723).

Exceptions

IllegalArgumentException	if the specified capacity is not greater than zero.

6.310.2.3 template<typename E> decaf::util::concurrent::LinkedBlockingQueue< E >::LinkedBlockingQueue (const Collection< E > & *collection*) [inline]

Create a new instance with a Capacity of Integer::MAX_VALUE and adds all the values contained in the specified collection to this **Queue** (p. 1723).

Parameters

collection	The **Collection** (p. 660) whose elements are to be copied to this **Queue** (p. 1723).

Exceptions

IllegalStateException	if the number of elements in the collection exceeds this **Queue** (p. 1723)'s capacity.

References DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::lang::Iterable< E >::iterator().

6.310.2.4 template<typename E> virtual decaf::util::concurrent::LinkedBlockingQueue< E >::~LinkedBlockingQueue ( ) [inline, virtual]

6.310.3 Member Function Documentation

6.310.3.1 template<typename E> virtual void decaf::util::concurrent::LinkedBlockingQueue< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException	if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false.

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 110).

References decaf::util::concurrent::atomic::AtomicInteger::getAndSet(), decaf::util::AbstractCollection< E >::lock(), decaf::util::concurrent::Mutex::notify(), and decaf::util::concurrent::atomic::AtomicInteger::set().

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::operator=().

6.310.3.2 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo (Collection< E > & *c*) [inline, virtual]

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into

Returns

the number of elements transferred

Exceptions

UnsupportedOperation-Exception	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 419).

References decaf::lang::Integer::MAX_VALUE.

6.310.3.3 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo (Collection< E > & *c*, int *maxElements*) [inline, virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into
maxElements	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

UnsupportedOperation-Exception	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 420).

References decaf::util::Collection< E >::add(), decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndAdd(), and decaf::lang::Math::min().

6.310.3.4 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::LinkedBlockingQueue< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

6.310.3.5 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::LinkedBlockingQueue< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

6.310.3.6 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::offer (const E & *e,* long long *timeout,* const TimeUnit & *unit*) [inline, virtual]

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters

e	the element to add
timeout	how long to wait before giving up, in units of `unit`
unit	a **`TimeUnit`** (p. 2134) determining how to interpret the `timeout` parameter

Returns

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions

InterruptedException	if interrupted while waiting
NullPointerException	if the specified element is null
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 420).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement(), decaf::util::concurrent::Mutex::notify(), decaf::util::concurrent::TimeUnit::toMillis(), and decaf::util::concurrent::Mutex::wait().

6.310.3.7 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters

value	the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException	if the **Queue** (p. 1723) implementation does not allow Null values to be inserted into the **Queue** (p. 1723).
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 1724).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement(), and decaf::util::concurrent::Mutex::notify().

6.310.3.8 template<typename E> LinkedBlockingQueue<E>& decaf::util::concurrent::LinkedBlockingQueue< E >::operator= (const LinkedBlockingQueue< E > & *queue*) [inline]

References decaf::util::AbstractQueue< E >::addAll(), and decaf::util::concurrent::LinkedBlockingQueue< E >::clear().

6.310.3.9 template<typename E> LinkedBlockingQueue<E>& decaf::util::concurrent::LinkedBlockingQueue< E >::operator= (const Collection< E > & *collection*) [inline]

References decaf::util::AbstractQueue< E >::addAll(), and decaf::util::concurrent::LinkedBlockingQueue< E >::clear().

6.310.3.10 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 1725).

References decaf::util::concurrent::atomic::AtomicInteger::get(), and decaf::lang::Pointer< T, REFCOUNTER >::get().

6.310.3.11 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::poll (E & *result,* long long *timeout,* const TimeUnit & *unit*) [inline, virtual]

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters

result	the referenced value that will be assigned the value retrieved from the **Queue** (p. 1723). Undefined if this methods returned false.
timeout	how long to wait before giving up, in units of `unit`
unit	a **`TimeUnit`** (p. 2134) determining how to interpret the `timeout` parameter.

Returns

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions

InterruptedException	if interrupted while waiting

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement(), decaf::util::concurrent::Mutex::notify(), decaf::util::concurrent::TimeUnit::toMillis(), and decaf::util::concurrent::Mutex::wait().

6.310.3.12 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 1723) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 1725).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement(), and decaf::util::concurrent::Mutex::notify().

6.310.3.13 template<typename E> virtual void decaf::util::concurrent::LinkedBlockingQueue< E >::put (const E & *value*) [inline, virtual]

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters

value	the element to add

Exceptions

InterruptedException	if interrupted while waiting
NullPointerException	if the specified element is null
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement(), decaf::util::concurrent::Mutex::notify(), and decaf::util::concurrent::Mutex::wait().

6.310.3.14 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::remainingCapacity ( ) const [inline, virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

References decaf::util::concurrent::atomic::AtomicInteger::get().

6.310.3.15 template<typename E> virtual bool decaf::util::concurrent::LinkedBlockingQueue< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

References decaf::util::AbstractCollection< E >::lock().

6.310.3.16 template<typename E> virtual int decaf::util::concurrent::LinkedBlockingQueue< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

References decaf::util::concurrent::atomic::AtomicInteger::get().

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::toArray().

6.310.3.17 template<typename E> virtual E decaf::util::concurrent::LinkedBlockingQueue< E >::take ( ) [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns

the head of this queue

Exceptions

InterruptedException	if interrupted while waiting

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 422).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement(), decaf::util::concurrent::Mutex::notify(), and decaf::util::concurrent::Mutex::wait().

6.310.3.18 template<typename E> virtual std::vector<E> decaf::util::concurrent::LinkedBlockingQueue< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 94).

References decaf::util::concurrent::atomic::AtomicInteger::get(), decaf::util::AbstractCollection< E >::lock(), and decaf::util::concurrent::LinkedBlockingQueue< E >::size().

6.310.3.19 template<typename E> virtual std::string decaf::util::concurrent::LinkedBlockingQueue< E >::toString ( ) const [inline, virtual]

References decaf::util::concurrent::atomic::AtomicInteger::get().

- **LinkedList**< E > & **operator=** (**const LinkedList**< E > &list)
- **LinkedList**< E > & **operator=** (**const Collection**< E > &collection)
- virtual E **get** (int index) **const**

  Gets the element contained at position passed.

  Parameters

index	*The position to get.*

  Returns

  value at index specified.

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*

  *This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1209) and returns it.*

- virtual E **set** (int index, **const** E &**element**)

  Replaces the element at the specified position in this list with the specified element.

  Parameters

index	*The index of the element to replace.*
element	*The element to be stored at the specified position.*

  Returns

  the element previously at the specified position.

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

  *This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1209) and replaces it with **ListIterator.set** (p. 1297).*

- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.

- virtual void **add** (int index, **const** E &value)

  Inserts the specified element at the specified position in this list.
  Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

  Parameters

index	*The index at which the specified element is to be inserted.*
element	*The element to be inserted in this **List** (p. 1286).*

  Exceptions

IndexOutOfBoundsException	*if the index is greater than size of the **List** (p. 1286).*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

  *This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1296).*

- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
  The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

  Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

  Returns

  true if this collection changed as a result of the call

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, **const Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
  Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

  Parameters

index	*The index at which to insert the first element from the specified collection*
source	*The **Collection** (p. 660) containing elements to be added to this list*

  Returns

  true if this list changed as a result of the call

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using ***ListIterator.add*** *(p. 1296) (to skip over the added element).*

- virtual void **copy** (**const Collection**< E > &collection)

  Renders this ***Collection*** *(p. 660) as a Copy of the given* ***Collection*** *(p. 660).*

- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters

value	*The reference to the element to remove from this* ***Collection*** *(p. 660).*

  Returns

  true if the collection was changed, false otherwise.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the* ***Collection*** *(p. 660) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.

- virtual int **size** () **const**

  Returns the number of elements in this collection.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).

- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters

value	*The value to check for presence in the collection.*

  Returns

  true if there is at least one of the elements in the collection

  Exceptions

NullPointerException	*if the* ***Collection*** *(p. 660) contains pointers and the* ***Collection*** *(p. 660) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **indexOf** (**const** E &value) **const**

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (**const** E &value) **const**

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::vector< E > **toArray** () **const**

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(p. 660).*

- virtual bool **offer** (**const** E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.

- virtual bool **poll** (E &result)

Gets and removes the element in the head of the queue.

- virtual E **remove** ()

  Gets and removes the element in the head of the queue.

- virtual bool **peek** (E &result) **const**

  Gets but not removes the element in the head of the queue.

- virtual E **element** () **const**

  Gets but not removes the element in the head of the queue.

- virtual void **addFirst** (**const** E &value)

  *Inserts an element onto the front of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.*

- virtual void **addLast** (**const** E &value)

  *Inserts an element onto the end of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.*

- virtual E & **getFirst** ()

  *Attempts to fetch a reference to the first element in the **Deque** (p. 926).*

- virtual **const** E & **getFirst** () **const**
- virtual E & **getLast** ()

  *Attempts to fetch a reference to the last element in the **Deque** (p. 926).*

- virtual **const** E & **getLast** () **const**
- virtual bool **offerFirst** (**const** E &**element**)

  *This method attempts to insert the given element into the **Deque** (p. 926) at the front end.*

- virtual bool **offerLast** (**const** E &**element**)

  *This method attempts to insert the given element into the **Deque** (p. 926) at the end.*

- virtual E **removeFirst** ()

  *Removes the topmost element from the **Deque** (p. 926) and returns it.*

- virtual E **removeLast** ()

  *Removes the last element from the **Deque** (p. 926) and returns it.*

- virtual bool **pollFirst** (E &result)

  *Removes the first element from the **Deque** (p. 926) assigns it to the element reference passed.*

- virtual bool **pollLast** (E &result)

  *Removes the last element from the **Deque** (p. 926) assigns it to the element reference passed.*

- virtual bool **peekFirst** (E &result) **const**

  *Retrieves the first element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).*

- virtual bool **peekLast** (E &result) **const**

  *Retrieves the last element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).*

- virtual E **pop** ()

  *Treats this **Deque** (p. 926) as a stack and attempts to pop an element off the top.*

- virtual void **push** (**const** E &**element**)

  Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.

- virtual bool **removeFirstOccurrence** (**const** E &value)

  *Removes the first occurrence of the specified element from this **Deque** (p. 926).*

- virtual bool **removeLastOccurrence** (**const** E &value)

  *Removes the last occurrence of the specified element from this **Deque** (p. 926).*

- virtual **ListIterator**< E > * **listIterator** (int index)
- virtual **ListIterator**< E > * **listIterator** (int index) **const**
- virtual **Iterator**< E > * **descendingIterator** ()

  *Provides an **Iterator** (p. 1209) over this **Collection** (p. 660) that traverses the element in reverse order.*

- virtual **Iterator**< E > * **descendingIterator** () **const**

6.311.1 Detailed Description

template<typename E>class decaf::util::LinkedList< E >

A complete implementation of the **List** (p. 1286) interface using a doubly linked list data structure.

This class also implements the **Deque** (p. 926) interface providing a common interface for additions into the list at the front and end as well as allowing insertions anywhere in between. This class can be used then to implement other data structures such as Stacks, **Queue** (p. 1723)'s or double ended **Queue** (p. 1723)'s.

The operations on this **List** (p. 1286) object that index a particular element involve iterating over the links of the list from beginning to end, starting from whichever end is closer to the location the operation is to be performed on.

Since

6.311.2 Constructor & Destructor Documentation

6.311.2.1 template<typename E> decaf::util::LinkedList< E >::LinkedList ( ) [inline]

6.311.2.2 template<typename E> decaf::util::LinkedList< E >::LinkedList (const LinkedList< E > & *list*) [inline]

6.311.2.3 template<typename E> decaf::util::LinkedList< E >::LinkedList (const Collection< E > & *collection*) [inline]

6.311.2.4 template<typename E> virtual decaf::util::LinkedList< E >::~LinkedList ( ) [inline, virtual]

6.311.3 Member Function Documentation

6.311.3.1 template<typename E> virtual bool decaf::util::LinkedList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList**< **E** > (p. 98).

6.311.3.2 template<typename E> virtual void decaf::util::LinkedList< E >::add (int index , const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1296).

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1296).

Reimplemented from **decaf::util::AbstractSequentialList**< **E** > (p. 114).

6.311.3.3 template<typename E> virtual bool decaf::util::LinkedList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 87).

6.311.3.4 template<typename E> virtual bool decaf::util::LinkedList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1296) (to skip over the added element).

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1296) (to skip over the added element).

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 114).

6.311.3.5 template<typename E> virtual void decaf::util::LinkedList< E >::addFirst (const E & *element*) [inline, virtual]

Inserts an element onto the front of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.

For a capacity restricted **Deque** (p. 926) it is preferable to call offerFirst instead.

Parameters

element	The element to be placed at the front of the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 928).

6.311.3.6 template<typename E> virtual void decaf::util::LinkedList< E >::addLast (const E & *element*) [inline, virtual]

Inserts an element onto the end of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.

For a capacity restricted **Deque** (p. 926) it is preferable to call offerLast instead.

Parameters

element	The element to be placed at the end of the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 928).

Referenced by decaf::util::LinkedList< cms::Connection * >::offer().

6.311.3.7 template<typename E> virtual void decaf::util::LinkedList< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

Referenced by decaf::util::LinkedList< cms::Connection * >::copy(), and decaf::util::LinkedList< cms::Connection * >::operator=().

6.311.3.8 template<typename E> virtual bool decaf::util::LinkedList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

6.311.3.9 template<typename E> virtual void decaf::util::LinkedList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

6.311.3.10 template<typename E> virtual Iterator<E>* decaf::util::LinkedList< E >::descendingIterator ( ) [inline, virtual]

Provides an **Iterator** (p. 1209) over this **Collection** (p. 660) that traverses the element in reverse order.

Returns

a new **Iterator** (p. 1209) instance that moves from last to first.

Implements **decaf::util::Deque< E >** (p. 929).

Referenced by decaf::util::LinkedList< cms::Connection * >::removeLastOccurrence().

6.311.3.11 template<typename E> virtual Iterator<E>* decaf::util::LinkedList< E >::descendingIterator ( ) const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 929).

6.311.3.12 template<typename E> virtual E decaf::util::LinkedList< E >::element ( ) const [inline, virtual]

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

Implements **decaf::util::Queue< E >** (p. 1724).

Referenced by decaf::util::LinkedList< cms::Connection * >::set().

6.311.3.13 template<typename E> virtual E decaf::util::LinkedList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1209) and returns it.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1209) and returns it.

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 115).

6.311.3.14 template<typename E> virtual E& decaf::util::LinkedList< E >::getFirst ( ) [inline, virtual]

Attempts to fetch a reference to the first element in the **Deque** (p. 926).

This method does not remove the element from the **Deque** (p. 926) but simply returns a reference to it.

Returns

reference to the first element in the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implements **decaf::util::Deque< E >** (p. 929).

6.311.3.15 template<typename E> virtual const E& decaf::util::LinkedList< E >::getFirst ( ) const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 930).

6.311.3.16 template<typename E> virtual E& decaf::util::LinkedList< E >::getLast ( ) [inline, virtual]

Attempts to fetch a reference to the last element in the **Deque** (p. 926).

This method does not remove the element from the **Deque** (p. 926) but simply returns a reference to it.

Returns

reference to the last element in the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implements **decaf::util::Deque< E >** (p. 930).

6.311.3.17 template<typename E> virtual const E& decaf::util::LinkedList< E >::getLast ( ) const [inline, virtual]

Implements **decaf::util::Deque< E >** (p. 931).

6.311.3.18 template<typename E> virtual int decaf::util::LinkedList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

Referenced by decaf::util::LinkedList< cms::Connection * >::contains().

6.311.3.19 template<typename E> virtual bool decaf::util::LinkedList< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 1286) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.311.3.20 template<typename E> virtual int decaf::util::LinkedList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 102).

6.311.3.21 template<typename E> virtual ListIterator<E>* decaf::util::LinkedList< E >::listIterator (int *index*) [inline, virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 1286))

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 116).

6.311.3.22 template<typename E> virtual ListIterator<E>* decaf::util::LinkedList< E >::listIterator (int index) const [inline, virtual]

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 117).

6.311.3.23 template<typename E> virtual bool decaf::util::LinkedList< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters

value	the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException	if the **Queue** (p. 1723) implementation does not allow Null values to be inserted into the **Queue** (p. 1723).
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 1724).

6.311.3.24 template<typename E> virtual bool decaf::util::LinkedList< E >::offerFirst (const E & *element*) [inline, virtual]

This method attempts to insert the given element into the **Deque** (p. 926) at the front end.

Unlike the addFirst method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters

element	The element to add to this **Deque** (p. 926).

Returns

true if the element was added, false otherwise.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 931).

6.311.3.25 template<typename E> virtual bool decaf::util::LinkedList< E >::offerLast (const E & *element*) [inline, virtual]

This method attempts to insert the given element into the **Deque** (p. 926) at the end.

Unlike the addLast method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters

element	The element to add to this **Deque** (p. 926).

Returns

true if the element was added, false otherwise.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 931).

6.311.3.26 template<typename E> LinkedList<E>& decaf::util::LinkedList< E >::operator= (const LinkedList< E > & *list*) [inline]

6.311.3.27 template<typename E> LinkedList<E>& decaf::util::LinkedList< E >::operator= (const Collection< E > & *collection*) [inline]

6.311.3.28 template<typename E> virtual bool decaf::util::LinkedList< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 1725).

6.311.3.29 template<typename E> virtual bool decaf::util::LinkedList< E >::peekFirst (E & *value*) const [inline, virtual]

Retrieves the first element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).

If this call is successful it returns true. Unlike getFirst this method does not throw an exception if the **Deque** (p. 926) is empty.

Returns

true if an element was assigned to the reference passed, false otherwise.

Implements **decaf::util::Deque< E >** (p. 932).

6.311.3.30 template<typename E> virtual bool decaf::util::LinkedList< E >::peekLast (E & *value*) const [inline, virtual]

Retrieves the last element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).

If this call is successful it returns true. Unlike getLast this method does not throw an exception if the **Deque** (p. 926) is empty.

Returns

true if an element was assigned to the reference passed, false otherwise.

Implements **decaf::util::Deque< E >** (p. 932).

6.311.3.31 template<typename E> virtual bool decaf::util::LinkedList< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 1723) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue**< **E** > (p. 1725).

6.311.3.32 template<typename E> virtual bool decaf::util::LinkedList< E >::pollFirst (E & *element*) [inline, virtual]

Removes the first element from the **Deque** (p. 926) assigns it to the element reference passed.

Parameters

element	Reference to an variable that can be assigned the value of the head of this **Deque** (p. 926).

Returns

true if an element was available to remove, false otherwise.

Implements **decaf::util::Deque**< **E** > (p. 933).

6.311.3.33 template<typename E> virtual bool decaf::util::LinkedList< E >::pollLast (E & *element*) [inline, virtual]

Removes the last element from the **Deque** (p. 926) assigns it to the element reference passed.

Parameters

element	Reference to an variable that can be assigned the value of the tail of this **Deque** (p. 926).

Returns

true if an element was available to remove, false otherwise.

Implements **decaf::util::Deque**< **E** > (p. 933).

6.311.3.34 template<typename E> virtual E decaf::util::LinkedList< E >::pop ( ) [inline, virtual]

Treats this **Deque** (p. 926) as a stack and attempts to pop an element off the top.

If there's no element to pop then a NuSuchElementException is thrown, otherwise the top element is removed and assigned to the reference passed.

This operation performs the same basic function as the removeFirst method.

Returns

the element at the front of this deque which would be the top of a stack.

Exceptions

NoSuchElementException *(p. 1537)*	if there is nothing on the top of the stack.

Implements **decaf::util::Deque**< **E** > (p. 933).

6.311.3.35 template<typename E> virtual void decaf::util::LinkedList< E >::push (const E & *element*) [inline, virtual]

Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.

This method performs the same basic operation as the addFirst method.

Parameters

element	The element to be pushed onto the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implements **decaf::util::Deque< E >** (p. 934).

6.311.3.36 template<typename E> virtual bool decaf::util::LinkedList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

6.311.3.37 template<typename E> virtual E decaf::util::LinkedList< E >::remove ( ) [inline, virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

Implements **decaf::util::Queue< E >** (p. 1725).

6.311.3.38 template<typename E> virtual E decaf::util::LinkedList< E >::removeFirst ( ) [inline, virtual]

Removes the topmost element from the **Deque** (p. 926) and returns it.

Unlike the pollFirst method this method throws a NuSuchElementException if the **Deque** (p. 926) is empty.

Returns

the element at the Head of the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implements **decaf::util::Deque< E >** (p. 934).

6.311.3.39 template<typename E> virtual bool decaf::util::LinkedList< E >::removeFirstOccurrence (const E & *value*) [inline, virtual]

Removes the first occurrence of the specified element from this **Deque** (p. 926).

If there is no matching element then the **Deque** (p. 926) is left unchanged.

Parameters

value	The value to be removed from this **Deque** (p. 926).

Returns

true if the **Deque** (p. 926) was modified as a result of this operation.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.

Implements **decaf::util::Deque< E >** (p. 935).

Referenced by decaf::util::LinkedList< cms::Connection * >::remove().

6.311.3.40 template<typename E> virtual E decaf::util::LinkedList< E >::removeLast ( ) [inline, virtual]

Removes the last element from the **Deque** (p. 926) and returns it.

Unlike the pollLast method this method throws a NuSuchElementException if the **Deque** (p. 926) is empty.

Returns

the element at the Tail of the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implements **decaf::util::Deque< E >** (p. 935).

6.311.3.41 template<typename E> virtual bool decaf::util::LinkedList< E >::removeLastOccurrence (const E & *value*) [inline, virtual]

Removes the last occurrence of the specified element from this **Deque** (p. 926).

If there is no matching element then the **Deque** (p. 926) is left unchanged.

Parameters

value	The value to be removed from this **Deque** (p. 926).

Returns

true if the **Deque** (p. 926) was modified as a result of this operation.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.

Implements **decaf::util::Deque< E >** (p. 936).

6.311.3.42 template<typename E> virtual E decaf::util::LinkedList< E >::set (int index , const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1209) and replaces it with **ListIterator.set** (p. 1297).

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1209) and replaces it with **ListIterator.set** (p. 1297).

Reimplemented from **decaf::util::AbstractSequentialList< E >** (p. 117).

6.311.3.43 template<typename E> virtual int decaf::util::LinkedList< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

6.311.3.44 template<typename E> virtual std::vector<E> decaf::util::LinkedList< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 94).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**LinkedList.h**

6.312 decaf::util::List< E > Class Template Reference

  Inserts the specified element at the specified position in this list.
- virtual bool **addAll** (int index, **const Collection**< E > &source)=0

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
- virtual E **removeAt** (int index)=0

  Removes the element at the specified position in this list.

6.312.1 Detailed Description

template<typename E>class decaf::util::List< E >

An ordered collection (also known as a sequence).

The user of this interface has precise control over where in the list each element is inserted. The user can access elements by their integer index (position in the list), and search for elements in the list.

Unlike sets, lists typically allow duplicate elements. More formally, lists typically allow pairs of elements e1 and e2 such that e1.equals(e2), and they typically allow multiple null elements if they allow null elements at all. It is not inconceivable that someone might wish to implement a list that prohibits duplicates, by throwing runtime exceptions when the user attempts to insert them, but we expect this usage to be rare.

6.312.2 Constructor & Destructor Documentation

6.312.2.1 template<typename E> decaf::util::List< E >::List ( ) [inline]

6.312.2.2 template<typename E> virtual decaf::util::List< E >::~List ( ) [inline, virtual]

6.312.3 Member Function Documentation

6.312.3.1 template<typename E> virtual void decaf::util::List< E >::add (int *index,* const E & *element*) [pure virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 801), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 801), **decaf::util::StlList< E >** (p. 1970), **decaf::util::ArrayList< E >** (p. 348), **decaf::util::LinkedList< E >** (p. 1272), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1272), **decaf::util::LinkedList< CompositeTask * >** (p. 1272), **decaf::util::LinkedList< URI >** (p. 1272), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1272), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1272), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1272), **decaf::util::LinkedList< Pointer< Command > >** (p. 1272), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1272), **decaf::util::LinkedList< cms::Destination * >** (p. 1272), **decaf::util::LinkedList< cms::Session * >** (p. 1272), **decaf::util::LinkedList< cms::Connection * >** (p. 1272), **decaf::util::AbstractSequentialList< E >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 114), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 114), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 114), **decaf::util::AbstractSequentialList< URI >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 114), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 114), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 114), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 114), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 114), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 114).

6.312.3.2 template<typename E> virtual bool decaf::util::List< E >::addAll (int *index*, const Collection< E > & *source*) [pure virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 802), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 802), **decaf::util::StlList< E >** (p. 1971), **decaf::util::AbstractList< E >** (p. 99), **decaf::util::AbstractList< Pointer< Transport > >** (p. 99), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 99), **decaf::util::AbstractList< CompositeTask * >** (p. 99), **decaf::util::AbstractList< URI >** (p. 99), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 99), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 99), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 99), **decaf::util::AbstractList< Pointer< Command > >** (p. 99), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 99), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 99), **decaf::util::AbstractList< cms::Destination * >** (p. 99), **decaf::util::AbstractList< cms::Session * >** (p. 99), **decaf::util::AbstractList< cms::Connection * >** (p. 99), **decaf::util::ArrayList< E >** (p. 349), **decaf::util::LinkedList< E >** (p. 1273), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1273), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1273), **decaf::util::LinkedList< CompositeTask * >** (p. 1273), **decaf::util::LinkedList< URI >** (p. 1273), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1273), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1273), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1273), **decaf::util::LinkedList< Pointer< Command > >** (p. 1273), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1273), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1273), **decaf::util::LinkedList< cms::Destination * >** (p. 1273), **decaf::util::LinkedList< cms::Session * >** (p. 1273), **decaf::util::LinkedList< cms::Connection * >** (p. 1273), **decaf::util::AbstractSequentialList< E >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 114), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 114), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 114), **decaf::util::AbstractSequentialList< URI >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 114), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 114), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 114), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 114), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 114), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 114), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 114).

6.312.3.3 template<typename E> virtual E decaf::util::List< E >::get (int *index*) const [pure virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 805), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 805), **decaf::util::StlList< E >** (p. 1973), **decaf::util::ArrayList< E >** (p. 351), **decaf::util::LinkedList< E >** (p. 1276), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1276), **decaf::util::LinkedList< CompositeTask * >** (p. 1276), **decaf::util::LinkedList< URI >** (p. 1276), **decaf::util::LinkedList< Pointer< MessageDispatch**

> > (p. 1276), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1276), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1276), **decaf::util::LinkedList< Pointer< Command > >** (p. 1276), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1276), **decaf::util::LinkedList< cms::Destination * >** (p. 1276), **decaf::util::LinkedList< cms::Session * >** (p. 1276), **decaf::util::LinkedList< cms::Connection * >** (p. 1276), **decaf::util::AbstractSequentialList< E >** (p. 115), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 115), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 115), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 115), **decaf::util::AbstractSequentialList< URI >** (p. 115), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 115), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 115), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 115), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 115), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 115), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 115), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 115), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 115), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 115).

6.312.3.4 template<typename E> virtual int decaf::util::List< E >::indexOf (const E & *value*) const [pure virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::StlList< E >** (p. 1974), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 805), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 805), **decaf::util::AbstractList< E >** (p. 100), **decaf::util::AbstractList< Pointer< Transport > >** (p. 100), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 100), **decaf::util::AbstractList< CompositeTask * >** (p. 100), **decaf::util::AbstractList< URI >** (p. 100), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 100), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 100), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 100), **decaf::util::AbstractList< Pointer< Command > >** (p. 100), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 100), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 100), **decaf::util::AbstractList< cms::Destination * >** (p. 100), **decaf::util::AbstractList< cms::Session * >** (p. 100), **decaf::util::AbstractList< cms::Connection * >** (p. 100), **decaf::util::ArrayList< E >** (p. 352), **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.312.3.5 template<typename E> virtual int decaf::util::List< E >::lastIndexOf (const E & *value*) const [pure virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::StlList< E >** (p. 1975), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 806), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 806), **decaf::util::AbstractList< E >** (p. 102), **decaf::util::AbstractList< Pointer< Transport > >** (p. 102), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 102), **decaf::util::AbstractList< CompositeTask * >** (p. 102), **decaf::util::AbstractList< URI >** (p. 102), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 102), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 102), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 102), **decaf::util::AbstractList< Pointer< Command > >** (p. 102), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 102), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 102), **decaf::util::AbstractList< cms::Destination * >** (p. 102), **decaf::util::AbstractList< cms::Session * >** (p. 102), **decaf::util::AbstractList< cms::Connection * >** (p. 102), **decaf::util::ArrayList< E >** (p. 352), **decaf::util::LinkedList< E >** (p. 1278), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), and **decaf::util::LinkedList< cms::Connection * >** (p. 1278).

6.312.3.6 template<typename E> virtual ListIterator<E>* decaf::util::List< E >::listIterator ( ) [pure virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 807), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 807), **decaf::util::AbstractList< E >** (p. 102), **decaf::util::AbstractList< Pointer< Transport > >** (p. 102), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 102), **decaf::util::AbstractList< CompositeTask * >** (p. 102), **decaf::util::AbstractList< URI >** (p. 102), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 102), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 102), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 102), **decaf::util::AbstractList< Pointer< Command > >** (p. 102), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 102), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 102), **decaf::util::AbstractList< cms::Destination * >** (p. 102), **decaf::util::AbstractList< cms::Session * >** (p. 102), **decaf::util::AbstractList< cms::Connection * >** (p. 102), **decaf::util::StlList< E >** (p. 1975), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList<**

CompositeTask ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **URI** > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 116), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **BackupTransport** > > (p. 116), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **cms::Destination** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **cms::Session** ∗ > (p. 116), and **decaf::util::AbstractSequentialList**< **cms::Connection** ∗ > (p. 116).

6.312.3.7 template<typename E> virtual ListIterator<E>∗ decaf::util::List< E >::listIterator ( ) const [pure virtual]

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 807), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** ∗ > (p. 807), **decaf::util::AbstractList**< **E** > (p. 103), **decaf::util::AbstractList**< **Pointer**< **Transport** > > (p. 103), **decaf::util::AbstractList**< **cms::MessageConsumer** ∗ > (p. 103), **decaf::util::AbstractList**< **CompositeTask** ∗ > (p. 103), **decaf::util::AbstractList**< **URI** > (p. 103), **decaf::util::AbstractList**< **Pointer**< **MessageDispatch** > > (p. 103), **decaf::util::AbstractList**< **Pointer**< **DestinationInfo** > > (p. 103), **decaf::util::AbstractList**< **PrimitiveValueNode** > (p. 103), **decaf::util::AbstractList**< **Pointer**< **Command** > > (p. 103), **decaf::util::AbstractList**< **Pointer**< **BackupTransport** > > (p. 103), **decaf::util::AbstractList**< **cms::MessageProducer** ∗ > (p. 103), **decaf::util::AbstractList**< **cms::Destination** ∗ > (p. 103), **decaf::util::AbstractList**< **cms::Session** ∗ > (p. 103), **decaf::util::AbstractList**< **cms::Connection** ∗ > (p. 103), **decaf::util::StlList**< **E** > (p. 1975), **decaf::util::AbstractSequentialList**< **E** > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **Transport** > > (p. 116), **decaf::util::AbstractSequentialList**< **cms::MessageConsumer** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **CompositeTask** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **URI** > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 116), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 116), **decaf::util::AbstractSequentialList**< **Pointer**< **BackupTransport** > > (p. 116), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **cms::Destination** ∗ > (p. 116), **decaf::util::AbstractSequentialList**< **cms::Session** ∗ > (p. 116), and **decaf::util::AbstractSequentialList**< **cms::Connection** ∗ > (p. 116).

6.312.3.8 template<typename E> virtual ListIterator<E>∗ decaf::util::List< E >::listIterator (int *index*) [pure virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 669))

Implemented in **decaf::util::LinkedList**< **E** > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1278), **decaf::util::LinkedList**< **cms::MessageConsumer** ∗ > (p. 1278), **decaf::util::LinkedList**< **CompositeTask** ∗ > (p. 1278), **decaf::util::LinkedList**< **URI** > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1278), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1278), **decaf::util::LinkedList**< **cms::MessageProducer** ∗ > (p. 1278), **decaf::util::LinkedList**< **cms::Destination** ∗ > (p. 1278), **decaf::util::LinkedList**< **cms::Session** ∗ > (p. 1278), **decaf::util::LinkedList**< **cms::Connection** ∗ > (p. 1278), **decaf-**

Implemented in **decaf::util::LinkedList< E >** (p. 1279), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1279), **decaf::util::LinkedList< CompositeTask * >** (p. 1279), **decaf::util::LinkedList< URI >** (p. 1279), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1279), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1279), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1279), **decaf::util::LinkedList< Pointer< Command > >** (p. 1279), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1279), **decaf::util::LinkedList< cms::Destination * >** (p. 1279), **decaf::util::LinkedList< cms::Session * >** (p. 1279), **decaf::util::LinkedList< cms::Connection * >** (p. 1279), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 808), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 808), **decaf::util::AbstractList< E >** (p. 103), **decaf::util::AbstractList< Pointer< Transport > >** (p. 103), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 103), **decaf::util::AbstractList< CompositeTask * >** (p. 103), **decaf::util::AbstractList< URI >** (p. 103), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 103), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 103), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 103), **decaf::util::AbstractList< Pointer< Command > >** (p. 103), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 103), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 103), **decaf::util::AbstractList< cms::Destination * >** (p. 103), **decaf::util::AbstractList< cms::Session * >** (p. 103), **decaf::util::AbstractList< cms::Connection * >** (p. 103), **decaf::util::StlList< E >** (p. 1976), **decaf::util::AbstractSequentialList< E >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 117), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 117), **decaf::util::AbstractSequentialList< URI >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 117), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 117), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 117).

6.312.3.10 template<typename E> virtual E decaf::util::List< E >::removeAt (int *index*) [pure virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 809), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 809), **decaf::util::StlList**< **E** > (p. 1976), **decaf::util::AbstractList**< **E** > (p. 104), **decaf::util::AbstractList**< **Pointer**< **Transport** > > (p. 104), **decaf::util::AbstractList**< **cms::MessageConsumer** * > (p. 104), **decaf::util::AbstractList**< **CompositeTask** * > (p. 104), **decaf::util::AbstractList**< **URI** > (p. 104), **decaf::util::AbstractList**< **Pointer**< **MessageDispatch** > > (p. 104), **decaf::util::AbstractList**< **Pointer**< **DestinationInfo** > > (p. 104), **decaf::util::AbstractList**< **PrimitiveValueNode** > (p. 104), **decaf::util::AbstractList**< **Pointer**< **Command** > > (p. 104), **decaf::util::AbstractList**< **Pointer**< **BackupTransport** > > (p. 104), **decaf::util::AbstractList**< **cms::MessageProducer** * > (p. 104), **decaf::util::AbstractList**< **cms::Destination** * > (p. 104), **decaf::util::AbstractList**< **cms::Session** * > (p. 104), **decaf::util::AbstractList**< **cms::Connection** * > (p. 104), **decaf::util::ArrayList**< **E** > (p. 353), **decaf::util::AbstractSequentialList**< **E** > (p. 117), **decaf::util::AbstractSequentialList**< **Pointer**< **Transport** > > (p. 117), **decaf::util::AbstractSequentialList**< **cms::MessageConsumer** * > (p. 117), **decaf::util::AbstractSequentialList**< **CompositeTask** * > (p. 117), **decaf::util::AbstractSequentialList**< **URI** > (p. 117), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 117), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 117), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 117), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 117), **decaf::util::AbstractSequentialList**< **Pointer**< **BackupTransport** > > (p. 117), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** * > (p. 117), **decaf::util::AbstractSequentialList**< **cms::Destination** * > (p. 117), **decaf::util::AbstractSequentialList**< **cms::Session** * > (p. 117), and **decaf::util::AbstractSequentialList**< **cms::Connection** * > (p. 117).

6.312.3.11 template<typename E> virtual E decaf::util::List< E >::set (int *index*, const E & *element*) [pure virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 810), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 810), **decaf::util::StlList< E >** (p. 1977), **decaf::util::ArrayList< E >** (p. 354), **decaf::util::LinkedList< E >** (p. 1285), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1285), **decaf::util::LinkedList< CompositeTask * >** (p. 1285), **decaf::util::LinkedList< URI >** (p. 1285), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1285), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1285), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1285), **decaf::util::LinkedList< Pointer< Command > >** (p. 1285), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1285), **decaf::util::LinkedList< cms::Destination * >** (p. 1285), **decaf::util::LinkedList< cms::Session * >** (p. 1285), **decaf::util::LinkedList< cms::Connection * >** (p. 1285), **decaf::util::AbstractSequentialList< E >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 117), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 117), **decaf::util::AbstractSequentialList< URI >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 117), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 117), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 117).

6.313 decaf::util::ListIterator< E > Class Template Reference

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

`#include <src/main/decaf/util/ListIterator.h>`

Inheritance diagram for decaf::util::ListIterator< E >:

Public Member Functions

- virtual ~**ListIterator** ()
- virtual void **add** (**const** E &e)=0

  Inserts the specified element into the list (optional operation).
- virtual void **set** (**const** E &e)=0

  Replaces the last element returned by next or previous with the specified element (optional operation).
- virtual bool **hasPrevious** () **const** =0

  Returns true if this list iterator has more elements when traversing the list in the reverse direction.
- virtual E **previous** ()=0

  Returns the previous element in the list.
- virtual int **nextIndex** () **const** =0

  Returns the index of the element that would be returned by a subsequent call to next.
- virtual int **previousIndex** () **const** =0

  Returns the index of the element that would be returned by a subsequent call to previous.

6.313.1 Detailed Description

template<typename E>class decaf::util::ListIterator< E >

An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.

Note that the **remove()** (p. 1210) and set(Object) methods are not defined in terms of the cursor position; they are defined to operate on the last element returned by a call to **next()** (p. 1209) or **previous()** (p. 1296).

6.313.2 Constructor & Destructor Documentation

6.313.2.1 template<typename E > virtual decaf::util::ListIterator< E >::~ListIterator ( ) [inline, virtual]

6.313.3 Member Function Documentation

6.313.3.1 template<typename E > virtual void decaf::util::ListIterator< E >::add (const E & *e*) [pure virtual]

Inserts the specified element into the list (optional operation).

The element is inserted immediately before the next element that would be returned by next, if any, and after the next element that would be returned by previous, if any. (If the list contains no elements, the new element becomes the sole element on the list.) The new element is inserted before the implicit cursor: a subsequent call to next would be unaffected, and a subsequent call to previous would return the new element. (This call increases by one the value that would be returned by a call to nextIndex or previousIndex.)

Parameters

e	The element to insert into the **List** (p. 1286).

Exceptions

UnsupportedOperation-Exception	if the add method is not supported by this list iterator.
IllegalArgumentException	if some aspect of this element prevents it from being added to this list.

6.313.3.2 template<typename E > virtual bool decaf::util::ListIterator< E >::hasPrevious ( ) const [pure virtual]

Returns true if this list iterator has more elements when traversing the list in the reverse direction.

(In other words, returns true if previous would return an element rather than throwing an exception.)

Returns

true if the list iterator has more elements when traversing the list in the reverse direction.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 356).

6.313.3.3 template<typename E > virtual int decaf::util::ListIterator< E >::nextIndex ( ) const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to next.

(Returns list size if the list iterator is at the end of the list.)

Returns

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 357).

6.313.3.4 template<typename E > virtual E decaf::util::ListIterator< E >::previous ( ) [pure virtual]

Returns the previous element in the list.

This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns

the previous element in the list.

Exceptions

NoSuchElementException *(p. 1537)*	if the iteration has no previous element.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 357).

6.313.3.5 template<typename E > virtual int decaf::util::ListIterator< E >::previousIndex ( ) const [pure virtual]

Returns the index of the element that would be returned by a subsequent call to previous.

(Returns -1 if the list iterator is at the beginning of the list.)

Returns

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator** (p. 357).

6.313.3.6 template<typename E > virtual void decaf::util::ListIterator< E >::set (const E & *e*) [pure virtual]

Replaces the last element returned by next or previous with the specified element (optional operation).

This call can be made only if neither **ListIterator.remove** (p. 1210) nor **ListIterator.add** (p. 1296) have been called after the last call to next or previous.

Parameters

e	The element with which to replace the last element returned by next or previous.

Exceptions

UnsupportedOperation-Exception	if the add method is not supported by this list iterator.
IllegalArgumentException	if some aspect of this element prevents it from being added to this list.
IllegalStateException	if neither next nor previous have been called, or remove or add have been called after the last call to next or previous.

6.314.1 Member Typedef Documentation

6.314.1.1 typedef decaf::lang::PointerComparator<LocalTransactionId> activemq::commands::LocalTransactionId::COMPARATOR

Reimplemented from **activemq::commands::TransactionId** (p. 2143).

6.314.2 Constructor & Destructor Documentation

6.314.2.1 activemq::commands::LocalTransactionId::LocalTransactionId ( )

6.314.2.2 activemq::commands::LocalTransactionId::LocalTransactionId (const LocalTransactionId & *other*)

6.314.2.3 virtual activemq::commands::LocalTransactionId::~LocalTransactionId ( ) [virtual]

6.314.3 Member Function Documentation

6.314.3.1 virtual LocalTransactionId* activemq::commands::LocalTransactionId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.314.3.2 virtual int activemq::commands::LocalTransactionId::compareTo (const LocalTransactionId & *value*) const [virtual]

6.314.3.3 virtual void activemq::commands::LocalTransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.314.3.4 virtual bool activemq::commands::LocalTransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.314.3.5 virtual bool activemq::commands::LocalTransactionId::equals (const LocalTransactionId & *value*) const [virtual]

6.314.3.6 virtual const Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId ( ) const [virtual]

6.314.3.7 virtual Pointer<ConnectionId>& activemq::commands::LocalTransactionId::getConnectionId ( ) [virtual]

6.314.3.8 virtual unsigned char activemq::commands::LocalTransactionId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.314.3.9 virtual long long activemq::commands::LocalTransactionId::getValue ( ) const [virtual]

6.314.3.10 virtual bool activemq::commands::LocalTransactionId::isLocalTransactionId ( ) const [inline, virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.314.3.11 virtual bool activemq::commands::LocalTransactionId::operator< (const LocalTransactionId & *value*) const [virtual]

6.314.3.12 LocalTransactionId& activemq::commands::LocalTransactionId::operator= (const LocalTransactionId & *other*)

6.314.3.13 virtual bool activemq::commands::LocalTransactionId::operator== (const LocalTransactionId & *value*) const [virtual]

6.314.3.14 virtual void activemq::commands::LocalTransactionId::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.314.3.15 virtual void activemq::commands::LocalTransactionId::setValue (long long *value*) [virtual]

6.314.3.16 virtual std::string activemq::commands::LocalTransactionId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.314.4 Field Documentation

6.314.4.1 Pointer<ConnectionId> activemq::commands::LocalTransactionId::connectionId [protected]

6.314.4.2 const unsigned char activemq::commands::LocalTransactionId::ID_LOCALTRANSACTIONID = 111 [static]

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.315.1 Detailed Description

Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1301).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.315.2 Constructor & Destructor Documentation

6.315.2.1 activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::LocalTransactionIdMarshaller ( ) [inline]

6.315.2.2 virtual activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::~LocalTransactionIdMarshaller ( ) [inline, virtual]

6.315.3 Member Function Documentation

6.315.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.315.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.315.3.3 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2146).

6.315.3.4 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2147).

6.315.3.5 virtual int activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2147).

6.315.3.6 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2148).

6.315.3.7 virtual void activemq::wireformat::openwire::marshal::generated::LocalTransactionId-Marshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2148).

The documentation for this class was generated from the following file:

6.316 decaf::util::concurrent::Lock Class Reference

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

`#include <src/main/decaf/util/concurrent/Lock.h>`

Public Member Functions

- **Lock** (**Synchronizable** *object, **const** bool intiallyLocked=true)

  Constructor - initializes the object member and locks the object if desired.
- virtual ~**Lock** ()

  Destructor - Unlocks the object if it is locked.
- void **lock** ()

  Locks the object.
- void **unlock** ()

  Unlocks the object if it is already locked, otherwise a call to this method has no effect.
- bool **isLocked** () **const**

  Indicates whether or not the object is locked.

6.316.1 Detailed Description

A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.

Since

1.0

6.316.2 Constructor & Destructor Documentation

6.316.2.1 decaf::util::concurrent::Lock::Lock (Synchronizable * *object*, const bool *intiallyLocked* = true)

Constructor - initializes the object member and locks the object if desired.

Parameters

object	The sync object to control
intiallyLocked	If true, the object will automatically be locked.

6.316.2.2 virtual decaf::util::concurrent::Lock::~Lock ( ) [virtual]

Destructor - Unlocks the object if it is locked.

6.316.3 Member Function Documentation

6.316.3.1 bool decaf::util::concurrent::Lock::isLocked ( ) const [inline]

Indicates whether or not the object is locked.

Returns

true if the object is locked, otherwise false.

6.316.3.2 void decaf::util::concurrent::Lock::lock ( )

Locks the object.

6.316.3.3 void decaf::util::concurrent::Lock::unlock ( )

Unlocks the object if it is already locked, otherwise a call to this method has no effect.

The documentation for this class was generated from the following file:

6.317 decaf::util::concurrent::locks::Lock Class Reference

Lock (p. 1305) implementations provide more extensive locking operations than can be obtained using synchronized statements.

`#include <src/main/decaf/util/concurrent/locks/Lock.h>`

Inheritance diagram for decaf::util::concurrent::locks::Lock:

Public Member Functions

- virtual ~**Lock** ()
- virtual void **lock** ()=0

  Acquires the lock.
- virtual void **lockInterruptibly** ()=0

  Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** ()=0

  Acquires the lock only if it is free at the time of invocation.
- virtual bool **tryLock** (long long time, **const TimeUnit** &unit)=0

  Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** ()=0

  Releases the lock.
- virtual **Condition** * **newCondition** ()=0

  *Returns a new **Condition** (p. 715) instance that is bound to this **Lock** (p. 1305) instance.*

6.317.1 Detailed Description

Lock (p. 1305) implementations provide more extensive locking operations than can be obtained using synchronized statements.

They allow more flexible structuring, may have quite different properties, and may support multiple associated **Condition** (p. 715) objects.

A lock is a tool for controlling access to a shared resource by multiple threads. Commonly, a lock provides exclusive access to a shared resource: only one thread at a time can acquire the lock and all access to the shared resource requires that the lock be acquired first. However, some locks may allow concurrent access to a shared resource, such as the read lock of a **ReadWriteLock** (p. 1741).

While the scoping mechanism for synchronized statements makes it much easier easier to program with monitor locks, and helps avoid many common programming errors involving locks, there are occasions where you need to work with locks in a more flexible way. For example, some algorithms for traversing concurrently accessed data structures require the use of "hand-over-hand" or "chain locking": you acquire the lock of node A, then node B, then release A and acquire C, then release B and acquire D and so on. Implementations of the **Lock** (p. 1305) interface enable the use of such techniques by allowing a lock to be acquired and released in different scopes, and allowing multiple locks to be acquired and released in any order.

With this increased flexibility comes additional responsibility. The absence of block-structured locking removes the automatic release of locks that occurs with synchronized statements. In most cases, the following idiom should be used:

Lock (p. 1305) l = ...; l.lock(); try { // access the resource protected by this lock } catch(...) { l.unlock(); }

When locking and unlocking occur in different scopes, care must be taken to ensure that all code that is executed while the lock is held is protected by try-catch ensure that the lock is released when necessary.

Lock (p. 1305) implementations provide additional functionality over the use of synchronized methods and statements by providing a non-blocking attempt to acquire a lock (**tryLock()** (p. 1308)), an attempt to acquire the lock that can be interrupted (**lockInterruptibly()** (p. 1307), and an attempt to acquire the lock that can timeout (tryLock(long, TimeUnit)).

Note that **Lock** (p. 1305) instances are just normal objects and can themselves be used as the target in a synchronized statement.

The three forms of lock acquisition (interruptible, non-interruptible, and timed) may differ in their performance characteristics, ordering guarantees, or other implementation qualities. Further, the ability to interrupt the ongoing acquisition of a lock may not be available in a given **Lock** (p. 1305) class. Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of lock acquisition, nor is it required to support interruption of an ongoing lock acquisition. An implementation is required to clearly document the semantics and guarantees provided by each of the locking methods. It must also obey the interruption semantics as

defined in this interface, to the extent that interruption of lock acquisition is supported: which is either totally, or only on method entry.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.317.2 Constructor & Destructor Documentation

6.317.2.1 virtual decaf::util::concurrent::locks::Lock::~Lock ( ) [inline, virtual]

6.317.3 Member Function Documentation

6.317.3.1 virtual void decaf::util::concurrent::locks::Lock::lock ( ) [pure virtual]

Acquires the lock.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired.

Implementation Considerations

A **Lock** (p. 1305) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1305) implementation.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1752).

6.317.3.2 virtual void decaf::util::concurrent::locks::Lock::lockInterruptibly ( ) [pure virtual]

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is available and returns immediately.

If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

- The lock is acquired by the current thread; or
  - Some other thread interrupts the current thread, and interruption of lock acquisition is supported.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return.

A **Lock** (p. 1305) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1305) implementation.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.
InterruptedException	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1752).

6.317.3.3 virtual Condition* decaf::util::concurrent::locks::Lock::newCondition ( ) [pure virtual]

Returns a new **Condition** (p. 715) instance that is bound to this **Lock** (p. 1305) instance.

Before waiting on the condition the lock must be held by the current thread. A call to **Condition.await()** (p. 717) will atomically release the lock before waiting and re-acquire the lock before the wait returns.

Implementation Considerations

The exact operation of the **Condition** (p. 715) instance depends on the **Lock** (p. 1305) implementation and must be documented by that implementation.

Returns

A new **Condition** (p. 715) instance for this **Lock** (p. 1305) instance the caller must delete the returned **Condition** (p. 715) object when done with it.

Exceptions

RuntimeException	if an error occurs while creating the **Condition** (p. 715).
UnsupportedOperationException	if this **Lock** (p. 1305) implementation does not support conditions

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1752).

6.317.3.4 virtual bool decaf::util::concurrent::locks::Lock::tryLock ( ) [pure virtual]

Acquires the lock only if it is free at the time of invocation.

Acquires the lock if it is available and returns immediately with the value true. If the lock is not available then this method will return immediately with the value false.

A typical usage idiom for this method would be:

Lock (p. 1305) lock = ...; if (lock.tryLock()) { try { // manipulate protected state } catch(...) { lock.unlock(); } } else { // perform alternative actions }

This usage ensures that the lock is unlocked if it was acquired, and doesn't try to unlock if the lock was not acquired.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException	if an error occurs while acquiring the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1753).

6.317.3.5 virtual bool decaf::util::concurrent::locks::Lock::tryLock (long long *time,* const TimeUnit & *unit*) [pure virtual]

Acquires the lock if it is free within the given waiting time and the current thread has not been interrupted.

If the lock is available this method returns immediately with the value true. If the lock is not available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- The lock is acquired by the current thread; or
  - Some other thread interrupts the current thread, and interruption of lock acquisition is supported; or
  - The specified waiting time elapses

If the lock is acquired then the value true is returned.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while acquiring the lock, and interruption of lock acquisition is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Implementation Considerations

The ability to interrupt a lock acquisition in some implementations may not be possible, and if possible may be an expensive operation. The programmer should be aware that this may be the case. An implementation should document when this is the case.

An implementation can favor responding to an interrupt over normal method return, or reporting a timeout.

A **Lock** (p. 1305) implementation may be able to detect erroneous use of the lock, such as an invocation that would cause deadlock, and may throw an (unchecked) exception in such circumstances. The circumstances and the exception type must be documented by that **Lock** (p. 1305) implementation.

Parameters

time	the maximum time to wait for the lock
unit	the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException	if an error occurs while acquiring the lock.
InterruptedException	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1754).

6.317.3.6 virtual void decaf::util::concurrent::locks::Lock::unlock ( ) [pure virtual]

Releases the lock.

Implementation Considerations

A **Lock** (p. 1305) implementation will usually impose restrictions on which thread can release a lock (typically only the holder of the lock can release it) and may throw an exception if the restriction is violated. Any restrictions and the exception type must be documented by that **Lock** (p. 1305) implementation.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.
IllegalMonitorState-Exception	if the current thread is not the owner of the lock.

Implemented in **decaf::util::concurrent::locks::ReentrantLock** (p. 1754).

The documentation for this class was generated from the following file:

6.318 decaf::util::concurrent::locks::LockSupport Class Reference

Basic thread blocking primitives for creating locks and other synchronization classes.

`#include <src/main/decaf/util/concurrent/locks/LockSupport.h>`

Public Member Functions

- ~**LockSupport** ()

Static Public Member Functions

- static void **unpark** (**decaf::lang::Thread** *thread) throw ()

  Makes available the permit for the given thread, if it was not already available.
- static void **park** () throw ()

  Disables the current thread for thread scheduling purposes unless the permit is available.
- static void **parkNanos** (long long nanos) throw ()

  Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.
- static void **parkUntil** (long long deadline) throw ()

  Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

6.318.1 Detailed Description

Basic thread blocking primitives for creating locks and other synchronization classes.

This class associates, with each thread that uses it, a permit (in the sense of the **Semaphore** (p. 1807) class). A call to park will return immediately if the permit is available, consuming it in the process; otherwise it may block. A call to unpark makes the permit available, if it was not already available. (Unlike with Semaphores though, permits do not accumulate. There is at most one.)

Methods park and unpark provide efficient means of blocking and unblocking threads Races between one thread invoking park and another thread trying to unpark it will preserve liveness, due to the permit. Additionally, park will return if the caller's thread was interrupted, and timeout versions are supported. The park method may also return

at any other time, for "no reason", so in general must be invoked within a loop that rechecks conditions upon return. In this sense park serves as an optimization of a "busy wait" that does not waste as much time spinning, but must be paired with an unpark to be effective.

These methods are designed to be used as tools for creating higher-level synchronization utilities, and are not in themselves useful for most concurrency control applications. The park method is designed for use only in constructions of the form:

while (!canProceed()) { ... LockSupport.park(this); }

where neither canProceed nor any other actions prior to the call to park entail locking or blocking. Because only one permit is associated with each thread, any intermediary uses of park could interfere with its intended effects.

Sample Usage. Here is a sketch of a first-in-first-out non-reentrant lock class:

class FIFOMutex { private:

AtomicBoolean locked; ConcurrentLinkedQueue<Thread*> waiters;

public:

void lock() {

bool wasInterrupted = false; Thread* current = Thread::currentThread(); waiters.add(current);

// Block while not first in queue or cannot acquire lock while(waiters.peek() != current || !locked.compareAndSet(false, true)) {

LockSupport.park(this); if(Thread::interrupted()) // ignore interrupts while waiting wasInterrupted = true; }

waiters.remove(); if(wasInterrupted) // reassert interrupt status on exit current.interrupt(); }

void unlock() { locked.set(false); **LockSupport.unpark** (p. 1312)(waiters.peek()); } };

Since

1.0

6.318.2 Constructor & Destructor Documentation

6.318.2.1 decaf::util::concurrent::locks::LockSupport::~LockSupport ( )

6.318.3 Member Function Documentation

6.318.3.1 static void decaf::util::concurrent::locks::LockSupport::park ( ) throw () [static]

Disables the current thread for thread scheduling purposes unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- Some other thread invokes unpark with the current thread as the target; or
  - Some other thread interrupts the current thread; or
  - The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread upon return.

6.318.3.2 static void decaf::util::concurrent::locks::LockSupport::parkNanos (long long *nanos*) throw () [static]

Disables the current thread for thread scheduling purposes, for up to the specified waiting time, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- Some other thread invokes unpark with the current thread as the target; or
  - Some other thread interrupts the current thread; or
  - The specified waiting time elapses; or
  - The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the elapsed time upon return.

Parameters

nanos	the maximum number of nanoseconds to wait

6.318.3.3 static void decaf::util::concurrent::locks::LockSupport::parkUntil (long long *deadline*) throw () [static]

Disables the current thread for thread scheduling purposes, until the specified deadline, unless the permit is available.

If the permit is available then it is consumed and the call returns immediately; otherwise the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- Some other thread invokes unpark with the current thread as the target; or
  - Some other thread interrupts the current thread; or
  - The specified deadline passes; or
  - The call spuriously (that is, for no reason) returns.

This method does not report which of these caused the method to return. Callers should re-check the conditions which caused the thread to park in the first place. Callers may also determine, for example, the interrupt status of the thread, or the current time upon return.

Parameters

deadline	the absolute time, in milliseconds from the Epoch, to wait until

6.318.3.4 static void decaf::util::concurrent::locks::LockSupport::unpark (decaf::lang::Thread * *thread*) throw () [static]

Makes available the permit for the given thread, if it was not already available.

If the thread was blocked on park then it will unblock. Otherwise, its next call to park is guaranteed not to block. This operation is not guaranteed to have any effect at all if the given thread has not been started.

Parameters

thread	the thread to unport, or NULL in which case the method has no effect.

The documentation for this class was generated from the following file:

  *Log a FINEST **Level** (p. 1253) Log.*
- virtual void **throwing** (**const** std::string &file, **const** int line, **const** std::string functionName, **const decaf::lang::Throwable** &thrown)

  Log throwing an exception.
- virtual bool **isLoggable** (**const Level** &level) **const**

  Check if a message of the given level would actually be logged by this logger.
- virtual void **log** (**LogRecord** &record)

  *Log a **LogRecord** (p. 1333).*
- virtual void **log** (**const Level** &level, **const** std::string &message)

  Log a message, with no arguments.
- virtual void **log** (**const Level** &levels, **const** std::string &file, **const** int line, **const** std::string &message,...)

  Log a message, with the list of params that is formatted into the message string.
- virtual void **log** (**const Level** &level, **const** std::string &file, **const** int line, **const** std::string &message, **lang::Exception** &ex)

  Log a message, with associated Throwable information.

Static Public Member Functions

- static **Logger** * **getAnonymousLogger** ()

  Creates an anonymous logger.
- static **Logger** * **getLogger** (**const** std::string &name)

  Find or create a logger for a named subsystem.

Protected Member Functions

- **Logger** (**const** std::string &name)

  *Creates a new instance of the **Logger** (p. 1312) with the given name.*

6.319.1 Detailed Description

A **Logger** (p. 1312) object is used to log messages for a specific system or application component.

Loggers are normally named, using a hierarchical dot-separated namespace. **Logger** (p. 1312) names can be arbitrary strings, but they should normally be based on the namespace or class name of the logged component, such as **decaf.net** (p. 73) or org.apache.decaf. In addition it is possible to create "anonymous" Loggers that are not stored in the **Logger** (p. 1312) namespace.

Logger (p. 1312) objects may be obtained by calls on one of the getLogger factory methods. These will either create a new **Logger** (p. 1312) or return a suitable existing **Logger** (p. 1312).

Logging messages will be forwarded to registered **Handler** (p. 1085) objects, which can forward the messages to a variety of destinations, including consoles, files, OS logs, etc.

Each **Logger** (p. 1312) keeps track of a "parent" **Logger** (p. 1312), which is its nearest existing ancestor in the **Logger** (p. 1312) namespace.

Each **Logger** (p. 1312) has a "Level" associated with it. This reflects a minimum **Level** (p. 1253) that this logger cares about. If a **Logger** (p. 1312)'s level is set to **Level::INHERIT** (p. 1257), then its effective level is inherited from its parent, which may in turn obtain it recursively from its parent, and so on up the tree.

The log level can be configured based on the properties from the logging configuration file, as described in the description of the **LogManager** (p. 1327) class. However it may also be dynamically changed by calls on the **Logger.setLevel** (p. 1321) method. If a logger's level is changed the change may also affect child loggers, since any child logger that has 'inherit' as its level will inherit its effective level from its parent.

On each logging call the **Logger** (p. 1312) initially performs a cheap check of the request level (e.g. SEVERE or FINE) against the effective log level of the logger. If the request level is lower than the log level, the logging call returns immediately.

After passing this initial (cheap) test, the **Logger** (p. 1312) will allocate a **LogRecord** (p. 1333) to describe the logging message. It will then call a **Filter** (p. 1031) (if present) to do a more detailed check on whether the record should be published. If that passes it will then publish the **LogRecord** (p. 1333) to its output Handlers. By default, loggers also publish to their parent's Handlers, recursively up the tree.

Formatting is the responsibility of the output **Handler** (p. 1085), which will typically call a **Formatter** (p. 1074).

Note that formatting need not occur synchronously. It may be delayed until a **LogRecord** (p. 1333) is actually written to an external sink.

All methods on **Logger** (p. 1312) are thread safe.

Since

1.0

6.319.2 Constructor & Destructor Documentation

6.319.2.1 decaf::util::logging::Logger::Logger (const std::string & *name*) [protected]

Creates a new instance of the **Logger** (p. 1312) with the given name.

The logger will be initially configured with a null **Level** (p. 1253) and with useParentHandlers true.

Parameters

name	A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as **decaf.net** (p. 73) or org.apache.-decaf. It may be empty for anonymous Loggers.

6.319.2.2 virtual decaf::util::logging::Logger::~Logger ( ) [virtual]

6.319.3 Member Function Documentation

6.319.3.1 void decaf::util::logging::Logger::addHandler (Handler * *handler*)

Add a log **Handler** (p. 1085) to receive logging messages.

By default, Loggers also send their output to their parent logger. Typically the root **Logger** (p. 1312) is configured with a set of Handlers that essentially act as default handlers for all loggers.

The ownership of the given **Handler** (p. 1085) is passed to the **Logger** (p. 1312) and the **Handler** (p. 1085) will be deleted when this **Logger** (p. 1312) is destroyed unless the caller first calls removeHandler with the same pointer value as was originally given.

Parameters

handler	A Logging **Handler** (p. 1085)

Exceptions

NullPointerException	if the **Handler** (p. 1085) given is NULL.

6.319.3.2 virtual void decaf::util::logging::Logger::config (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a CONFIG **Level** (p. 1253) Log.

If the logger is currently enabled for the CONFIG message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.3 virtual void decaf::util::logging::Logger::debug (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a DEBUG **Level** (p. 1253) Log.

If the logger is currently enabled for the DEBUG message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.4 virtual void decaf::util::logging::Logger::entering (const std::string & *blockName,* const std::string & *file,* const int *line*) [virtual]

Logs an Block Enter message.

This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 1256) log level.

Parameters

blockName	The source block name, (usually ClassName::MethodName, or MethodName).
file	The source file name where this method was called from.
line	The source line number where this method was called from.

6.319.3.5 virtual void decaf::util::logging::Logger::exiting (const std::string & *blockName,* const std::string & *file,* const int *line*) [virtual]

Logs an Block Exit message.

This is a convenience method that is used to tag a block enter, a log record with the given information is logged at the **Level::FINER** (p. 1256) log level.

Parameters

blockName	The source block name, (usually ClassName::MethodName, or MethodName).
file	The source file name where this method was called from.
line	The source line number where this method was called from.

6.319.3.6 virtual void decaf::util::logging::Logger::fine (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a FINE **Level** (p. 1253) Log.

If the logger is currently enabled for the FINE message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.7 virtual void decaf::util::logging::Logger::finer (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a FINER **Level** (p. 1253) Log.

If the logger is currently enabled for the FINER message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.8 virtual void decaf::util::logging::Logger::finest (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a FINEST **Level** (p. 1253) Log.

If the logger is currently enabled for the FINEST message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.9 static Logger* decaf::util::logging::Logger::getAnonymousLogger ( ) [static]

Creates an anonymous logger.

The newly created **Logger** (p. 1312) is not registered in the **LogManager** (p. 1327) namespace. There will be no access checks on updates to the logger. Even although the new logger is anonymous, it is configured to have the root logger ("") as its parent. This means that by default it inherits its effective level and handlers from the root logger.

The caller is responsible for destroying the returned logger.

Returns

Newly created anonymous logger

6.319.3.10 const Filter* decaf::util::logging::Logger::getFilter ( ) const [inline]

Gets the **Filter** (p. 1031) object that this class is using.

Returns

the **Filter** (p. 1031) in use, (can be NULL).

6.319.3.11 const std::list<Handler*>& decaf::util::logging::Logger::getHandlers ( ) const

Gets a vector containing all the handlers that this class has been assigned to use.

Returns

a list of handlers that are used by this logger

6.319.3.12 Level decaf::util::logging::Logger::getLevel ( ) const [inline]

Get the log **Level** (p. 1253) that has been specified for this **Logger** (p. 1312).

The result may be the INHERIT level, which means that this logger's effective level will be inherited from its parent.

Returns

the level that is currently set

6.319.3.13 static Logger* decaf::util::logging::Logger::getLogger (const std::string & *name*) [static]

Find or create a logger for a named subsystem.

If a logger has already been created with the given name it is returned. Otherwise a new logger is created.

If a new logger is created its log level will be configured based on the **LogManager** (p. 1327) and it will configured to also send logging output to its parent loggers Handlers. It will be registered in the **LogManager** (p. 1327) global namespace.

Parameters

name	- A name for the logger. This should be a dot-separated name and should normally be based on the package name or class name of the subsystem, such as cms or **activemq.core.ActiveMQConnection** (p. 145)

Returns

a suitable logger.

6.319.3.14 const std::string& decaf::util::logging::Logger::getName ( ) const [inline]

Gets the name of this **Logger** (p. 1312).

Returns

logger name

6.319.3.15 Logger* decaf::util::logging::Logger::getParent ( ) const [inline]

Gets the parent of this **Logger** (p. 1312) which will be the nearest existing **Logger** (p. 1312) in this Loggers namespace.

If this is the Root **Logger** (p. 1312) than this method returns NULL.

Returns

Pointer to this Loggers nearest parent **Logger** (p. 1312).

6.319.3.16 bool decaf::util::logging::Logger::getUseParentHandlers ( ) const [inline]

Discover whether or not this logger is sending its output to its parent logger.

Returns

true if using Parent Handlers

6.319.3.17 virtual void decaf::util::logging::Logger::info (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a INFO **Level** (p. 1253) Log.

If the logger is currently enabled for the INFO message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.18 virtual bool decaf::util::logging::Logger::isLoggable (const Level & *level*) const [virtual]

Check if a message of the given level would actually be logged by this logger.

This check is based on the Loggers effective level, which may be inherited from its parent.

Parameters

level	- a message logging level

Returns

true if the given message level is currently being logged.

6.319.3.19 virtual void decaf::util::logging::Logger::log (LogRecord & *record*) [virtual]

Log a **LogRecord** (p. 1333).

All the other logging methods in this class call through this method to actually perform any logging. Subclasses can override this single method to capture all log activity.

Parameters

record	- the **LogRecord** (p. 1333) to be published

6.319.3.20 virtual void decaf::util::logging::Logger::log (const Level & *level,* const std::string & *message*) [virtual]

Log a message, with no arguments.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects

Parameters

level	the **Level** (p. 1253) to log at
message	the message to log

6.319.3.21 virtual void decaf::util::logging::Logger::log (const Level & *levels,* const std::string & *file,* const int *line,* const std::string & *message,* ...) [virtual]

Log a message, with the list of params that is formatted into the message string.

If the logger is currently enabled for the given message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects

Parameters

level	the **Level** (p. 1253) to log at
file	the message to log
line	the line in the file
...	variable length argument to format the message string.

6.319.3.22 virtual void decaf::util::logging::Logger::log (const Level & *level,* const std::string & *file,* const int *line,* const std::string & *message,* lang::Exception & *ex*) [virtual]

Log a message, with associated Throwable information.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 1333) which is forwarded to all registered output handlers. Note that the thrown argument is stored in the **LogRecord** (p. 1333) thrown property, rather than the **LogRecord** (p. 1333) parameters property. Thus is it processed specially by output Formatters and is not treated as a formatting parameter to the **LogRecord** (p. 1333) message

property.

Parameters

level	the **Level** (p. 1253) to log at.
file	File that the message was logged in.
line	the line number where the message was logged at.
message	the message to log.
ex	the Exception to log

6.319.3.23 void decaf::util::logging::Logger::removeHandler (Handler * *handler*)

Removes the specified **Handler** (p. 1085) from this logger, ownership of the **Handler** (p. 1085) pointer is returned to the caller.

Returns silently if the given **Handler** (p. 1085) is not found.

Parameters

handler	The **Handler** (p. 1085) to remove

6.319.3.24 void decaf::util::logging::Logger::setFilter (Filter * *filter*)

Set (p. 1857) a filter to control output on this **Logger** (p. 1312).

After passing the initial "level" check, the **Logger** (p. 1312) will call this **Filter** (p. 1031) to check if a log record should really be published.

The caller releases ownership of this filter to this logger

Parameters

filter	The **Filter** (p. 1031) to use, (can be NULL).

6.319.3.25 void decaf::util::logging::Logger::setLevel (const Level & *level*) [inline]

Set (p. 1857) the log level specifying which message levels will be logged by this logger.

Message levels lower than this value will be discarded. The level value **Level::OFF** (p. 1257) can be used to turn off logging.

If the new level is the INHERIT **Level** (p. 1253), it means that this node should inherit its level from its nearest ancestor with a specific (non-INHERIT) level value.

Parameters

level	The new **Level** (p. 1253) value to use when logging.

6.319.3.26 void decaf::util::logging::Logger::setParent (Logger * *parent*) [inline]

Set (p. 1857) the parent for this **Logger** (p. 1312).

This method is used by the **LogManager** (p. 1327) to update a **Logger** (p. 1312) when the namespace changes.

It should not be called from application code.

6.319.3.27 void decaf::util::logging::Logger::setUseParentHandlers (bool *value*) [inline]

Specify whether or not this logger should send its output to it's parent **Logger** (p. 1312).

This means that any LogRecords will also be written to the parent's Handlers, and potentially to its parent, recursively up the namespace.

Parameters

value	True is output is to be written to the parent

6.319.3.28 virtual void decaf::util::logging::Logger::severe (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a SEVERE **Level** (p. 1253) Log.

If the logger is currently enabled for the SEVERE message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.319.3.29 virtual void decaf::util::logging::Logger::throwing (const std::string & *file,* const int *line,* const std::string *functionName,* const decaf::lang::Throwable & *thrown*) [virtual]

Log throwing an exception.

This is a convenience method to log that a method is terminating by throwing an exception. The logging is done using the FINER level.

If the logger is currently enabled for the given message level then the given arguments are stored in a **LogRecord** (p. 1333) which is forwarded to all registered output handlers. The **LogRecord** (p. 1333)'s message is set to "THROW".

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
thrown	The Throwable that will be thrown, will be cloned.

6.319.3.30 virtual void decaf::util::logging::Logger::warning (const std::string & *file,* const int *line,* const std::string *functionName,* const std::string & *message*) [virtual]

Log a WARN **Level** (p. 1253) Log.

If the logger is currently enabled for the WARN message level then the given message is forwarded to all the registered output **Handler** (p. 1085) objects.

Parameters

file	The file name where the log was generated.
line	The line number where the log was generated.
functionName	The name of the function that logged this.
message	The message to log at this **Level** (p. 1253).

6.323 activemq::transport::logging::LoggingTransport Class Reference

A transport filter that logs commands as they are sent/received.

`#include <src/main/activemq/transport/logging/LoggingTransport.h>`

Inheritance diagram for activemq::transport::logging::LoggingTransport:

Public Member Functions

- **LoggingTransport** (**const Pointer**< **Transport** > &**next**)

  Constructor.
- virtual ~**LoggingTransport** ()
- virtual void **onCommand** (**const Pointer**< **Command** > &command)

  Event handler for the receipt of a command.
- virtual void **oneway** (**const Pointer**< **Command** > &command)

  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command)

  Sends the given command to the broker and then waits for the response.

  Parameters

command	*the command to be sent.*

  Returns

  the response from the broker.

  Exceptions

IOException	*if an exception occurs during the read of the command.*
UnsupportedOperation-Exception	*if this method is not implemented by this transport.*

- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.

  Parameters

command	*The command to be sent.*
timeout	*The time to wait for this response.*

  Returns

  the response from the broker.

  Exceptions

IOException	*if an exception occurs during the read of the command.*
UnsupportedOperation-Exception	*if this method is not implemented by this transport.*

6.323.1 Detailed Description

A transport filter that logs commands as they are sent/received.

6.323.2 Constructor & Destructor Documentation

6.323.2.1 activemq::transport::logging::LoggingTransport::LoggingTransport (const Pointer< Transport > & *next*)

Constructor.

Parameters

next	- the next **Transport** (p. 2161) in the chain

6.323.2.2 virtual activemq::transport::logging::LoggingTransport::~LoggingTransport ( ) [inline, virtual]

6.323.3 Member Function Documentation

6.323.3.1 virtual void activemq::transport::logging::LoggingTransport::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters

command	- the received command object.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.323.3.2 virtual void activemq::transport::logging::LoggingTransport::oneway (const Pointer< Command > & *command*) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.323.3.3 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Not supported by this class - throws an exception.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

6.323.3.4 virtual Pointer<Response> activemq::transport::logging::LoggingTransport::request (const Pointer< Command > & *command,* unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Not supported by this class - throws an exception.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/logging/**LoggingTransport.h**

6.324 decaf::util::logging::LogManager Class Reference

There is a single global **LogManager** (p. 1327) object that is used to maintain a set of shared state about Loggers and log services.

`#include <src/main/decaf/util/logging/LogManager.h>`

Public Member Functions

- virtual ~**LogManager** ()
- bool **addLogger** (**Logger** *logger)

  Add a named logger.
- **Logger** * **getLogger** (**const** std::string &name)

  *Retrieves or creates a new **Logger** (p. 1312) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.*
- int **getLoggerNames** (**const** std::vector< std::string > &names)

  *Gets a list of known **Logger** (p. 1312) Names from this Manager, new loggers added while this method is in progress are not garunteed to be in the list.*
- void **setProperties** (**const util::Properties** &properties)

  *Sets the **Properties** (p. 1705) this **LogManager** (p. 1327) should use to configure its loggers.*
- **const util::Properties** & **getProperties** () **const**

  *Gets a reference to the Logging **Properties** (p. 1705) used by this logger.*
- std::string **getProperty** (**const** std::string &name)

  *Gets the value of a named property of this **LogManager** (p. 1327).*
- void **addPropertyChangeListener** (PropertyChangeListener *listener)

  *Adds a change listener for **LogManager** (p. 1327) **Properties** (p. 1705), adding the same instance of a change event listener does nothing.*
- void **removePropertyChangeListener** (PropertyChangeListener *listener)

  *Removes a properties change listener from the **LogManager** (p. 1327), if the listener is not found of the param is NULL this method returns silently.*
- void **readConfiguration** ()

  Reinitialize the logging properties and reread the logging configuration.
- void **readConfiguration** (**decaf::io::InputStream** *stream)

  *Reinitialize the logging properties and reread the logging configuration from the given stream, which should be in **decaf.util.Properties** (p. 1705) format.*
- void **reset** ()

  Reset the logging configuration.

  Assignment operator.

Friends

- class **decaf::lang::Runtime**

6.324.1 Detailed Description

There is a single global **LogManager** (p. 1327) object that is used to maintain a set of shared state about Loggers and log services.

This **LogManager** (p. 1327) object:

- Manages a hierarchical namespace of **Logger** (p. 1312) objects. All named Loggers are stored in this namespace.
  - Manages a set of logging control properties. These are simple key-value pairs that can be used by Handlers and other logging objects to configure themselves.

The global **LogManager** (p. 1327) object can be retrieved using **LogManager::getLogManager()** (p. 1331). The **LogManager** (p. 1327) object is created during class initialization and cannot subsequently be changed.

∗∗∗TODO∗∗∗∗ By default, the **LogManager** (p. 1327) reads its initial configuration from a properties file "lib/logging.properties" in the JRE directory. If you edit that property file you can change the default logging configuration for all uses of that JRE.

In addition, the **LogManager** (p. 1327) uses two optional system properties that allow more control over reading the initial configuration:

- "decaf.logger.config.class"
  - "decaf.logger.config.file"

These two properties may be set via the Preferences API, or as command line property definitions to the "java" command, or as system property definitions passed to JNI_CreateJavaVM.

If the "java.util.logging.config.class" property is set, then the property value is treated as a class name. The given class will be loaded, an object will be instantiated, and that object's constructor is responsible for reading in the initial configuration. (That object may use other system properties to control its configuration.) The alternate configuration class can use readConfiguration(InputStream) to define properties in the **LogManager** (p. 1327).

If "decaf.util.logging.config.class" property is not set, then the "decaf.util.logging.config.file" system property can be used to specify a properties file (in **decaf.util.Properties** (p. 1705) format). The initial logging configuration will be read from this file.

If neither of these properties is defined then, as described above, the **LogManager** (p. 1327) will read its initial configuration from a properties file "lib/logging.properties" in the working directory.

The properties for loggers and Handlers will have names starting with the dot-separated name for the handler or logger. ∗∗∗TODO∗∗∗∗

The global logging properties may include:

- A property "handlers". This defines a whitespace separated list of class names for handler classes to load and register as handlers on the root **Logger** (p. 1312) (the **Logger** (p. 1312) named ""). Each class name must be for a **Handler** (p. 1085) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used.
  - A property "<logger>.handlers". This defines a whitespace or comma separated list of class names for handlers classes to load and register as handlers to the specified logger. Each class name must be for a **Handler** (p. 1085) class which has a default constructor. Note that these Handlers may be created lazily, when they are first used.

- A property "<logger>.useParentHandlers". This defines a boolean value. By default every logger calls its parent in addition to handling the logging message itself, this often result in messages being handled by the root logger as well. When setting this property to false a **Handler** (p. 1085) needs to be configured for this logger otherwise no logging messages are delivered.
- A property "config". This property is intended to allow arbitrary configuration code to be run. The property defines a whitespace separated list of class names. A new instance will be created for each named class. The default constructor of each class may execute arbitrary code to update the logging configuration, such as setting logger levels, adding handlers, adding filters, etc.

Loggers are organized into a naming hierarchy based on their dot separated names. Thus "a.b.c" is a child of "a.b", but "a.b1" and a.b2" are peers.

All properties whose names end with ".level" are assumed to define log levels for Loggers. Thus "foo.level" defines a log level for the logger called "foo" and (recursively) for any of its children in the naming hierarchy. Log Levels are applied in the order they are defined in the properties file. Thus level settings for child nodes in the tree should come after settings for their parents. The property name ".level" can be used to set the level for the root of the tree.

All methods on the **LogManager** (p. 1327) object are multi-thread safe.

Since

1.0

6.324.2 Constructor & Destructor Documentation

6.324.2.1 virtual decaf::util::logging::LogManager::~LogManager ( ) [virtual]

6.324.2.2 decaf::util::logging::LogManager::LogManager ( ) [protected]

Constructor, hidden to protect against direct instantiation.

6.324.2.3 decaf::util::logging::LogManager::LogManager (const LogManager & *manager*) [protected]

Copy Constructor.

Parameters

manager	the Manager to copy

6.324.3 Member Function Documentation

6.324.3.1 bool decaf::util::logging::LogManager::addLogger (Logger * *logger*)

Add a named logger.

This does nothing and returns false if a logger with the same name is already registered.

The **Logger** (p. 1312) factory methods call this method to register each newly created **Logger** (p. 1312).

Parameters

logger	The new **Logger** (p. 1312) instance to add to this **LogManager** (p. 1327).

Exceptions

NullPointerException	if logger is NULL.
IllegalArgumentException	if the logger has no name.

6.324.3.2 void decaf::util::logging::LogManager::addPropertyChangeListener (PropertyChangeListener * *listener*)

Adds a change listener for **LogManager** (p. 1327) **Properties** (p. 1705), adding the same instance of a change event listener does nothing.

Parameters

listener	The PropertyChangeListener to add (can be NULL).

6.324.3.3 Logger* decaf::util::logging::LogManager::getLogger (const std::string & *name*)

Retrieves or creates a new **Logger** (p. 1312) using the name specified a new logger inherits the configuration of the logger's parent if there is no configuration data for the logger.

Parameters

name	The name of the **Logger** (p. 1312).

6.324.3.4 int decaf::util::logging::LogManager::getLoggerNames (const std::vector< std::string > & *names*)

Gets a list of known **Logger** (p. 1312) Names from this Manager, new loggers added while this method is in progress are not garunteed to be in the list.

Parameters

names	STL Vector to hold string logger names.

Returns

names count of how many loggers were inserted.

6.324.3.5 static LogManager& decaf::util::logging::LogManager::getLogManager ( ) [static]

Get the global **LogManager** (p. 1327) instance.

Returns

A reference to the global **LogManager** (p. 1327) instance.

6.324.3.6 const util::Properties& decaf::util::logging::LogManager::getProperties ( ) const [inline]

Gets a reference to the Logging **Properties** (p. 1705) used by this logger.

Returns

The **Logger** (p. 1312) **Properties** (p. 1705) Pointer

6.324.3.7 std::string decaf::util::logging::LogManager::getProperty (const std::string & *name*)

Gets the value of a named property of this **LogManager** (p. 1327).

Parameters

name	The name of the Property to retrieve.

Returns

the value of the property

6.324.3.8 void decaf::util::logging::LogManager::operator= (const LogManager & *manager*) [protected]

Assignment operator.

Parameters

manager	the manager to assign from

6.324.3.9 void decaf::util::logging::LogManager::readConfiguration ( )

Reinitialize the logging properties and reread the logging configuration.

The same rules are used for locating the configuration properties as are used at startup. So normally the logging properties will be re-read from the same file that was used at startup.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 1321), if the target **Logger** (p. 1312) exists.

A PropertyChangeEvent will be fired after the properties are read.

Exceptions

IOException	if an I/O error occurs.

6.324.3.10 void decaf::util::logging::LogManager::readConfiguration (decaf::io::InputStream * *stream*)

Reinitialize the logging properties and reread the logging configuration from the given stream, which should be in **decaf.util.Properties** (p. 1705) format.

A PropertyChangeEvent will be fired after the properties are read.

Any log level definitions in the new configuration file will be applied using **Logger.setLevel()** (p. 1321), if the target **Logger** (p. 1312) exists.

Parameters

stream	The InputStream to read the **Properties** (p. 1705) from.

Exceptions

NullPointerException	if stream is NULL.
IOException	if an I/O error occurs.

6.324.3.11 void decaf::util::logging::LogManager::removePropertyChangeListener (PropertyChangeListener * *listener*)

Removes a properties change listener from the **LogManager** (p. 1327), if the listener is not found of the param is NULL this method returns silently.

Parameters

listener	The PropertyChangeListener to remove from the listeners set.

6.324.3.12 void decaf::util::logging::LogManager::reset ( )

Reset the logging configuration.

For all named loggers, the reset operation removes and closes all Handlers and (except for the root logger) sets the level to INHERIT. The root logger's level is set to **Level::INFO** (p. 1256).

6.324.3.13 void decaf::util::logging::LogManager::setProperties (const util::Properties & *properties*)

Sets the **Properties** (p. 1705) this **LogManager** (p. 1327) should use to configure its loggers.

Once set a properties change event is fired.

Parameters

properties	Pointer to read the configuration from

6.324.4 Friends And Related Function Documentation

6.324.4.1 friend class decaf::lang::Runtime [friend]

- void **setSourceFunction** (**const** std::string &functionName)

  Sets the name of the function where this log was logged.

- long long **getTimestamp** () **const**

  Gets the time in mills that this message was logged.

- void **setTimestamp** (long long timeStamp)

  Sets the time in mills that this message was logged.

- long long **getTreadId** () **const**

  Gets the Thread Id where this Log was created.

- void **setTreadId** (long long threadId)

  Sets the Thread Id where this Log was created.

- **decaf::lang::Throwable** ∗ **getThrown** () **const**

  *Gets any Throwable associated with this **LogRecord** (p. 1333).*

- void **setThrown** (**decaf::lang::Throwable** ∗thrown)

  *Sets the Throwable associated with this **LogRecord** (p. 1333), the pointer becomes the property of this instance of the **LogRecord** (p. 1333) and will be deleted when the record is destroyed.*

6.325.1 Detailed Description

LogRecord (p. 1333) objects are used to pass logging requests between the logging framework and individual log Handlers.

When a **LogRecord** (p. 1333) is passed into the logging framework it logically belongs to the framework and should no longer be used or updated by the client application.

Since

1.0

6.325.2 Constructor & Destructor Documentation

6.325.2.1 decaf::util::logging::LogRecord::LogRecord ( )

6.325.2.2 virtual decaf::util::logging::LogRecord::∼LogRecord ( ) [virtual]

6.325.3 Member Function Documentation

6.325.3.1 Level decaf::util::logging::LogRecord::getLevel ( ) const [inline]

Get **Level** (p. 1253) of this log record.

Returns

Level (p. 1253) enumeration value.

6.325.3.2 const std::string& decaf::util::logging::LogRecord::getLoggerName ( ) const [inline]

Gets the Source **Logger** (p. 1312)'s Name.

Returns

the source loggers name

6.325.3.3 const std::string& decaf::util::logging::LogRecord::getMessage ( ) const [inline]

Gets the Message to be Logged.

Returns

the source logger's message

6.325.3.4 const std::string& decaf::util::logging::LogRecord::getSourceFile ( ) const [inline]

Gets the Source Log File name.

Returns

the source loggers name

6.325.3.5 const std::string& decaf::util::logging::LogRecord::getSourceFunction ( ) const [inline]

Gets the name of the function where this log was logged.

Returns

the source logger's message

6.325.3.6 unsigned int decaf::util::logging::LogRecord::getSourceLine ( ) const [inline]

Gets the Source Log line number.

Returns

the source loggers line number

6.325.3.7 decaf::lang::Throwable* decaf::util::logging::LogRecord::getThrown ( ) const [inline]

Gets any Throwable associated with this **LogRecord** (p. 1333).

Returns

point to a Throwable instance or Null.

6.325.3.8 long long decaf::util::logging::LogRecord::getTimestamp ( ) const [inline]

Gets the time in mills that this message was logged.

Returns

UTC time in milliseconds

6.325.3.9 long long decaf::util::logging::LogRecord::getTreadId ( ) const [inline]

Gets the Thread Id where this Log was created.

Returns

the source loggers line number

6.325.3.10 void decaf::util::logging::LogRecord::setLevel (Level *value*) [inline]

Set (p. 1857) the **Level** (p. 1253) of this Log Record.

Parameters

value	**Level** (p. 1253) Enumeration Value

6.325.3.11 void decaf::util::logging::LogRecord::setLoggerName (const std::string & *loggerName*) [inline]

Sets the Source **Logger** (p. 1312)'s Name.

Parameters

loggerName	the source loggers name

6.325.3.12 void decaf::util::logging::LogRecord::setMessage (const std::string & *message*) [inline]

Sets the Message to be Logged.

Parameters

message	the source loggers message

6.325.3.13 void decaf::util::logging::LogRecord::setSourceFile (const std::string & *sourceFile*) [inline]

Sets the Source Log File Name.

Parameters

sourceFile	the source loggers name

6.325.3.14 void decaf::util::logging::LogRecord::setSourceFunction (const std::string & *functionName*) [inline]

Sets the name of the function where this log was logged.

Parameters

functionName	the source of the log

6.325.3.15 void decaf::util::logging::LogRecord::setSourceLine (unsigned int *sourceLine*) [inline]

Sets the Source Log line number.

Parameters

sourceLine	the source logger's line number

6.325.3.16 void decaf::util::logging::LogRecord::setThrown (decaf::lang::Throwable * *thrown*) [inline]

Sets the Throwable associated with this **LogRecord** (p. 1333), the pointer becomes the property of this instance of the **LogRecord** (p. 1333) and will be deleted when the record is destroyed.

Parameters

thrown	A pointer to a Throwable that will be associated with this record.

6.325.3.17 void decaf::util::logging::LogRecord::setTimestamp (long long *timeStamp*) [inline]

Sets the time in mills that this message was logged.

Parameters

timeStamp	UTC Time in Milliseconds.

6.325.3.18 void decaf::util::logging::LogRecord::setTreadId (long long *threadId*) [inline]

Sets the Thread Id where this Log was created.

Parameters

threadId	the source logger's line number

`#include <src/main/decaf/lang/Long.h>`

Inheritance diagram for decaf::lang::Long:

Public Member Functions

- **Long** (long long value)
- **Long** (**const** std::string &value)

  *Constructs a new **Long** (p. 1338) and attempts to convert the given string to an long long value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted long long.*
- virtual ~**Long** ()
- virtual int **compareTo** (**const Long** &l) **const**

  *Compares this **Long** (p. 1338) instance with another.*
- bool **equals** (**const Long** &l) **const**
- virtual bool **operator==** (**const Long** &l) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Long** &l) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** long long &l) **const**

  *Compares this **Long** (p. 1338) instance with another.*
- bool **equals** (**const** long long &l) **const**
- virtual bool **operator==** (**const** long long &l) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** long long &l) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.

Static Public Member Functions

- static int **bitCount** (long long value)

  Returns the number of one-bits in the two's complement binary representation of the specified int value.
- static **Long decode** (**const** std::string &value)

  *Decodes a **String** (p. 2031) into a **Long** (p. 1338).*
- static long long **highestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

- static long long **lowestOneBit** (long long value)

  Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.
- static int **numberOfLeadingZeros** (long long value)

  Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.
- static int **numberOfTrailingZeros** (long long value)

  Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.
- static long long **parseLong** (**const** std::string &value)

  Parses the string argument as a signed decimal long.
- static long long **parseLong** (**const** std::string &value, int radix)

  *Returns a **Long** (*p. *1338) object holding the value extracted from the specified string when parsed with the radix given by the second argument.*
- static long long **reverseBytes** (long long value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.
- static long long **reverse** (long long value)

  Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.
- static long long **rotateLeft** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.
- static long long **rotateRight** (long long value, int distance)

  Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.
- static int **signum** (long long value)

  Returns the signum function of the specified value.
- static std::string **toString** (long long value)

  *Converts the long to a **String** (*p. *2031) representation.*
- static std::string **toString** (long long value, int radix)
- static std::string **toHexString** (long long value)

  Returns a string representation of the integer argument as an unsigned integer in base 16.
- static std::string **toOctalString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 8.
- static std::string **toBinaryString** (long long value)

  Returns a string representation of the long long argument as an unsigned long long in base 2.
- static **Long valueOf** (long long value)

  *Returns a **Long** (*p. *1338) instance representing the specified int value.*
- static **Long valueOf** (**const** std::string &value)

  *Returns a **Long** (*p. *1338) object holding the value given by the specified std::string.*
- static **Long valueOf** (**const** std::string &value, int radix)

  *Returns a **Long** (*p. *1338) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static **const** int **SIZE** = 64

  The size in bits of the primitive long long type.
- static **const** long long **MAX_VALUE** = (long long)0x7FFFFFFFFFFFFFFFLL

  The maximum value that the primitive type can hold.
- static **const** long long **MIN_VALUE** = (long long)0x8000000000000000LL

  The minimum value that the primitive type can hold.

6.327.1 Constructor & Destructor Documentation

6.327.1.1 decaf::lang::Long::Long (long long *value*)

Parameters

value	- the primitive long long to wrap

6.327.1.2 decaf::lang::Long::Long (const std::string & *value*)

Constructs a new **Long** (p. 1338) and attempts to convert the given string to an long long value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted long long.

Parameters

value	The string to convert to a primitive type to wrap.

Exceptions

NumberFormatException	if the string is not a a valid 64bit long.

6.327.1.3 virtual decaf::lang::Long::~Long ( ) [inline, virtual]

6.327.2 Member Function Documentation

6.327.2.1 static int decaf::lang::Long::bitCount (long long *value*) [static]

Returns the number of one-bits in the two's complement binary representation of the specified int value.

This function is sometimes referred to as the population count.

Parameters

value	- the long long to count

Returns

the number of one-bits in the two's complement binary representation of the specified long long value.

6.327.2.2 virtual unsigned char decaf::lang::Long::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.327.2.3 virtual int decaf::lang::Long::compareTo (const Long & *l*) const [virtual]

Compares this **Long** (p. 1338) instance with another.

Parameters

l	- the **Long** (p. 1338) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Long** > (p. 687).

6.327.2.4 virtual int decaf::lang::Long::compareTo (const long long & *l*) const [virtual]

Compares this **Long** (p. 1338) instance with another.

Parameters

l	- the **Integer** (p. 1161) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **long long** > (p. 687).

6.327.2.5 static Long decaf::lang::Long::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2031) into a **Long** (p. 1338).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the Integer.parseInteger method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2031) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value	- The string to decode

Returns

a **Long** (p. 1338) object containing the decoded value

Exceptions

NumberFomatException	if the string is not formatted correctly.

6.327.2.6 virtual double decaf::lang::Long::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.327.2.7 bool decaf::lang::Long::equals (const Long & *l*) const [inline, virtual]

Parameters

l	- the **Long** (p. 1338) object to compare against.

Returns

true if the two **Integer** (p. 1161) Objects have the same value.

Implements **decaf::lang::Comparable**< **Long** > (p. 688).

6.327.2.8 bool decaf::lang::Long::equals (const long long & *l*) const [inline, virtual]

Parameters

l	- the **Long** (p. 1338) object to compare against.

Returns

true if the two **Integer** (p. 1161) Objects have the same value.

Implements **decaf::lang::Comparable**< **long long** > (p. 688).

6.327.2.9 virtual float decaf::lang::Long::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.327.2.10 static long long decaf::lang::Long::highestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the highest-order ("leftmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value	- the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the highest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.327.2.11 virtual int decaf::lang::Long::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.327.2.12 virtual long long decaf::lang::Long::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.327.2.13 static long long decaf::lang::Long::lowestOneBit (long long *value*) [static]

Returns an long long value with at most a single one-bit, in the position of the lowest-order ("rightmost") one-bit in the specified int value.

Returns zero if the specified value has no one-bits in its two's complement binary representation, that is, if it is equal to zero.

Parameters

value	- the long long to be inspected

Returns

an long long value with a single one-bit, in the position of the lowest-order one-bit in the specified value, or zero if the specified value is itself equal to zero.

6.327.2.14 static int decaf::lang::Long::numberOfLeadingZeros (long long *value*) [static]

Returns the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Note that this method is closely related to the logarithm base 2. For all positive int values x:

```
* floor( log2(x)) = 63 - numberOfLeadingZeros(x)
* ceil( log2(x)) = 64 - numberOfLeadingZeros(x - 1)
```

Parameters

value	- the long long to be inspected

Returns

the number of zero bits preceding the highest-order ("leftmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.327.2.15 static int decaf::lang::Long::numberOfTrailingZeros (long long *value*) [static]

Returns the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value.

Returns 64 if the specified value has no one-bits in its two's complement representation, in other words if it is equal to zero.

Parameters

value	- the int to be inspected

Returns

the number of zero bits following the lowest-order ("rightmost") one-bit in the two's complement binary representation of the specified long long value, or 64 if the value is equal to zero.

6.327.2.16 virtual bool decaf::lang::Long::operator< (const Long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Long >** (p. 688).

6.327.2.17 virtual bool decaf::lang::Long::operator< (const long long & *l*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

l	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< long long >** (p. 688).

6.327.2.18 virtual bool decaf::lang::Long::operator== (const Long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

l	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Long** > (p. 688).

6.327.2.19 virtual bool decaf::lang::Long::operator== (const long long & *l*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

l	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **long long** > (p. 688).

6.327.2.20 static long long decaf::lang::Long::parseLong (const std::string & *value*) [static]

Parses the string argument as a signed decimal long.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting long value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseLong(java.lang.String, int) method.

Note that the characters LL or ULL are not permitted to appear at the end of this string as would normally be permitted in a C++ program.

Parameters

value	- **String** (p. 2031) to parse

Returns

long long value

Exceptions

NumberFormatException	on invalid string value

6.327.2.21 static long long decaf::lang::Long::parseLong (const std::string & *value,* int *radix*) [static]

Returns a **Long** (p. 1338) object holding the value extracted from the specified string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long in the radix specified by the second argument, exactly as if the arguments were given to the parseLong(std::string, int) method. The result is a **Long** (p. 1338) object that represents the long long value specified by the string.

Parameters

value	- **String** (p. 2031) to parse
radix	- the base encoding of the string

Returns

long long value

Exceptions

NumberFormatException	on invalid string value

6.327.2.22 static long long decaf::lang::Long::reverse (long long *value*) [static]

Returns the value obtained by reversing the order of the bits in the two's complement binary representation of the specified long long value.

Parameters

value	- the value whose bits are to be reversed

Returns

the reversed bits long long.

6.327.2.23 static long long decaf::lang::Long::reverseBytes (long long *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified long long value.

Parameters

value	- the long long whose bytes we are to reverse

Returns

the reversed long long.

6.327.2.24 static long long decaf::lang::Long::rotateLeft (long long *value,* int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

(Bits shifted out of the left hand, or high-order, side reenter on the right, or low-order.)

Note that left rotation with a negative distance is equivalent to right rotation: rotateLeft(val, -distance) == rotateRight(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateLeft(val, distance) == rotateLeft(val, distance & 0x1F).

Parameters

value	- the long long to be inspected
distance	- the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value left by the specified number of bits.

6.327.2.25 static long long decaf::lang::Long::rotateRight (long long *value,* int *distance*) [static]

Returns the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

(Bits shifted out of the right hand, or low-order, side reenter on the left, or high-order.)

Note that right rotation with a negative distance is equivalent to left rotation: rotateRight(val, -distance) == rotateLeft(val, distance). Note also that rotation by any multiple of 32 is a no-op, so all but the last five bits of the rotation distance can be ignored, even if the distance is negative: rotateRight(val, distance) == rotateRight(val, distance & 0x1F).

Parameters

value	- the long long to be inspected
distance	- the number of bits to rotate

Returns

the value obtained by rotating the two's complement binary representation of the specified value right by the specified number of bits.

6.327.2.26 virtual short decaf::lang::Long::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.327.2.27 static int decaf::lang::Long::signum (long long *value*) [static]

Returns the signum function of the specified value.

(The return value is -1 if the specified value is negative; 0 if the specified value is zero; and 1 if the specified value is positive.)

Parameters

value	- the long long to be inspected

Returns

the signum function of the specified long long value.

6.327.2.28 static std::string decaf::lang::Long::toBinaryString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 2.

The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise it is equal to the argument. This value is converted to a string of ASCII digits in binary (base 2) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The characters '0' and '1' are used as binary digits.

Parameters

value	- the long long to be translated to a binary string

Returns

the unsigned long long value as a binary string

6.327.2.29 static std::string decaf::lang::Long::toHexString (long long *value*) [static]

Returns a string representation of the integer argument as an unsigned integer in base 16.

The unsigned integer value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in hexadecimal (base 16) with no extra leading 0s. If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as hexadecimal digits:

```
0123456789abcdef
```

If uppercase letters are desired, the toUpperCase() method may be called on the result:

Parameters

value	- the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.327.2.30 static std::string decaf::lang::Long::toOctalString (long long *value*) [static]

Returns a string representation of the long long argument as an unsigned long long in base 8.

The unsigned long long value is the argument plus 2^32 if the argument is negative; otherwise, it is equal to the argument. This value is converted to a string of ASCII digits in octal (base 8) with no extra leading 0s.

If the unsigned magnitude is zero, it is represented by a single zero character '0'; otherwise, the first character of the representation of the unsigned magnitude will not be the zero character. The following characters are used as octal digits:

```
01234567
```

Parameters

value	- the long long to be translated to an Octal string

Returns

the unsigned long long value as a Octal string

6.327.2.31 std::string decaf::lang::Long::toString ( ) const

Returns

this **Long** (p. 1338) Object as a **String** (p. 2031) Representation

6.327.2.32 static std::string decaf::lang::Long::toString (long long *value*) [static]

Converts the long to a **String** (p. 2031) representation.

Parameters

value	The long to convert to a std::string.

Returns

string representation

6.327.2.33 static std::string decaf::lang::Long::toString (long long *value,* int *radix*) [static]

6.327.2.34 static Long decaf::lang::Long::valueOf (long long *value*) [inline, static]

Returns a **Long** (p. 1338) instance representing the specified int value.

Parameters

value	- the long long to wrap

Returns

the new **Integer** (p. 1161) object wrapping value.

6.327.2.35 static Long decaf::lang::Long::valueOf (const std::string & *value*) [static]

Returns a **Long** (p. 1338) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal long long, exactly as if the argument were given to the parseLong(std::string) method. The result is a **Integer** (p. 1161) object that represents the long long value specified by the string.

Parameters

value	- std::string to parse as base 10

Returns

new **Long** (p. 1338) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a decimal long long.

6.327.2.36 static Long decaf::lang::Long::valueOf (const std::string & *value,* int *radix*) [static]

Returns a **Long** (p. 1338) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed long long in the radix specified by the second argument, exactly as if the argument were given to the parseLong(std::string, int) method. The result is a **Long** (p. 1338) object that represents the long long value specified by the string.

Parameters

value	- std::string to parse as base (radix)
radix	- base of the string to parse.

Returns

new **Long** (p. 1338) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a valid long long.

6.327.3 Field Documentation

6.327.3.1 const long long decaf::lang::Long::MAX_VALUE = (long long)0x7FFFFFFFFFFFFFFFLL [static]

The maximum value that the primitive type can hold.

6.327.3.2 const long long decaf::lang::Long::MIN_VALUE = (long long)0x8000000000000000LL [static]

The minimum value that the primitive type can hold.

6.327.3.3 const int decaf::lang::Long::SIZE = 64 [static]

The size in bits of the primitive long long type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Long.h**

6.328 decaf::internal::nio::LongArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/LongArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::LongArrayBuffer:

Public Member Functions

- **LongArrayBuffer** (int size, bool readOnly=false)

  *Creates a **IntArrayBuffer** (p. 1144) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **LongArrayBuffer** (long long ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **LongArrayBuffer** (p. 1351) object that wraps the given array.*
- **LongArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **LongArrayBuffer** (**const LongArrayBuffer** &other)

  *Create a **LongArrayBuffer** (p. 1351) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual ∼**LongArrayBuffer** ()

- virtual long long * **array** ()

  Returns the long long array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  *the array that backs this **Buffer** (p. 451).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The offset long longo the backing array where index zero starts.

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual **LongBuffer** * **asReadOnlyBuffer** () **const**

  Creates a new, read-only long long buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

  Returns

  The new, read-only long long buffer which the caller then owns.

- virtual **LongBuffer** & **compact** ()

  Compacts this buffer.
  *The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

  Returns

  *a reference to this **LongBuffer** (p. 1359).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **LongBuffer** * **duplicate** ()

  Creates a new long long buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new long long **Buffer** (p. 451) which the caller owns.*

- virtual long long **get** ()

Relative get method.
Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return.*

- virtual long long **get** (int index) **const**

Absolute get method.
Reads the value at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the long long is to be read.*

Returns

the long long that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or index is negative.*

- virtual bool **hasArray** () **const**

Tells whether or not this buffer is backed by an accessible long long array.
If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () **const**

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual **LongBuffer** & **put** (long long value)

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value	*The long longs value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **LongBuffer** & **put** (int index, long long value)

Writes the given long longs long longo this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data*
value	*The long longs to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **LongBuffer** * **slice** () **const**

  *Creates a new **LongBuffer** (p. 1359) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the newly create **LongBuffer** (p. 1359) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **LongArrayBuffer** (p. 1351) as Read-Only.*

6.328.1 Constructor & Destructor Documentation

6.328.1.1 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **IntArrayBuffer** (p. 1144) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.328.1.2 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (long long * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **LongArrayBuffer** (p. 1351) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.328.1.3 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array,* int *offset,* int *length,* bool *readOnly* = false)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **LongArrayBuffer** (p. 1351) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.328.1.4 decaf::internal::nio::LongArrayBuffer::LongArrayBuffer (const LongArrayBuffer & *other*)

Create a **LongArrayBuffer** (p. 1351) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **LongArrayBuffer** (p. 1351) this one is to mirror.

6.328.1.5 virtual decaf::internal::nio::LongArrayBuffer::~LongArrayBuffer ( ) [virtual]

6.328.2 Member Function Documentation

6.328.2.1 virtual long long* decaf::internal::nio::LongArrayBuffer::array ( ) [virtual]

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1361).

6.328.2.2 virtual int decaf::internal::nio::LongArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long longo the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::LongBuffer** (p. 1362).

6.328.2.3 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implements **decaf::nio::LongBuffer** (p. 1362).

6.328.2.4 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **LongBuffer** (p. 1359).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::LongBuffer** (p. 1362).

6.328.2.5 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::duplicate ( ) [virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1363).

6.328.2.6 virtual long long decaf::internal::nio::LongArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implements **decaf::nio::LongBuffer** (p. 1363).

6.328.2.7 virtual long long decaf::internal::nio::LongArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the long long is to be read.

Returns

the long long that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::LongBuffer** (p. 1363).

6.328.2.8 virtual bool decaf::internal::nio::LongArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::LongBuffer** (p. 1365).

6.328.2.9 virtual bool decaf::internal::nio::LongArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.328.2.10 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (long long *value*) [virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value	The long longs value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1366).

6.328.2.11 virtual LongBuffer& decaf::internal::nio::LongArrayBuffer::put (int *index*, long long *value*) [virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The long longs to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::LongBuffer** (p. 1367).

6.328.2.12 virtual void decaf::internal::nio::LongArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **LongArrayBuffer** (p. 1351) as Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.328.2.13 virtual LongBuffer* decaf::internal::nio::LongArrayBuffer::slice ( ) const [virtual]

Creates a new **LongBuffer** (p. 1359) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **LongBuffer** (p. 1359) which the caller owns.

Implements **decaf::nio::LongBuffer** (p. 1367).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**LongArrayBuffer.h**

6.329 decaf::nio::LongBuffer Class Reference

This class defines four categories of operations upon long long buffers:

`#include <src/main/decaf/nio/LongBuffer.h>`

Inheritance diagram for decaf::nio::LongBuffer:

Public Member Functions

- virtual ~**LongBuffer** ()
- virtual std::string **toString** () **const**
- virtual long long * **array** ()=0

Returns the long long array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **LongBuffer** ∗ **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only long long buffer that shares this buffer's content.

- virtual **LongBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **LongBuffer** ∗ **duplicate** ()=0

  Creates a new long long buffer that shares this buffer's content.

- virtual long long **get** ()=0

  Relative get method.

- virtual long long **get** (int index) **const** =0

  Absolute get method.

- **LongBuffer** & **get** (std::vector< long long > buffer)

  Relative bulk get method.

- **LongBuffer** & **get** (long long ∗buffer, int size, int offset, int length)

  Relative bulk get method.

- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible long long array.

- **LongBuffer** & **put** (**LongBuffer** &src)

  This method transfers the long longs remaining in the given source buffer long longo this buffer.

- **LongBuffer** & **put** (**const** long long ∗buffer, int size, int offset, int length)

  This method transfers long longs long longo this buffer from the given source array.

- **LongBuffer** & **put** (std::vector< long long > &buffer)

  This method transfers the entire content of the given source long longs array long longo this buffer.

- virtual **LongBuffer** & **put** (long long value)=0

  Writes the given long longs long longo this buffer at the current position, and then increments the position.

- virtual **LongBuffer** & **put** (int index, long long value)=0

  Writes the given long longs long longo this buffer at the given index.

- virtual **LongBuffer** ∗ **slice** () **const** =0

  *Wraps the passed STL long long Vector in a **LongBuffer** (p. 1359).*

Protected Member Functions

- **LongBuffer** (int **capacity**)

  *Creates a **LongBuffer** (p. 1359) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.*

6.329.1 Detailed Description

This class defines four categories of operations upon long long buffers:

o Absolute and relative get and put methods that read and write single long longs; o Relative bulk get methods that transfer contiguous sequences of long longs from this buffer long longo an array; and o Relative bulk put methods that transfer contiguous sequences of long longs from a long long array or some other long long buffer long longo this buffer o Methods for compacting, duplicating, and slicing a long long buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing long long array long longo a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.329.2 Constructor & Destructor Documentation

6.329.2.1 decaf::nio::LongBuffer::LongBuffer (int *capacity*) [protected]

Creates a **LongBuffer** (p. 1359) object that has its backing array allocated long longernally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size and limit of the **Buffer** (p. 451) in long longs.

Exceptions

IllegalArguementException	if capacity is negative.

6.329.2.2 virtual decaf::nio::LongBuffer::~LongBuffer ( ) [inline, virtual]

6.329.3 Member Function Documentation

6.329.3.1 static LongBuffer* decaf::nio::LongBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Double buffer in long longs.

Returns

the **LongBuffer** (p. 1359) that was allocated, caller owns.

6.329.3.2 virtual long long* decaf::nio::LongBuffer::array ( ) [pure virtual]

Returns the long long array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1355).

6.329.3.3 virtual int decaf::nio::LongBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset long longo the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1355).

6.329.3.4 virtual LongBuffer* decaf::nio::LongBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only long long buffer which the caller then owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1356).

6.329.3.5 virtual LongBuffer& decaf::nio::LongBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **LongBuffer** (p. 1359).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1356).

6.329.3.6 virtual int decaf::nio::LongBuffer::compareTo (const LongBuffer & *value*) const [virtual]

6.329.3.7 virtual LongBuffer* decaf::nio::LongBuffer::duplicate ( ) [pure virtual]

Creates a new long long buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new long long **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1356).

6.329.3.8 virtual bool decaf::nio::LongBuffer::equals (const LongBuffer & *value*) const [virtual]

6.329.3.9 virtual long long decaf::nio::LongBuffer::get ( ) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the long long at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1357).

6.329.3.10 virtual long long decaf::nio::LongBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the long long is to be read.

Returns

the long long that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1357).

6.329.3.11 LongBuffer& decaf::nio::LongBuffer::get (std::vector< long long > *buffer*)

Relative bulk get method.

This method transfers values from this buffer long longo the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length long longs remaining in this buffer.

6.329.3.12 LongBuffer& decaf::nio::LongBuffer::get (long long * *buffer,* int *size,* int *offset,* int *length*)

Relative bulk get method.

This method transfers long longs from this buffer long longo the given destination array. If there are fewer long longs remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length long longs from this buffer long longo the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated long long buffer to fill.
size	The size of the passed in buffer.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length long longs remaining in this buffer
NullPolong	longerException if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.329.3.13 virtual bool decaf::nio::LongBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible long long array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1357).

6.329.3.14 virtual bool decaf::nio::LongBuffer::operator< (const LongBuffer & *value*) const [virtual]

6.329.3.15 virtual bool decaf::nio::LongBuffer::operator== (const LongBuffer & *value*) const [virtual]

6.329.3.16 LongBuffer& decaf::nio::LongBuffer::put (LongBuffer & *src*)

This method transfers the long longs remaining in the given source buffer long longo this buffer.

If there are more long longs remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no long longs are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() long longs from the given buffer long longo this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take long longs from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining long longs in the source buffer
IllegalArgumentException	if the source buffer is this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

6.329.3.17 LongBuffer& decaf::nio::LongBuffer::put (const long long * *buffer*, int *size*, int *offset*, int *length*)

This method transfers long longs long longo this buffer from the given source array.

If there are more long longs to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no long longs are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array long longo this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which long longs are to be read.
size	The size of the buffer passed.
offset	The offset within the array of the first char to be read.
length	The number of long longs to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only
NullPolong	longerException if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.329.3.18 LongBuffer& decaf::nio::LongBuffer::put (std::vector< long long > & *buffer*)

This method transfers the entire content of the given source long longs array long longo this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **LongBuffer** (p. 1359).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.329.3.19 virtual LongBuffer& decaf::nio::LongBuffer::put (long long *value*) [pure virtual]

Writes the given long longs long longo this buffer at the current position, and then increments the position.

Parameters

value	The long longs value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1358).

6.329.3.20 virtual LongBuffer& decaf::nio::LongBuffer::put (int *index*, long long *value*) [pure virtual]

Writes the given long longs long longo this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The long longs to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1358).

6.329.3.21 virtual LongBuffer* decaf::nio::LongBuffer::slice ( ) const [pure virtual]

Creates a new **LongBuffer** (p. 1359) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **LongBuffer** (p. 1359) which the caller owns.

Implemented in **decaf::internal::nio::LongArrayBuffer** (p. 1359).

6.329.3.22 virtual std::string decaf::nio::LongBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.329.3.23 static LongBuffer* decaf::nio::LongBuffer::wrap (long long * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **LongBuffer** (p. 1359).

The new buffer will be backed by the given long long array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the passed in array.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **LongBuffer** (p. 1359) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.329.3.24 static LongBuffer* decaf::nio::LongBuffer::wrap (std::vector< long long > & *buffer*) [static]

Wraps the passed STL long long Vector in a **LongBuffer** (p. 1359).

The new buffer will be backed by the given long long array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **LongBuffer** (p. 1359) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**LongBuffer.h**

6.330 activemq::util::LongSequenceGenerator Class Reference

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

`#include <src/main/activemq/util/LongSequenceGenerator.h>`

Public Member Functions

- **LongSequenceGenerator** ()
- virtual ~**LongSequenceGenerator** ()
- long long **getNextSequenceId** ()
- long long **getLastSequenceId** ()

6.330.1 Detailed Description

This class is used to generate a sequence of long long values that are incremented each time a new value is requested.

This class is thread safe so the ids can be requested in different threads safely.

6.330.2 Constructor & Destructor Documentation

6.330.2.1 activemq::util::LongSequenceGenerator::LongSequenceGenerator ( )

6.330.2.2 virtual activemq::util::LongSequenceGenerator::~LongSequenceGenerator ( ) [inline, virtual]

6.330.3 Member Function Documentation

6.330.3.1 long long activemq::util::LongSequenceGenerator::getLastSequenceId ( )

Returns

the last id that was generated.

6.330.3.2 long long activemq::util::LongSequenceGenerator::getNextSequenceId ( )

Returns

the next id in the sequence.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**LongSequenceGenerator.h**

6.331 decaf::net::MalformedURLException Class Reference

`#include <src/main/decaf/net/MalformedURLException.h>`

Inheritance diagram for decaf::net::MalformedURLException:

Public Member Functions

- **MalformedURLException** () throw ()

  Default Constructor.

- **MalformedURLException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **MalformedURLException** (**const MalformedURLException** &ex) throw ()

  Copy Constructor.
- **MalformedURLException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **MalformedURLException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **MalformedURLException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **MalformedURLException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**MalformedURLException** () throw ()

6.331.1 Constructor & Destructor Documentation

6.331.1.1 decaf::net::MalformedURLException::MalformedURLException ( ) throw () [inline]

Default Constructor.

6.331.1.2 decaf::net::MalformedURLException::MalformedURLException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.331.1.3 decaf::net::MalformedURLException::MalformedURLException (const MalformedURLException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.331.1.4 decaf::net::MalformedURLException::MalformedURLException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.331.1.5 decaf::net::MalformedURLException::MalformedURLException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.331.1.6 decaf::net::MalformedURLException::MalformedURLException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.331.1.7 virtual decaf::net::MalformedURLException::~MalformedURLException ( ) throw () [inline, virtual]

6.331.2 Member Function Documentation

6.331.2.1 virtual MalformedURLException* decaf::net::MalformedURLException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**MalformedURLException.h**

6.332 decaf::util::Map< K, V, COMPARATOR > Class Template Reference

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

`#include <src/main/decaf/util/Map.h>`

Inheritance diagram for decaf::util::Map< K, V, COMPARATOR >:

Data Structures

- class **Entry**

Public Member Functions

- **Map** ()

  Default constructor - does nothing.
- virtual ~**Map** ()
- virtual bool **equals** (**const Map** &source) **const** =0

  Comparison, equality is dependent on the method of determining if the element are equal.
- virtual void **copy** (**const Map** &source)=0

  Copies the content of the source map into this map.
- virtual void **clear** ()=0

  Removes all keys and values from this map.
- virtual bool **containsKey** (**const** K &key) **const** =0

  Indicates whether or this map contains a value for the given key.
- virtual bool **containsValue** (**const** V &value) **const** =0

  Indicates whether or this map contains a value for the given value, i.e.
- virtual bool **isEmpty** () **const** =0
- virtual int **size** () **const** =0
- virtual V & **get** (**const** K &key)=0

  *Gets the value mapped to the specified key in the **Map*** (p. *1371).*
- virtual **const** V & **get** (**const** K &key) **const** =0

  *Gets the value mapped to the specified key in the **Map*** (p. *1371).*
- virtual void **put** (**const** K &key, **const** V &value)=0

  Sets the value for the specified key.
- virtual void **putAll** (**const Map**< K, V, COMPARATOR > &other)=0

  *Stores a copy of the Mappings contained in the other **Map*** (p. *1371) in this one.*
- virtual V **remove** (**const** K &key)=0

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.
- virtual std::vector< K > **keySet** () **const** =0

  *Returns a **Set*** (p. *1857) view of the mappings contained in this map.*
- virtual std::vector< V > **values** () **const** =0

6.332.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>>class decaf::util::Map< K, V, COMPARATOR >

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

6.332.2 Constructor & Destructor Documentation

6.332.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::Map< K, V, COMPARATOR >::Map ( ) [inline]

Default constructor - does nothing.

6.332.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::Map< K, V, COMPARATOR >::~Map ( ) [inline, virtual]

6.332.3 Member Function Documentation

6.332.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::clear ( ) [pure virtual]

Removes all keys and values from this map.

Exceptions

UnsupportedOperation-Exception	if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 705), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 705), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1981), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1981), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1981), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1981), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1981), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1981), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1981), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1981), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1981), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1981), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1981), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1981), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1981).

6.332.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsKey (const K & *key*) const [pure virtual]

Indicates whether or this map contains a value for the given key.

Parameters

key	The key to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 706), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1981), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1981), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1981), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1981), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1981), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1981), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1981), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1981), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1981), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1981), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1981), **decaf-**

::util::StlMap< std::string, CachedProducer * > (p. 1981), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1981).

6.332.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::containsValue (const V & *value*) const [pure virtual]

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 706), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1982), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1982), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1982), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1982), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1982), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1982), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1982), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1982), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1982), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1982), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1982), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1982), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1982).

6.332.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & *source*) [pure virtual]

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source	The source object to copy from.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 707), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1982).

6.332.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & *source*) const [pure virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source	- **Map** (p. 1371) to compare to this one.

Returns

true if the **Map** (p. 1371) passed is equal in value to this one.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 707), and **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1982).

6.332.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::Map< K, V, COMPARATOR >::get (const K & *key*) [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 707), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1983), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1983), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1983), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1983), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1983), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1983), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1983), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1983), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1983), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1983), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1983), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1983), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1983).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::StlMap< std::string, cms::Topic * >::putAll(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll().

6.332.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::Map< K, V, COMPARATOR >::get (const K & *key*) const [pure virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 708), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1983), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1983), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1983), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1983), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1983), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1983), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1983), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1983), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1983), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1983), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1983), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1983), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1983).

6.332.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::Map< K, V, COMPARATOR >::isEmpty ( ) const [pure virtual]

Returns

if the **Map** (p. 1371) contains any element or not, TRUE or FALSE

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 708), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1984), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1984), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1984), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1984), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1984), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1984), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1984), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1984), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1984), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1984), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1984).

6.332.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::Map< K, V, COMPARATOR >::keySet ( ) const [pure virtual]

Returns a **Set** (p. 1857) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1210), **Set.remove** (p. 667), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 708), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1984), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1984), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1984), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1984), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1984), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1984), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1984), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1984), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1984), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1984), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1984).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::StlMap< std::string, cms::Topic * >::putAll(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll().

6.332.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) [pure virtual]

Sets the value for the specified key.

Parameters

key	The target key.
value	The value to be set.

Exceptions

UnsupportedOperationException	if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 709), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1985), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1985), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1985), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1985), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1985), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1985), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1985), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1985), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1985), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1985), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1985), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1985), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1985).

6.332.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::Map< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) [pure virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 1371) in this one.

Parameters

other	A **Map** (p. 1371) instance whose elements are to all be inserted in this **Map** (p. 1371).

Exceptions

UnsupportedOperation-Exception	If the implementing class does not support the putAll operation.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 710), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1985), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1985), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1985), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1985), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1985), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1985), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1985), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1985), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1985), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1985), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1985), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1985), and **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1985).

6.332.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::Map< K, V, COMPARATOR >::remove (const K & *key*) [pure virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key	The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException *(p. 1537)*	if this key is not in the **Map** (p. 1371).
UnsupportedOperation-Exception	if this map is unmodifiable.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 711), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1986), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1986), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1986), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1986), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1986), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1986), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1986), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1986), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1986), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1986), and **decaf::util::StlMap< std::string, cms::Topic**

∗ > (p. 1986).

6.332.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual int decaf::util::Map< K, V, COMPARATOR >::size ( ) const [pure virtual]

Returns

The number of elements (key/value pairs) in this map.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 713), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1986), **decaf::util::StlMap< cms::Session ∗, SessionResolver ∗ >** (p. 1986), **decaf::util::StlMap< std::string, WireFormatFactory ∗ >** (p. 1986), **decaf::util::StlMap< decaf::lang::Runnable ∗, decaf::util::TimerTask ∗ >** (p. 1986), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1986), **decaf::util::StlMap< std::string, cms::Queue ∗ >** (p. 1986), **decaf::util::StlMap< std::string, CachedConsumer ∗ >** (p. 1986), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer ∗, commands::ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< std::string, TransportFactory ∗ >** (p. 1986), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1986), **decaf::util::StlMap< std::string, CachedProducer ∗ >** (p. 1986), and **decaf::util::StlMap< std::string, cms::Topic ∗ >** (p. 1986).

6.332.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::Map< K, V, COMPARATOR >::values ( ) const [pure virtual]

Returns

the entire set of values in this map as a std::vector.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 713), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1987), **decaf::util::StlMap< cms::Session ∗, SessionResolver ∗ >** (p. 1987), **decaf::util::StlMap< std::string, WireFormatFactory ∗ >** (p. 1987), **decaf::util::StlMap< decaf::lang::Runnable ∗, decaf::util::TimerTask ∗ >** (p. 1987), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1987), **decaf::util::StlMap< std::string, cms::Queue ∗ >** (p. 1987), **decaf::util::StlMap< std::string, CachedConsumer ∗ >** (p. 1987), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer ∗, commands::ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< std::string, TransportFactory ∗ >** (p. 1987), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1987), **decaf::util::StlMap< std::string, CachedProducer ∗ >** (p. 1987), and **decaf::util::StlMap< std::string, cms::Topic ∗ >** (p. 1987).

  Sets a Bytes value with the specified name into the Map.
- virtual char **getChar** (**const** std::string &name) **const** =0

  Returns the Char value of the Specified name.
- virtual void **setChar** (**const** std::string &name, char value)=0

  Sets a Char value with the specified name into the Map.
- virtual double **getDouble** (**const** std::string &name) **const** =0

  Returns the Double value of the Specified name.
- virtual void **setDouble** (**const** std::string &name, double value)=0

  Sets a Double value with the specified name into the Map.
- virtual float **getFloat** (**const** std::string &name) **const** =0

  Returns the Float value of the Specified name.
- virtual void **setFloat** (**const** std::string &name, float value)=0

  Sets a Float value with the specified name into the Map.
- virtual int **getInt** (**const** std::string &name) **const** =0

  Returns the Int value of the Specified name.
- virtual void **setInt** (**const** std::string &name, int value)=0

  Sets a Int value with the specified name into the Map.
- virtual long long **getLong** (**const** std::string &name) **const** =0

  Returns the Long value of the Specified name.
- virtual void **setLong** (**const** std::string &name, long long value)=0

  Sets a Long value with the specified name into the Map.

- virtual short **getShort** (**const** std::string &name) **const** =0

  Returns the Short value of the Specified name.
- virtual void **setShort** (**const** std::string &name, short value)=0

  Sets a Short value with the specified name into the Map.
- virtual std::string **getString** (**const** std::string &name) **const** =0

  Returns the String value of the Specified name.
- virtual void **setString** (**const** std::string &name, **const** std::string &value)=0

  Sets a String value with the specified name into the Map.

6.333.1 Detailed Description

A **MapMessage** (p. 1379) object is used to send a set of name-value pairs.

The names are String objects, and the values are primitive data types in the Java programming language. The names must have a value that is not null, and not an empty string. The entries can be accessed sequentially or randomly by name. The order of the entries is undefined. **MapMessage** (p. 1379) inherits from the **Message** (p. 1426) interface and adds a message body that contains a Map.

When a client receives a **MapMessage** (p. 1379), it is in read-only mode. If a client attempts to write to the message at this point, a **MessageNotWriteableException** (p. 1490) is thrown. To place the **MapMessage** (p. 1379) back into a state where it can be read from and written to, call the `clearBody` method.

MapMessage (p. 1379) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 640). The String-to-primitive conversions may throw a **MessageFormatException** (p. 1478) if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

6.333.2 Constructor & Destructor Documentation

6.333.2.1 virtual cms::MapMessage::~MapMessage ( ) throw () [virtual]

6.333.3 Member Function Documentation

6.333.3.1 virtual bool cms::MapMessage::getBoolean (const std::string & *name*) const [pure virtual]

Returns the Boolean value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 211).

6.333.3.2 virtual unsigned char cms::MapMessage::getByte (const std::string & *name*) const [pure virtual]

Returns the Byte value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 212).

6.333.3.3 virtual std::vector<unsigned char> cms::MapMessage::getBytes (const std::string & *name*) const [pure virtual]

Returns the Bytes value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 212).

6.333.3.4 virtual char cms::MapMessage::getChar (const std::string & *name*) const [pure virtual]

Returns the Char value of the Specified name.

Parameters

name	name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 212).

6.333.3.5 virtual double cms::MapMessage::getDouble (const std::string & *name*) const [pure virtual]

Returns the Double value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 213).

6.333.3.6 virtual float cms::MapMessage::getFloat (const std::string & *name*) const [pure virtual]

Returns the Float value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 213).

6.333.3.7 virtual int cms::MapMessage::getInt (const std::string & *name*) const [pure virtual]

Returns the Int value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 213).

6.333.3.8 virtual long long cms::MapMessage::getLong (const std::string & *name*) const [pure virtual]

Returns the Long value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 214).

6.333.3.9 virtual std::vector< std::string > cms::MapMessage::getMapNames ( ) const [pure virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 1379) object.

Returns

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1379)

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 214).

6.333.3.10 virtual short cms::MapMessage::getShort (const std::string & *name*) const [pure virtual]

Returns the Short value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 215).

6.333.3.11 virtual std::string cms::MapMessage::getString (const std::string & *name*) const [pure virtual]

Returns the String value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 215).

6.333.3.12 virtual bool cms::MapMessage::isEmpty ( ) const [pure virtual]

Returns true if there are no values stored in the **MapMessage** (p. 1379) body.

Returns

true if the body of the **MapMessage** (p. 1379) contains no elements.

Exceptions

CMSException *(p. 640)*	if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 215).

6.333.3.13 virtual bool cms::MapMessage::itemExists (const std::string & *name*) const [pure virtual]

Indicates whether an item exists in this **MapMessage** (p. 1379) object.

Parameters

name	String name of the Object in question

Returns

boolean value indicating if the name is in the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 216).

6.333.3.14 virtual void cms::MapMessage::setBoolean (const std::string & *name*, bool *value*) [pure virtual]

Sets a boolean value with the specified name into the Map.

Parameters

name	the name of the boolean
value	the boolean value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWritable-Exception	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 216).

6.333.3.15 virtual void cms::MapMessage::setByte (const std::string & *name,* unsigned char *value*) [pure virtual]

Sets a Byte value with the specified name into the Map.

Parameters

name	the name of the Byte
value	the Byte value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 216).

6.333.3.16 virtual void cms::MapMessage::setBytes (const std::string & *name,* const std::vector< unsigned char > & *value*) [pure virtual]

Sets a Bytes value with the specified name into the Map.

Parameters

name	The name of the Bytes
value	The Bytes value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 217).

6.333.3.17 virtual void cms::MapMessage::setChar (const std::string & *name,* char *value*) [pure virtual]

Sets a Char value with the specified name into the Map.

Parameters

name	the name of the Char
value	the Char value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 217).

6.333.3.18 virtual void cms::MapMessage::setDouble (const std::string & *name*, double *value*) [pure virtual]

Sets a Double value with the specified name into the Map.

Parameters

name	The name of the Double
value	The Double value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 217).

6.333.3.19 virtual void cms::MapMessage::setFloat (const std::string & *name*, float *value*) [pure virtual]

Sets a Float value with the specified name into the Map.

Parameters

name	The name of the Float
value	The Float value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 218).

6.333.3.20 virtual void cms::MapMessage::setInt (const std::string & *name*, int *value*) [pure virtual]

Sets a Int value with the specified name into the Map.

Parameters

name	The name of the Int
value	The Int value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 218).

6.333.3.21 virtual void cms::MapMessage::setLong (const std::string & *name,* long long *value*) [pure virtual]

Sets a Long value with the specified name into the Map.

Parameters

name	The name of the Long
value	The Long value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 218).

6.333.3.22 virtual void cms::MapMessage::setShort (const std::string & *name,* short *value*) [pure virtual]

Sets a Short value with the specified name into the Map.

Parameters

name	The name of the Short
value	The Short value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 219).

6.333.3.23 virtual void cms::MapMessage::setString (const std::string & *name,* const std::string & *value*) [pure virtual]

Sets a String value with the specified name into the Map.

Parameters

name	The name of the String
value	The String value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 219).

6.334 decaf::util::logging::MarkBlockLogger Class Reference

Defines a class that can be used to mark the entry and exit from scoped blocks.

`#include <src/main/decaf/util/logging/MarkBlockLogger.h>`

Public Member Functions

- **MarkBlockLogger** (**Logger** *logger, **const** std::string &blockName)

  Constructor - Marks Block entry.
- virtual ~**MarkBlockLogger** ()

6.334.1 Detailed Description

Defines a class that can be used to mark the entry and exit from scoped blocks.

Create an instance of this class at the start of a scoped block, passing it the logger to use and the name of the block. The block entry and exit will be marked using the scope name, logger to the logger at the MARKBLOCK log level.

6.334.2 Constructor & Destructor Documentation

6.334.2.1 decaf::util::logging::MarkBlockLogger::MarkBlockLogger (Logger * *logger,* const std::string & *blockName*) [inline]

Constructor - Marks Block entry.

Parameters

logger	**Logger** (p. 1312) to use
blockName	Block name

6.334.2.2 virtual decaf::util::logging::MarkBlockLogger::~MarkBlockLogger ( ) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**MarkBlockLogger.h**

6.335 activemq::wireformat::MarshalAware Class Reference

`#include <src/main/activemq/wireformat/MarshalAware.h>`

Inheritance diagram for activemq::wireformat::MarshalAware:

Public Member Functions

- virtual ~**MarshalAware** ()
- virtual bool **isMarshalAware** () **const** =0

  Determine if the class implementing this interface is really wanting to be told about marshaling.
- virtual void **beforeMarshal** (**WireFormat** *wireFormat)=0

  Called before marshaling is started to prepare the object to be marshaled.
- virtual void **afterMarshal** (**WireFormat** *wireFormat)=0

  Called after marshaling is started to cleanup the object being marshaled.
- virtual void **beforeUnmarshal** (**WireFormat** *wireFormat)=0

  Called before unmarshaling is started to prepare the object to be unmarshaled.
- virtual void **afterUnmarshal** (**WireFormat** *wireFormat)=0

  Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual void **setMarshaledForm** (**WireFormat** *wireFormat, **const** std::vector< char > &data)=0

  Called to set the data to this object that will contain the objects marshaled form.
- virtual std::vector< unsigned char > **getMarshaledForm** (**WireFormat** *wireFormat)=0

  Called to get the data to this object that will contain the objects marshaled form.

6.335.1 Constructor & Destructor Documentation

6.335.1.1 virtual activemq::wireformat::MarshalAware::~MarshalAware ( ) [inline, virtual]

6.335.2 Member Function Documentation

6.335.2.1 virtual void activemq::wireformat::MarshalAware::afterMarshal (WireFormat * *wireFormat*) [pure virtual]

Called after marshaling is started to cleanup the object being marshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

6.335.2.2 virtual void activemq::wireformat::MarshalAware::afterUnmarshal (WireFormat * *wireFormat*) [pure virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

6.335.2.3 virtual void activemq::wireformat::MarshalAware::beforeMarshal (WireFormat * *wireFormat*) [pure virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

Implemented in **activemq::commands::ActiveMQMapMessage** (p. 210), and **activemq::commands::ActiveMQTextMessage** (p. 315).

6.335.2.4 virtual void activemq::wireformat::MarshalAware::beforeUnmarshal (WireFormat * *wireFormat*) [pure virtual]

Called before unmarshaling is started to prepare the object to be unmarshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

6.335.2.5 virtual std::vector<unsigned char> activemq::wireformat::MarshalAware::getMarshaledForm (WireFormat * *wireFormat*) [pure virtual]

Called to get the data to this object that will contain the objects marshaled form.

Parameters

wireFormat	The wireformat object to control unmarshaling

Returns

buffer that holds the objects data.

6.335.2.6 virtual bool activemq::wireformat::MarshalAware::isMarshalAware ( ) const [pure virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Implemented in **activemq::commands::Message** (p. 1421), **activemq::commands::WireFormatInfo** (p. 2244), **activemq::commands::ActiveMQMapMessage** (p. 216), and **activemq::commands::BaseDataStructure** (p. 410).

6.335.2.7 virtual void activemq::wireformat::MarshalAware::setMarshaledForm (WireFormat * *wireFormat*, const std::vector< char > & *data*) [pure virtual]

Called to set the data to this object that will contain the objects marshaled form.

Parameters

wireFormat	- the wireformat object to control unmarshaling
data	- vector of object binary data
wireFormat	The wireformat object to control marshaling
data	A vector of bytes that contains the object in marshaled form.

Exceptions

IOException	if an I/O error occurs.

- virtual ~**MarshallingSupport** ()

Static Public Member Functions

- static void **writeString** (**decaf::io::DataOutputStream** &dataOut, **const** std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.
- static void **writeString16** (**decaf::io::DataOutputStream** &dataOut, **const** std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.
- static void **writeString32** (**decaf::io::DataOutputStream** &dataOut, **const** std::string &value)

  Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.
- static std::string **readString16** (**decaf::io::DataInputStream** &dataIn)

  Reads an Openwire encoded string from the provided DataInputStream.
- static std::string **readString32** (**decaf::io::DataInputStream** &dataIn)

  Reads an Openwire encoded string from the provided DataInputStream.
- static std::string **asciiToModifiedUtf8** (**const** std::string &asciiString)

  Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string.
- static std::string **modifiedUtf8ToAscii** (**const** std::string modifiedUtf8String)

  Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255].

6.337.1 Constructor & Destructor Documentation

6.337.1.1 activemq::util::MarshallingSupport::MarshallingSupport ( )

6.337.1.2 virtual activemq::util::MarshallingSupport::~MarshallingSupport ( ) [virtual]

6.337.2 Member Function Documentation

6.337.2.1 static std::string activemq::util::MarshallingSupport::asciiToModifiedUtf8 (const std::string & *asciiString*) [static]

Given an ASCII String with byte values [0..255] convert the string to a string containing the modified UTF-8 form of that same string.

This allows an ASCII string containing values greater than 127 as well as embedded NULLs to be sent to a Java client.

Parameters

asciiString	The ASCII string to encode as Modified UTF-8

Returns

a string containing the Modified UTF-8 encoded form of the provided string.

Exceptions

UTFDataFormatException	if the length of the encoded string would exceed the size of an signed integer.

6.337.2.2 static std::string activemq::util::MarshallingSupport::modifiedUtf8ToAscii (const std::string *modifiedUtf8String*) [static]

Given a string that contains bytes in the Java Modified UTF-8 format convert that string back into ASCII values from [0..255].

This will handle any string sent from a Java client which contains values within the [0..255] range or has embedded Nulls. Strings that have encoded values greater than 255 will cause an exception to be thrown.

Parameters

modifiedUtf8-String	The string to convert from Modified UTF-8 to ASCII.

Returns

the ASCII encoded version of the provided string.

Exceptions

UTFDataFormatException	if the provided string contains invalid data or the character values encoded in the string exceed ASCII value 255.

6.337.2.3 static std::string activemq::util::MarshallingSupport::readString16 (decaf::io::DataInputStream & *dataIn*) [static]

Reads an Openwire encoded string from the provided DataInputStream.

No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 16bits.

Parameters

dataIn	The DataInputStream to read the String data from.

Returns

the String value.

Exceptions

IOException	if an I/O error occurs while writing the string.

6.337.2.4 static std::string activemq::util::MarshallingSupport::readString32 (decaf::io::DataInputStream & *dataIn*) [static]

Reads an Openwire encoded string from the provided DataInputStream.

No string processing is performed by this method, clients that know the data contains UTF-8 encoded content must use one of the utility methods of this class to decode the UTF-8 data.

This version assumes a size prefix of 32bits.

Parameters

dataIn	The DataInputStream to read the String data from.

Returns

the String value.

Exceptions

IOException	if an I/O error occurs while writing the string.

6.337.2.5 static void activemq::util::MarshallingSupport::writeString (decaf::io::DataOutputStream & *dataOut,* const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed.

Parameters

dataOut	The DataOutputStream to write the String data to.
value	Thre String value to write in Openwire form.

Exceptions

IOException	if an I/O error occurs while writing the string.

6.337.2.6 static void activemq::util::MarshallingSupport::writeString16 (decaf::io::DataOutputStream & *dataOut,* const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed. This method write out only the size as a short and the string data no Openwire Type tag is appended.

Parameters

dataOut	The DataOutputStream to write the String data to.
value	Thre String value to write in Openwire form.

Exceptions

IOException	if an I/O error occurs while writing the string.

6.337.2.7 static void activemq::util::MarshallingSupport::writeString32 (decaf::io::DataOutputStream & *dataOut,* const std::string & *value*) [static]

Write the string object to the given DataOutputStream as Raw bytes, no string encoding is done on this char values in the string.

User must encode to Modified UTF-8 as needed. This method write out only the size as a int and the string data no Openwire Type tag is appended.

Parameters

dataOut	The DataOutputStream to write the String data to.
value	Thre String value to write in Openwire form.

Exceptions

IOException	if an I/O error occurs while writing the string.

6.338 decaf::lang::Math Class Reference

The class **Math** (p. 1396) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

`#include <src/main/decaf/lang/Math.h>`

Public Member Functions

- **Math** ()
- virtual ~**Math** ()

Static Public Member Functions

- static int **abs** (int value)

  Returns the absolute value of an int value.
- static long long **abs** (long long value)

  Returns the absolute value of an long long value.
- static float **abs** (float value)

  Returns the absolute value of a float value.
- static double **abs** (double value)

  Returns the absolute value of a double value.
- static double **sqrt** (double value)

  Returns the arc cosine of an angle, in the range of 0.0 through pi.
- static double **pow** (double base, double exp)

  Returns the value of the first argument raised to the power of the second argument.
- static short **min** (short a, short b)

  Returns the double value that is closest in value to the argument and is equal to a mathematical integer.
- static int **min** (int a, int b)

  Returns the smaller of two `int` values.
- static unsigned int **min** (unsigned int a, unsigned int b)

Returns the smaller of two `unsigned int` values.

- static long long **min** (long long a, long long b)

  Returns the smaller of two `long long` values.

- static float **min** (float a, float b)

  Returns the smaller of two float values.

- static double **min** (double a, double b)

  Returns the smaller of two double values.

- static short **max** (short a, short b)

  Returns the larger of two `short` values.

- static int **max** (int a, int b)

  Returns the larger of two `int` values.

- static long long **max** (long long a, long long b)

  Returns the larger of two `long long` values.

- static float **max** (float a, float b)

  Returns the greater of two float values.

- static double **max** (double a, double b)

  Returns the greater of two double values.

- static double **ceil** (double value)

  Returns the natural logarithm (base e) of a double value.

- static double **floor** (double value)

  Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

- static int **round** (float value)

  Returns the closest int to the argument.

- static long long **round** (double value)

  Returns the closest long long to the argument.

- static double **random** ()

  Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

- static float **signum** (float value)

  Returns Euler's number e raised to the power of a double value.

- static double **signum** (double value)

  Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

- static double **toRadians** (double angdeg)

  Returns the measure in radians of the supplied degree angle.

- static double **toDegrees** (double angrad)

  Returns the measure in degrees of the supplied radian angle.

Static Public Attributes

- static **const** double **E**
- static **const** double **PI**

6.338.1 Detailed Description

The class **`Math`** (p. 1396) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.

6.338.2 Constructor & Destructor Documentation

6.338.2.1 decaf::lang::Math::Math ( ) [inline]

6.338.2.2 virtual decaf::lang::Math::~Math ( ) [inline, virtual]

6.338.3 Member Function Documentation

6.338.3.1 static int decaf::lang::Math::abs (int *value*) [inline, static]

Returns the absolute value of an int value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value	- the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.338.3.2 static long long decaf::lang::Math::abs (long long *value*) [inline, static]

Returns the absolute value of an long long value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned.

Parameters

value	- the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.338.3.3 static float decaf::lang::Math::abs (float *value*) [static]

Returns the absolute value of a float value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Float::intBitsToFloat** (p. 1045)(0x7fffffff & Float::floatToIntBits(value))

Parameters

value	- the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.338.3.4 static double decaf::lang::Math::abs (double *value*) [static]

Returns the absolute value of a double value.

If the argument is not negative, the argument is returned. If the argument is negative, the negation of the argument is returned. Special cases:

o If the argument is positive zero or negative zero, the result is positive zero. o If the argument is infinite, the result is positive infinity. o If the argument is NaN, the result is NaN.

In other words, the result is the same as the value of the expression: **Double::longBitsToDouble** (p. 962)(0x7fffffffffffffffULL & Double::doubleToLongBits(value))

Parameters

value	- the value to return the abs of

Returns

the value if positive, otherwise the negative of value

6.338.3.5 static double decaf::lang::Math::ceil (double *value*) [static]

Returns the natural logarithm (base e) of a double value.

Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity.

Parameters

value	the value to compute the natural log of.

Returns

the natural log of value. Returns the base 10 logarithm of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is negative infinity. o If the argument is equal to 10n for integer n, then the result is n.

Parameters

value	- the value to operate on

Returns

the long base 10 of value Returns the natural logarithm of the sum of the argument and 1. Note that for small values x, the result of log1p(x) is much closer to the true result of ln(1 + x) than the floating-point evaluation of log(1.0+x).

Special cases:

o If the argument is NaN or less than -1, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative one, then the result is negative infinity. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the value to operate on

Returns

the the value ln(x + 1), the natural log of x + 1 Returns the smallest (closest to negative infinity) double value that is greater than or equal to the argument and is equal to a mathematical integer. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument. o If the argument value is less than zero but greater than -1.0, then the result is negative zero.

Note that the value of Math.ceil(x) is exactly the value of -Math.floor(-x).

Parameters

value	- the value to find the ceiling of

Returns

the smallest (closest to negative infinity) floating-point value that is greater than or equal to the argument and is equal to a mathematical integer.

6.338.3.6 static double decaf::lang::Math::floor (double *value*) [static]

Returns the largest (closest to positive infinity) double value that is less than or equal to the argument and is equal to a mathematical integer.

Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

value	- the value to find the floor of

Returns

the largest (closest to positive infinity) floating-point value that less than or equal to the argument and is equal to a mathematical integer.

6.338.3.7 static short decaf::lang::Math::max (short *a*, short *b*) [inline, static]

Returns the larger of two `short` values.

That is, the result the argument closer to the value of **`Short::MAX_VALUE`** (p. 1866). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the larger of `a` and `b`.

6.338.3.8 static int decaf::lang::Math::max (int *a,* int *b*) [inline, static]

Returns the larger of two `int` values.

That is, the result the argument closer to the value of **`Integer::MAX_VALUE`** (p. 1174). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the larger of `a` and `b`.

6.338.3.9 static long long decaf::lang::Math::max (long long *a,* long long *b*) [inline, static]

Returns the larger of two `long long` values.

That is, the result the argument closer to the value of **`Long::MAX_VALUE`** (p. 1351). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the larger of `a` and `b`.

6.338.3.10 static float decaf::lang::Math::max (float *a,* float *b*) [static]

Returns the greater of two float values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

a	- an argument.
b	- another argument.

Returns

the larger of `a` and `b`.

6.338.3.11 static double decaf::lang::Math::max (double *a,* double *b*) [static]

Returns the greater of two double values.

That is, the result is the argument closer to positive infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this

method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other negative zero, the result is positive zero.

Parameters

a	- an argument.
b	- another argument.

Returns

the larger of `a` and `b`.

6.338.3.12 static short decaf::lang::Math::min (short *a*, short *b*) [inline, static]

Returns the double value that is closest in value to the argument and is equal to a mathematical integer.

If two double values that are mathematical integers are equally close, the result is the integer value that is even. Special cases:

o If the argument value is already equal to a mathematical integer, then the result is the same as the argument. o If the argument is NaN or an infinity or positive zero or negative zero, then the result is the same as the argument.

Parameters

value	- the value to round to the nearest integer

Returns

the rounded value Returns the smaller of two short values. That is, the result is the argument closer to the value of **`decaf.lang.Short::MIN_VALUE`** (p. 1866). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo().

6.338.3.13 static int decaf::lang::Math::min (int *a*, int *b*) [inline, static]

Returns the smaller of two `int` values.

That is, the result the argument closer to the value of **`Integer::MIN_VALUE`** (p. 1175). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

6.338.3.14 static unsigned int decaf::lang::Math::min (unsigned int *a,* unsigned int *b*) [inline, static]

Returns the smaller of two `unsigned int` values.

That is, the result the argument closer to the value of **`Integer::MIN_VALUE`** (p. 1175). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

6.338.3.15 static long long decaf::lang::Math::min (long long *a,* long long *b*) [inline, static]

Returns the smaller of two `long long` values.

That is, the result the argument closer to the value of **`Long::MIN_VALUE`** (p. 1351). If the arguments have the same value, the result is that same value.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

6.338.3.16 static float decaf::lang::Math::min (float *a,* float *b*) [static]

Returns the smaller of two float values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

6.338.3.17 static double decaf::lang::Math::min (double *a,* double *b*) [static]

Returns the smaller of two double values.

That is, the result is the value closer to negative infinity. If the arguments have the same value, the result is that same value. If either value is NaN, then the result is NaN. Unlike the numerical comparison operators, this method considers negative zero to be strictly smaller than positive zero. If one argument is positive zero and the other is negative zero, the result is negative zero.

Parameters

a	- an argument.
b	- another argument.

Returns

the smaller of `a` and `b`.

6.338.3.18 static double decaf::lang::Math::pow (double *base,* double *exp*) [static]

Returns the value of the first argument raised to the power of the second argument.

Special cases:

o If the second argument is positive or negative zero, then the result is 1.0. o If the second argument is 1.0, then the result is the same as the first argument. o If the second argument is NaN, then the result is NaN. o If the first argument is NaN and the second argument is nonzero, then the result is NaN.

Parameters

base	- the base
exp	- the exponent

Returns

the base raised to the power of exp.

6.338.3.19 static double decaf::lang::Math::random ( ) [static]

Computes the remainder operation on two arguments as prescribed by the IEEE 754 standard.

The remainder value is mathematically equal to f1 - f2 × n, where n is the mathematical integer closest to the exact mathematical value of the quotient f1/f2, and if two mathematical integers are equally close to f1/f2, then n is the integer that is even. If the remainder is zero, its sign is the same as the sign of the first argument. Special cases:

o If either argument is NaN, or the first argument is infinite, or the second argument is positive zero or negative zero, then the result is NaN. o If the first argument is finite and the second argument is infinite, then the result is the same as the first argument.

Parameters

f1	- the dividend.
f2	- the divisor

Returns

the IEEE remainder of value Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0. Returned values are chosen pseudorandomly with (approximately) uniform distribution from that range.

When this method is first called, it creates a single new pseudorandom-number generator; This new pseudorandom-number generator is used thereafter for all calls to this method and is used nowhere else.

This method is properly synchronized to allow correct use by more than one thread. However, if many threads need to generate pseudorandom numbers at a great rate, it may reduce contention for each thread to have its own pseudorandom-number generator.

Returns

a pseudorandom double greater than or equal to 0.0 and less than 1.0.

6.338.3.20 static int decaf::lang::Math::round (float *value*) [static]

Returns the closest int to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type int. In other words, the result is equal to the value of the expression: (int)**Math.floor** (p. 1400)(a + 0.5f)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Integer::MIN_VALUE** (p. 1175), the result is equal to the value of **Integer::MIN_VALUE** (p. 1175). o If the argument is positive infinity or any value greater than or equal to the value of **Integer::MAX_VALUE** (p. 1174), the result is equal to the value of **Integer::MAX_VALUE** (p. 1174).

Parameters

value	- the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.338.3.21 static long long decaf::lang::Math::round (double *value*) [static]

Returns the closest long long to the argument.

The result is rounded to an integer by adding 1/2, taking the floor of the result, and casting the result to type long long. In other words, the result is equal to the value of the expression: (long long)**Math.floor** (p. 1400)(a + 0.5d)

o If the argument is NaN, the result is 0. o If the argument is negative infinity or any value less than or equal to the value of **Long::MIN_VALUE** (p. 1351), the result is equal to the value of **Long::MIN_VALUE** (p. 1351). o If the argument is positive infinity or any value greater than or equal to the value of **Long::MAX_VALUE** (p. 1351), the result is equal to the value of **Long::MAX_VALUE** (p. 1351).

Parameters

value	- the value to round

Returns

the value of the argument rounded to the nearest integral value.

6.338.3.22 static float decaf::lang::Math::signum (float *value*) [static]

Returns Euler's number e raised to the power of a double value.

Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is positive zero.

Parameters

value	- the exponent to raise e to

Returns

the value e^a, where e is the base of the natural logarithms. Returns e^x - 1. Note that for values of x near 0, the exact sum of expm1(x) + 1 is much closer to the true result of ex than exp(x). Special cases:

o If the argument is NaN, the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is negative infinity, then the result is -1.0. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the value to raise e^x - 1

Returns

the value ex - 1. Returns sqrt(x^2 + y^2) without intermediate overflow or underflow. Special cases:

If either argument is infinite, then the result is positive infinity. If either argument is NaN and neither argument is infinite, then the result is NaN.

Parameters

x	- an argument
y	- another argument

Returns

the sqrt(x^2 + y^2) without intermediate overflow or underflow Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero. Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value	- the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.338.3.23 static double decaf::lang::Math::signum (double *value*) [static]

Returns the signum function of the argument; zero if the argument is zero, 1.0f if the argument is greater than zero, -1.0f if the argument is less than zero.

Special Cases:

o If the argument is NaN, then the result is NaN. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Parameters

value	- the floating-point value whose signum is to be returned

Returns

the signum function of the argument

6.338.3.24 static double decaf::lang::Math::sqrt (double *value*) [static]

Returns the arc cosine of an angle, in the range of 0.0 through pi.

Special case:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN.

Parameters

value	- the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc sine of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN or its absolute value is greater than 1, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the value to return the arc cosine of.

Returns

arc cosine of value in radians. Returns the arc tangent of an angle, in the range of -pi/2 through pi/2. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the value to return the arc cosine of.

Returns

arc tangent of value in radians. Converts rectangular coordinates (x, y) to polar (r, theta). This method computes the phase theta by computing an arc tangent of y/x in the range of -pi to pi. Special cases:

o If either argument is NaN, then the result is NaN. o If the first argument is positive zero and the second argument is positive, or the first argument is positive and finite and the second argument is positive infinity, then the result is positive zero. o If the first argument is negative zero and the second argument is positive, or the first argument is negative and finite and the second argument is positive infinity, then the result is negative zero. o If the first argument is positive zero and the second argument is negative, or the first argument is positive and finite and the second argument is negative infinity, then the result is the double value closest to pi. o If the first argument is negative zero and the second argument is negative, or the first argument is negative and finite and the second argument is negative infinity, then the result is the double value closest to -pi. o If the first argument is positive and the second argument is positive zero or negative zero, or the first argument is positive infinity and the second argument is finite, then the result is the double value closest to pi/2. o If the first argument is negative and the second argument is positive zero or negative zero, or the first argument is negative infinity and the second argument is finite, then the result is the double value closest to -pi/2. o If both arguments are positive infinity, then the result is the double value closest to pi/4. o If the first argument is positive infinity and the second argument is negative infinity, then the result is the double value closest to 3∗pi/4. o If the first argument is negative infinity and the second argument is positive

infinity, then the result is the double value closest to -pi/4. o If both arguments are negative infinity, then the result is the double value closest to -3∗pi/4.

Parameters

y	- the ordinate coordinate
x	- the abscissa coordinate

Returns

the theta component of the point (r, theta) in polar coordinates that corresponds to the point (x, y) in Cartesian coordinates. Returns the cube root of a double value. For positive finite x, cbrt(-x) == -cbrt(x); that is, the cube root of a negative value is the negative of the cube root of that value's magnitude. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the double to compute the cube root of

Returns

the cube root of value Returns the trigonometric cosine of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN.

Parameters

value	- an value in radians

Returns

the cosine of the argument. Returns the hyperbolic cosine of a double value. The hyperbolic cosine of x is defined to be (ex + e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is positive infinity. o If the argument is zero, then the result is 1.0.

Parameters

value	- the number whose hyperbolic cosine is to be found

Returns

the hyperbolic cosine of value Returns the trigonometric sine of an angle. Special case:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the number whose sin is to be found

Returns

the sine of value Returns the hyperbolic sine of a double value. The hyperbolic sine of x is defined to be (ex - e-x)/2 where e is Euler's number. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is infinite, then the result is an infinity with the same sign as the argument. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the number whose hyperbolic sin is to be found

Returns

the hyperbolic sine of value Returns the trigonometric tangent of an angle. Special cases:

o If the argument is NaN or an infinity, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument.

Parameters

value	- the number whose tangent is to be found

Returns

the tangent of value Returns the hyperbolic tangent of a double value. The hyperbolic tangent of x is defined to be (ex - e-x)/(ex + e-x), in other words, sinh(x)/cosh(x). Note that the absolute value of the exact tanh is always less than 1. Special cases:

o If the argument is NaN, then the result is NaN. o If the argument is zero, then the result is a zero with the same sign as the argument. o If the argument is positive infinity, then the result is +1.0. o If the argument is negative infinity, then the result is -1.0.

Parameters

value	- the number whose hyperbolic tangent is to be found

Returns

the hyperbolic cosine of value Returns the correctly rounded positive square root of a double value. Special cases:

o If the argument is NaN or less than zero, then the result is NaN. o If the argument is positive infinity, then the result is positive infinity. o If the argument is positive zero or negative zero, then the result is the same as the argument.

Otherwise, the result is the double value closest to the true mathematical square root of the argument value.

Parameters

value	- the value to find the square root of
the	square root of the argument.

6.338.3.25 static double decaf::lang::Math::toDegrees (double *angrad*) [inline, static]

Returns the measure in degrees of the supplied radian angle.

Parameters

angrad	- an angle in radians

Returns

the degree measure of the angle.

6.338.3.26 static double decaf::lang::Math::toRadians (double *angdeg*) [inline, static]

Returns the measure in radians of the supplied degree angle.

Parameters

angdeg	- an angle in degrees

Returns

the radian measure of the angle.

6.338.4 Field Documentation

6.338.4.1 const double decaf::lang::Math::E [static]

6.338.4.2 const double decaf::lang::Math::PI [static]

6.339 activemq::util::MemoryUsage Class Reference

`#include <src/main/activemq/util/MemoryUsage.h>`

Inheritance diagram for activemq::util::MemoryUsage:

Public Member Functions

- **MemoryUsage** ()

  Default Constructor.
- **MemoryUsage** (unsigned long long limit)

  *Creates an instance of an **Usage** (p. 2226) monitor with a set limit.*
- virtual ~**MemoryUsage** ()
- virtual void **waitForSpace** ()

  *Waits forever for more space to be returned to this **Usage** (p. 2226) Manager.*
- virtual void **waitForSpace** (unsigned int timeout)

  *Waits for more space to be returned to this **Usage** (p. 2226) Manager, times out when the given time span in milliseconds elapses.*
- virtual void **enqueueUsage** (unsigned long long value)

  Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void **increaseUsage** (unsigned long long value)

  Increases the usage by the value amount.
- virtual void **decreaseUsage** (unsigned long long value)

  Decreases the usage by the value amount.

- virtual bool **isFull** () **const**

  *Returns true if this **Usage** (p. 2226) instance is full, i.e.*
- unsigned long long **getUsage** () **const**

  Gets the current usage amount.
- void **setUsage** (unsigned long long usage)

  Sets the current usage amount.
- unsigned long long **getLimit** () **const**

  Gets the current limit amount.
- void **setLimit** (unsigned long long limit)

  Sets the current limit amount.

6.339.1 Constructor & Destructor Documentation

6.339.1.1 activemq::util::MemoryUsage::MemoryUsage ( )

Default Constructor.

6.339.1.2 activemq::util::MemoryUsage::MemoryUsage (unsigned long long *limit*)

Creates an instance of an **Usage** (p. 2226) monitor with a set limit.

Parameters

limit	- amount of memory this manager allows.

6.339.1.3 virtual activemq::util::MemoryUsage::~MemoryUsage ( ) [virtual]

6.339.2 Member Function Documentation

6.339.2.1 virtual void activemq::util::MemoryUsage::decreaseUsage (unsigned long long *value*) [virtual]

Decreases the usage by the value amount.

Parameters

value	Amount of space to return to the pool

Implements **activemq::util::Usage** (p. 2227).

6.339.2.2 virtual void activemq::util::MemoryUsage::enqueueUsage (unsigned long long *value*) [inline, virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

value	Amount of usage in bytes to add.

Implements **activemq::util::Usage** (p. 2227).

6.339.2.3 unsigned long long activemq::util::MemoryUsage::getLimit ( ) const [inline]

Gets the current limit amount.

Returns

the amount that can be used before full.

6.339.2.4 unsigned long long activemq::util::MemoryUsage::getUsage ( ) const [inline]

Gets the current usage amount.

Returns

the amount of bytes currently used.

6.339.2.5 virtual void activemq::util::MemoryUsage::increaseUsage (unsigned long long *value*) [virtual]

Increases the usage by the value amount.

Parameters

value	Amount of usage to add.

Implements **activemq::util::Usage** (p. 2227).

6.339.2.6 virtual bool activemq::util::MemoryUsage::isFull ( ) const [virtual]

Returns true if this **Usage** (p. 2226) instance is full, i.e.

Usage (p. 2226) >= 100%

Implements **activemq::util::Usage** (p. 2227).

6.339.2.7 void activemq::util::MemoryUsage::setLimit (unsigned long long *limit*) [inline]

Sets the current limit amount.

Parameters

limit	- The amount that can be used before full.

6.339.2.8 void activemq::util::MemoryUsage::setUsage (unsigned long long *usage*) [inline]

Sets the current usage amount.

Parameters

usage	- The amount to tag as used.

6.339.2.9 virtual void activemq::util::MemoryUsage::waitForSpace ( ) [virtual]

Waits forever for more space to be returned to this **Usage** (p. 2226) Manager.

Implements **activemq::util::Usage** (p. 2227).

6.339.2.10 virtual void activemq::util::MemoryUsage::waitForSpace (unsigned int *timeout*) [virtual]

Waits for more space to be returned to this **Usage** (p. 2226) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout	The time to wait for more space.

Implements **activemq::util::Usage** (p. 2228).

The documentation for this class was generated from the following file:

6.340 activemq::commands::Message Class Reference

`#include <src/main/activemq/commands/Message.h>`

Inheritance diagram for activemq::commands::Message:

Public Member Functions

- **Message** ()
- virtual ∼**Message** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **Message** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual void **beforeMarshal** (**wireformat::WireFormat** ∗wireFormat AMQCPP_UNUSED)

  Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.
- virtual void **afterUnmarshal** (**wireformat::WireFormat** ∗wireFormat AMQCPP_UNUSED)

  Called after unmarshaling is started to cleanup the object being unmarshaled.
- virtual bool **isMarshalAware** () **const**

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual void **setAckHandler** (**const Pointer**< **core::ActiveMQAckHandler** > &handler)

  *Sets the Acknowledgment Handler that this **Message** (p. 1412) will use when the Acknowledge method is called.*
- virtual **Pointer**
  < **core::ActiveMQAckHandler** > **getAckHandler** () **const**

  *Gets the Acknowledgment Handler that this **Message** (p. 1412) will use when the Acknowledge method is called.*
- void **setConnection** (**core::ActiveMQConnection** ∗**connection**)

*Sets the ActiveMQConnection instance that this **Command** (p. 671) was created from when the session create methods are called to create a **Message** (p. 1412).*

- **core::ActiveMQConnection** * **getConnection** () **const**

  *Gets the ActiveMQConnection instance that this **Command** (p. 671) was created from when the session create methods are called to create a **Message** (p. 1412).*

- virtual unsigned int **getSize** () **const**

  Returns the Size of this message in Bytes.

- virtual bool **isExpired** () **const**

  Returns if this message has expired, meaning that its Expiration time has elapsed.

- virtual void **onSend** ()

  *Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.*

- **util::PrimitiveMap** & **getMessageProperties** ()

  *Gets a reference to the **Message** (p. 1412)'s Properties object, allows the derived classes to get and set their own specific properties.*

- **const util::PrimitiveMap** & **getMessageProperties** () **const**
- bool **isReadOnlyProperties** () **const**

  *Returns if the **Message** (p. 1412) Properties Are Read Only.*

- void **setReadOnlyProperties** (bool value)

  *Set the Read Only State of the **Message** (p. 1412) Properties.*

- bool **isReadOnlyBody** () **const**

  *Returns if the **Message** (p. 1412) Body is Read Only.*

- void **setReadOnlyBody** (bool value)

  *Set the Read Only State of the **Message** (p. 1412) Content.*

- virtual **const Pointer**

6.340.1 Constructor & Destructor Documentation

6.340.1.1 activemq::commands::Message::Message ( )

6.340.1.2 virtual activemq::commands::Message::~Message ( ) [virtual]

6.340.2 Member Function Documentation

6.340.2.1 virtual void activemq::commands::Message::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

Parameters

wireFormat	- the wireformat object to control unmarshaling

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.340.2.2 virtual void activemq::commands::Message::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Handles the marshaling of the objects properties into the internal byte array before the object is marshaled to the wire.

Parameters

wireFormat	- the wireformat controller

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.340.2.3 virtual Message* activemq::commands::Message::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::ActiveMQTextMessage** (p. 315), **activemq::commands::ActiveMQMessage** (p. 224), and **activemq::commands::ActiveMQObjectMessage** (p. 234).

6.340.2.4 virtual void activemq::commands::Message::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 224).

6.340.2.5 virtual bool activemq::commands::Message::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 132), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230), **activemq::commands::ActiveMQBlobMessage** (p. 124), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 224).

6.340.2.6 virtual Pointer<core::ActiveMQAckHandler> activemq::commands::Message::getAckHandler ( ) const [inline, virtual]

Gets the Acknowledgment Handler that this **Message** (p. 1412) will use when the Acknowledge method is called.

Returns

handler ActiveMQAckHandler to call or NULL if not set

6.340.2.7 virtual long long activemq::commands::Message::getArrival ( ) const [virtual]

6.340.2.8 virtual long long activemq::commands::Message::getBrokerInTime ( ) const [virtual]

6.340.2.9 virtual long long activemq::commands::Message::getBrokerOutTime ( ) const [virtual]

6.340.2.10 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath ( ) const [virtual]

6.340.2.11 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getBrokerPath ( ) [virtual]

6.340.2.12 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster ( ) const [virtual]

6.340.2.13 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::Message::getCluster ( ) [virtual]

6.340.2.14 core::ActiveMQConnection* activemq::commands::Message::getConnection ( ) const [inline]

Gets the ActiveMQConnection instance that this **Command** (p. 671) was created from when the session create methods are called to create a **Message** (p. 1412).

Returns

the ActiveMQConnection parent for this **Message** (p. 1412) or NULL if not set.

6.340.2.15 virtual const std::vector<unsigned char>& activemq::commands::Message::getContent ( ) const [virtual]

6.340.2.16 virtual std::vector<unsigned char>& activemq::commands::Message::getContent ( ) [virtual]

6.340.2.17 virtual const std::string& activemq::commands::Message::getCorrelationId ( ) const [virtual]

6.340.2.18 virtual std::string& activemq::commands::Message::getCorrelationId ( ) [virtual]

6.340.2.19 virtual const Pointer<DataStructure>& activemq::commands::Message::getDataStructure ( ) const [virtual]

6.340.2.20 virtual Pointer<DataStructure>& activemq::commands::Message::getDataStructure ( ) [virtual]

6.340.2.21 virtual unsigned char activemq::commands::Message::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 132), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQMapMessage** (p. 213), **activemq::commands::ActiveMQBlobMessage** (p. 124), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 225).

6.340.2.22 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination ( ) const [virtual]

6.340.2.23 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getDestination ( ) [virtual]

6.340.2.24 virtual long long activemq::commands::Message::getExpiration ( ) const [virtual]

6.340.2.25 virtual const std::string& activemq::commands::Message::getGroupID ( ) const [virtual]

6.340.2.26 virtual std::string& activemq::commands::Message::getGroupID ( ) [virtual]

6.340.2.27 virtual int activemq::commands::Message::getGroupSequence ( ) const [virtual]

6.340.2.28 virtual const std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties ( ) const [virtual]

6.340.2.29 virtual std::vector<unsigned char>& activemq::commands::Message::getMarshalledProperties ( ) [virtual]

6.340.2.30 virtual const Pointer<MessageId>& activemq::commands::Message::getMessageId ( ) const [virtual]

6.340.2.31 virtual Pointer<MessageId>& activemq::commands::Message::getMessageId ( ) [virtual]

6.340.2.32 util::PrimitiveMap& activemq::commands::Message::getMessageProperties ( ) [inline]

Gets a reference to the **Message** (p. 1412)'s Properties object, allows the derived classes to get and set their own specific properties.

Returns

a reference to the Primitive Map that holds message properties.

6.340.2.33 const util::PrimitiveMap& activemq::commands::Message::getMessageProperties ( ) const [inline]

6.340.2.34 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination ( ) const [virtual]

6.340.2.35 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getOriginalDestination ( ) [virtual]

6.340.2.36 virtual const Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId ( ) const [virtual]

6.340.2.37 virtual Pointer<TransactionId>& activemq::commands::Message::getOriginalTransactionId ( ) [virtual]

6.340.2.38 virtual unsigned char activemq::commands::Message::getPriority ( ) const [virtual]

6.340.2.39 virtual const Pointer<ProducerId>& activemq::commands::Message::getProducerId ( ) const [virtual]

6.340.2.40 virtual Pointer<ProducerId>& activemq::commands::Message::getProducerId ( ) [virtual]

6.340.2.41 virtual int activemq::commands::Message::getRedeliveryCounter ( ) const [virtual]

6.340.2.42 virtual const Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo ( ) const [virtual]

6.340.2.43 virtual Pointer<ActiveMQDestination>& activemq::commands::Message::getReplyTo ( ) [virtual]

6.340.2.44 virtual unsigned int activemq::commands::Message::getSize ( ) const [virtual]

Returns the Size of this message in Bytes.

Returns

number of bytes this message equates to.

Reimplemented in **activemq::commands::ActiveMQTextMessage** (p. 316).

6.340.2.45 virtual const Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId ( ) const [virtual]

6.340.2.46 virtual Pointer<ConsumerId>& activemq::commands::Message::getTargetConsumerId ( ) [virtual]

6.340.2.47 virtual long long activemq::commands::Message::getTimestamp ( ) const [virtual]

6.340.2.48 virtual const Pointer<TransactionId>& activemq::commands::Message::getTransactionId ( ) const [virtual]

6.340.2.49 virtual Pointer<TransactionId>& activemq::commands::Message::getTransactionId ( ) [virtual]

6.340.2.50 virtual const std::string& activemq::commands::Message::getType ( ) const [virtual]

6.340.2.51 virtual std::string& activemq::commands::Message::getType ( ) [virtual]

6.340.2.52 virtual const std::string& activemq::commands::Message::getUserID ( ) const [virtual]

6.340.2.53 virtual std::string& activemq::commands::Message::getUserID ( ) [virtual]

6.340.2.54 virtual bool activemq::commands::Message::isCompressed ( ) const [virtual]

6.340.2.55 virtual bool activemq::commands::Message::isDroppable ( ) const [virtual]

6.340.2.56 virtual bool activemq::commands::Message::isExpired ( ) const [virtual]

Returns if this message has expired, meaning that its Expiration time has elapsed.

Returns

true if message is expired.

6.340.2.57 virtual bool activemq::commands::Message::isMarshalAware ( ) const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

Reimplemented in **activemq::commands::ActiveMQMapMessage** (p. 216).

6.340.2.58 virtual bool activemq::commands::Message::isMessage ( ) const [inline, virtual]

Returns

an answer of true to the **isMessage()** (p. 1421) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.340.2.59 virtual bool activemq::commands::Message::isPersistent ( ) const [virtual]

6.340.2.60 bool activemq::commands::Message::isReadOnlyBody ( ) const [inline]

Returns if the **Message** (p. 1412) Body is Read Only.

Returns

true if **Message** (p. 1412) Content is Read Only.

6.340.2.61 bool activemq::commands::Message::isReadOnlyProperties ( ) const [inline]

Returns if the **Message** (p. 1412) Properties Are Read Only.

Returns

true if **Message** (p. 1412) Properties are Read Only.

6.340.2.62 virtual bool activemq::commands::Message::isRecievedByDFBridge ( ) const [virtual]

6.340.2.63 virtual void activemq::commands::Message::onSend ( ) [inline, virtual]

Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 133), **activemq::commands::ActiveMQStreamMessage** (p. 282), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.340.2.64 virtual void activemq::commands::Message::setAckHandler (const Pointer< core::ActiveMQAckHandler > & *handler*) [inline, virtual]

Sets the Acknowledgment Handler that this **Message** (p. 1412) will use when the Acknowledge method is called.

Parameters

handler	ActiveMQAckHandler to call

6.340.2.65 virtual void activemq::commands::Message::setArrival (long long *arrival*) [virtual]

6.340.2.66 virtual void activemq::commands::Message::setBrokerInTime (long long *brokerInTime*) [virtual]

6.340.2.67 virtual void **activemq::commands::Message::setBrokerOutTime** (long long *brokerOutTime*) [virtual]

6.340.2.68 virtual void **activemq::commands::Message::setBrokerPath** (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.340.2.69 virtual void **activemq::commands::Message::setCluster** (const std::vector< decaf::lang::Pointer< BrokerId > > & *cluster*) [virtual]

6.340.2.70 virtual void **activemq::commands::Message::setCompressed** (bool *compressed*) [virtual]

6.340.2.71 void **activemq::commands::Message::setConnection** (core::ActiveMQConnection * *connection*) [inline]

Sets the ActiveMQConnection instance that this **Command** (p. 671) was created from when the session create methods are called to create a **Message** (p. 1412).

Parameters

handler	ActiveMQConnection parent for this message

6.340.2.72 virtual void **activemq::commands::Message::setContent** (const std::vector< unsigned char > & *content*) [virtual]

6.340.2.73 virtual void **activemq::commands::Message::setCorrelationId** (const std::string & *correlationId*) [virtual]

6.340.2.74 virtual void **activemq::commands::Message::setDataStructure** (const Pointer< DataStructure > & *dataStructure*) [virtual]

6.340.2.75 virtual void **activemq::commands::Message::setDestination** (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.340.2.76 virtual void **activemq::commands::Message::setDroppable** (bool *droppable*) [virtual]

6.340.2.77 virtual void **activemq::commands::Message::setExpiration** (long long *expiration*) [virtual]

6.340.2.78 virtual void **activemq::commands::Message::setGroupID** (const std::string & *groupID*) [virtual]

6.340.2.79 virtual void **activemq::commands::Message::setGroupSequence** (int *groupSequence*) [virtual]

6.340.2.80 virtual void **activemq::commands::Message::setMarshalledProperties** (const std::vector< unsigned char > & *marshalledProperties*) [virtual]

6.340.2.81 virtual void **activemq::commands::Message::setMessageId** (const Pointer< MessageId > & *messageId*) [virtual]

6.340.2.82 virtual void **activemq::commands::Message::setOriginalDestination** (const Pointer< ActiveMQDestination > & *originalDestination*) [virtual]

6.340.2.83 virtual void **activemq::commands::Message::setOriginalTransactionId** (const Pointer< TransactionId > & *originalTransactionId*) [virtual]

6.340.2.84 virtual void **activemq::commands::Message::setPersistent** (bool *persistent*) [virtual]

6.340.2.85 virtual void **activemq::commands::Message::setPriority** (unsigned char *priority*) [virtual]

6.340.2.86 virtual void **activemq::commands::Message::setProducerId** (const Pointer< ProducerId > & *producerId*) [virtual]

6.340.2.87 void **activemq::commands::Message::setReadOnlyBody** (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 1412) Content.

Parameters

value	- true if Content should be read only.

6.340.2.88 void **activemq::commands::Message::setReadOnlyProperties** (bool *value*) [inline]

Set the Read Only State of the **Message** (p. 1412) Properties.

Parameters

value	- true if Properties should be read only.

6.340.2.89 virtual void **activemq::commands::Message::setRecievedByDFBridge** (bool *recievedByDFBridge*) [virtual]

6.340.2.90 virtual void **activemq::commands::Message::setRedeliveryCounter** (int *redeliveryCounter*) [virtual]

6.340.2.91 virtual void **activemq::commands::Message::setReplyTo** (const Pointer< ActiveMQDestination > & *replyTo*) [virtual]

6.340.2.92 virtual void **activemq::commands::Message::setTargetConsumerId** (const Pointer< ConsumerId > & *targetConsumerId*) [virtual]

6.340.2.93 virtual void **activemq::commands::Message::setTimestamp** (long long *timestamp*) [virtual]

6.340.2.94 virtual void **activemq::commands::Message::setTransactionId** (const Pointer< TransactionId > & *transactionId*) [virtual]

6.340.2.95 virtual void **activemq::commands::Message::setType** (const std::string & *type*) [virtual]

6.340.2.96 virtual void **activemq::commands::Message::setUserID** (const std::string & *userID*) [virtual]

6.340.2.97 virtual std::string **activemq::commands::Message::toString** ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

Reimplemented in **activemq::commands::ActiveMQBytesMessage** (p. 138), **activemq::commands::ActiveMQStreamMessage** (p. 286), **activemq::commands::ActiveMQMapMessage** (p. 219), **activemq::commands::ActiveMQBlobMessage** (p. 125), **activemq::commands::ActiveMQTextMessage** (p. 317), **activemq::commands::ActiveMQObjectMessage** (p. 235), and **activemq::commands::ActiveMQMessage** (p. 225).

6.340.2.98 virtual Pointer<Command> activemq::commands::Message::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.341 cms::Message Class Reference

Root of all messages.

`#include <src/main/cms/Message.h>`

Inheritance diagram for cms::Message:

Public Member Functions

- virtual ~**Message** ()
- virtual **Message** * **clone** () **const** =0

  Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **acknowledge** () **const** =0

  Acknowledges all consumed messages of the session of this consumed message.
- virtual void **clearBody** ()=0

  Clears out the body of the message.
- virtual void **clearProperties** ()=0

  Clears out the message body.
- virtual std::vector< std::string > **getPropertyNames** () **const** =0

Retrieves the property names.

- virtual bool **propertyExists** (**const** std::string &name) **const** =0

  Indicates whether or not a given property exists.
- virtual bool **getBooleanProperty** (**const** std::string &name) **const** =0

  Gets a boolean property.
- virtual unsigned char **getByteProperty** (**const** std::string &name) **const** =0

  Gets a byte property.
- virtual double **getDoubleProperty** (**const** std::string &name) **const** =0

  Gets a double property.
- virtual float **getFloatProperty** (**const** std::string &name) **const** =0

  Gets a float property.
- virtual int **getIntProperty** (**const** std::string &name) **const** =0

  Gets a int property.
- virtual long long **getLongProperty** (**const** std::string &name) **const** =0

  Gets a long property.
- virtual short **getShortProperty** (**const** std::string &name) **const** =0

  Gets a short property.
- virtual std::string **getStringProperty** (**const** std::string &name) **const** =0

  Gets a string property.
- virtual void **setBooleanProperty** (**const** std::string &name, bool value)=0

  Sets a boolean property.
- virtual void **setByteProperty** (**const** std::string &name, unsigned char value)=0

  Sets a byte property.
- virtual void **setDoubleProperty** (**const** std::string &name, double value)=0

  Sets a double property.
- virtual void **setFloatProperty** (**const** std::string &name, float value)=0

  Sets a float property.
- virtual void **setIntProperty** (**const** std::string &name, int value)=0

  Sets a int property.
- virtual void **setLongProperty** (**const** std::string &name, long long value)=0

  Sets a long property.
- virtual void **setShortProperty** (**const** std::string &name, short value)=0

  Sets a short property.
- virtual void **setStringProperty** (**const** std::string &name, **const** std::string &value)=0

  Sets a string property.
- virtual std::string **getCMSCorrelationID** () **const** =0

  Gets the correlation ID for the message.
- virtual void **setCMSCorrelationID** (**const** std::string &correlationId)=0

  Sets the correlation ID for the message.
- virtual int **getCMSDeliveryMode** () **const** =0

  *Gets the **DeliveryMode** (p. 925) for this message.*
- virtual void **setCMSDeliveryMode** (int mode)=0

  *Sets the **DeliveryMode** (p. 925) for this message.*
- virtual **const Destination** ∗ **getCMSDestination** () **const** =0

  *Gets the **Destination** (p. 936) object for this message.*
- virtual void **setCMSDestination** (**const Destination** ∗destination)=0

  *Sets the **Destination** (p. 936) object for this message.*
- virtual long long **getCMSExpiration** () **const** =0

  Gets the message's expiration value.
- virtual void **setCMSExpiration** (long long expireTime)=0

  Sets the message's expiration value.

- virtual std::string **getCMSMessageID** () **const** =0

  The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.
- virtual void **setCMSMessageID** (**const** std::string &id)=0

  Sets the message ID.
- virtual int **getCMSPriority** () **const** =0

  Gets the message priority level.
- virtual void **setCMSPriority** (int priority)=0

  Sets the Priority Value for this message.
- virtual bool **getCMSRedelivered** () **const** =0

  Gets an indication of whether this message is being redelivered.
- virtual void **setCMSRedelivered** (bool redelivered)=0

  Specifies whether this message is being redelivered.
- virtual **const cms::Destination** ∗ **getCMSReplyTo** () **const** =0

  *Gets the **Destination** (p. 936) object to which a reply to this message should be sent.*
- virtual void **setCMSReplyTo** (**const cms::Destination** ∗destination)=0

  *Sets the **Destination** (p. 936) object to which a reply to this message should be sent.*
- virtual long long **getCMSTimestamp** () **const** =0

  Gets the message timestamp.
- virtual void **setCMSTimestamp** (long long timeStamp)=0

  Sets the message timestamp.
- virtual std::string **getCMSType** () **const** =0

  Gets the message type identifier supplied by the client when the message was sent.
- virtual void **setCMSType** (**const** std::string &type)=0

  Sets the message type.

Static Public Attributes

- static **const** int **DEFAULT_DELIVERY_MODE**

  *The Default delivery mode for **Message** (p. 1426) Producers is PERSISTENT.*
- static **const** int **DEFAULT_MSG_PRIORITY**

  *The Default priority assigned to a **Message** (p. 1426) is 4.*
- static **const** long long **DEFAULT_TIME_TO_LIVE**

  *The Default Time to Live for a **Message** (p. 1426) Producer is unlimited, the message will never expire.*

6.341.1 Detailed Description

Root of all messages.

As in JMS, a message is comprised of 3 parts: CMS-specific headers, user-defined properties, and the body.

Message (p. 1426) Bodies

The CMS API defines four types of message bodies, each type is contained within its own **Message** (p. 1426) Interface definition.

- Stream - A **StreamMessage** (p. 2020) object's message body contains a stream of primitive values in the C++ language. It is filled and read sequentially. Unlike the **BytesMessage** (p. 557) type the values written to a **StreamMessage** (p. 2020) retain information on their type and rules for type conversion are enforced when reading back the values from the **Message** (p. 1426) Body.
  - Map - A **MapMessage** (p. 1379) object's message body contains a set of name-value pairs, where names are std::string objects, and values are C++ primitives. The entries can be accessed sequentially or randomly by name. The **MapMessage** (p. 1379) makes no garuntee on the order of the elements within the **Message** (p. 1426) body.

- Text - A **TextMessage** (p. 2093) object's message body contains a std::string object. This message type can be used to transport plain-text messages, and XML messages.
- Bytes - A **BytesMessage** (p. 557) object's message body contains a stream of uninterpreted bytes. This message type is for literally encoding a body to match an existing message format. In many cases, it is possible to use one of the other body types, which are easier to use.

Message (p. 1426) Properties

Message (p. 1426) properties support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 640). The String-to-primitive conversions may throw a runtime exception if the primitive's valueOf method does not accept the String as a valid representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	int	long	float	double	String
boolean	X							X
byte		X	X	X	X			X
short			X	X	X			X
int				X	X			X
long					X			X
float						X	X	X
double							X	X
String	X	X	X	X	X	X	X	X

When a **Message** (p. 1426) is delivered its properties are considered to be in a read-only mode and cannot be changed. Attempting to change the value of a delivered **Message** (p. 1426)'s properties will result in a **CMSException** (p. 640) being thrown.

6.341.2 Constructor & Destructor Documentation

6.341.2.1 virtual cms::Message::~Message ( ) [virtual]

6.341.3 Member Function Documentation

6.341.3.1 virtual void cms::Message::acknowledge ( ) const [pure virtual]

Acknowledges all consumed messages of the session of this consumed message.

All consumed CMS messages support the acknowledge method for use when a client has specified that its CMS session's consumed messages are to be explicitly acknowledged. By invoking acknowledge on a consumed message, a client acknowledges all messages consumed by the session that the message was delivered to.

Calls to acknowledge are ignored for both transacted sessions and sessions specified to use implicit acknowledgment modes.

A client may individually acknowledge each message as it is consumed, or it may choose to acknowledge messages as an application-defined group (which is done by calling acknowledge on the last received message of the group, thereby acknowledging all messages consumed by the session.)

Messages that have been received but not acknowledged may be redelivered.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.
IllegalStateException *(p. 1098)*	- if this method is called on a closed session.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230).

6.341.3.2 virtual void cms::Message::clearBody ( ) [pure virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230), **activemq::commands::ActiveMQStreamMessage** (p. 280), **activemq::commands::ActiveMQMapMessage** (p. 210), and **activemq::commands::ActiveMQTextMessage** (p. 315).

6.341.3.3 virtual void cms::Message::clearProperties ( ) [pure virtual]

Clears out the message body.

Clearing a message's body does not clear its header values or property entries.

If this message body was read-only, calling this method leaves the message body in the same state as an empty body in a newly created message.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230).

6.341.3.4 virtual Message* cms::Message::clone ( ) const [pure virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implemented in **cms::BytesMessage** (p. 559), **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::ActiveMQTextMessage** (p. 315), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 224).

6.341.3.5 virtual bool cms::Message::getBooleanProperty (const std::string & *name*) const [pure virtual]

Gets a boolean property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230).

6.341.3.6 virtual unsigned char cms::Message::getByteProperty (const std::string & *name*) const [pure virtual]

Gets a byte property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::**

::ActiveMQMessageTemplate< cms::Message > (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230).

6.341.3.7 virtual std::string cms::Message::getCMSCorrelationID ( ) const [pure virtual]

Gets the correlation ID for the message.

This method is used to return correlation ID values that are either provider-specific message IDs or application-specific String values.

Returns

string representation of the correlation Id

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.8 virtual int cms::Message::getCMSDeliveryMode ( ) const [pure virtual]

Gets the **DeliveryMode** (p. 925) for this message.

Returns

DeliveryMode (p. 925) enumerated value.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.9 virtual const Destination* cms::Message::getCMSDestination ( ) const [pure virtual]

Gets the **Destination** (p. 936) object for this message.

The CMSDestination header field contains the destination to which the message is being sent.

When a message is sent, this field is ignored. After completion of the send or publish method, the field holds the destination specified by the method.

When a message is received, its CMSDestination value must be equivalent to the value assigned when it was sent.

Returns

Destination (p. 936) object

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.10 virtual long long cms::Message::getCMSExpiration ( ) const [pure virtual]

Gets the message's expiration value.

When a message is sent, the CMSExpiration header field is left unassigned. After completion of the send or publish method, it holds the expiration time of the message. This is the sum of the time-to-live value specified by the client and the GMT at the time of the send or publish.

If the time-to-live is specified as zero, CMSExpiration is set to zero to indicate that the message does not expire.

When a message's expiration time is reached, a provider should discard it. The CMS API does not define any form of notification of message expiration.

Clients should not receive messages that have expired; however, the CMS API does not guarantee that this will not happen.

Returns

the time the message expires, which is the sum of the time-to-live value specified by the client and the GMT at the time of the send

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.11 virtual std::string cms::Message::getCMSMessageID ( ) const [pure virtual]

The CMSMessageID header field contains a value that uniquely identifies each message sent by a provider.

When a message is sent, CMSMessageID can be ignored. When the send or publish method returns, it contains a provider-assigned value.

A CMSMessageID is a String value that should function as a unique key for identifying messages in a historical repository. The exact scope of uniqueness is provider-defined. It should at least cover all messages for a specific installation of a provider, where an installation is some connected set of message routers.

All CMSMessageID values must start with the prefix 'ID:'. Uniqueness of message ID values across different providers is not required.

Since message IDs take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the message ID is not used by an application. By calling the **MessageProducer.setDisableMessageID** (p. 1496) method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the message ID set to null; if the provider ignores the hint, the message ID must be set to its normal unique value.

Returns

provider-assigned message id

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.12 virtual int cms::Message::getCMSPriority ( ) const [pure virtual]

Gets the message priority level.

The CMS API defines ten levels of priority value, with 0 as the lowest priority and 9 as the highest. In addition, clients should consider priorities 0-4 as gradations of normal priority and priorities 5-9 as gradations of expedited priority.

The CMS API does not require that a provider strictly implement priority ordering of messages; however, it should do its best to deliver expedited messages ahead of normal messages.

Returns

priority value

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.13 virtual bool cms::Message::getCMSRedelivered ( ) const [pure virtual]

Gets an indication of whether this message is being redelivered.

If a client receives a message with the CMSRedelivered field set, it is likely, but not guaranteed, that this message was delivered earlier but that its receipt was not acknowledged at that time.

Returns

true if this message is being redelivered

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.14 virtual const cms::Destination* cms::Message::getCMSReplyTo ( ) const [pure virtual]

Gets the **Destination** (p. 936) object to which a reply to this message should be sent.

Returns

Destination (p. 936) to which to send a response to this message

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.15 virtual long long cms::Message::getCMSTimestamp ( ) const [pure virtual]

Gets the message timestamp.

The CMSTimestamp header field contains the time a message was handed off to a provider to be sent. It is not the time the message was actually transmitted, because the actual send may occur later due to transactions or other client-side queuing of messages.

When a message is sent, CMSTimestamp is ignored. When the send or publish method returns, it contains a time value somewhere in the interval between the call and the return. The value is in the format of a normal millis time value in the Java programming language.

Since timestamps take some effort to create and increase a message's size, some CMS providers may be able to optimize message overhead if they are given a hint that the timestamp is not used by an application. By calling the MessageProducer.setDisableMessageTimestamp method, a CMS client enables this potential optimization for all messages sent by that message producer. If the CMS provider accepts this hint, these messages must have the timestamp set to zero; if the provider ignores the hint, the timestamp must be set to its normal value.

Returns

the message timestamp

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands-**

::ActiveMQMessageTemplate< cms::Message > (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.16 virtual std::string cms::Message::getCMSType ( ) const [pure virtual]

Gets the message type identifier supplied by the client when the message was sent.

Returns

the message type

See also

setCMSType (p. 1444)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.17 virtual double cms::Message::getDoubleProperty (const std::string & *name*) const [pure virtual]

Gets a double property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.18 virtual float cms::Message::getFloatProperty (const std::string & *name*) const [pure virtual]

Gets a float property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.19 virtual int cms::Message::getIntProperty (const std::string & *name*) const [pure virtual]

Gets a int property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.20 virtual long long cms::Message::getLongProperty (const std::string & *name*) const [pure virtual]

Gets a long property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.21 virtual std::vector<std::string> cms::Message::getPropertyNames ( ) const [pure virtual]

Retrieves the property names.

Returns

The complete set of property names currently in this message.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.22 virtual short cms::Message::getShortProperty (const std::string & *name*) const [pure virtual]

Gets a short property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.23 virtual std::string cms::Message::getStringProperty (const std::string & *name*) const [pure virtual]

Gets a string property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

Exceptions

CMSException *(p. 640)*	if the property does not exist.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 231), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 231), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 231).

6.341.3.24 virtual bool cms::Message::propertyExists (const std::string & *name*) const [pure virtual]

Indicates whether or not a given property exists.

Parameters

name	The name of the property to look up.

Returns

True if the property exists in this message.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.25 virtual void cms::Message::setBooleanProperty (const std::string & *name,* bool *value*) [pure virtual]

Sets a boolean property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.26 virtual void cms::Message::setByteProperty (const std::string & *name,* unsigned char *value*) [pure virtual]

Sets a byte property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.27 virtual void cms::Message::setCMSCorrelationID (const std::string & *correlationId*) [pure virtual]

Sets the correlation ID for the message.

A client can use the CMSCorrelationID header field to link one message with another. A typical use is to link a response message with its request message.

CMSCorrelationID can hold one of the following:

- A provider-specific message ID
  - An application-specific String
  - A provider-native byte[] value

Since each message sent by a CMS provider is assigned a message ID value, it is convenient to link messages via message ID. All message ID values must start with the 'ID:' prefix.

In some cases, an application (made up of several clients) needs to use an application-specific value for linking messages. For instance, an application may use CMSCorrelationID to hold a value referencing some external information. Application-specified values must not start with the 'ID:' prefix; this is reserved for provider-generated message ID values.

If a provider supports the native concept of correlation ID, a CMS client may need to assign specific CMSCorrelationID values to match those expected by clients that do not use the CMS API. A byte[] value is used for this purpose. CMS providers without native correlation ID values are not required to support byte[] values. The use of a byte[] value for CMSCorrelationID is non-portable.

Parameters

correlationId	The message ID of a message being referred to.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.28 virtual void cms::Message::setCMSDeliveryMode (int *mode*) [pure virtual]

Sets the **DeliveryMode** (p. 925) for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

mode	**DeliveryMode** (p. 925) enumerated value.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.29 virtual void cms::Message::setCMSDestination (const Destination * *destination*) [pure virtual]

Sets the **Destination** (p. 936) object for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

destination	**Destination** (p. 936) Object

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.30 virtual void cms::Message::setCMSExpiration (long long *expireTime*) [pure virtual]

Sets the message's expiration value.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

expireTime	the message's expiration time

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.31 virtual void cms::Message::setCMSMessageID (const std::string & *id*) [pure virtual]

Sets the message ID.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

id	the ID of the message

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

6.341.3.32 virtual void cms::Message::setCMSPriority (int *priority*) [pure virtual]

Sets the Priority Value for this message.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

priority	priority value for this message

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.33 virtual void cms::Message::setCMSRedelivered (bool *redelivered*) [pure virtual]

Specifies whether this message is being redelivered.

This field is set at the time the message is delivered. This method can be used to change the value for a message that has been received.

Parameters

redelivered	boolean redelivered value

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.34 virtual void cms::Message::setCMSReplyTo (const cms::Destination * *destination*) [pure virtual]

Sets the **Destination** (p. 936) object to which a reply to this message should be sent.

The CMSReplyTo header field contains the destination where a reply to the current message should be sent. If it is null, no reply is expected. The destination may be either a **Queue** (p. 1722) object or a **Topic** (p. 2141) object.

Messages sent with a null CMSReplyTo value may be a notification of some event, or they may just be some data the sender thinks is of interest.

Messages with a CMSReplyTo value typically expect a response. A response is optional; it is up to the client to decide. These messages are called requests. A message sent in response to a request is called a reply.

In some cases a client may wish to match a request it sent earlier with a reply it has just received. The client can use the CMSCorrelationID header field for this purpose.

Parameters

destination	**Destination** (p. 936) to which to send a response to this message

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.35 virtual void cms::Message::setCMSTimestamp (long long *timeStamp*) [pure virtual]

Sets the message timestamp.

CMS providers set this field when a message is sent. This method can be used to change the value for a message that has been received.

Parameters

timeStamp	integer time stamp value

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.36 virtual void cms::Message::setCMSType (const std::string & *type*) [pure virtual]

Sets the message type.

Some CMS providers use a message repository that contains the definitions of messages sent by applications. The CMSType header field may reference a message's definition in the provider's repository.

The CMS API does not define a standard message definition repository, nor does it define a naming policy for the definitions it contains.

Some messaging systems require that a message type definition for each application message be created and that each message specify its type. In order to work with such CMS providers, CMS clients should assign a value to CMSType, whether the application makes use of it or not. This ensures that the field is properly set for those providers that require it.

To ensure portability, CMS clients should use symbolic values for CMSType that can be configured at installation time to the values defined in the current provider's message repository. If string literals are used, they may not be

valid type names for some CMS providers.

Parameters

type	the message type

See also

getCMSType (p. 1435)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.37 virtual void cms::Message::setDoubleProperty (const std::string & *name*, double *value*) [pure virtual]

Sets a double property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteableException *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.38 virtual void cms::Message::setFloatProperty (const std::string & *name*, float *value*) [pure virtual]

Sets a float property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.39 virtual void cms::Message::setIntProperty (const std::string & *name,* int *value*) [pure virtual]

Sets a int property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 232), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 232), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 232).

6.341.3.40 virtual void cms::Message::setLongProperty (const std::string & *name,* long long *value*) [pure virtual]

Sets a long property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 233), **activemq::commands::ActiveMQMessage-**

Template< cms::StreamMessage > (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 233), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 233).

6.341.3.41 virtual void cms::Message::setShortProperty (const std::string & *name,* short *value*) [pure virtual]

Sets a short property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 233), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 233).

6.341.3.42 virtual void cms::Message::setStringProperty (const std::string & *name,* const std::string & *value*) [pure virtual]

Sets a string property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

Exceptions

CMSException *(p. 640)*	- if the name is an empty string.
MessageNotWriteable-Exception *(p. 1490)*	- if properties are read-only

Implemented in **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 233), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 233), and **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 233).

6.341.4 Field Documentation

6.341.4.1 const int cms::Message::DEFAULT_DELIVERY_MODE [static]

The Default delivery mode for **Message** (p. 1426) Producers is PERSISTENT.

6.341.4.2 const int cms::Message::DEFAULT_MSG_PRIORITY [static]

The Default priority assigned to a **Message** (p. 1426) is 4.

6.341.4.3 const long long cms::Message::DEFAULT_TIME_TO_LIVE [static]

The Default Time to Live for a **Message** (p. 1426) Producer is unlimited, the message will never expire.

The documentation for this class was generated from the following file:

6.342.1 Constructor & Destructor Documentation

6.342.1.1 activemq::commands::MessageAck::MessageAck ( )

6.342.1.2 virtual activemq::commands::MessageAck::~MessageAck ( ) [virtual]

6.342.2 Member Function Documentation

6.342.2.1 virtual MessageAck* activemq::commands::MessageAck::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.342.2.2 virtual void activemq::commands::MessageAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.342.2.3 virtual bool activemq::commands::MessageAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.342.2.4 virtual unsigned char activemq::commands::MessageAck::getAckType ( ) const [virtual]

6.342.2.5 virtual const Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId ( ) const [virtual]

6.342.2.6 virtual Pointer<ConsumerId>& activemq::commands::MessageAck::getConsumerId ( ) [virtual]

6.342.2.7 virtual unsigned char activemq::commands::MessageAck::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.342.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination ( ) const [virtual]

6.342.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageAck::getDestination ( ) [virtual]

6.342.2.10 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId ( ) const [virtual]

6.342.2.11 virtual Pointer<MessageId>& activemq::commands::MessageAck::getFirstMessageId ( ) [virtual]

6.342.2.12 virtual const Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId ( ) const [virtual]

6.342.2.13 virtual Pointer<MessageId>& activemq::commands::MessageAck::getLastMessageId ( ) [virtual]

6.342.2.14 virtual int activemq::commands::MessageAck::getMessageCount ( ) const [virtual]

6.342.2.15 virtual const Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId ( ) const [virtual]

6.342.2.16 virtual Pointer<TransactionId>& activemq::commands::MessageAck::getTransactionId ( ) [virtual]

6.342.2.17 virtual bool activemq::commands::MessageAck::isMessageAck ( ) const [inline, virtual]

Returns

an answer of true to the **isMessageAck()** (p. 1451) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.342.2.18 virtual void activemq::commands::MessageAck::setAckType (unsigned char *ackType*) [virtual]

6.342.2.19 virtual void activemq::commands::MessageAck::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.342.2.20 virtual void activemq::commands::MessageAck::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.342.2.21 virtual void activemq::commands::MessageAck::setFirstMessageId (const Pointer< MessageId > & *firstMessageId*) [virtual]

6.342.2.22 virtual void activemq::commands::MessageAck::setLastMessageId (const Pointer< MessageId > & *lastMessageId*) [virtual]

6.342.2.23 virtual void activemq::commands::MessageAck::setMessageCount (int *messageCount*) [virtual]

6.342.2.24 virtual void activemq::commands::MessageAck::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.342.2.25 virtual std::string activemq::commands::MessageAck::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.342.2.26 virtual Pointer<Command> activemq::commands::MessageAck::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.343.1 Detailed Description

Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 1452).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.343.2 Constructor & Destructor Documentation

6.343.2.1 activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::MessageAckMarshaller ( ) [inline]

6.343.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::∼MessageAckMarshaller ( ) [inline, virtual]

6.343.3 Member Function Documentation

6.343.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.343.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.343.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.343.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.343.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.343.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.343.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**MessageAckMarshaller.h**

6.344 cms::MessageConsumer Class Reference

A client uses a **MessageConsumer** (p. 1455) to received messages from a destination.

`#include <src/main/cms/MessageConsumer.h>`

Inheritance diagram for cms::MessageConsumer:

Public Member Functions

- virtual ~**MessageConsumer** () throw ()
- virtual **Message** * **receive** ()=0

  *Synchronously Receive a **Message** (p. 1426).*
- virtual **Message** * **receive** (int millisecs)=0

  *Synchronously Receive a **Message** (p. 1426), time out after defined interval.*
- virtual **Message** * **receiveNoWait** ()=0

  *Receive a **Message** (p. 1426), does not wait if there isn't a new message to read, returns NULL if nothing read.*
- virtual void **setMessageListener** (**MessageListener** *listener)=0

  *Sets the **MessageListener** (p. 1485) that this class will send notifs on.*
- virtual **MessageListener** * **getMessageListener** () **const** =0

  *Gets the **MessageListener** (p. 1485) that this class will send mew **Message** (p. 1426) notification events to.*
- virtual std::string **getMessageSelector** () **const** =0

  Gets this message consumer's message selector expression.

6.344.1 Detailed Description

A client uses a **MessageConsumer** (p. 1455) to received messages from a destination.

A client may either synchronously receive a message consumer's messages or have the consumer asynchronously deliver them as they arrive.

For synchronous receipt, a client can request the next message from a message consumer using one of its `receive` methods. There are several variations of `receive` that allow a client to poll or wait for the next message.

For asynchronous delivery, a client can register a **MessageListener** (p. 1485) object with a message consumer. As messages arrive at the message consumer, it delivers them by calling the **MessageListener** (p. 1485)'s `onMessage` method.

When the **MessageConsumer** (p. 1455)'s close method is called the method can block while an asynchronous message delivery is in progress or until a `receive` operation completes. A blocked consumer in a `receive` call will return a Null when the close method is called.

While the **MessageConsumer** (p. 1455) implements the **Startable** (p. 1963) and **Stoppable** (p. 2016) interfaces it is not required to implement these methods and can throw an UnsupportedOperation exception if they are not available for the given CMS provider.

6.344.2 Constructor & Destructor Documentation

6.344.2.1 virtual cms::MessageConsumer::~MessageConsumer ( ) throw () [virtual]

6.344.3 Member Function Documentation

6.344.3.1 virtual MessageListener* cms::MessageConsumer::getMessageListener ( ) const [pure virtual]

Gets the **MessageListener** (p. 1485) that this class will send mew **Message** (p. 1426) notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 186), and **activemq::cmsutil::CachedConsumer** (p. 570).

6.344.3.2 virtual std::string cms::MessageConsumer::getMessageSelector ( ) const [pure virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 186), and **activemq::cmsutil::CachedConsumer** (p. 571).

6.344.3.3 virtual Message* cms::MessageConsumer::receive ( ) [pure virtual]

Synchronously Receive a **Message** (p. 1426).

Returns

new message which the caller owns and must delete.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 187), and **activemq::cmsutil::CachedConsumer** (p. 571).

6.344.3.4 virtual Message* cms::MessageConsumer::receive (int *millisecs*) [pure virtual]

Synchronously Receive a **Message** (p. 1426), time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 187), and **activemq::cmsutil::CachedConsumer** (p. 571).

6.344.3.5 virtual Message* cms::MessageConsumer::receiveNoWait ( ) [pure virtual]

Receive a **Message** (p. 1426), does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 188), and **activemq::cmsutil::CachedConsumer** (p. 571).

6.344.3.6 virtual void cms::MessageConsumer::setMessageListener (MessageListener * *listener*) [pure virtual]

Sets the **MessageListener** (p. 1485) that this class will send notifs on.

Parameters

listener	The listener of messages received by this consumer.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQConsumer** (p. 188), and **activemq::cmsutil::CachedConsumer** (p. 572).

6.346.1 Constructor & Destructor Documentation

6.346.1.1 activemq::commands::MessageDispatch::MessageDispatch ( )

6.346.1.2 virtual activemq::commands::MessageDispatch::~MessageDispatch ( ) [virtual]

6.346.2 Member Function Documentation

6.346.2.1 virtual MessageDispatch* activemq::commands::MessageDispatch::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.346.2.2 virtual void activemq::commands::MessageDispatch::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.346.2.3 virtual bool activemq::commands::MessageDispatch::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.346.2.4 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId ( ) const [virtual]

6.346.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatch::getConsumerId ( ) [virtual]

6.346.2.6 virtual unsigned char activemq::commands::MessageDispatch::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.346.2.7 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination ( ) const [virtual]

6.346.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatch::getDestination ( ) [virtual]

6.346.2.9 virtual const Pointer<Message>& activemq::commands::MessageDispatch::getMessage ( ) const [virtual]

6.346.2.10 virtual Pointer<Message>& activemq::commands::MessageDispatch::getMessage ( ) [virtual]

6.346.2.11 virtual int activemq::commands::MessageDispatch::getRedeliveryCounter ( ) const [virtual]

6.346.2.12 virtual bool activemq::commands::MessageDispatch::isMessageDispatch ( ) const [inline, virtual]

Returns

an answer of true to the **isMessageDispatch()** (p. 1461) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.346.2.13 virtual void activemq::commands::MessageDispatch::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.346.2.14 virtual void activemq::commands::MessageDispatch::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.346.2.15 virtual void activemq::commands::MessageDispatch::setMessage (const Pointer< Message > & *message*) [virtual]

6.346.2.16 virtual void activemq::commands::MessageDispatch::setRedeliveryCounter (int *redeliveryCounter*) [virtual]

6.346.2.17 virtual std::string activemq::commands::MessageDispatch::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.346.2.18 virtual Pointer<Command> activemq::commands::MessageDispatch::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.346.3 Field Documentation

6.347 activemq::core::MessageDispatchChannel Class Reference

`#include <src/main/activemq/core/MessageDispatchChannel.h>`

Inheritance diagram for activemq::core::MessageDispatchChannel:

Public Member Functions

- virtual ~**MessageDispatchChannel** ()
- virtual void **enqueue** (**const Pointer**< **MessageDispatch** > &message)=0

  Add a Message to the Channel behind all pending message.
- virtual void **enqueueFirst** (**const Pointer**< **MessageDispatch** > &message)=0

  Add a message to the front of the Channel.
- virtual bool **isEmpty** () **const** =0
- virtual bool **isClosed** () **const** =0
- virtual bool **isRunning** () **const** =0
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)=0

  Used to get an enqueued message.
- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()=0

  Used to get an enqueued message if there is one queued right now.

- virtual **Pointer**< **MessageDispatch** > **peek** () **const** =0

  Peek in the Queue and return the first message in the Channel without removing it from the channel.
- virtual void **start** ()=0

  Starts dispatch of messages from the Channel.
- virtual void **stop** ()=0

  Stops dispatch of message from the Channel.
- virtual void **close** ()=0

  Close this channel no messages will be dispatched after this method is called.
- virtual void **clear** ()=0

  Clear the Channel, all pending messages are removed.
- virtual int **size** () **const** =0
- virtual std::vector< **Pointer** < **MessageDispatch** > > **removeAll** ()=0

  Remove all messages that are currently in the Channel and return them as a list of Messages.

6.347.1 Constructor & Destructor Documentation

6.347.1.1 virtual activemq::core::MessageDispatchChannel::~MessageDispatchChannel ( ) [inline, virtual]

6.347.2 Member Function Documentation

6.347.2.1 virtual void activemq::core::MessageDispatchChannel::clear ( ) [pure virtual]

Clear the Channel, all pending messages are removed.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1895), and **activemq::core::FifoMessageDispatchChannel** (p. 1024).

6.347.2.2 virtual void activemq::core::MessageDispatchChannel::close ( ) [pure virtual]

Close this channel no messages will be dispatched after this method is called.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1895), and **activemq::core::FifoMessageDispatchChannel** (p. 1024).

6.347.2.3 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeue (long long *timeout*) [pure virtual]

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

ActiveMQException	

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1895), and **activemq::core::FifoMessageDispatchChannel** (p. 1024).

6.347.2.4 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::dequeueNoWait ( ) [pure virtual]

Used to get an enqueued message if there is one queued right now.

If there is no waiting message than this method returns Null.

Returns

a message if there is one in the queue.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1895), and **activemq::core::FifoMessageDispatchChannel** (p. 1025).

6.347.2.5 virtual void activemq::core::MessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [pure virtual]

Add a Message to the Channel behind all pending message.

Parameters

message	- The message to add to the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1895), and **activemq::core::FifoMessageDispatchChannel** (p. 1025).

6.347.2.6 virtual void activemq::core::MessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [pure virtual]

Add a message to the front of the Channel.

Parameters

message	- The Message to add to the front of the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1896), and **activemq::core::FifoMessageDispatchChannel** (p. 1025).

6.347.2.7 virtual bool activemq::core::MessageDispatchChannel::isClosed ( ) const [pure virtual]

Returns

has the Queue been closed.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1896), and **activemq::core::FifoMessageDispatchChannel** (p. 1025).

6.347.2.8 virtual bool activemq::core::MessageDispatchChannel::isEmpty ( ) const [pure virtual]

Returns

true if there are no messages in the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1896), and **activemq::core::FifoMessageDispatchChannel** (p. 1025).

6.347.2.9 virtual bool activemq::core::MessageDispatchChannel::isRunning ( ) const [pure virtual]

Returns

true if the Channel currently running and will dequeue message.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1896), and **activemq::core::FifoMessageDispatchChannel** (p. 1026).

6.347.2.10 virtual Pointer<MessageDispatch> activemq::core::MessageDispatchChannel::peek ( ) const [pure virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1897), and **activemq::core::FifoMessageDispatchChannel** (p. 1027).

6.347.2.11 virtual std::vector< Pointer<MessageDispatch> > activemq::core::MessageDispatchChannel::removeAll ( ) [pure virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1897), and **activemq::core::FifoMessageDispatchChannel** (p. 1027).

6.347.2.12 virtual int activemq::core::MessageDispatchChannel::size ( ) const [pure virtual]

Returns

the number of Messages currently in the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1897), and **activemq::core::FifoMessageDispatchChannel** (p. 1027).

6.347.2.13 virtual void activemq::core::MessageDispatchChannel::start ( ) [pure virtual]

Starts dispatch of messages from the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1898), and **activemq::core::FifoMessageDispatchChannel** (p. 1027).

6.347.2.14 virtual void activemq::core::MessageDispatchChannel::stop ( ) [pure virtual]

Stops dispatch of message from the Channel.

Implemented in **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1898), and **activemq::core::FifoMessageDispatchChannel** (p. 1027).

The documentation for this class was generated from the following file:

6.348.3 Member Function Documentation

6.348.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.348.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.348.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.348.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.348.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.348.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.348.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal

dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.349.1 Constructor & Destructor Documentation

6.349.1.1 activemq::commands::MessageDispatchNotification::MessageDispatchNotification ( )

6.349.1.2 virtual activemq::commands::MessageDispatchNotification::~MessageDispatchNotification ( ) [virtual]

6.349.2 Member Function Documentation

6.349.2.1 virtual MessageDispatchNotification* activemq::commands::MessageDispatchNotification::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.349.2.2 virtual void activemq::commands::MessageDispatchNotification::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.349.2.3 virtual bool activemq::commands::MessageDispatchNotification::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.349.2.4 virtual const Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId ( ) const [virtual]

6.349.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessageDispatchNotification::getConsumerId ( ) [virtual]

6.349.2.6 virtual unsigned char activemq::commands::MessageDispatchNotification::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.349.2.7 virtual long long activemq::commands::MessageDispatchNotification::getDeliverySequenceId ( ) const [virtual]

6.349.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination ( ) const [virtual]

6.349.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::MessageDispatchNotification::getDestination ( ) [virtual]

6.349.2.10 virtual const Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId ( ) const [virtual]

6.349.2.11 virtual Pointer<MessageId>& activemq::commands::MessageDispatchNotification::getMessageId ( ) [virtual]

6.349.2.12 virtual bool activemq::commands::MessageDispatchNotification::isMessageDispatchNotification ( ) const [inline, virtual]

Returns

an answer of true to the **isMessageDispatchNotification()** (p. 1471) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.349.2.13 virtual void activemq::commands::MessageDispatchNotification::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.349.2.14 virtual void activemq::commands::MessageDispatchNotification::setDeliverySequenceId (long long *deliverySequenceId*) [virtual]

6.349.2.15 virtual void activemq::commands::MessageDispatchNotification::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.349.2.16 virtual void activemq::commands::MessageDispatchNotification::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.349.2.17 virtual std::string activemq::commands::MessageDispatchNotification::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.349.2.18 virtual Pointer<Command> activemq::commands::MessageDispatchNotification::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.350.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageDispatch-NotificationMarshaller::∼MessageDispatchNotificationMarshaller ( ) [inline, virtual]

6.350.3 Member Function Documentation

6.350.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal-::generated::MessageDispatchNotificationMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.350.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.350.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.350.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.350.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.350.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.350.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**MessageDispatchNotificationMarshaller.h**

6.351 cms::MessageEnumeration Class Reference

Defines an object that enumerates a collection of Messages.

`#include <src/main/cms/MessageEnumeration.h>`

Inheritance diagram for cms::MessageEnumeration:

Public Member Functions

- virtual ~**MessageEnumeration** () throw ()
- virtual bool **hasMoreMessages** ()=0

  *Returns true if there are more **Message** (p. 1426) in the Browser that can be retrieved via the `nextMessage` method.*
- virtual **cms::Message** * **nextMessage** ()=0

  *Returns the Next **Message** (p. 1426) in the **Queue** (p. 1722) if one is present, if no more **Message** (p. 1426)'s are available then an Exception is thrown.*

6.351.1 Detailed Description

Defines an object that enumerates a collection of Messages.

The client calls the hasMoreMessages method to determine if a **Message** (p. 1426) is available. If a **Message** (p. 1426) is available the client calls the nextMessage method to retrieve that **Message** (p. 1426), calling nextMessage when a **Message** (p. 1426) is not available results in an exception.

Since

2.1

6.351.2 Constructor & Destructor Documentation

6.351.2.1 virtual cms::MessageEnumeration::~MessageEnumeration ( ) throw () [virtual]

6.351.3 Member Function Documentation

6.351.3.1 virtual bool cms::MessageEnumeration::hasMoreMessages ( ) [pure virtual]

Returns true if there are more **Message** (p. 1426) in the Browser that can be retrieved via the `nextMessage` method.

If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns

true if more **Message** (p. 1426)'s are available in the Browser.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 254).

6.351.3.2 virtual cms::Message* cms::MessageEnumeration::nextMessage ( ) [pure virtual]

Returns the Next **Message** (p. 1426) in the **Queue** (p. 1722) if one is present, if no more **Message** (p. 1426)'s are available then an Exception is thrown.

If a **Message** (p. 1426) object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns

The next **Message** (p. 1426) in the **Queue** (p. 1722).

Exceptions

CMSException *(p. 640)*	if no more **Message** (p. 1426)'s currently in the **Queue** (p. 1722).

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 254).

The documentation for this class was generated from the following file:

- src/main/cms/**MessageEnumeration.h**

6.352 cms::MessageEOFException Class Reference

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2020) or **BytesMessage** (p. 557) is being read.

`#include <src/main/cms/MessageEOFException.h>`

Inheritance diagram for cms::MessageEOFException:

Public Member Functions

- **MessageEOFException** ()
- **MessageEOFException** (**const MessageEOFException** &ex)
- **MessageEOFException** (**const** std::string &message)
- **MessageEOFException** (**const** std::string &message, **const** std::exception *cause)
- **MessageEOFException** (**const** std::string &message, **const** std::exception *cause, **const** std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**MessageEOFException** () throw ()

6.352.1 Detailed Description

This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2020) or **BytesMessage** (p. 557) is being read.

Since

1.3

6.352.2 Constructor & Destructor Documentation

6.353 cms::MessageFormatException Class Reference

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

`#include <src/main/cms/MessageFormatException.h>`

Inheritance diagram for cms::MessageFormatException:

Public Member Functions

- **MessageFormatException** ()
- **MessageFormatException** (**const MessageFormatException** &ex)
- **MessageFormatException** (**const** std::string &message)
- **MessageFormatException** (**const** std::string &message, **const** std::exception *cause)
- **MessageFormatException** (**const** std::string &message, **const** std::exception *cause, **const** std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**MessageFormatException** () throw ()

6.353.1 Detailed Description

This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

It must also be thrown when equivalent type errors are made with message property values. For example, this exception must be thrown if **StreamMessage.readShort** (p. 2026) is used to read a boolean value.

- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.355.1 Detailed Description

Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 1482).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.355.2 Constructor & Destructor Documentation

6.355.2.1 activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::MessageId-Marshaller ( ) [inline]

6.355.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::∼MessageId-Marshaller ( ) [inline, virtual]

6.355.3 Member Function Documentation

6.355.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::-MessageIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.355.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller-::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.355.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.355.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.355.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.355.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.355.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessageIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**MessageIdMarshaller.h**

6.356 cms::MessageListener Class Reference

A **MessageListener** (p. 1485) object is used to receive asynchronously delivered messages.

`#include <src/main/cms/MessageListener.h>`

Public Member Functions

- virtual ~**MessageListener** () throw ()
- virtual void **onMessage** (**const Message** *message)=0 throw ()

  *Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 1426) types.*

6.356.1 Detailed Description

A **MessageListener** (p. 1485) object is used to receive asynchronously delivered messages.

Since

1.0

6.356.2 Constructor & Destructor Documentation

6.356.2.1 virtual cms::MessageListener::~MessageListener ( ) throw () [virtual]

6.356.3 Member Function Documentation

6.356.3.1 virtual void cms::MessageListener::onMessage (const Message * *message*) throw () [pure virtual]

Called asynchronously when a new message is received, the message reference can be to any of the **Message** (p. 1426) types.

a dynamic cast is used to find out what type of message this is. The lifetime of this object is only guaranteed to be for life of the onMessage function after this call-back returns the message may no longer exists. Users should copy the data or clone the message if they wish to retain information that was contained in this **Message** (p. 1426).

It is considered a programming error for this method to throw an exception. The method has been tagged with the 'throw()' qualifier, this implies that you application will segfault if you throw an error from an implementation of this method.

Parameters

message	**Message** (p. 1426) object {const} pointer recipient does not own.

The documentation for this class was generated from the following file:

- src/main/cms/**MessageListener.h**

6.357 activemq::wireformat::openwire::marshal::generated::MessageMarshaller Class Reference

Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1486).

6.357.3 Member Function Documentation

6.357.3.1 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 221), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 236), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 319).

6.357.3.2 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 319).

6.357.3.3 virtual int activemq::wireformat::openwire::marshal::generated::MessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320).

6.357.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 145), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 228), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 293), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320).

  Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () **const** =0

  Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time)=0

  Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () **const** =0

  Gets the Time to Live that this producer sends messages with.

6.360.1 Detailed Description

A client uses a **MessageProducer** (p. 1491) object to send messages to a **Destination** (p. 936).

A **MessageProducer** (p. 1491) object is created by passing a **Destination** (p. 936) object to a message-producer creation method supplied by a session.

A client also has the option of creating a message producer without supplying a destination. In this case, a **Destination** (p. 936) must be provided with every send operation. A typical use for this kind of message producer is to send replies to requests using the request's CMSReplyTo destination.

A client can specify a default delivery mode, priority, and time to live for messages sent by a message producer. It can also specify the delivery mode, priority, and time to live for an individual message.

A client can specify a time-to-live value in milliseconds for each message it sends. This value defines a message expiration time that is the sum of the message's time-to-live and the GMT when it is sent (for transacted sends, this is the time the client sends the message, not the time the transaction is committed).

Since

1.0

6.360.2 Constructor & Destructor Documentation

6.360.2.1 virtual cms::MessageProducer::~MessageProducer ( ) throw () [virtual]

6.360.3 Member Function Documentation

6.360.3.1 virtual int cms::MessageProducer::getDeliveryMode ( ) const [pure virtual]

Gets the delivery mode for this Producer.

Returns

The **DeliveryMode** (p. 925)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 240), and **activemq::cmsutil::CachedProducer** (p. 574).

6.360.3.2 virtual bool cms::MessageProducer::getDisableMessageID ( ) const [pure virtual]

Gets if **Message** (p. 1426) Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 240), and **activemq::cmsutil::CachedProducer** (p. 574).

6.360.3.3 virtual bool cms::MessageProducer::getDisableMessageTimeStamp ( ) const [pure virtual]

Gets if **Message** (p. 1426) Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 240), and **activemq::cmsutil::CachedProducer** (p. 574).

6.360.3.4 virtual int cms::MessageProducer::getPriority ( ) const [pure virtual]

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 241), and **activemq::cmsutil::CachedProducer** (p. 575).

6.360.3.5 virtual long long cms::MessageProducer::getTimeToLive ( ) const [pure virtual]

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 241), and **activemq::cmsutil::CachedProducer** (p. 575).

6.360.3.6 virtual void cms::MessageProducer::send (Message * *message*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message	The message to be sent.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while sending the message.
MessageFormatException *(p. 1478)*	- if an Invalid **Message** (p. 1426) is given.
InvalidDestination-Exception *(p. 1190)*	- if a client uses this method with a **MessageProducer** (p. 1491) with an invalid destination.
UnsupportedOperation-Exception *(p. 2190)*	- if a client uses this method with a **MessageProducer** (p. 1491) that did not specify a destination at creation time.

Implemented in **activemq::core::ActiveMQProducer** (p. 242), and **activemq::cmsutil::CachedProducer** (p. 575).

6.360.3.7 virtual void cms::MessageProducer::send (Message * *message,* int *deliveryMode,* int *priority,* long long *timeToLive*) [pure virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while sending the message.
MessageFormatException *(p. 1478)*	- if an Invalid **Message** (p. 1426) is given.
InvalidDestination-Exception *(p. 1190)*	- if a client uses this method with a **MessageProducer** (p. 1491) with an invalid destination.
UnsupportedOperation-Exception *(p. 2190)*	- if a client uses this method with a **MessageProducer** (p. 1491) that did not specify a destination at creation time.

Implemented in **activemq::core::ActiveMQProducer** (p. 242), and **activemq::cmsutil::CachedProducer** (p. 575).

6.360.3.8 virtual void cms::MessageProducer::send (const Destination * *destination,* Message * *message*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination	The destination on which to send the message
message	the message to be sent.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while sending the message.
MessageFormatException *(p. 1478)*	- if an Invalid **Message** (p. 1426) is given.
InvalidDestination-Exception *(p. 1190)*	- if a client uses this method with a **MessageProducer** (p. 1491) with an invalid destination.
UnsupportedOperation-Exception *(p. 2190)*	- if a client uses this method with a **MessageProducer** (p. 1491) that did not specify a destination at creation time.

Implemented in **activemq::core::ActiveMQProducer** (p. 243), and **activemq::cmsutil::CachedProducer** (p. 576).

6.360.3.9 virtual void cms::MessageProducer::send (const Destination * *destination,* Message * *message,* int *deliveryMode,* int *priority,* long long *timeToLive*) [pure virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination	The destination on which to send the message
message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while sending the message.
MessageFormatException *(p. 1478)*	- if an Invalid **Message** (p. 1426) is given.
InvalidDestination-Exception *(p. 1190)*	- if a client uses this method with a **MessageProducer** (p. 1491) with an invalid destination.
UnsupportedOperation-Exception *(p. 2190)*	- if a client uses this method with a **MessageProducer** (p. 1491) that did not specify a destination at creation time.

Implemented in **activemq::core::ActiveMQProducer** (p. 243), and **activemq::cmsutil::CachedProducer** (p. 576).

6.360.3.10 virtual void cms::MessageProducer::setDeliveryMode (int *mode*) [pure virtual]

Sets the delivery mode for this Producer.

Parameters

mode	The **DeliveryMode** (p. 925)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 243), and **activemq::cmsutil::CachedProducer** (p. 577).

6.360.3.11 virtual void cms::MessageProducer::setDisableMessageID (bool *value*) [pure virtual]

Sets if **Message** (p. 1426) Ids are disabled for this Producer.

Parameters

value	boolean indicating enable / disable (true / false)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 244), and **activemq::cmsutil::CachedProducer** (p. 577).

6.360.3.12 virtual void cms::MessageProducer::setDisableMessageTimeStamp (bool *value*) [pure virtual]

Sets if **Message** (p. 1426) Time Stamps are disabled for this Producer.

Parameters

value	- boolean indicating enable / disable (true / false)

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 244), and **activemq::cmsutil::CachedProducer** (p. 577).

6.360.3.13 virtual void cms::MessageProducer::setPriority (int *priority*) [pure virtual]

Sets the Priority that this Producers sends messages at.

Parameters

priority	int value for Priority level

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 244), and **activemq::cmsutil::CachedProducer** (p. 578).

6.360.3.14 virtual void cms::MessageProducer::setTimeToLive (long long *time*) [pure virtual]

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

time	default time to live value in milliseconds

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::core::ActiveMQProducer** (p. 244), and **activemq::cmsutil::CachedProducer** (p. 578).

The documentation for this class was generated from the following file:

6.361 activemq::wireformat::openwire::utils::MessagePropertyInterceptor Class Reference

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

`#include <src/main/activemq/wireformat/openwire/utils/MessagePropertyInterceptor.h>`

Public Member Functions

- **MessagePropertyInterceptor** (**commands::Message** *message, **util::PrimitiveMap** *properties)

  Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.
- virtual ~**MessagePropertyInterceptor** () throw ()
- virtual bool **getBooleanProperty** (**const** std::string &name) **const**

  Gets a boolean property.
- virtual unsigned char **getByteProperty** (**const** std::string &name) **const**

  Gets a byte property.
- virtual double **getDoubleProperty** (**const** std::string &name) **const**

  Gets a double property.
- virtual float **getFloatProperty** (**const** std::string &name) **const**

  Gets a float property.
- virtual int **getIntProperty** (**const** std::string &name) **const**

  Gets a int property.
- virtual long long **getLongProperty** (**const** std::string &name) **const**

  Gets a long property.
- virtual short **getShortProperty** (**const** std::string &name) **const**

  Gets a short property.
- virtual std::string **getStringProperty** (**const** std::string &name) **const**

  Gets a string property.
- virtual void **setBooleanProperty** (**const** std::string &name, bool value)

  Sets a boolean property.
- virtual void **setByteProperty** (**const** std::string &name, unsigned char value)

  Sets a byte property.
- virtual void **setDoubleProperty** (**const** std::string &name, double value)

  Sets a double property.
- virtual void **setFloatProperty** (**const** std::string &name, float value)

  Sets a float property.
- virtual void **setIntProperty** (**const** std::string &name, int value)

  Sets a int property.
- virtual void **setLongProperty** (**const** std::string &name, long long value)

  Sets a long property.
- virtual void **setShortProperty** (**const** std::string &name, short value)

  Sets a short property.
- virtual void **setStringProperty** (**const** std::string &name, **const** std::string &value)

  Sets a string property.

6.361.1 Detailed Description

Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

Currently the only properties that are intercepted and handled are:

Name | Conversion Supported

JMSXDeliveryCount | Int, Long, String JMSXGroupID | String JMSXGroupSeq | Int, Long, String

6.361.2 Constructor & Destructor Documentation

6.361.2.1 activemq::wireformat::openwire::utils::MessagePropertyInterceptor::MessagePropertyInterceptor (commands::Message * *message*, util::PrimitiveMap * *properties*)

Constructor, accepts the Message that will be used to store JMS reserved property values, and the PrimitiveMap to get and set the rest to.

Parameters

message	- The Message to store reserved property data in
properties	- The PrimitiveMap to store the rest of the properties in.

Exceptions

NullPointerException	if either param is NULL

6.361.2.2 virtual activemq::wireformat::openwire::utils::MessagePropertyInterceptor::~MessagePropertyInterceptor ( ) throw () [virtual]

6.361.3 Member Function Documentation

6.361.3.1 virtual bool activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getBooleanProperty (const std::string & *name*) const [virtual]

Gets a boolean property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.2 virtual unsigned char activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getByteProperty (const std::string & *name*) const [virtual]

Gets a byte property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.3 virtual double activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getDoubleProperty (const std::string & *name*) const [virtual]

Gets a double property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.4 virtual float activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getFloatProperty (const std::string & *name*) const [virtual]

Gets a float property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.5 virtual int activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getIntProperty (const std::string & *name*) const [virtual]

Gets a int property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.6 virtual long long activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getLongProperty (const std::string & *name*) const [virtual]

Gets a long property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.7 virtual short activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getShortProperty (const std::string & *name*) const [virtual]

Gets a short property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.8 virtual std::string activemq::wireformat::openwire::utils::MessagePropertyInterceptor::getStringProperty (const std::string & *name*) const [virtual]

Gets a string property.

Parameters

name	The name of the property to retrieve.

Returns

The value for the named property.

6.361.3.9 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setBooleanProperty (const std::string & *name,* bool *value*) [virtual]

Sets a boolean property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.10 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setByteProperty (const std::string & *name,* unsigned char *value*) [virtual]

Sets a byte property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.11 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setDoubleProperty (const std::string & *name*, double *value*) [virtual]

Sets a double property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.12 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setFloatProperty (const std::string & *name*, float *value*) [virtual]

Sets a float property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.13 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setIntProperty (const std::string & *name*, int *value*) [virtual]

Sets a int property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.14 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setLongProperty (const std::string & *name*, long long *value*) [virtual]

Sets a long property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.15 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setShortProperty (const std::string & *name*, short *value*) [virtual]

Sets a short property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.361.3.16 virtual void activemq::wireformat::openwire::utils::MessagePropertyInterceptor::setStringProperty (const std::string & *name*, const std::string & *value*) [virtual]

Sets a string property.

Parameters

name	The name of the property to retrieve.
value	The value for the named property.

6.362.1 Constructor & Destructor Documentation

6.362.1.1 activemq::commands::MessagePull::MessagePull ( )

6.362.1.2 virtual activemq::commands::MessagePull::~MessagePull ( ) [virtual]

6.362.2 Member Function Documentation

6.362.2.1 virtual MessagePull* activemq::commands::MessagePull::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.362.2.2 virtual void activemq::commands::MessagePull::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.362.2.3 virtual bool activemq::commands::MessagePull::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.362.2.4 virtual const Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId ( ) const [virtual]

6.362.2.5 virtual Pointer<ConsumerId>& activemq::commands::MessagePull::getConsumerId ( ) [virtual]

6.362.2.6 virtual const std::string& activemq::commands::MessagePull::getCorrelationId ( ) const [virtual]

6.362.2.7 virtual std::string& activemq::commands::MessagePull::getCorrelationId ( ) [virtual]

6.362.2.8 virtual unsigned char activemq::commands::MessagePull::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.362.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination ( ) const [virtual]

6.362.2.10 virtual Pointer<ActiveMQDestination>& activemq::commands::MessagePull::getDestination ( ) [virtual]

6.362.2.11 virtual const Pointer<MessageId>& activemq::commands::MessagePull::getMessageId ( ) const [virtual]

6.362.2.12 virtual Pointer<MessageId>& activemq::commands::MessagePull::getMessageId ( ) [virtual]

6.362.2.13 virtual long long activemq::commands::MessagePull::getTimeout ( ) const [virtual]

6.362.2.14 virtual void activemq::commands::MessagePull::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.362.2.15 virtual void activemq::commands::MessagePull::setCorrelationId (const std::string & *correlationId*) [virtual]

6.362.2.16 virtual void activemq::commands::MessagePull::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.362.2.17 virtual void activemq::commands::MessagePull::setMessageId (const Pointer< MessageId > & *messageId*) [virtual]

6.362.2.18 virtual void activemq::commands::MessagePull::setTimeout (long long *timeout*) [virtual]

6.362.2.19 virtual std::string activemq::commands::MessagePull::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.362.2.20 virtual Pointer<Command> activemq::commands::MessagePull::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.362.3 Field Documentation

6.362.3.1 Pointer<ConsumerId> activemq::commands::MessagePull::consumerId [protected]

6.362.3.2 std::string activemq::commands::MessagePull::correlationId [protected]

6.362.3.3 Pointer<ActiveMQDestination> activemq::commands::MessagePull::destination [protected]

6.363 activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller Class Reference

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 1506).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/MessagePullMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller:

Public Member Functions

- **MessagePullMarshaller** ()
- virtual ∼**MessagePullMarshaller** ()
- virtual **commands::DataStructure** ∗ **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.363.1 Detailed Description

Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 1506).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.363.2 Constructor & Destructor Documentation

6.363.2.1 activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::MessagePullMarshaller ( ) [inline]

6.363.2.2 virtual activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::∼MessagePullMarshaller ( ) [inline, virtual]

6.363.3 Member Function Documentation

6.363.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.363.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.363.3.3 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.363.3.4 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.363.3.5 virtual int activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.363.3.6 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.363.3.7 virtual void activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.364 activemq::transport::mock::MockTransport Class Reference

The **MockTransport** (p. 1509) defines a base level **Transport** (p. 2161) class that is intended to be used in place of an a regular protocol **Transport** (p. 2161) suck as TCP.

`#include <src/main/activemq/transport/mock/MockTransport.h>`

Inheritance diagram for activemq::transport::mock::MockTransport:

Public Member Functions

- **MockTransport** (**const Pointer**< **wireformat::WireFormat** > &wireFormat, **const Pointer**< **ResponseBuilder** > &responseBuilder)
- virtual ~**MockTransport** ()
- virtual void **fireCommand** (**const Pointer**< **Command** > &command)

  Fires a Command back through this transport to its registered CommandListener if there is one.
- virtual void **fireException** (**const exceptions::ActiveMQException** &ex)

  Fires a Exception back through this transport to its registered ExceptionListener if there is one.
- void **setResponseBuilder** (**const Pointer**< **ResponseBuilder** > &responseBuilder)

  *Sets the **ResponseBuilder** (p. 1784) that this class uses to create Responses to Commands sent.*
- virtual void **setOutgoingListener** (**TransportListener** *listener)

  Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.
- **Pointer**< **wireformat::WireFormat** > **getWireFormat** () **const**

  Gets the currently set WireFormat.
- virtual void **oneway** (**const Pointer**< **Command** > &command)

  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command)

  Sends the given command to the broker and then waits for the response.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.
- virtual void **setWireFormat** (**const Pointer**< **wireformat::WireFormat** > &wireFormat AMQCPP_UNUSED)
- virtual void **setTransportListener** (**TransportListener** *listener)

  Sets the observer of asynchronous events from this transport.
- virtual **TransportListener** * **getTransportListener** () **const**

  Gets the observer of asynchronous events from this transport.
- virtual void **start** ()

  *Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.*
- virtual void **stop** ()

  *Stops the **Transport** (p. 2161).*
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual **Transport** * **narrow** (**const** std::type_info &typeId)

  *Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.*
- virtual bool **isFaultTolerant** () **const**

  *Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () **const**

  *Is the **Transport** (p. 2161) Connected to its Broker.*

- virtual bool **isClosed** () **const**

  *Has the **Transport** (p. 2161) been shutdown and no longer usable.*

6.364.1 Detailed Description

The **MockTransport** (p. 1509) defines a base level **Transport** (p. 2161) class that is intended to be used in place of an a regular protocol **Transport** (p. 2161) suck as TCP.

This **Transport** (p. 2161) assumes that it is the base **Transport** (p. 2161) in the Transports stack, and destroys any Transports that are passed to it in its constructor.

This **Transport** (p. 2161) defines an Interface **ResponseBuilder** (p. 1784) which must be implemented by any protocol for which the **Transport** (p. 2161) is used to Emulate. The **Transport** (p. 2161) hands off all outbound commands to the **ResponseBuilder** (p. 1784) for processing, it is up to the builder to create appropriate responses and schedule any asynchronous messages that might result from a message sent to the Broker.

6.364.2 Constructor & Destructor Documentation

6.364.2.1 activemq::transport::mock::MockTransport::MockTransport (const Pointer< wireformat::WireFormat > & *wireFormat,* const Pointer< ResponseBuilder > & *responseBuilder*)

6.364.2.2 virtual activemq::transport::mock::MockTransport::~MockTransport ( ) [inline, virtual]

6.364.3 Member Function Documentation

6.364.3.1 virtual void activemq::transport::mock::MockTransport::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

6.364.3.2 virtual void activemq::transport::mock::MockTransport::fireCommand (const Pointer< Command > & *command*) [inline, virtual]

Fires a Command back through this transport to its registered CommandListener if there is one.

Parameters

command	- Command to send to the Listener.

6.364.3.3 virtual void activemq::transport::mock::MockTransport::fireException (const exceptions::ActiveMQException & *ex*) [inline, virtual]

Fires a Exception back through this transport to its registered ExceptionListener if there is one.

Parameters

ex	The Exception that will be passed on the the **Transport** (p. 2161) listener.

6.364.3.4 static MockTransport* activemq::transport::mock::MockTransport::getInstance ( ) [inline, static]

6.364.3.5 std::string activemq::transport::mock::MockTransport::getName ( ) const [inline]

6.364.3.6 int activemq::transport::mock::MockTransport::getNumReceivedMessageBeforeFail ( ) const [inline]

6.364.3.7 int activemq::transport::mock::MockTransport::getNumReceivedMessages ( ) const [inline]

6.364.3.8 int activemq::transport::mock::MockTransport::getNumSentKeepAlives ( ) const [inline]

6.364.3.9 int activemq::transport::mock::MockTransport::getNumSentKeepAlivesBeforeFail ( ) const [inline]

6.364.3.10 int activemq::transport::mock::MockTransport::getNumSentMessageBeforeFail ( ) const [inline]

6.364.3.11 int activemq::transport::mock::MockTransport::getNumSentMessages ( ) const [inline]

6.364.3.12 virtual std::string activemq::transport::mock::MockTransport::getRemoteAddress ( ) const [inline, virtual]

Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2162).

6.364.3.13 virtual TransportListener* activemq::transport::mock::MockTransport::getTransportListener ( ) const [inline, virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implements **activemq::transport::Transport** (p. 2163).

6.364.3.14 Pointer<wireformat::WireFormat> activemq::transport::mock::MockTransport::getWireFormat ( ) const [inline, virtual]

Gets the currently set WireFormat.

Returns

the current WireFormat object.

Implements **activemq::transport::Transport** (p. 2163).

6.364.3.15 virtual bool activemq::transport::mock::MockTransport::isClosed ( ) const [inline, virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Implements **activemq::transport::Transport** (p. 2163).

6.364.3.16 virtual bool activemq::transport::mock::MockTransport::isConnected ( ) const [inline, virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2163).

6.364.3.17 bool activemq::transport::mock::MockTransport::isFailOnClose ( ) const [inline]

6.364.3.18 bool activemq::transport::mock::MockTransport::isFailOnKeepAliveSends ( ) const [inline]

6.364.3.19 bool activemq::transport::mock::MockTransport::isFailOnReceiveMessage ( ) const [inline]

6.364.3.20 bool activemq::transport::mock::MockTransport::isFailOnSendMessage ( ) const [inline]

6.364.3.21 bool activemq::transport::mock::MockTransport::isFailOnStart ( ) const [inline]

6.364.3.22 bool activemq::transport::mock::MockTransport::isFailOnStop ( ) const [inline]

6.364.3.23 virtual bool activemq::transport::mock::MockTransport::isFaultTolerant ( ) const [inline, virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2163).

6.364.3.24 virtual bool activemq::transport::mock::MockTransport::isReconnectSupported ( ) const [inline, virtual]

Returns

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.364.3.25 virtual bool activemq::transport::mock::MockTransport::isUpdateURIsSupported ( ) const [inline, virtual]

Returns

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.364.3.26 virtual Transport* activemq::transport::mock::MockTransport::narrow (const std::type_info & *typeId*) [inline, virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId	- The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2164).

6.364.3.27 virtual void activemq::transport::mock::MockTransport::oneway (const Pointer< Command > & *command*) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2164).

6.364.3.28 virtual void activemq::transport::mock::MockTransport::reconnect (const decaf::net::URI &uri *AMQCPP_UNUSED*) [inline, virtual]

6.364.3.29 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

6.364.3.30 virtual Pointer<Response> activemq::transport::mock::MockTransport::request (const Pointer< Command > & *command,* unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

6.364.3.31 void **activemq::transport::mock::MockTransport::setFailOnClose** (bool *value*) [inline]

6.364.3.32 void **activemq::transport::mock::MockTransport::setFailOnKeepAliveSends** (bool *value*) [inline]

6.364.3.33 void **activemq::transport::mock::MockTransport::setFailOnReceiveMessage** (bool *value*) [inline]

6.364.3.34 void **activemq::transport::mock::MockTransport::setFailOnSendMessage** (bool *value*) [inline]

6.364.3.35 void **activemq::transport::mock::MockTransport::setFailOnStart** (bool *value*) [inline]

6.364.3.36 void **activemq::transport::mock::MockTransport::setFailOnStop** (bool *value*) [inline]

6.364.3.37 void **activemq::transport::mock::MockTransport::setName** (const std::string & *name*) [inline]

6.364.3.38 void **activemq::transport::mock::MockTransport::setNumReceivedMessageBeforeFail** (int *value*) [inline]

6.364.3.39 void **activemq::transport::mock::MockTransport::setNumReceivedMessages** (int *value*) [inline]

6.364.3.40 void **activemq::transport::mock::MockTransport::setNumSentKeepAlives** (int *value*) [inline]

6.364.3.41 void **activemq::transport::mock::MockTransport::setNumSentKeepAlivesBeforeFail** (int *value*) [inline]

6.364.3.42 void **activemq::transport::mock::MockTransport::setNumSentMessageBeforeFail** (int *value*) [inline]

6.364.3.43 void **activemq::transport::mock::MockTransport::setNumSentMessages** (int *value*) [inline]

6.364.3.44 virtual void **activemq::transport::mock::MockTransport::setOutgoingListener** (TransportListener * *listener*) [inline, virtual]

Sets a Listener that gets notified for every command that would have been sent by this transport to the Broker, this allows a client to verify that its messages are making it to the wire.

Parameters

listener	- The CommandListener to notify for each message

6.364.3.45 void **activemq::transport::mock::MockTransport::setResponseBuilder** (const Pointer< ResponseBuilder > & *responseBuilder*) [inline]

Sets the **ResponseBuilder** (p. 1784) that this class uses to create Responses to Commands sent.

These are either real Response Objects, or Commands that would have been sent Asynchronously be the Broker.

Parameters

responseBuilder	- The **ResponseBuilder** (p. 1784) to use from now on.

6.364.3.46 virtual void activemq::transport::mock::MockTransport::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener	the listener of transport events.

Implements **activemq::transport::Transport** (p. 2166).

6.364.3.47 virtual void activemq::transport::mock::MockTransport::setWireFormat (const Pointer< wireformat::WireFormat > &wireFormat *AMQCPP_UNUSED*) [inline, virtual]

6.364.3.48 virtual void activemq::transport::mock::MockTransport::start ( ) [virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Implements **activemq::transport::Transport** (p. 2166).

6.364.3.49 virtual void activemq::transport::mock::MockTransport::stop ( ) [virtual]

Stops the **Transport** (p. 2161).

Exceptions

IOException	if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 2167).

6.364.3.50 virtual void activemq::transport::mock::MockTransport::updateURIs (bool rebalance *AMQCPP_UNUSED*, const decaf::util::List< decaf::net::URI > &uris *AMQCPP_UNUSED*) [inline, virtual]

6.365.1 Detailed Description

Manufactures MockTransports, which are objects that read from input streams and write to output streams.

6.365.2 Constructor & Destructor Documentation

6.365.2.1 virtual activemq::transport::mock::MockTransportFactory::~MockTransportFactory ( ) [inline, virtual]

6.365.3 Member Function Documentation

6.365.3.1 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.365.3.2 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.365.3.3 virtual Pointer<Transport> activemq::transport::mock::MockTransportFactory::doCreateComposite (const decaf::net::URI & *location,* const Pointer< wireformat::WireFormat > & *wireFormat,* const decaf::util::Properties & *properties*) [protected, virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to.
wireFormat	- the assigned WireFormat for the new **Transport** (p. 2161).
properties	- Properties to apply to the transport.

Returns

Pointer to a new **Transport** (p. 2161) instance.

Exceptions

ActiveMQexception	if an error occurs

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.366.1 Detailed Description

Mutex (p. 1519) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.

Since

1.0

6.366.2 Constructor & Destructor Documentation

6.366.2.1 decaf::util::concurrent::Mutex::Mutex ( )

6.366.2.2 decaf::util::concurrent::Mutex::Mutex (const std::string & *name*)

6.366.2.3 virtual decaf::util::concurrent::Mutex::~Mutex ( ) [virtual]

6.366.3 Member Function Documentation

6.366.3.1 std::string decaf::util::concurrent::Mutex::getName ( ) const

6.366.3.2 virtual void decaf::util::concurrent::Mutex::lock ( ) [virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

Referenced by decaf::util::StlQueue< T >::lock(), decaf::util::StlMap< std::string, cms::Topic * >::lock(), decaf::util::AbstractCollection< cms::Connection * >::lock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::lock(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::lock().

6.366.3.3 virtual void decaf::util::concurrent::Mutex::notify ( ) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::clear(), decaf::util::StlQueue< T >::notify(), decaf::util::StlMap< std::string, cms::Topic * >::notify(), decaf::util::AbstractCollection< cms::Connection * >::notify(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notify(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::notify(), decaf::util::concurrent::LinkedBlockingQueue< E >::offer(), decaf::util::concurrent::LinkedBlockingQueue< E >::poll(), decaf::util::concurrent::LinkedBlockingQueue< E >::put(), and decaf::util::concurrent::LinkedBlockingQueue< E >::take().

6.366.3.4 virtual void decaf::util::concurrent::Mutex::notifyAll ( ) [virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

Referenced by decaf::util::StlQueue< T >::notifyAll(), decaf::util::StlMap< std::string, cms::Topic * >::notifyAll(), decaf::util::AbstractCollection< cms::Connection * >::notifyAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::notifyAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::notifyAll().

6.366.3.5 std::string decaf::util::concurrent::Mutex::toString ( ) const

6.366.3.6 virtual bool decaf::util::concurrent::Mutex::tryLock ( ) [virtual]

Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

Referenced by decaf::util::StlQueue< T >::tryLock(), decaf::util::StlMap< std::string, cms::Topic * >::tryLock(), decaf::util::AbstractCollection< cms::Connection * >::tryLock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::tryLock(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::tryLock().

6.366.3.7 virtual void decaf::util::concurrent::Mutex::unlock ( ) [virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

Referenced by decaf::util::StlQueue< T >::unlock(), decaf::util::StlMap< std::string, cms::Topic * >::unlock(), decaf::util::AbstractCollection< cms::Connection * >::unlock(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::unlock(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::unlock().

6.366.3.8 virtual void decaf::util::concurrent::Mutex::wait ( ) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::offer(), decaf::util::concurrent::LinkedBlockingQueue< E >::poll(), decaf::util::concurrent::LinkedBlockingQueue< E >::put(), decaf::util::concurrent::LinkedBlockingQueue< E >::take(), decaf::util::StlQueue< T >::wait(), decaf::util::StlMap< std::string, cms::Topic * >::wait(), decaf::util::AbstractCollection< cms::Connection * >::wait(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::wait(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::wait().

6.366.3.9 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.366.3.10 virtual void decaf::util::concurrent::Mutex::wait (long long *millisecs,* int *nanos*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

6.368 decaf::internal::util::concurrent::MutexImpl Class Reference

`#include <src/main/decaf/internal/util/concurrent/MutexImpl.h>`

Static Public Member Functions

- static **decaf::util::concurrent::MutexHandle** * **create** ()

  Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.
- static void **destroy** (**decaf::util::concurrent::MutexHandle** *handle)

  Destroy a previously create Mutex instance.
- static void **lock** (**decaf::util::concurrent::MutexHandle** *handle)

  Locks the Mutex.
- static bool **trylock** (**decaf::util::concurrent::MutexHandle** *handle)

  Tries to lock the Mutex.
- static void **unlock** (**decaf::util::concurrent::MutexHandle** *handle)

  Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

6.368.1 Member Function Documentation

6.368.1.1 static decaf::util::concurrent::MutexHandle* decaf::internal::util::concurrent::MutexImpl::create ( ) [static]

Creates a Reentrant Mutex and returns the handle, throws a Runtime Exception if the Mutex cannot be created for some reason.

Returns

handle to a newly created Mutex.

6.368.1.2 static void decaf::internal::util::concurrent::MutexImpl::destroy (decaf::util::concurrent::MutexHandle * *handle*) [static]

Destroy a previously create Mutex instance.

Parameters

mutex	The Mutex instance to be destroyed.

6.368.1.3 static void decaf::internal::util::concurrent::MutexImpl::lock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Locks the Mutex.

If the Mutex is already locked by another thread this method blocks until the Mutex becomes unlocked and this thread acquires the lock.

Parameters

handle	the handle to the Mutex to Lock.

6.368.1.4 static bool decaf::internal::util::concurrent::MutexImpl::trylock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Tries to lock the Mutex.

If the Mutex is unlocked this Thread acquires the lock on the Mutex and this method returns true, if the Mutex is already locked then the lock is not acquired and this method returns false.

Parameters

handle	the handle to the Mutex to attempt to Lock.

Returns

true if the lock was acquired false otherwise.

6.368.1.5 static void decaf::internal::util::concurrent::MutexImpl::unlock (decaf::util::concurrent::MutexHandle * *handle*) [static]

Unlocks the Mutex allowing other Thread to then acquire the Lock on it.

Parameters

handle	the handle to the Mutex to attempt to Lock.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**MutexImpl.h**

6.369 decaf::internal::net::Network Class Reference

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

`#include <src/main/decaf/internal/net/Network.h>`

Public Member Functions

- virtual ~**Network** ()
- **decaf::util::concurrent::Mutex** * **getRuntimeLock** ()

  *Gets a pointer to the **Network** (p. 1525) Runtime's Lock object, this can be used by **Network** (p. 1525) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 1525) layer, etc.*

- void **addNetworkResource** (**decaf::internal::util::Resource** ∗value)

  *Adds a Resource to the **Network** (p. 1525) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 1525) Runtime are destroyed.*

- template<typename T >
  void **addAsResource** (T ∗value)
- void **addShutdownTask** (**decaf::lang::Runnable** ∗task)

  *Register a Runnable to be called when the **Network** (p. 1525) Runtime is shutdown to provide a chance to cleanup any data or references that could cause problems should the **Network** (p. 1525) Runtime be re-initialized.*

Static Public Member Functions

- static **Network** ∗ **getNetworkRuntime** ()

  *Gets the one and only instance of the **Network** (p. 1525) class, if this is called before the **Network** (p. 1525) layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.*

- static void **initializeNetworking** ()

  Initialize the Networking layer.

- static void **shutdownNetworking** ()

  *Shutdown the **Network** (p. 1525) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.*

Protected Member Functions

- **Network** ()

6.369.1 Detailed Description

Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.

Since

1.0

6.369.2 Constructor & Destructor Documentation

6.369.2.1 decaf::internal::net::Network::Network ( ) [protected]

6.369.2.2 virtual decaf::internal::net::Network::∼Network ( ) [virtual]

6.369.3 Member Function Documentation

6.369.3.1 template<typename T > void decaf::internal::net::Network::addAsResource (T ∗ *value*) [inline]

6.369.3.2 void decaf::internal::net::Network::addNetworkResource (decaf::internal::util::Resource ∗ *value*)

Adds a Resource to the **Network** (p. 1525) Runtime, this resource will be held by the runtime until the Library shutdown method is called at which time all the Resources held by the **Network** (p. 1525) Runtime are destroyed.

Parameters

value	The Resource to add to the **Network** (p. 1525) Runtime.

Exceptions

NullPointerException	if the Resource value passed is null.

6.369.3.3 void decaf::internal::net::Network::addShutdownTask (decaf::lang::Runnable * *task*)

Register a Runnable to be called when the **Network** (p. 1525) Runtime is shutdown to provide a chance to cleanup any data or references that could cause problems should the **Network** (p. 1525) Runtime be re-initialized.

The Runnable pointer ownership is transfered to the NetworkRuntime to guarantee the timing of resource cleanup.

The cleanup tasks are run at a critical time in the Shutdown process and should be as simple as possible and make every attempt to no throw any exceptions. If an exception is thrown it is ignored and processing of the next task is started.

The tasks should not assume that any **Network** (p. 1525) resources are still available and should execute as quickly as possible.

Parameters

task	Pointer to a Runnable object that will now be owned by the **Network** (p. 1525) Runtime.

6.369.3.4 static Network* decaf::internal::net::Network::getNetworkRuntime ( ) [static]

Gets the one and only instance of the **Network** (p. 1525) class, if this is called before the **Network** (p. 1525) layer has been initialized or after it has been shutdown then an IllegalStateException is thrown.

Returns

pointer to the **Network** (p. 1525) runtime for the Decaf library.

6.369.3.5 decaf::util::concurrent::Mutex* decaf::internal::net::Network::getRuntimeLock ( )

Gets a pointer to the **Network** (p. 1525) Runtime's Lock object, this can be used by **Network** (p. 1525) layer APIs to synchronize around certain actions such as adding a resource to the **Network** (p. 1525) layer, etc.

The pointer returned is owned by the **Network** (p. 1525) runtime and should not be deleted or copied by the caller.

Returns

a pointer to the **Network** (p. 1525) Runtime's single Lock instance.

6.369.3.6 static void decaf::internal::net::Network::initializeNetworking ( ) [static]

Initialize the Networking layer.

6.369.3.7 static void decaf::internal::net::Network::shutdownNetworking ( ) [static]

Shutdown the **Network** (p. 1525) layer and free any associated resources, classes in the Decaf library that use the networking layer will now fail if used after calling the shutdown method.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**Network.h**

6.370 activemq::commands::NetworkBridgeFilter Class Reference

`#include <src/main/activemq/commands/NetworkBridgeFilter.h>`

Inheritance diagram for activemq::commands::NetworkBridgeFilter:

Public Member Functions

- **NetworkBridgeFilter** ()
- virtual ~**NetworkBridgeFilter** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **NetworkBridgeFilter** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual int **getNetworkTTL** () **const**
- virtual void **setNetworkTTL** (int **networkTTL**)
- virtual **const Pointer**< **BrokerId** > & **getNetworkBrokerId** () **const**
- virtual **Pointer**< **BrokerId** > & **getNetworkBrokerId** ()
- virtual void **setNetworkBrokerId** (**const Pointer**< **BrokerId** > &**networkBrokerId**)

Static Public Attributes

- static **const** unsigned char **ID_NETWORKBRIDGEFILTER** = 91

Protected Attributes

- int **networkTTL**
- **Pointer**< **BrokerId** > **networkBrokerId**

6.370.1 Constructor & Destructor Documentation

6.370.1.1 activemq::commands::NetworkBridgeFilter::NetworkBridgeFilter ( )

6.370.1.2 virtual activemq::commands::NetworkBridgeFilter::~NetworkBridgeFilter ( ) [virtual]

6.370.2 Member Function Documentation

6.370.2.1 virtual NetworkBridgeFilter* activemq::commands::NetworkBridgeFilter::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.370.2.2 virtual void activemq::commands::NetworkBridgeFilter::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.370.2.3 virtual bool activemq::commands::NetworkBridgeFilter::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.370.2.4 virtual unsigned char activemq::commands::NetworkBridgeFilter::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.370.2.5 virtual const Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId ( ) const [virtual]

6.370.2.6 virtual Pointer<BrokerId>& activemq::commands::NetworkBridgeFilter::getNetworkBrokerId ( ) [virtual]

6.370.2.7 virtual int activemq::commands::NetworkBridgeFilter::getNetworkTTL ( ) const [virtual]

6.370.2.8 virtual void activemq::commands::NetworkBridgeFilter::setNetworkBrokerId (const Pointer< BrokerId > & *networkBrokerId*) [virtual]

6.370.2.9 virtual void activemq::commands::NetworkBridgeFilter::setNetworkTTL (int *networkTTL*) [virtual]

6.370.2.10 virtual std::string activemq::commands::NetworkBridgeFilter::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.370.3 Field Documentation

6.370.3.1 const unsigned char activemq::commands::NetworkBridgeFilter::ID_NETWORKBRIDGEFILTER = 91 [static]

6.370.3.2 Pointer<BrokerId> activemq::commands::NetworkBridgeFilter::networkBrokerId [protected]

6.370.3.3 int activemq::commands::NetworkBridgeFilter::networkTTL [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**NetworkBridgeFilter.h**

6.371 activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller Class Reference

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 1530).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/NetworkBridgeFilterMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller:

Public Member Functions

- **NetworkBridgeFilterMarshaller** ()
- virtual ~**NetworkBridgeFilterMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.371.1 Detailed Description

Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 1530).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.371.2 Constructor & Destructor Documentation

6.371.2.1 activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::NetworkBridgeFilterMarshaller ( ) [inline]

6.371.2.2 virtual activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::~NetworkBridgeFilterMarshaller ( ) [inline, virtual]

6.371.3 Member Function Documentation

6.371.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.371.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.371.3.3 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.371.3.4 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.371.3.5 virtual int activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.371.3.6 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.371.3.7 virtual void activemq::wireformat::openwire::marshal::generated::NetworkBridgeFilterMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**NetworkBridgeFilterMarshaller.h**

6.372 decaf::net::NoRouteToHostException Class Reference

`#include <src/main/decaf/net/NoRouteToHostException.h>`

Inheritance diagram for decaf::net::NoRouteToHostException:

Public Member Functions

- **NoRouteToHostException** () throw ()
  Default Constructor.
- **NoRouteToHostException** (**const Exception** &ex) throw ()
  Conversion Constructor from some other Exception.
- **NoRouteToHostException** (**const NoRouteToHostException** &ex) throw ()
  Copy Constructor.
- **NoRouteToHostException** (**const** char *file, **const** int lineNumber, **const** std::exception *__cause__, **const** char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NoRouteToHostException** (**const** std::exception *__cause__) throw ()
  Constructor.
- **NoRouteToHostException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoRouteToHostException** * **clone** () **const**
  Clones this exception.
- virtual ~**NoRouteToHostException** () throw ()

6.372.1 Constructor & Destructor Documentation

6.372.1.1 decaf::net::NoRouteToHostException::NoRouteToHostException ( ) throw () [inline]

Default Constructor.

6.372.1.2 decaf::net::NoRouteToHostException::NoRouteToHostException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.372.1.3 decaf::net::NoRouteToHostException::NoRouteToHostException (const NoRouteToHostException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.372.1.4 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.372.1.5 decaf::net::NoRouteToHostException::NoRouteToHostException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.372.1.6 decaf::net::NoRouteToHostException::NoRouteToHostException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.372.1.7 virtual decaf::net::NoRouteToHostException::~NoRouteToHostException ( ) throw () [inline, virtual]

6.372.2 Member Function Documentation

6.372.2.1 virtual NoRouteToHostException* decaf::net::NoRouteToHostException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 1916).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**NoRouteToHostException.h**

6.373 decaf::security::NoSuchAlgorithmException Class Reference

`#include <src/main/decaf/security/NoSuchAlgorithmException.h>`

Inheritance diagram for decaf::security::NoSuchAlgorithmException:

Public Member Functions

- **NoSuchAlgorithmException** () throw ()
  Default Constructor.

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **NoSuchAlgorithmException** * **clone** () **const**
  Clones this exception.
- virtual ~**NoSuchAlgorithmException** () throw ()

6.373.1 Constructor & Destructor Documentation

6.373.1.1 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException ( ) throw () [inline]

Default Constructor.

6.373.1.2 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.373.1.3 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const NoSuchAlgorithmException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.373.1.4 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.373.1.5 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.373.1.6 decaf::security::NoSuchAlgorithmException::NoSuchAlgorithmException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.373.1.7 virtual decaf::security::NoSuchAlgorithmException::~NoSuchAlgorithmException ( ) throw ()

[inline, virtual]

6.373.2 Member Function Documentation

6.373.2.1 virtual NoSuchAlgorithmException* decaf::security::NoSuchAlgorithmException::clone ( ) const

[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1081).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**NoSuchAlgorithmException.h**

6.374 decaf::util::NoSuchElementException Class Reference

  Constructor - Initializes the file name and line number where this message occured.
- virtual **NoSuchElementException** * **clone** () **const**

  Clones this exception.
- virtual ~**NoSuchElementException** () throw ()

6.374.1 Constructor & Destructor Documentation

6.374.1.1 decaf::util::NoSuchElementException::NoSuchElementException ( ) throw ()

Default Constructor.

6.374.1.2 decaf::util::NoSuchElementException::NoSuchElementException (const decaf::lang::exceptions::RuntimeException & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	The Exception whose data is to be copied into this one.

6.374.1.3 decaf::util::NoSuchElementException::NoSuchElementException (const NoSuchElementException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The Exception whose data is to be copied into this one.

6.374.1.4 decaf::util::NoSuchElementException::NoSuchElementException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.374.1.5 decaf::util::NoSuchElementException::NoSuchElementException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.374.1.6 decaf::util::NoSuchElementException::NoSuchElementException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.374.1.7 virtual decaf::util::NoSuchElementException::~NoSuchElementException ( ) throw ()

[virtual]

6.374.2 Member Function Documentation

6.375.1 Constructor & Destructor Documentation

6.375.1.1 decaf::security::NoSuchProviderException::NoSuchProviderException ( ) throw () [inline]

Default Constructor.

6.375.1.2 decaf::security::NoSuchProviderException::NoSuchProviderException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.375.1.3 decaf::security::NoSuchProviderException::NoSuchProviderException (const NoSuchProviderException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.375.1.4 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.375.1.5 decaf::security::NoSuchProviderException::NoSuchProviderException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.375.1.6 decaf::security::NoSuchProviderException::NoSuchProviderException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.375.1.7 virtual decaf::security::NoSuchProviderException::~NoSuchProviderException ( ) throw () [inline, virtual]

6.375.2 Member Function Documentation

6.375.2.1 virtual NoSuchProviderException* decaf::security::NoSuchProviderException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1081).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**NoSuchProviderException.h**

6.376 decaf::lang::exceptions::NullPointerException Class Reference

`#include <src/main/decaf/lang/exceptions/NullPointerException.h>`

Inheritance diagram for decaf::lang::exceptions::NullPointerException:

Public Member Functions

- **NullPointerException** () throw ()
  Default Constructor.
- **NullPointerException** (**const Exception** &ex) throw ()
  *Conversion Constructor from some other **Exception** (p. 990).*
- **NullPointerException** (**const NullPointerException** &ex) throw ()
  Copy Constructor.
- **NullPointerException** (**const** char *file, **const** int lineNumber, **const** std::exception *__cause__, **const** char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **NullPointerException** (**const** std::exception *__cause__) throw ()
  Constructor.
- **NullPointerException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occured.
- virtual **NullPointerException** * **clone** () **const**
  Clones this exception.
- virtual ~**NullPointerException** () throw ()

6.376.1 Constructor & Destructor Documentation

6.376.1.1 decaf::lang::exceptions::NullPointerException::NullPointerException ( ) throw () [inline]

Default Constructor.

6.376.1.2 decaf::lang::exceptions::NullPointerException::NullPointerException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.376.1.3 decaf::lang::exceptions::NullPointerException::NullPointerException (const NullPointerException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.376.1.4 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.376.1.5 decaf::lang::exceptions::NullPointerException::NullPointerException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.376.1.6 decaf::lang::exceptions::NullPointerException::NullPointerException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.376.1.7 virtual decaf::lang::exceptions::NullPointerException::~NullPointerException ( ) throw ()

[inline, virtual]

6.376.2 Member Function Documentation

6.376.2.1 virtual NullPointerException* decaf::lang::exceptions::NullPointerException::clone ( ) const

[inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**NullPointerException.h**

6.377 decaf::lang::Number Class Reference

The abstract class **Number** (p. 1543) is the superclass of classes **Byte** (p. 476), **Double** (p. 956), **Float** (p. 1040), **Integer** (p. 1161), **Long** (p. 1338), and **Short** (p. 1858).

`#include <src/main/decaf/lang/Number.h>`

Inheritance diagram for decaf::lang::Number:

Public Member Functions

- virtual ~**Number** ()
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual double **doubleValue** () **const** =0

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const** =0

  Answers the float value which the receiver represents.
- virtual int **intValue** () **const** =0

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const** =0

  Answers the long value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.

6.377.1 Detailed Description

The abstract class **Number** (p. 1543) is the superclass of classes **Byte** (p. 476), **Double** (p. 956), **Float** (p. 1040), **Integer** (p. 1161), **Long** (p. 1338), and **Short** (p. 1858).

Subclasses of **Number** (p. 1543) must provide methods to convert the represented numeric value to byte, double, float, int, long, and short.

Since

1.0

6.377.2 Constructor & Destructor Documentation

6.377.2.1 virtual decaf::lang::Number::~Number ( ) [inline, virtual]

6.377.3 Member Function Documentation

6.377.3.1 virtual unsigned char decaf::lang::Number::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented in **decaf::lang::Double** (p. 959), **decaf::lang::Float** (p. 1042), **decaf::lang::Integer** (p. 1164), **decaf::lang::Byte** (p. 478), **decaf::lang::Long** (p. 1341), **decaf::lang::Short** (p. 1860), and **decaf::lang::Character** (p. 595).

6.377.3.2 virtual double decaf::lang::Number::doubleValue ( ) const [pure virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implemented in **decaf::util::concurrent::atomic::AtomicInteger** (p. 370), **decaf::lang::Double** (p. 960), **decaf::lang::Float** (p. 1043), **decaf::lang::Integer** (p. 1165), **decaf::lang::Byte** (p. 479), **decaf::lang::Long** (p. 1342), **decaf::lang::Short** (p. 1861), and **decaf::lang::Character** (p. 596).

6.377.3.3 virtual float decaf::lang::Number::floatValue ( ) const [pure virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implemented in **decaf::lang::Double** (p. 961), **decaf::lang::Float** (p. 1045), **decaf::lang::Integer** (p. 1166), **decaf::lang::Byte** (p. 480), **decaf::lang::Long** (p. 1343), **decaf::util::concurrent::atomic::AtomicInteger** (p. 370), **decaf::lang::Short** (p. 1861), and **decaf::lang::Character** (p. 596).

6.377.3.4 virtual int decaf::lang::Number::intValue ( ) const [pure virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implemented in **decaf::lang::Double** (p. 961), **decaf::lang::Float** (p. 1045), **decaf::lang::Integer** (p. 1167), **decaf::lang::Byte** (p. 480), **decaf::lang::Long** (p. 1343), **decaf::lang::Short** (p. 1862), **decaf::lang::Character** (p. 597), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 372).

6.377.3.5 virtual long long decaf::lang::Number::longValue ( ) const [pure virtual]

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implemented in **decaf::lang::Double** (p. 962), **decaf::lang::Float** (p. 1046), **decaf::lang::Integer** (p. 1167), **decaf::lang::Byte** (p. 480), **decaf::lang::Long** (p. 1343), **decaf::lang::Short** (p. 1862), **decaf::lang::Character** (p. 597), and **decaf::util::concurrent::atomic::AtomicInteger** (p. 372).

6.377.3.6 virtual short decaf::lang::Number::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented in **decaf::lang::Double** (p. 964), **decaf::lang::Float** (p. 1048), **decaf::lang::Integer** (p. 1171), **decaf::lang::Byte** (p. 482), **decaf::lang::Long** (p. 1348), **decaf::lang::Short** (p. 1864), and **decaf::lang::Character** (p. 599).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Number.h**

6.378.1 Constructor & Destructor Documentation

6.378.1.1 decaf::lang::exceptions::NumberFormatException::NumberFormatException ( ) [inline]

Default Constructor.

Referenced by clone().

6.378.1.2 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.378.1.3 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const NumberFormatException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.378.1.4 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.378.1.5 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.378.1.6 decaf::lang::exceptions::NumberFormatException::NumberFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

References decaf::lang::Exception::buildMessage(), and decaf::lang::Exception::setMark().

6.378.1.7 virtual decaf::lang::exceptions::NumberFormatException::~NumberFormatException ( ) throw () [inline, virtual]

6.378.2 Member Function Documentation

6.378.2.1 virtual NumberFormatException* decaf::lang::exceptions::NumberFormatException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

References NumberFormatException().

6.380 decaf::internal::net::ssl::openssl::OpenSSLContextSpi Class Reference

Provides an SSLContext that wraps the OpenSSL API.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLContextSpi.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLContextSpi:

Public Member Functions

- **OpenSSLContextSpi** ()
- virtual ~**OpenSSLContextSpi** ()
- virtual void **providerInit** (**security::SecureRandom** *random)

  Perform the initialization of this Context.

  Parameters

random	*Pointer to an instance of a secure random number generator.*

  Exceptions

NullPointerException	*if the SecureRandom instance is NULL.*
KeyManagementException	*if an error occurs while initializing the context.*

- virtual **decaf::net::SocketFactory** * **providerGetSocketFactory** ()

  *Returns a **SocketFactory** (p. 1916) instance that can be used to create new **SSLSocket** (p. 1947) objects.*
  *The **SocketFactory** (p. 1916) is owned by the Service Provider and should not be destroyed by the caller.*

  Returns

  ***SocketFactory** (p. 1916) instance that can be used to create new SSLSockets.*

  Exceptions

IllegalStateException	*if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.*

- virtual **decaf::net::ServerSocketFactory** * **providerGetServerSocketFactory** ()

  *Returns a **ServerSocketFactory** (p. 1823) instance that can be used to create new **SSLServerSocket** (p. 1941) objects.*
  *The **ServerSocketFactory** (p. 1823) is owned by the Service Provider and should not be destroyed by the caller.*

Returns

SocketFactory *(p. 1916) instance that can be used to create new SSLServerSockets.*

Exceptions

IllegalStateException	*if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.*

Friends

- class **OpenSSLSocket**
- class **OpenSSLSocketFactory**

6.380.1 Detailed Description

Provides an SSLContext that wraps the OpenSSL API.

Since

1.0

6.380.2 Constructor & Destructor Documentation

6.380.2.1 decaf::internal::net::ssl::openssl::OpenSSLContextSpi::OpenSSLContextSpi ( )

6.380.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLContextSpi::~OpenSSLContextSpi ( ) [virtual]

6.380.3 Member Function Documentation

6.380.3.1 virtual decaf::net::ServerSocketFactory* decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetServerSocketFactory ( ) [virtual]

Returns a **ServerSocketFactory** (p. 1823) instance that can be used to create new **SSLServerSocket** (p. 1941) objects.

The **ServerSocketFactory** (p. 1823) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 1916) instance that can be used to create new SSLServerSockets.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 1937).

6.380.3.2 virtual decaf::net::SocketFactory* decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerGetSocketFactory ( ) [virtual]

Returns a **SocketFactory** (p. 1916) instance that can be used to create new **SSLSocket** (p. 1947) objects.

The **SocketFactory** (p. 1916) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 1916) instance that can be used to create new SSLSockets.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.

Implements **decaf::net::ssl::SSLContextSpi** (p. 1937).

6.380.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLContextSpi::providerInit (security::SecureRandom * *random*) [virtual]

Perform the initialization of this Context.

Parameters

random	Pointer to an instance of a secure random number generator.

Exceptions

NullPointerException	if the SecureRandom instance is NULL.
KeyManagementException	if an error occurs while initializing the context.

Implements **decaf::net::ssl::SSLContextSpi** (p. 1938).

6.380.4 Friends And Related Function Documentation

6.382 decaf::internal::net::ssl::openssl::OpenSSLServerSocket Class Reference

SSLServerSocket based on OpenSSL library code.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocket.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLServerSocket:

Public Member Functions

- **OpenSSLServerSocket** (**OpenSSLParameters** ∗parameters)
- virtual ∼**OpenSSLServerSocket** ()
- virtual std::vector< std::string > **getSupportedCipherSuites** () **const**

  *Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 1941). Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).*

  Returns

  a vector containing the names of all the supported cipher suites.
- virtual std::vector< std::string > **getSupportedProtocols** () **const**

  *Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 1941) instance.*

  Returns

  a vector containing the names of all the supported protocols.
- virtual std::vector< std::string > **getEnabledCipherSuites** () **const**

  *Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 1941).*

  Returns

  vector of the names of all enabled Cipher Suites.
- virtual void **setEnabledCipherSuites** (**const** std::vector< std::string > &suites)

  *Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 1941) connection.*
  Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

  Parameters

suites	*An Vector of names for all the Cipher Suites that are to be enabled.*

  Exceptions

IllegalArgumentException	*if the vector is empty or one of the names is invalid.*

- virtual std::vector< std::string > **getEnabledProtocols** () **const**

  *Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 1941).*

Returns

vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (**const** std::vector< std::string > &protocols)

*Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 1941) connection.*
Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols	*An Vector of names for all the Protocols that are to be enabled.*

Exceptions

IllegalArgumentException	*if the vector is empty or one of the names is invalid.*

- virtual bool **getWantClientAuth** () **const**

Returns

*true if the **Socket** (p. 1900) request client Authentication.*

- virtual void **setWantClientAuth** (bool value)

*Sets whether or not this **Socket** (p. 1900) will request Client Authentication.*
*If set to true the **Socket** (p. 1900) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.*

Parameters

value	*Whether the server socket should request client authentication.*

- virtual bool **getNeedClientAuth** () **const**

Returns

*true if the **Socket** (p. 1900) requires client Authentication.*

- virtual void **setNeedClientAuth** (bool value)

*Sets whether or not this **Socket** (p. 1900) will require Client Authentication.*
*If set to true the **Socket** (p. 1900) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.*

Parameters

value	*Whether the server socket should require client authentication.*

- virtual **decaf::net::Socket** * **accept** ()

*Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 1816), the caller blocks until a connection is made.*
*If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 1932) if the operation times out.*

Returns

*a new **Socket** (p. 1900) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.*

Exceptions

IOException	*if an I/O error occurs while binding the socket.*
SocketException (p. 1915)	*if an error occurs while blocking on the accept call.*
SocketTimeoutException (p. 1932)	*if the SO_TIMEOUT option was used and the accept timed out.*

6.382.1 Detailed Description

SSLServerSocket based on OpenSSL library code.

Since

1.0

6.382.2 Constructor & Destructor Documentation

6.382.2.1 decaf::internal::net::ssl::openssl::OpenSSLServerSocket::OpenSSLServerSocket (OpenSSLParameters * *parameters*)

6.382.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLServerSocket::~OpenSSLServerSocket ( ) [virtual]

6.382.3 Member Function Documentation

6.382.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLServerSocket::accept ( ) [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 1816), the caller blocks until a connection is made.

If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 1932) if the operation times out.

Returns

a new **Socket** (p. 1900) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions

IOException	if an I/O error occurs while binding the socket.
SocketException *(p. 1915)*	if an error occurs while blocking on the accept call.
SocketTimeoutException *(p. 1932)*	if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented from **decaf::net::ServerSocket** (p. 1819).

6.382.3.2 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledCipherSuites ( ) const [virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 1941).

Returns

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1943).

6.382.3.3 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getEnabledProtocols ( ) const [virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 1941).

Returns

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1943).

6.382.3.4 virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getNeedClientAuth ( ) const [virtual]

Returns

true if the **Socket** (p. 1900) requires client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1944).

6.382.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedCipherSuites ( ) const [virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 1941).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).

Returns

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1944).

6.382.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getSupportedProtocols ( ) const [virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 1941) instance.

Returns

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1944).

6.382.3.7 virtual bool decaf::internal::net::ssl::openssl::OpenSSLServerSocket::getWantClientAuth ( ) const [virtual]

Returns

true if the **Socket** (p. 1900) request client Authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1944).

6.382.3.8 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 1941) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites	An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1944).

6.382.3.9 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 1941) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols	An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1945).

6.382.3.10 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setNeedClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 1900) will require Client Authentication.

If set to true the **Socket** (p. 1900) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters

value	Whether the server socket should require client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1945).

6.382.3.11 virtual void decaf::internal::net::ssl::openssl::OpenSSLServerSocket::setWantClientAuth (bool *value*) [virtual]

Sets whether or not this **Socket** (p. 1900) will request Client Authentication.

If set to true the **Socket** (p. 1900) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters

value	Whether the server socket should request client authentication.

Implements **decaf::net::ssl::SSLServerSocket** (p. 1945).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLServerSocket.h**

6.383 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory Class Reference

SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLServerSocketFactory.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory:

Public Member Functions

- **OpenSSLServerSocketFactory** (**OpenSSLContextSpi** ∗parent)
- virtual ∼**OpenSSLServerSocketFactory** ()
- virtual **decaf::net::ServerSocket** ∗ **createServerSocket** ()

  *Create a new **ServerSocket** (p. 1816) that is unbound.*
  *The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.*

  Returns

  *new **ServerSocket** (p. 1816) pointer that is owned by the caller.*

  Exceptions

IOException	*if the **ServerSocket** (p. 1816) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** ∗ **createServerSocket** (int port)

  *Create a new **ServerSocket** (p. 1816) that is bound to the given port.*
  *The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.*

  Parameters

port	*The port to bind the **ServerSocket** (p. 1816) to.*

  Returns

  *new **ServerSocket** (p. 1816) pointer that is owned by the caller.*

  Exceptions

IOException	*if the **ServerSocket** (p. 1816) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** ∗ **createServerSocket** (int port, int backlog)

  *Create a new **ServerSocket** (p. 1816) that is bound to the given port.*
  *The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will use the specified connection backlog setting.*

  Parameters

port	*The port to bind the **ServerSocket** (p. 1816) to.*
backlog	*The number of pending connect request the **ServerSocket** (p. 1816) can queue.*

  Returns

  *new **ServerSocket** (p. 1816) pointer that is owned by the caller.*

  Exceptions

IOException	*if the **ServerSocket** (p. 1816) cannot be created for some reason.*

- virtual **decaf::net::ServerSocket** ∗ **createServerSocket** (int port, int backlog, **const decaf::net::InetAddress** ∗address)

  *Create a new **ServerSocket** (p. 1816) that is bound to the given port.*
  *The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 1816) will listen on all interfaces.*

  Parameters

port	*The port to bind the **ServerSocket** (p. 1816) to.*
backlog	*The number of pending connect request the **ServerSocket** (p. 1816) can queue.*
address	*The address of the interface on the local machine to bind to.*

  Returns

  *new **ServerSocket** (p. 1816) pointer that is owned by the caller.*

Exceptions

IOException	*if the **ServerSocket** (p. 1816) cannot be created for some reason.*

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

  Returns the list of cipher suites which are enabled by default.
  Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

  Returns

  an STL vector containing the list of cipher suites enabled by default.

  See also

  getSupportedCipherSuites() (p. 1947)

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

  Returns the names of the cipher suites which could be enabled for use on an SSL connection.
  Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

  Returns

  an STL vector containing the list of supported cipher suites.

  See also

  getDefaultCipherSuites() (p. 1947)

6.383.1 Detailed Description

SSLServerSocketFactory that creates Server Sockets that use OpenSSL.

Since

1.0

6.383.2 Constructor & Destructor Documentation

6.383.2.1 decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::OpenSSLServerSocketFactory (OpenSSLContextSpi * *parent*)

6.383.3 Member Function Documentation

6.383.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket ( ) [virtual]

Create a new **ServerSocket** (p. 1816) that is unbound.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 1824).

6.383.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1824).

6.383.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port,* int *backlog*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will use the specified connection backlog setting.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

6.383.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::createServerSocket (int *port,* int *backlog,* const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 1816) will listen on all interfaces.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

address	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

6.383.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getDefaultCipherSuites ( ) [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1947)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 1947).

6.383.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory::getSupportedCipherSuites ( ) [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

getDefaultCipherSuites() (p. 1947)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 1947).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLServerSocketFactory.h**

6.384 decaf::internal::net::ssl::openssl::OpenSSLSocket Class Reference

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocket.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocket:

Public Member Functions

- **OpenSSLSocket** (**OpenSSLParameters** ∗parameters)
- **OpenSSLSocket** (**OpenSSLParameters** ∗parameters, **const decaf::net::InetAddress** ∗address, int port)
- **OpenSSLSocket** (**OpenSSLParameters** ∗parameters, **const decaf::net::InetAddress** ∗address, int port, **const decaf::net::InetAddress** ∗localAddress, int localPort)
- **OpenSSLSocket** (**OpenSSLParameters** ∗parameters, **const** std::string &host, int port)
- **OpenSSLSocket** (**OpenSSLParameters** ∗parameters, **const** std::string &host, int port, **const decaf::net::-InetAddress** ∗localAddress, int localPort)
- virtual ∼**OpenSSLSocket** ()
- virtual void **connect** (**const** std::string &host, int port, int timeout)

  Connects to the specified destination, with a specified timeout value.
  *If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeout-Exception** (p. 1932) is thrown. A timeout value of zero is treated as an inifinite timeout.*

  Parameters

host	*The host name or IP address of the remote host to connect to.*
port	*The port on the remote host to connect to.*
timeout	*The number of Milliseconds to wait before treating the connection as failed.*

  Exceptions

IOException	*Thrown if a failure occurred in the connect.*
SocketTimeoutException (p. 1932)	*if the timeout for connection is exceeded.*
IllegalArguementException	*if the timeout value is negative or the endpoint is invalid.*

- virtual void **close** ()

  *Closes the **Socket** (p. 1900).*
  *Once closed a **Socket** (p. 1900) cannot be connected or otherwise operated upon, a new **Socket** (p. 1900) instance must be created.*

  Exceptions

IOException	*if an I/O error occurs while closing the **Socket** (p. 1900).*

- virtual **decaf::io::InputStream** ∗ **getInputStream** ()

  Gets the InputStream for this socket if its connected.
  *The pointer returned is the property of the associated **Socket** (p. 1900) and should not be deleted by the caller.*
  When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.
  *Closing the InputStream will also close the underlying **Socket** (p. 1900).*

  Returns

  The InputStream for this socket.

  Exceptions

IOException	*if an error occurs during creation of the InputStream, also if the **Socket** (p. 1900) is not connected or the input has been shutdown previously.*

- virtual **decaf::io::OutputStream** ∗ **getOutputStream** ()

  Gets the OutputStream for this socket if it is connected.

*The pointer returned is the property of the **Socket** (p. 1900) instance and should not be deleted by the caller.*
*Closing the returned **Socket** (p. 1900) will also close the underlying **Socket** (p. 1900).*

Returns

the OutputStream for this socket.

Exceptions

IOException	*if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 1900) is closed or the output has been shutdown previously.*

- virtual void **shutdownInput** ()

  Shuts down the InputStream for this socket essentially marking it as EOF.
  The stream returns EOF for any calls to read after this method has been called.

  Exceptions

IOException	*if an I/O error occurs while performing this operation.*

- virtual void **shutdownOutput** ()

  Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

  Exceptions

IOException	*if an I/O error occurs while performing this operation.*

- virtual void **setOOBInline** (bool value)

  Sets the value of the OOBINLINE for this socket, by default this option is disabled.
  *If enabled the urgent data is read inline on the **Socket** (p. 1900)'s InputStream, no notification is give.*

  Returns

  true if OOBINLINE is enabled, false otherwise.

  Exceptions

SocketException (p. 1915)	*if an error is encountered while performing this operation.*

- virtual void **sendUrgentData** (int data)

  *Sends on byte of urgent data to the **Socket** (p. 1900).*

  Parameters

data	*The value to write as urgent data, only the lower eight bits are sent.*

  Exceptions

IOException	*if an I/O error occurs while performing this operation.*

- virtual std::vector< std::string > **getSupportedCipherSuites** () **const**

  *Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 1947).*
  *Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).*

  Returns

  a vector containing the names of all the supported cipher suites.

- virtual std::vector< std::string > **getSupportedProtocols** () **const**

  *Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 1947) instance.*

  Returns

  a vector containing the names of all the supported protocols.

- virtual std::vector< std::string > **getEnabledCipherSuites** () **const**

  *Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 1900).*

  Returns

  vector of the names of all enabled Cipher Suites.

- virtual void **setEnabledCipherSuites** (**const** std::vector< std::string > &suites)

  *Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 1900) connection.*
  Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites	*An Vector of names for all the Cipher Suites that are to be enabled.*

Exceptions

IllegalArgumentException	*if the vector is empty or one of the names is invalid.*

- virtual std::vector< std::string > **getEnabledProtocols** () **const**

  *Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 1900).*

  Returns

  vector of the names of all enabled Protocols.

- virtual void **setEnabledProtocols** (**const** std::vector< std::string > &protocols)

  *Sets the Protocols that are to be enabled on the SSL **Socket** (p. 1900) connection.*
  Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

  Parameters

protocols	*An Vector of names for all the Protocols that are to be enabled.*

  Exceptions

IllegalArgumentException	*if the vector is empty or one of the names is invalid.*

- virtual void **startHandshake** ()

  Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.
  When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

  Exceptions

IOException	*if an I/O error occurs while performing the Handshake*

- virtual void **setUseClientMode** (bool value)

  Determines the mode that the socket uses when a handshake is initiated, client or server.
  *This method must be called prior to any handshake attempts on this **Socket** (p. 1900), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.*

  Parameters

value	*The mode setting, true for client or false for server.*

  Exceptions

IllegalArguementException	*if the handshake process has begun and mode is lcoked.*

- virtual bool **getUseClientMode** () **const**

  *Gets whether this **Socket** (p. 1900) is in Client or Server mode, true indicates that the mode is set to Client.*

  Returns

  *true if the **Socket** (p. 1900) is in Client mode, false otherwise.*

- virtual void **setNeedClientAuth** (bool value)

  *Sets the **Socket** (p. 1900) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
  This option only applies to sockets in the Server mode.
  If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

  Parameters

value	*The value indicating if a client is required to authenticate itself or not.*

- virtual bool **getNeedClientAuth** () **const**

  Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.
  This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

- virtual void **setWantClientAuth** (bool value)

  *Sets the **Socket** (p. 1900) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
  This option only applies to sockets in the Server mode.
  If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

  Parameters

value	*The value indicating if a client is requested to authenticate itself or not.*

- virtual bool **getWantClientAuth** () **const**

  Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.
  This option is only useful when the socket is operating in server mode.

  Returns

  true if client authentication is required.

- int **read** (unsigned char ∗buffer, int size, int offset, int length)

  Reads the requested data from the Socket and write it into the passed in buffer.

- void **write** (**const** unsigned char ∗buffer, int size, int offset, int length)

  Writes the specified data in the passed in buffer to the Socket.

- int **available** ()

  Gets the number of bytes in the Socket buffer that can be read without blocking.

6.384.1 Detailed Description

Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.

Since

1.0

6.384.2 Constructor & Destructor Documentation

6.384.2.6 virtual decaf::internal::net::ssl::openssl::OpenSSLSocket::∼OpenSSLSocket ( ) [virtual]

6.384.3 Member Function Documentation

6.384.3.1 int decaf::internal::net::ssl::openssl::OpenSSLSocket::available ( )

Gets the number of bytes in the Socket buffer that can be read without blocking.

Returns

the number of bytes that can be read from the Socket without blocking.

Exceptions

IOException	if an I/O error occurs while performing this operation.

6.384.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::close ( ) [virtual]

Closes the **Socket** (p. 1900).

Once closed a **Socket** (p. 1900) cannot be connected or otherwise operated upon, a new **Socket** (p. 1900) instance must be created.

Exceptions

IOException	if an I/O error occurs while closing the **Socket** (p. 1900).

Reimplemented from **decaf::net::Socket** (p. 1905).

6.384.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::connect (const std::string & *host,* int *port,* int *timeout*) [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 1932) is thrown. A timeout value of zero is treated as an inifinite timeout.

Parameters

host	The host name or IP address of the remote host to connect to.
port	The port on the remote host to connect to.
timeout	The number of Milliseconds to wait before treating the connection as failed.

Exceptions

IOException	Thrown if a failure occurred in the connect.
SocketTimeoutException *(p. 1932)*	if the timeout for connection is exceeded.
IllegalArguementException	if the timeout value is negative or the endpoint is invalid.

Reimplemented from **decaf::net::Socket** (p. 1905).

6.384.3.4 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledCipherSuites ( ) const [virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 1900).

Returns

vector of the names of all enabled Cipher Suites.

Implements **decaf::net::ssl::SSLSocket** (p. 1950).

6.384.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getEnabledProtocols ( ) const [virtual]

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 1900).

Returns

vector of the names of all enabled Protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 1950).

6.384.3.6 virtual decaf::io::InputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getInputStream ( ) [virtual]

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 1900) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 1900).

Returns

The InputStream for this socket.

Exceptions

IOException	if an error occurs during creation of the InputStream, also if the **Socket** (p. 1900) is not connected or the input has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 1906).

6.384.3.7 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getNeedClientAuth ( ) const [virtual]

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 1951).

6.384.3.8 virtual decaf::io::OutputStream* decaf::internal::net::ssl::openssl::OpenSSLSocket::getOutputStream ( ) [virtual]

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 1900) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 1900) will also close the underlying **Socket** (p. 1900).

Returns

the OutputStream for this socket.

Exceptions

IOException	if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 1900) is closed or the output has been shutdown previously.

Reimplemented from **decaf::net::Socket** (p. 1907).

6.384.3.9 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedCipherSuites ( ) const [virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 1947).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).

Returns

a vector containing the names of all the supported cipher suites.

Implements **decaf::net::ssl::SSLSocket** (p. 1951).

6.384.3.10 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocket::getSupportedProtocols ( ) const [virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 1947) instance.

Returns

a vector containing the names of all the supported protocols.

Implements **decaf::net::ssl::SSLSocket** (p. 1951).

6.384.3.11 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getUseClientMode ( ) const [virtual]

Gets whether this **Socket** (p. 1900) is in Client or Server mode, true indicates that the mode is set to Client.

Returns

true if the **Socket** (p. 1900) is in Client mode, false otherwise.

Implements **decaf::net::ssl::SSLSocket** (p. 1951).

6.384.3.12 virtual bool decaf::internal::net::ssl::openssl::OpenSSLSocket::getWantClientAuth ( ) const [virtual]

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implements **decaf::net::ssl::SSLSocket** (p. 1952).

6.384.3.13 int decaf::internal::net::ssl::openssl::OpenSSLSocket::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters

buffer	The buffer to read into
size	The size of the specified buffer
offset	The offset into the buffer where reading should start filling.
length	The number of bytes past offset to fill with data.

Returns

the actual number of bytes read or -1 if at EOF.

Exceptions

IOException	if an I/O error occurs during the read.
NullPointerException	if buffer is Null.
IndexOutOfBounds-Exception	if offset + length is greater than buffer size.

6.384.3.14 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 1900).

Parameters

data	The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 1910).

6.384.3.15 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [virtual]

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 1900) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites	An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 1952).

6.384.3.16 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [virtual]

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 1900) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols	An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implements **decaf::net::ssl::SSLSocket** (p. 1952).

6.384.3.17 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setNeedClientAuth (bool *value*) [virtual]

Sets the **Socket** (p. 1900) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters

value	The value indicating if a client is required to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 1952).

6.384.3.18 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setOOBInline (bool *value*) [virtual]

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the **Socket** (p. 1900)'s InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException *(p. 1915)*	if an error is encountered while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 1910).

6.384.3.19 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setUseClientMode (bool *value*) [virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 1900), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.

Parameters

value	The mode setting, true for client or false for server.

Exceptions

IllegalArguementException	if the handshake process has begun and mode is lcoked.

Implements **decaf::net::ssl::SSLSocket** (p. 1953).

6.384.3.20 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::setWantClientAuth (bool *value*) [virtual]

Sets the **Socket** (p. 1900) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters

value	The value indicating if a client is requested to authenticate itself or not.

Implements **decaf::net::ssl::SSLSocket** (p. 1953).

6.384.3.21 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownInput ( ) [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 1913).

6.384.3.22 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::shutdownOutput ( ) [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented from **decaf::net::Socket** (p. 1913).

6.384.3.23 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocket::startHandshake ( ) [virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

Exceptions

IOException	if an I/O error occurs while performing the Handshake

Implements **decaf::net::ssl::SSLSocket** (p. 1954).

6.384.3.24 void decaf::internal::net::ssl::openssl::OpenSSLSocket::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Writes the specified data in the passed in buffer to the Socket.

Parameters

buffer	The buffer to write to the socket.
size	The size of the specified buffer.
offset	The offset into the buffer where the data to write starts at.
length	The number of bytes past offset to write.

Exceptions

IOException	if an I/O error occurs during the write.
NullPointerException	if buffer is Null.
IndexOutOfBounds-Exception	if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocket.h**

6.385 decaf::internal::net::ssl::openssl::OpenSSLSocketException Class Reference

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketException.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketException:

Public Member Functions

- **OpenSSLSocketException** () throw ()

  *Creates an new **OpenSSLSocketException** (p. 1571) with default values.*
- **OpenSSLSocketException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **OpenSSLSocketException** (**const OpenSSLSocketException** &ex) throw ()

Copy Constructor.

- **OpenSSLSocketException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  *Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.*
- **OpenSSLSocketException** (**const** std::exception ∗**cause**) throw ()

  *Creates a new **OpenSSLSocketException** (p. 1571) with the passed exception set as the cause of this exception.*
- **OpenSSLSocketException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  *Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.*
- **OpenSSLSocketException** (**const** char ∗file, **const** int lineNumber) throw ()

  *Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.*
- virtual **OpenSSLSocketException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**OpenSSLSocketException** () throw ()

Protected Member Functions

- std::string **getErrorString** () **const**

  Gets and formats an error message string from the OpenSSL error stack.

6.385.1 Detailed Description

Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.

Since

1.0

6.385.2 Constructor & Destructor Documentation

6.385.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException ( ) throw ()

Creates an new **OpenSSLSocketException** (p. 1571) with default values.

6.385.2.2 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const Exception & *ex*) throw ()

Conversion Constructor from some other Exception.

Parameters

ex	An Exception object that should become this type of Exception.

6.385.2.3 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const OpenSSLSocketException & *ex*) throw ()

Copy Constructor.

Parameters

ex	The **OpenSSLSocketException** (p. 1571) whose values should be copied to this instance.

6.385.2.4 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw ()

Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown (can be null).
msg	The error message to report.
...	The list of primitives that are formatted into the message.

6.385.2.5 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const std::exception * *cause*) throw ()

Creates a new **OpenSSLSocketException** (p. 1571) with the passed exception set as the cause of this exception.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.385.2.6 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()

Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

file	The file name where exception occurs.
lineNumber	The line number where the exception occurred.
msg	The error message to report.
...	The list of primitives that are formatted into the message

6.385.2.7 decaf::internal::net::ssl::openssl::OpenSSLSocketException::OpenSSLSocketException (const char * *file*, const int *lineNumber*) throw ()

Create a new **OpenSSLSocketException** (p. 1571) and initializes the file name and line number where this message occurred.

Sets the message to report by getting the complete set of error messages from the OpenSSL error stack and concatenating them into one string.

Parameters

file	The file name where exception occurs.
lineNumber	The line number where the exception occurred.

6.385.2.8 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketException::~OpenSSLSocketException ( ) throw () [virtual]

6.385.3 Member Function Documentation

6.385.3.1 virtual OpenSSLSocketException* decaf::internal::net::ssl::openssl::OpenSSLSocketException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override this method.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 1916).

6.385.3.2 std::string decaf::internal::net::ssl::openssl::OpenSSLSocketException::getErrorString ( ) const [protected]

Gets and formats an error message string from the OpenSSL error stack.

Returns

a string containing the complete OpenSSL error string.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketException.h**

6.386 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory Class Reference

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketFactory.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketFactory:

Public Member Functions

- **OpenSSLSocketFactory** (**OpenSSLContextSpi** *parent)
- virtual ~**OpenSSLSocketFactory** ()
- virtual **decaf::net::Socket** * **createSocket** ()

  *Creates an unconnected **Socket** (p. 1900) object.*

  Returns

  *a new **Socket** (p. 1900) object, caller must free this object when done.*

Exceptions

IOException	*if the **Socket** (p. 1900) cannot be created.*

- virtual **decaf::net::Socket** * **createSocket** (**const decaf::net::InetAddress** *host, int port)

  *Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).*

  Parameters

host	*The host to connect the socket to.*
port	*The port on the remote host to connect to.*

  Returns

  *a new **Socket** (p. 1900) object, caller must free this object when done.*

  Exceptions

IOException	*if an I/O error occurs while creating the **Socket** (p. 1900) object.*
UnknownHostException (p. 2181)	*if the host name is not known.*

- virtual **decaf::net::Socket** * **createSocket** (**const decaf::net::InetAddress** *host, int port, **const decaf::net::InetAddress** *ifAddress, int localPort)

  *Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).*
  *The **Socket** (p. 1900) will be bound to the specified local address and port.*

  Parameters

host	*The host to connect the socket to.*
port	*The port on the remote host to connect to.*
ifAddress	*The address on the local machine to bind the **Socket** (p. 1900) to.*
localPort	*The local port to bind the **Socket** (p. 1900) to.*

  Returns

  *a new **Socket** (p. 1900) object, caller must free this object when done.*

  Exceptions

IOException	*if an I/O error occurs while creating the **Socket** (p. 1900) object.*
UnknownHostException (p. 2181)	*if the host name is not known.*

- virtual **decaf::net::Socket** * **createSocket** (**const** std::string &hostname, int port)

  *Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).*

  Parameters

host	*The host name or IP address to connect the socket to.*
port	*The port on the remote host to connect to.*

  Returns

  *a new **Socket** (p. 1900) object, caller must free this object when done.*

  Exceptions

IOException	*if an I/O error occurs while creating the **Socket** (p. 1900) object.*
UnknownHostException (p. 2181)	*if the host name is not known.*

- virtual **decaf::net::Socket** * **createSocket** (**const** std::string &name, int port, **const decaf::net::InetAddress** *ifAddress, int localPort)

  *Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).*

  Parameters

host	*The host name or IP address to connect the socket to.*
port	*The port on the remote host to connect to.*
ifAddress	*The address on the local machine to bind the **Socket** (p. 1900) to.*

localPort	*The local port to bind the **Socket** (p. 1900) to.*

Returns

*a new **Socket** (p. 1900) object, caller must free this object when done.*

Exceptions

IOException	*if an I/O error occurs while creating the **Socket** (p. 1900) object.*
UnknownHostException (p. 2181)	*if the host name is not known.*

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

  Returns the list of cipher suites which are enabled by default.
  Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

  Returns

  an STL vector containing the list of cipher suites enabled by default.

  See also

  ***getSupportedCipherSuites()** (p. 1956)*

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

  Returns the names of the cipher suites which could be enabled for use on an SSL connection.
  Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

  Returns

  an STL vector containing the list of supported cipher suites.

  See also

  ***getDefaultCipherSuites()** (p. 1956)*

- virtual **decaf::net::Socket** * **createSocket** (**decaf::net::Socket** *socket, std::string host, int port, bool autoClose)

  Returns a socket layered over an existing socket connected to the named host, at the given port.
  This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

  Parameters

socket	*The existing socket to layer over.*
host	*The server host the original **Socket** (p. 1900) is connected to.*
port	*The server port the original **Socket** (p. 1900) is connected to.*
autoClose	*Should the layered over **Socket** (p. 1900) be closed when the topmost socket is closed.*

  Returns

  *a new **Socket** (p. 1900) instance that wraps the given **Socket** (p. 1900).*

  Exceptions

IOException	*if an I/O exception occurs while performing this operation.*
UnknownHostException (p. 2181)	*if the host is unknown.*

6.386.1 Detailed Description

Client Socket Factory that creates SSL based client sockets using the OpenSSL library.

Since

1.0

6.386.2 Constructor & Destructor Documentation

6.386.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::OpenSSLSocketFactory (OpenSSLContextSpi * *parent*)

6.386.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::~OpenSSLSocketFactory ( ) [virtual]

6.386.3 Member Function Documentation

6.386.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket ( ) [virtual]

Creates an unconnected **Socket** (p. 1900) object.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if the **Socket** (p. 1900) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 1917).

6.386.3.2 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.386.3.3 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

The **Socket** (p. 1900) will be bound to the specified local address and port.

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.386.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const std::string & *hostname,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

6.386.3.5 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (const std::string & *name,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

6.386.3.6 virtual decaf::net::Socket* decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::createSocket (decaf::net::Socket * *socket*, std::string *host*, int *port*, bool *autoClose*) [virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket	The existing socket to layer over.
host	The server host the original **Socket** (p. 1900) is connected to.
port	The server port the original **Socket** (p. 1900) is connected to.
autoClose	Should the layered over **Socket** (p. 1900) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 1900) instance that wraps the given **Socket** (p. 1900).

Exceptions

IOException	if an I/O exception occurs while performing this operation.
UnknownHostException *(p. 2181)*	if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 1955).

6.386.3.7 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getDefaultCipherSuites ( ) [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1956)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 1956).

6.386.3.8 virtual std::vector<std::string> decaf::internal::net::ssl::openssl::OpenSSLSocketFactory::getSupportedCipherSuites ( ) [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 1956)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 1956).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketFactory.h**

6.387 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream Class Reference

An output stream for reading data from an OpenSSL Socket instance.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketInputStream.h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream:

Public Member Functions

- **OpenSSLSocketInputStream** (**OpenSSLSocket** *socket)
- virtual ~**OpenSSLSocketInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  Close - does nothing.

- virtual long long **skip** (long long num)

  Not supported.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.387.1 Detailed Description

An output stream for reading data from an OpenSSL Socket instance.

Since

1.0

6.387.2 Constructor & Destructor Documentation

6.387.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::OpenSSLSocketInputStream (OpenSSLSocket * *socket*)

6.387.2.2 virtual decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::~OpenSSLSocketInputStream ( ) [virtual]

6.387.3 Member Function Documentation

6.387.3.1 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.387.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::close ( ) [virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.387.3.3 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.387.3.4 virtual int decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

6.387.3.5 virtual long long decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream::skip (long long *num*) [virtual]

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1140).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketInputStream.h**

6.388 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream Class Reference

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 1560) instance.

`#include <src/main/decaf/internal/net/ssl/openssl/OpenSSLSocketOutputStream.-h>`

Inheritance diagram for decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream:

Public Member Functions

- **OpenSSLSocketOutputStream** (**OpenSSLSocket** ∗socket)
- virtual ∼**OpenSSLSocketOutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

  Exceptions

IOException (p. 1198)	*if an error occurs while closing.*

  The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c)
- virtual void **doWriteArrayBounded** (**const** unsigned char ∗buffer, int size, int offset, int length)

6.388.1 Detailed Description

OutputStream implementation used to write data to an **OpenSSLSocket** (p. 1560) instance.

Since

1.0

6.388.2 Constructor & Destructor Documentation

6.388.2.1 decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::OpenSSLSocketOutputStream (OpenSSLSocket ∗ *socket*)

6.388.3 Member Function Documentation

6.388.3.1 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.388.3.2 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.388.3.3 virtual void decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream::doWriteByte (unsigned char *c*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 1602).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/ssl/openssl/**OpenSSLSocketOutputStream.h**

6.389 activemq::wireformat::openwire::OpenWireFormat Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormat.h>`

Inheritance diagram for activemq::wireformat::openwire::OpenWireFormat:

Public Member Functions

- **OpenWireFormat** (**const decaf::util::Properties** &properties)

  *Constructs a new **OpenWireFormat** (p. 1584) object.*
- virtual ~**OpenWireFormat** ()
- virtual bool **hasNegotiator** () **const**

  *Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.*

  Returns

  *true if the **WireFormat** (p. 2236) provides a Negotiator.*
- virtual **Pointer** < **transport::Transport** > **createNegotiator** (**const Pointer**< **transport::Transport** > &transport)

  If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

  Parameters

transport	*The Transport to Wrap the Negotiator around.*

  Returns

  *new instance of a **WireFormatNegotiator** (p. 2251) as a **Pointer**<**Transport**> (p. 1614).*

  Exceptions

UnsupportedOperation-Exception	*if the **WireFormat** (p. 2236) doesn't have a Negotiator.*

- void **addMarshaller** (**marshal::DataStreamMarshaller** *marshaler)

  Allows an external source to add marshalers to this object for types that may be marshaled or unmarhsaled.
- virtual void **marshal** (**const Pointer**< **commands::Command** > &command, **const activemq::transport-::Transport** *transport, **decaf::io::DataOutputStream** *out)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

  Parameters

command	*The Command to Marshal*
transport	*The Transport that called this method.*
out	*The output stream to write the command to.*

Exceptions

IOException	*if an I/O error occurs.*

- virtual **Pointer**
  < **commands::Command** > **unmarshal** (**const activemq::transport::Transport** *transport, **decaf::io::-DataInputStream** *in)

  Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
  Returns a Pointer to the newly unmarshaled Command.

  Parameters

transport	*Pointer to the transport that is making this request.*
in	*The input stream to read the command from.*

  Returns

  the newly marshaled Command, caller owns the pointer

  Exceptions

IOException	*if an I/O error occurs.*

- virtual int **tightMarshalNestedObject1** (**commands::DataStructure** *object, **utils::BooleanStream** *bs)

  Utility method for Tight Marshaling the given object to the boolean stream passed.
- void **tightMarshalNestedObject2** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *ds, **utils::BooleanStream** *bs)

  Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.
- **commands::DataStructure** * **tightUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis, **utils::-BooleanStream** *bs)

  Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.
- **commands::DataStructure** * **looseUnmarshalNestedObject** (**decaf::io::DataInputStream** *dis)

  Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.
- void **looseMarshalNestedObject** (**commands::DataStructure** *o, **decaf::io::DataOutputStream** *data-Out)

  Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.
- void **renegotiateWireFormat** (**const commands::WireFormatInfo** &info)

  Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.
- void **setPreferedWireFormatInfo** (**const Pointer**< **commands::WireFormatInfo** > &info)

  Configures this object using the provided WireformatInfo object.
- **const Pointer**
  < **commands::WireFormatInfo** > & **getPreferedWireFormatInfo** () **const**

  Gets the Preferred WireFormatInfo object that this class holds.
- bool **isStackTraceEnabled** () **const**

  Checks if the stackTraceEnabled flag is on.
- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.
- bool **isTcpNoDelayEnabled** () **const**

  Checks if the tcpNoDelayEnabled flag is on.
- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

  Sets if the tcpNoDelayEnabled flag is on.
- int **getVersion** () **const**

  Get the current Wireformat Version.
- void **setVersion** (int version)

  Set the current Wireformat Version.
- virtual bool **inReceive** () **const**

  Is there a Message being unmarshaled?
- bool **isCacheEnabled** () **const**

Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)

  Sets if the cacheEnabled flag is on.

- int **getCacheSize** () **const**

  Returns the currently set Cache size.

- void **setCacheSize** (int value)

  Sets the current Cache size.

- bool **isTightEncodingEnabled** () **const**

  Checks if the tightEncodingEnabled flag is on.

- void **setTightEncodingEnabled** (bool tightEncodingEnabled)

  Sets if the tightEncodingEnabled flag is on.

- bool **isSizePrefixDisabled** () **const**

  Checks if the sizePrefixDisabled flag is on.

- void **setSizePrefixDisabled** (bool sizePrefixDisabled)

  Sets if the sizePrefixDisabled flag is on.

- long long **getMaxInactivityDuration** () **const**

  Gets the MaxInactivityDuration setting.

- void **setMaxInactivityDuration** (long long value)

  Sets the MaxInactivityDuration setting.

- long long **getMaxInactivityDurationInitialDelay** () **const**

  Gets the MaxInactivityDurationInitialDelay setting.

- void **setMaxInactivityDurationInitialDelay** (long long value)

  Sets the MaxInactivityDurationInitialDelay setting.

Protected Member Functions

- **commands::DataStructure** ∗ **doUnmarshal** (**decaf::io::DataInputStream** ∗dis)

  Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

- void **destroyMarshalers** ()

  Cleans up all registered Marshallers and empties the dataMarshallers vector.

Static Protected Attributes

- static **const** unsigned char **NULL_TYPE**
- static **const** int **DEFAULT_VERSION**
- static **const** int **MAX_SUPPORTED_VERSION**

6.389.1 Constructor & Destructor Documentation

6.389.1.1 activemq::wireformat::openwire::OpenWireFormat::OpenWireFormat (const decaf::util::Properties & *properties*)

Constructs a new **OpenWireFormat** (p. 1584) object.

Parameters

properties	- can contain optional config params.

6.389.1.2 virtual activemq::wireformat::openwire::OpenWireFormat::∼OpenWireFormat ( ) [virtual]

6.389.2 Member Function Documentation

6.389.2.1 void activemq::wireformat::openwire::OpenWireFormat::addMarshaller (marshal::DataStreamMarshaller * *marshaler*)

Allows an external source to add marshalers to this object for types that may be marshaled or unmarhsaled.

Parameters

marshaler	- the Marshaler to add to the collection.

6.389.2.2 virtual Pointer<transport::Transport> activemq::wireformat::openwire::OpenWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) [virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters

transport	The Transport to Wrap the Negotiator around.

Returns

new instance of a **WireFormatNegotiator** (p. 2251) as a **Pointer**<**Transport**> (p. 1614).

Exceptions

UnsupportedOperationException	if the **WireFormat** (p. 2236) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.389.2.3 void activemq::wireformat::openwire::OpenWireFormat::destroyMarshalers ( ) [protected]

Cleans up all registered Marshallers and empties the dataMarshallers vector.

This should be called before a reconfiguration of the version marshallers, or on destruction of this object

6.389.2.4 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::doUnmarshal (decaf::io::DataInputStream * *dis*) [protected]

Perform the actual unmarshal of data from the given DataInputStream return the unmarshalled DataStrucutre object once done, caller takes ownership of this object.

This method can return null if the type of the object to unmarshal is NULL, empty data.

Parameters

dis	The DataInputStream to read from.

Returns

new DataStructure* that the caller owns.

Exceptions

IOException	if an error occurs during the unmarshal.

6.389.2.5 int activemq::wireformat::openwire::OpenWireFormat::getCacheSize ( ) const [inline]

Returns the currently set Cache size.

Returns

the current value of the broker's cache size.

6.389.2.6 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDuration ( ) const [inline]

Gets the MaxInactivityDuration setting.

Returns

maximum inactivity duration value in milliseconds.

6.389.2.7 long long activemq::wireformat::openwire::OpenWireFormat::getMaxInactivityDurationInitialDelay ( ) const [inline]

Gets the MaxInactivityDurationInitialDelay setting.

Returns

maximum inactivity duration initial delay value in milliseconds.

6.389.2.8 const Pointer<commands::WireFormatInfo>& activemq::wireformat::openwire::OpenWireFormat::getPreferedWireFormatInfo ( ) const [inline]

Gets the Preferred WireFormatInfo object that this class holds.

Returns

pointer to a preferred WireFormatInfo object

6.389.2.9 int activemq::wireformat::openwire::OpenWireFormat::getVersion ( ) const [inline, virtual]

Get the current Wireformat Version.

Returns

int that identifies the version

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.389.2.10 virtual bool activemq::wireformat::openwire::OpenWireFormat::hasNegotiator ( ) const [inline, virtual]

Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 2236) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.389.2.11 virtual bool activemq::wireformat::openwire::OpenWireFormat::inReceive ( ) const [inline, virtual]

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.389.2.12 bool activemq::wireformat::openwire::OpenWireFormat::isCacheEnabled ( ) const [inline]

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.389.2.13 bool activemq::wireformat::openwire::OpenWireFormat::isSizePrefixDisabled ( ) const [inline]

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.389.2.14 bool activemq::wireformat::openwire::OpenWireFormat::isStackTraceEnabled ( ) const [inline]

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.389.2.15 bool activemq::wireformat::openwire::OpenWireFormat::isTcpNoDelayEnabled ( ) const [inline]

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.389.2.16 bool activemq::wireformat::openwire::OpenWireFormat::isTightEncodingEnabled ( ) const [inline]

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.389.2.17 void activemq::wireformat::openwire::OpenWireFormat::looseMarshalNestedObject (commands::DataStructure * *o*, decaf::io::DataOutputStream * *dataOut*)

Utility method to loosely Marshal an object that is derived from the DataStrucutre interface.

The marshaled data is written to the passed in DataOutputStream.

Parameters

o	- DataStructure derived Object to Marshal
dataOut	- DataOutputStream to write the data to

Exceptions

IOException	if an error occurs.

6.389.2.18 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::looseUnmarshalNestedObject (decaf::io::DataInputStream * *dis*)

Utility method to unmarshal an DataStructure object from an DataInputStream using the Loose Unmarshaling format.

Will read the Data and construct a new DataStructure based Object, the pointer to the Object returned is now owned by the caller.

Parameters

dis	- the DataInputStream to read the data from

Returns

a new DataStructure derived Object pointer

Exceptions

IOException	if an error occurs.

6.389.2.19 virtual void activemq::wireformat::openwire::OpenWireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command	The Command to Marshal
transport	The Transport that called this method.
out	The output stream to write the command to.

Exceptions

IOException	if an I/O error occurs.

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.389.2.20 void activemq::wireformat::openwire::OpenWireFormat::renegotiateWireFormat (const commands::WireFormatInfo & *info*)

Called to re-negotiate the settings for the WireFormatInfo, these determine how the client and broker communicate.

Parameters

info	The new Wireformat Info settings.

Exceptions

IllegalStateException	is wire format can't be negotiated.

6.389.2.21 void activemq::wireformat::openwire::OpenWireFormat::setCacheEnabled (bool *cacheEnabled*) [inline]

Sets if the cacheEnabled flag is on.

Parameters

cacheEnabled	- true to turn flag is on

6.389.2.22 void activemq::wireformat::openwire::OpenWireFormat::setCacheSize (int *value*) [inline]

Sets the current Cache size.

Parameters

value	- the value to send as the broker's cache size.

6.389.2.23 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDuration (long long *value*) [inline]

Sets the MaxInactivityDuration setting.

Parameters

value	- the Max inactivity duration value in milliseconds.

6.389.2.24 void activemq::wireformat::openwire::OpenWireFormat::setMaxInactivityDurationInitialDelay (long long *value*) [inline]

Sets the MaxInactivityDurationInitialDelay setting.

Parameters

value	- the Max inactivity Initial Delay duration value in milliseconds.

6.389.2.25 void activemq::wireformat::openwire::OpenWireFormat::setPreferedWireFormatInfo (const Pointer< commands::WireFormatInfo > & *info*)

Configures this object using the provided WireformatInfo object.

Parameters

info	A WireFormatInfo object, takes ownership.

Exceptions

IllegalStateException	if the **WireFormat** (p. 2236) object has not been initialized.

6.389.2.26 void activemq::wireformat::openwire::OpenWireFormat::setSizePrefixDisabled (bool *sizePrefixDisabled*) [inline]

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefix-Disabled	- true to turn flag is on

6.389.2.27 void activemq::wireformat::openwire::OpenWireFormat::setStackTraceEnabled (bool *stackTraceEnabled*) [inline]

Sets if the stackTraceEnabled flag is on.

Parameters

stackTrace-Enabled	- true to turn flag is on

6.389.2.28 void activemq::wireformat::openwire::OpenWireFormat::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*) [inline]

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelay-Enabled	- true to turn flag is on

6.389.2.29 void activemq::wireformat::openwire::OpenWireFormat::setTightEncodingEnabled (bool *tightEncodingEnabled*) [inline]

Sets if the tightEncodingEnabled flag is on.

Parameters

tightEncoding-Enabled	- true to turn flag is on

6.389.2.30 void activemq::wireformat::openwire::OpenWireFormat::setVersion (int *version*) [virtual]

Set the current Wireformat Version.

Parameters

version	An int that identifies the version

Exceptions

IllegalArgumentException	if the version given is not supported.

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.389.2.31 virtual int activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject1 (commands::DataStructure * *object,* utils::BooleanStream * *bs*) [virtual]

Utility method for Tight Marshaling the given object to the boolean stream passed.

Parameters

object	- The DataStructure to marshal
bs	- the BooleanStream to write to

Returns

size of the data returned.

6.389.2.32 void activemq::wireformat::openwire::OpenWireFormat::tightMarshalNestedObject2 (commands::DataStructure * *o,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*)

Utility method that will Tight marshal some internally nested object that implements the DataStructure interface.

Writes the data to the Data Output Stream provided.

Parameters

o	- DataStructure object
ds	- DataOuputStream for writing
bs	- BooleanStream

Exceptions

IOException	if an error occurs.

6.389.2.33 commands::DataStructure* activemq::wireformat::openwire::OpenWireFormat::tightUnmarshalNestedObject (decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*)

Utility method used to Unmarshal a Nested DataStructure type object from the given DataInputStream.

The DataStructure instance that is returned is now the property of the caller.

Parameters

dis	- DataInputStream to read from
bs	- BooleanStream to read from

Returns

Newly allocated DataStructure Object

Exceptions

IOException	if an error occurs.

6.389.2.34 virtual Pointer<commands::Command> activemq::wireformat::openwire::OpenWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) [virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

transport	Pointer to the transport that is making this request.
in	The input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException	if an I/O error occurs.

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.389.3 Field Documentation

6.389.3.1 const int activemq::wireformat::openwire::OpenWireFormat::DEFAULT_VERSION [static, protected]

6.390.1.2 virtual activemq::wireformat::openwire::OpenWireFormatFactory::~OpenWireFormatFactory ( ) [inline, virtual]

6.390.2 Member Function Documentation

6.390.2.1 virtual Pointer<wireformat::WireFormat> activemq::wireformat::openwire::OpenWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) [virtual]

Creates a new **WireFormat** (p. 2236) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties	The Properties for this **WireFormat** (p. 2236).

Returns

Pointer to a new instance of a **WireFormat** (p. 2236) object.

Exceptions

IllegalStateException	if the factory has not been initialized.

Implements **activemq::wireformat::WireFormatFactory** (p. 2239).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatFactory.h**

6.391 activemq::wireformat::openwire::OpenWireFormatNegotiator Class Reference

`#include <src/main/activemq/wireformat/openwire/OpenWireFormatNegotiator.h>`

Inheritance diagram for activemq::wireformat::openwire::OpenWireFormatNegotiator:

Public Member Functions

- **OpenWireFormatNegotiator** (**OpenWireFormat** *wireFormat, **const Pointer**< **transport::Transport** > &**next**)

  Constructor - Initializes this object around another Transport.
- virtual ~**OpenWireFormatNegotiator** ()
- virtual void **oneway** (**const Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends a one-way command.
- virtual **Pointer**
  < **commands::Response** > **request** (**const Pointer**< **commands::Command** > &command) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.
- virtual **Pointer**
  < **commands::Response** > **request** (**const Pointer**< **commands::Command** > &command, unsigned int timeout) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException)

  Sends the given request to the server and waits for the response.
- virtual void **onCommand** (**const Pointer**< **commands::Command** > &command)

  This is called in the context of the nested transport's reading thread.
- virtual void **onTransportException** (**transport::Transport** *source, **const decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.
- virtual void **start** () throw (decaf::io::IOException)

  Starts this transport object and creates the thread for polling on the input stream for commands.
- virtual void **close** () throw (decaf::io::IOException)

  Stops the polling thread and closes the streams.

6.391.1 Constructor & Destructor Documentation

6.391.1.1 activemq::wireformat::openwire::OpenWireFormatNegotiator::OpenWireFormatNegotiator (OpenWireFormat * *wireFormat,* const Pointer< transport::Transport > & *next*)

Constructor - Initializes this object around another Transport.

Parameters

wireFormat	- The **WireFormat** (p. 2236) object we use to negotiate
next	- The next transport in the chain

6.391.1.2 virtual activemq::wireformat::openwire::OpenWireFormatNegotiator::~OpenWireFormatNegotiator ( ) [virtual]

6.391.2 Member Function Documentation

6.391.2.1 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::close ( ) throw (decaf::io::IOException) [virtual]

Stops the polling thread and closes the streams.

This can be called explicitly, but is also called in the destructor. Once this object has been closed, it cannot be restarted.

Exceptions

IOException	if errors occur.

Reimplemented from **activemq::transport::TransportFilter** (p. 2170).

6.391.2.2 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onCommand (const Pointer< commands::Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command	the received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.391.2.3 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::oneway (const Pointer< commands::Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends a one-way command.

Does not wait for any response from the broker. First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command	the command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.391.2.4 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::onTransportException (transport::Transport * *source,* const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

source	The source of the exception
ex	The exception.

6.391.2.5 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWire-FormatNegotiator::request (const Pointer< commands::Command > & *command*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command	The request to send.

Returns

the response from the server.

Exceptions

IOException	if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

6.391.2.6 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWireFormat-Negotiator::request (const Pointer< commands::Command > & *command,* unsigned int *timeout*) throw (decaf::io::IOException, decaf::lang::exceptions::UnsupportedOperationException) [virtual]

Sends the given request to the server and waits for the response.

First waits for the WireFormatInfo exchange to happen so that we know how to encode out-bound data.

Parameters

command	The request to send.
timeout	The time to wait for the response.

Returns

the response from the server.

Exceptions

IOException	if an error occurs with the request.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

6.391.2.7 virtual void activemq::wireformat::openwire::OpenWireFormatNegotiator::start ( ) throw (decaf::io::IOException) [virtual]

Starts this transport object and creates the thread for polling on the input stream for commands.

If this object has been closed, throws an exception. Before calling start, the caller must set the IO streams and the reader and writer objects.

Exceptions

IOException	if an error occurs or if this transport has already been closed.

Reimplemented from **activemq::transport::TransportFilter** (p. 2175).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireFormatNegotiator.h**

6.392 activemq::wireformat::openwire::OpenWireResponseBuilder Class Reference

Used to allow a MockTransport to generate response commands to OpenWire Commands.

`#include <src/main/activemq/wireformat/openwire/OpenWireResponseBuilder.h>`

Inheritance diagram for activemq::wireformat::openwire::OpenWireResponseBuilder:

Public Member Functions

- **OpenWireResponseBuilder** ()
- virtual ~**OpenWireResponseBuilder** ()
- virtual **Pointer**
  < **commands::Response** > **buildResponse** (**const Pointer**< **commands::Command** > &command)

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.
- virtual void **buildIncomingCommands** (**const Pointer**< **commands::Command** > &command, **decaf-::util::LinkedList**< **Pointer**< **commands::Command** > > &queue)

  When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

6.392.1 Detailed Description

Used to allow a MockTransport to generate response commands to OpenWire Commands.

6.392.2 Constructor & Destructor Documentation

6.392.2.1 activemq::wireformat::openwire::OpenWireResponseBuilder::OpenWireResponseBuilder ( ) [inline]

6.392.2.2 virtual activemq::wireformat::openwire::OpenWireResponseBuilder::~OpenWireResponseBuilder ( ) [inline, virtual]

6.392.3 Member Function Documentation

6.392.3.1 virtual void activemq::wireformat::openwire::OpenWireResponseBuilder::buildIncoming-Commands (const Pointer< commands::Command > & *command*, decaf::util::LinkedList< Pointer< commands::Command > > & *queue*) [virtual]

When called the ResponseBuilder must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

command	- The Command being sent to the Broker.
queue	- Queue of Command sent back from the broker.

Implements **activemq::transport::mock::ResponseBuilder** (p. 1785).

6.392.3.2 virtual Pointer<commands::Response> activemq::wireformat::openwire::OpenWire-ResponseBuilder::buildResponse (const Pointer< commands::Command > & *command*) [virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters

command	- The command to build a response for

Returns

A Response object pointer, or NULL if no response.

Implements **activemq::transport::mock::ResponseBuilder** (p. 1785).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/**OpenWireResponseBuilder.h**

6.393 decaf::io::OutputStream Class Reference

Base interface for any class that wants to represent an output stream of bytes.

`#include <src/main/decaf/io/OutputStream.h>`

Inheritance diagram for decaf::io::OutputStream:

Public Member Functions

- **OutputStream** ()

- virtual ~**OutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

  Exceptions

IOException (p. 1198)	*if an error occurs while closing.*

- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **write** (unsigned char c)

  Writes a single byte to the output stream.
- virtual void **write** (**const** unsigned char *buffer, int size)

  Writes an array of bytes to the output stream.
- virtual void **write** (**const** unsigned char *buffer, int size, int offset, int length)

  Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.
- virtual std::string **toString** () **const**

  Output a String representation of this object.
- virtual void **lock** ()

  Locks the object.
- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** ()

  Unlocks the object.
- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)=0
- virtual void **doWriteArray** (**const** unsigned char *buffer, int size)
- virtual void **doWriteArrayBounded** (**const** unsigned char *buffer, int size, int offset, int length)

6.393.1 Detailed Description

Base interface for any class that wants to represent an output stream of bytes.

Since

1.0

6.393.2 Constructor & Destructor Documentation

6.393.2.1 decaf::io::OutputStream::OutputStream ( )

6.393.2.2 virtual decaf::io::OutputStream::~OutputStream ( ) [virtual]

6.393.3 Member Function Documentation

6.393.3.1 virtual void decaf::io::OutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(*p. *1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

Implements **decaf::io::Closeable** (p. 633).

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 923), **decaf::io::FilterOutputStream** (p. 1039), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 2086), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 1583), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1962).

6.393.3.2 virtual void decaf::io::OutputStream::doWriteArray (const unsigned char * *buffer,* int *size*) [protected, virtual]

Reimplemented in **decaf::io::FilterOutputStream** (p. 1039), and **decaf::io::BufferedOutputStream** (p. 462).

6.393.3.3 virtual void decaf::io::OutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented in **decaf::util::zip::DeflaterOutputStream** (p. 924), **decaf::io::DataOutputStream** (p. 862), **decaf::io::ByteArrayOutputStream** (p. 534), **decaf::io::FilterOutputStream** (p. 1039), **decaf::io::BufferedOutputStream** (p. 462), **decaf::util::zip::CheckedOutputStream** (p. 628), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 2086), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 1584), **activemq::io::LoggingOutputStream** (p. 1324), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1963).

6.393.3.4 virtual void decaf::io::OutputStream::doWriteByte (unsigned char *value*) [protected, pure virtual]

Implemented in **decaf::util::zip::DeflaterOutputStream** (p. 924), **decaf::io::DataOutputStream** (p. 862), **decaf::io::ByteArrayOutputStream** (p. 534), **decaf::io::FilterOutputStream** (p. 1039), **decaf::io::BufferedOutputStream** (p. 463), **decaf::util::zip::CheckedOutputStream** (p. 628), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 2086), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 1584), **activemq::io::LoggingOutputStream** (p. 1324), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1963).

6.393.3.5 virtual void decaf::io::OutputStream::flush ( ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

The default implementation of this method does nothing.

Implements **decaf::io::Flushable** (p. 1068).

Reimplemented in **decaf::io::BufferedOutputStream** (p. 463), **decaf::io::FilterOutputStream** (p. 1039), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1963).

6.393.3.6 virtual void decaf::io::OutputStream::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.393.3.7 virtual void decaf::io::OutputStream::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.393.3.8 virtual void decaf::io::OutputStream::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.393.3.9 virtual std::string decaf::io::OutputStream::toString ( ) const [virtual]

Output a String representation of this object.

The default version of this method just prints the Class Name.

Returns

a string representation of the object.

Reimplemented in **decaf::io::ByteArrayOutputStream** (p. 535), and **decaf::io::FilterOutputStream** (p. 1040).

6.393.3.10 virtual bool decaf::io::OutputStream::tryLock ( ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.393.3.11 virtual void decaf::io::OutputStream::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.393.3.12 virtual void decaf::io::OutputStream::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.393.3.13 virtual void decaf::io::OutputStream::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.393.3.14 virtual void decaf::io::OutputStream::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

6.393.3.15 virtual void decaf::io::OutputStream::write (unsigned char *c*) [virtual]

Writes a single byte to the output stream.

The default implementation of this method calls the pure virtual method doWriteByte which must be implemented by any subclass of the **OutputStream** (p. 1600).

Parameters

c	The byte to write to the sink.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

6.393.3.16 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer,* int *size*) [virtual]

Writes an array of bytes to the output stream.

The entire contents of the given vector are written to the output stream.

The default implementation of this method simply calls the doWriteArray which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArray to provide

more performant means of writing the array.

Parameters

buffer	The vector of bytes to write.
size	The size of the buffer passed.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	thrown if buffer is Null.
IndexOutOfBounds-Exception	if size value is negative.

6.393.3.17 virtual void decaf::io::OutputStream::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Writes an array of bytes to the output stream in order starting at buffer[offset] and proceeding until the number of bytes specified by the length argument are written or an error occurs.

The default implementation of this method simply calls the doWriteArrayBounded method which writes the contents of the array using the doWriteByte method repeatedly. It is recommended that a subclass override doWriteArray-Bounded to provide more performant means of writing the array.

Parameters

buffer	The array of bytes to write.
size	The size of the buffer array passed.
offset	The position to start writing in buffer.
length	The number of bytes from the buffer to be written.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	thrown if buffer is Null.
IndexOutOfBounds-Exception	if the offset + length $>$ size. or one of the parameters is negative.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**OutputStream.h**

6.394 decaf::io::OutputStreamWriter Class Reference

A class for turning a character stream into a byte stream.

`#include <src/main/decaf/io/OutputStreamWriter.h>`

Inheritance diagram for decaf::io::OutputStreamWriter:

Public Member Functions

- **OutputStreamWriter** (**OutputStream** *stream, bool own=false)

*Creates a new **OutputStreamWriter** (p. 1606).*

- virtual ~**OutputStreamWriter** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

Protected Member Functions

- virtual void **doWriteArrayBounded** (**const** char *buffer, int size, int offset, int length)

  Override this method to customize the functionality of the method write(char buffer, int size, int offset, int length).*
- virtual void **checkClosed** () **const**

6.394.1 Detailed Description

A class for turning a character stream into a byte stream.

See also

InputStreamReader (p. 1142)

Since

1.0

6.394.2 Constructor & Destructor Documentation

6.394.2.1 decaf::io::OutputStreamWriter::OutputStreamWriter (OutputStream * *stream*, bool *own* = false)

Creates a new **OutputStreamWriter** (p. 1606).

Parameters

stream	The **OutputStream** (p. 1600) to wrap. (cannot be NULL).
own	Indicates whether this instance own the given **OutputStream** (p. 1600). If true then the **OutputStream** (p. 1600) is destroyed when this class is.

Exceptions

NullPointerException	if the stream is NULL.

6.394.2.2 virtual decaf::io::OutputStreamWriter::~OutputStreamWriter ( ) [virtual]

6.394.3 Member Function Documentation

6.394.3.1 virtual void decaf::io::OutputStreamWriter::checkClosed ( ) const [protected, virtual]

6.394.3.2 virtual void decaf::io::OutputStreamWriter::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

6.394.3.3 virtual void decaf::io::OutputStreamWriter::doWriteArrayBounded (const char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Override this method to customize the functionality of the method write(char* buffer, int size, int offset, int length).

All subclasses must override this method to provide the basic **Writer** (p. 2255) functionality.

Implements **decaf::io::Writer** (p. 2257).

6.394.3.4 virtual void decaf::io::OutputStreamWriter::flush ( ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Implements **decaf::io::Flushable** (p. 1068).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**OutputStreamWriter.h**

6.395.1 Constructor & Destructor Documentation

6.395.1.1 activemq::commands::PartialCommand::PartialCommand ( )

6.395.1.2 virtual activemq::commands::PartialCommand::~PartialCommand ( ) [virtual]

6.395.2 Member Function Documentation

6.395.2.1 virtual PartialCommand* activemq::commands::PartialCommand::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1246).

6.395.2.2 virtual void activemq::commands::PartialCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1246).

6.395.2.3 virtual bool activemq::commands::PartialCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1246).

6.395.2.4 virtual int activemq::commands::PartialCommand::getCommandId ( ) const [virtual]

6.395.2.7 virtual unsigned char activemq::commands::PartialCommand::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1246).

6.395.2.8 virtual void activemq::commands::PartialCommand::setCommandId (int *commandId*) [virtual]

6.395.2.9 virtual void activemq::commands::PartialCommand::setData (const std::vector< unsigned char > & *data*) [virtual]

6.395.2.10 virtual std::string activemq::commands::PartialCommand::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

Reimplemented in **activemq::commands::LastPartialCommand** (p. 1247).

6.396.2.2 virtual activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::∼PartialCommandMarshaller ( ) [inline, virtual]

6.396.3 Member Function Documentation

6.396.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1248).

6.396.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1248).

6.396.3.3 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1248).

6.396.3.4 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1249).

6.396.3.5 virtual int activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1249).

6.396.3.6 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1249).

6.396.3.7 virtual void activemq::wireformat::openwire::marshal::generated::PartialCommandMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LastPartialCommandMarshaller** (p. 1250).

6.397.1 Detailed Description

template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter>class decaf::lang::Pointer< T, REFCOUNTER >

Decaf's implementation of a Smart **Pointer** (p. 1614) that is a template on a Type and is **Thread** (p. 2094) Safe if the default Reference Counter is used.

This **Pointer** (p. 1614) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 1614) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 1614) in a STL container that requires it, **Pointer** (p. 1614) provides an implementation of std::less.

Since

1.0

6.397.2 Member Typedef Documentation

6.397.2.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef REFCOUNTER decaf::lang::Pointer< T, REFCOUNTER >::CounterType

6.397.2.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T* decaf::lang::Pointer< T, REFCOUNTER >::PointerType

6.397.2.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T& decaf::lang::Pointer< T, REFCOUNTER >::ReferenceType

6.397.3 Constructor & Destructor Documentation

6.397.3.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer ( ) [inline]

Default Constructor.

Initialized the contained pointer to NULL, using the -> operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::Pointer< TransactionId >::reset().

6.397.3.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const PointerType *value*) [inline, explicit]

Explicit Constructor, creates a **Pointer** (p. 1614) that contains value with a single reference.

This object now has ownership until a call to release.

Parameters

value	- instance of the type we are containing here.

6.397.3.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T, REFCOUNTER > & *value*) throw () [inline]

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.397.3.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value*) throw () [inline]

Copy constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter.

6.397.3.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value,* const STATIC_CAST_TOKEN &) throw () [inline]

Static Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a static cast on the value contained in the source **Pointer** (p. 1614) object.

Parameters

value	- **Pointer** (p. 1614) instance to cast to this type.

6.397.3.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > decaf::lang::Pointer< T, REFCOUNTER >::Pointer (const Pointer< T1, R1 > & *value,* const DYNAMIC_CAST_TOKEN &) [inline]

Dynamic Cast constructor.

Copies the value contained in the pointer to the new instance and increments the reference counter performing a dynamic cast on the value contained in the source **Pointer** (p. 1614) object. If the cast fails and return NULL then this method throws a ClassCastException.

Parameters

value	- **Pointer** (p. 1614) instance to cast to this type.

Exceptions

ClassCastException	if the dynamic cast returns NULL

6.397.3.7 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::Pointer< T, REFCOUNTER >::~Pointer ( ) throw () [inline, virtual]

6.397.4 Member Function Documentation

6.397.4.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::dynamicCast ( ) const [inline]

6.397.4.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::get ( ) const [inline]

Gets the real pointer that is contained within this **Pointer** (p. 1614).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL auto_ptr and gives access in cases where the caller absolutely needs the real **Pointer** (p. 1614). Use at your own risk.

Returns

the contained pointer.

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::equals(), activemq::state::ConnectionState::getTransactionState(), decaf::lang::Pointer< TransactionId >::operator!=(), decaf::lang::operator!=(), std::less< decaf::lang::Pointer< T > >::operator()(), decaf::lang::Pointer< TransactionId >::operator==(), decaf::lang::operator==(), decaf::util::concurrent::LinkedBlockingQueue< E >::peek(), and activemq::state::ConnectionState::removeTempDestination().

6.397.4.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> bool decaf::lang::Pointer< T, REFCOUNTER >::operator! ( ) const [inline]

6.397.4.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator!= (const Pointer< T1, R1 > & *right*) const [inline]

6.397.4.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* ( ) [inline]

Dereference Operator, returns a reference to the Contained value.

This method throws an NullPointerException if the contained value is NULL.

Returns

reference to the contained pointer.

Exceptions

NullPointerException	if the contained value is Null

6.397.4.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType decaf::lang::Pointer< T, REFCOUNTER >::operator* ( ) const [inline]

6.397.4.7 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> ( ) [inline]

Indirection Operator, returns a pointer to the Contained value.

This method throws an NullPointerException if the contained value is NULL.

Returns

reference to the contained pointer.

Exceptions

NullPointerException	if the contained value is Null

6.397.4.8 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::Pointer< T, REFCOUNTER >::operator-> ( ) const [inline]

6.397.4.9 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T, REFCOUNTER > & *right*) throw () [inline]

Assigns the value of right to this **Pointer** (p. 1614) and increments the reference Count.

Parameters

right	- **Pointer** (p. 1614) on the right hand side of an operator= call to this.

6.397.4.10 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > Pointer& decaf::lang::Pointer< T, REFCOUNTER >::operator= (const Pointer< T1, R1 > & *right*) throw () [inline]

6.397.4.11 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::Pointer< T, REFCOUNTER >::operator== (const Pointer< T1, R1 > & *right*) const [inline]

6.397.4.12 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> T* decaf::lang::Pointer< T, REFCOUNTER >::release ( ) [inline]

Releases the **Pointer** (p. 1614) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 1614) is held by more than one object or this method is called from more than one thread.

Parameters

value	- The new value to contain.

Returns

The pointer instance that was held by this **Pointer** (p. 1614) object, the pointer is no longer owned by this **Pointer** (p. 1614) and won't be freed when this **Pointer** (p. 1614) goes out of scope.

Referenced by decaf::lang::Pointer< TransactionId >::Pointer().

6.397.4.13 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::reset (T * *value*) [inline]

Resets the **Pointer** (p. 1614) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 1614) to a NULL pointer.

Parameters

value	- The new value to contain.

6.397.4.14 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 > Pointer<T1, CounterType> decaf::lang::Pointer< T, REFCOUNTER >::staticCast ( ) const [inline]

6.397.4.15 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::Pointer< T, REFCOUNTER >::swap (Pointer< T, REFCOUNTER > & *value*) throw () [inline]

Exception (p. 990) Safe Swap Function.

Parameters

value	- the value to swap with this.

Referenced by decaf::lang::Pointer< TransactionId >::operator=(), and decaf::lang::Pointer< TransactionId >::swap().

6.397.5 Friends And Related Function Documentation

- virtual int **compare** (**const Pointer**< T, R > &left, **const Pointer**< T, R > &right) **const**

6.398.1 Detailed Description

template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter>class decaf::lang::PointerComparator< T, R >

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 1614) instance.

This can be useful in the case where a series of values in a Collection is more efficiently accessed in the Objects Natural Order and not the underlying pointers location in memory.

Also this allows **Pointer** (p. 1614) objects that Point to different instances of the same type to be compared based on the comparison of the object itself and not just the value of the pointer.

6.398.2 Constructor & Destructor Documentation

6.398.2.1 template<typename T , typename R = decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::PointerComparator< T, R >::~PointerComparator ( ) [inline, virtual]

6.399 activemq::cmsutil::PooledSession Class Reference

A pooled session object that wraps around a delegate session.

`#include <src/main/activemq/cmsutil/PooledSession.h>`

Inheritance diagram for activemq::cmsutil::PooledSession:

Public Member Functions

- **PooledSession** (**SessionPool** *pool, **cms::Session** *session)
- virtual ~**PooledSession** () throw ()

  Does nothing.
- virtual **cms::Session** * **getSession** ()

  Returns a non-constant reference to the internal session object.
- virtual **const cms::Session** * **getSession** () **const**

  Returns a constant reference to the internal session object.
- virtual void **close** ()

  Returns this session back to the pool, but does not close or destroy the internal session object.
- virtual void **start** ()

  Starts the service.
- virtual void **stop** ()

  Stops this service.
- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination)

  Creates a MessageConsumer for the specified destination.
- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination, **const** std::string &selector)

  Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination, **const** std::string &selector, bool noLocal)

  Creates a MessageConsumer for the specified destination, using a message selector.
- virtual **cms::MessageConsumer** * **createDurableConsumer** (**const cms::Topic** *destination, **const** std::string &name, **const** std::string &selector, bool noLocal=false)

Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageConsumer** ∗ **createCachedConsumer** (**const cms::Destination** ∗destination, **const** std::string &selector, bool noLocal)

  First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal.

- virtual **cms::MessageProducer** ∗ **createProducer** (**const cms::Destination** ∗destination)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::MessageProducer** ∗ **createCachedProducer** (**const cms::Destination** ∗destination)

  First checks the internal producer cache and creates one if none exist for the given destination.

- virtual **cms::QueueBrowser** ∗ **createBrowser** (**const cms::Queue** ∗queue)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** ∗ **createBrowser** (**const cms::Queue** ∗queue, **const** std::string &selector)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** ∗ **createQueue** (**const** std::string &queueName)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** ∗ **createTopic** (**const** std::string &topicName)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** ∗ **createTemporaryQueue** ()

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** ∗ **createTemporaryTopic** ()

  Creates a TemporaryTopic object.

- virtual **cms::Message** ∗ **createMessage** ()

  Creates a new Message.

- virtual **cms::BytesMessage** ∗ **createBytesMessage** ()

  Creates a BytesMessage.

- virtual **cms::BytesMessage** ∗ **createBytesMessage** (**const** unsigned char ∗bytes, int bytesSize)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** ∗ **createStreamMessage** ()

  Creates a new StreamMessage.

- virtual **cms::TextMessage** ∗ **createTextMessage** ()

  Creates a new TextMessage.

- virtual **cms::TextMessage** ∗ **createTextMessage** (**const** std::string &text)

  Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage** ∗ **createMapMessage** ()

  Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode getAcknowledgeMode** () **const**

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () **const**

  Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (**const** std::string &name)

  Unsubscribes a durable subscription that has been created by a client.

6.399.1 Detailed Description

A pooled session object that wraps around a delegate session.

Calls to close this session only result in giving the session back to the pool.

6.399.2 Constructor & Destructor Documentation

6.399.2.1 activemq::cmsutil::PooledSession::PooledSession (SessionPool * *pool,* cms::Session * *session*)

6.399.2.2 virtual activemq::cmsutil::PooledSession::~PooledSession ( ) throw () [virtual]

Does nothing.

6.399.3 Member Function Documentation

6.399.3.1 virtual void activemq::cmsutil::PooledSession::close ( ) [virtual]

Returns this session back to the pool, but does not close or destroy the internal session object.

Exceptions

CMSException	if an error occurs while performing this operation.

Implements **cms::Session** (p. 1833).

6.399.3.2 virtual void activemq::cmsutil::PooledSession::commit ( ) [inline, virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 1834).

References cms::Session::commit().

6.399.3.3 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue	the Queue to browse

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if the destination given is invalid.

Implements **cms::Session** (p. 1834).

6.399.3.4 virtual cms::QueueBrowser* activemq::cmsutil::PooledSession::createBrowser (const cms::Queue * *queue,* const std::string & *selector*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue	the Queue to browse
selector	the Message selector to filter which messages are browsed.

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if the destination given is invalid.

Implements **cms::Session** (p. 1834).

6.399.3.5 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage ( ) [inline, virtual]

Creates a BytesMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1835).

References cms::Session::createBytesMessage().

6.399.3.6 virtual cms::BytesMessage* activemq::cmsutil::PooledSession::createBytesMessage (const unsigned char * *bytes,* int *bytesSize*) [inline, virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters

bytes	an array of bytes to set in the message
bytesSize	the size of the bytes array, or number of bytes to use

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1835).

References cms::Session::createBytesMessage().

6.399.3.7 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createCachedConsumer (const cms::Destination * *destination,* const std::string & *selector,* bool *noLocal*) [virtual]

First checks the internal consumer cache and creates on if none exist for the given destination, selector, noLocal.

If created, the consumer is added to the pool's lifecycle manager.

Parameters

destination	the destination to receive on
selector	the selector to use
noLocal	whether or not to receive messages from the same connection

Returns

the consumer resource

Exceptions

cms::CMSException *(p. 640)*	if something goes wrong.

6.399.3.8 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createCachedProducer (const cms::Destination * *destination*) [virtual]

First checks the internal producer cache and creates one if none exist for the given destination.

If created, the producer is added to the pool's lifecycle manager.

Parameters

destination	the destination to send on

Returns

the producer resource

Exceptions

cms::CMSException *(p. 640)*	if something goes wrong.

6.399.3.9 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*) [inline, virtual]

Creates a MessageConsumer for the specified destination.

Parameters

destination	the Destination that this consumer receiving messages for.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.

Implements **cms::Session** (p. 1835).

References cms::Session::createConsumer().

6.399.3.10 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination	the Destination that this consumer receiving messages for.
selector	the Message Selector to use

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1836).

References cms::Session::createConsumer().

6.399.3.11 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*, bool *noLocal*) [inline, virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination	the Destination that this consumer receiving messages for.
selector	the Message Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1836).

References cms::Session::createConsumer().

6.399.3.12 virtual cms::MessageConsumer* activemq::cmsutil::PooledSession::createDurableConsumer (const cms::Topic * *destination*, const std::string & *name*, const std::string & *selector*, bool *noLocal* = false) [inline, virtual]

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination	the topic to subscribe to
name	The name used to identify the subscription
selector	the Message Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1837).

References cms::Session::createDurableConsumer().

6.399.3.13 virtual cms::MapMessage* activemq::cmsutil::PooledSession::createMapMessage ( ) [inline, virtual]

Creates a new MapMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1837).

References cms::Session::createMapMessage().

6.399.3.14 virtual cms::Message* activemq::cmsutil::PooledSession::createMessage ( ) [inline, virtual]

Creates a new Message.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1837).

References cms::Session::createMessage().

6.399.3.15 virtual cms::MessageProducer* activemq::cmsutil::PooledSession::createProducer (const cms::Destination * *destination*) [inline, virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters

destination	the Destination to send on

Returns

New MessageProducer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.

Implements **cms::Session** (p. 1838).

References cms::Session::createProducer().

6.399.3.16 virtual cms::Queue* activemq::cmsutil::PooledSession::createQueue (const std::string & *queueName*) [inline, virtual]

Creates a queue identity given a Queue name.

Parameters

queueName	the name of the new Queue

Returns

new Queue pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1838).

References cms::Session::createQueue().

6.399.3.17 virtual cms::StreamMessage* activemq::cmsutil::PooledSession::createStreamMessage ( ) [inline, virtual]

Creates a new StreamMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1838).

References cms::Session::createStreamMessage().

6.399.3.18 virtual cms::TemporaryQueue* activemq::cmsutil::PooledSession::createTemporaryQueue ( ) [inline, virtual]

Creates a TemporaryQueue object.

Returns

new TemporaryQueue pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

References cms::Session::createTemporaryQueue().

6.399.3.19 virtual cms::TemporaryTopic* activemq::cmsutil::PooledSession::createTemporaryTopic ( ) [inline, virtual]

Creates a TemporaryTopic object.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

References cms::Session::createTemporaryTopic().

6.399.3.20 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage ( ) [inline, virtual]

Creates a new TextMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

References cms::Session::createTextMessage().

6.399.3.21 virtual cms::TextMessage* activemq::cmsutil::PooledSession::createTextMessage (const std::string & *text*) [inline, virtual]

Creates a new TextMessage and set the text to the value given.

Parameters

text	the initial text for the message

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

References cms::Session::createTextMessage().

6.399.3.22 virtual cms::Topic* activemq::cmsutil::PooledSession::createTopic (const std::string & *topicName*) [inline, virtual]

Creates a topic identity given a Queue name.

Parameters

topicName	the name of the new Topic

Returns

new Topic pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

References cms::Session::createTopic().

6.399.3.23 virtual cms::Session::AcknowledgeMode activemq::cmsutil::PooledSession::getAcknowledgeMode ( ) const [inline, virtual]

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

References cms::Session::getAcknowledgeMode().

6.399.3.24 virtual cms::Session* activemq::cmsutil::PooledSession::getSession ( ) [inline, virtual]

Returns a non-constant reference to the internal session object.

Returns

the session object.

6.399.3.25 virtual const cms::Session* activemq::cmsutil::PooledSession::getSession ( ) const [inline, virtual]

Returns a constant reference to the internal session object.

Returns

the session object.

6.399.3.26 virtual bool activemq::cmsutil::PooledSession::isTransacted ( ) const [inline, virtual]

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

References cms::Session::isTransacted().

6.399.3.27 virtual void activemq::cmsutil::PooledSession::recover ( ) [inline, virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
  - Mark all messages that might have been delivered but not acknowledged as "redelivered"
  - Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSException	- if the CMS provider fails to stop and restart message delivery due to some internal error.
IllegalStateException	- if the method is called by a transacted session.

Implements **cms::Session** (p. 1840).

References cms::Session::recover().

6.399.3.28 virtual void activemq::cmsutil::PooledSession::rollback ( ) [inline, virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 1841).

References cms::Session::rollback().

6.399.3.29 virtual void activemq::cmsutil::PooledSession::start ( ) [inline, virtual]

Starts the service.

Exceptions

CMSException	if an internal error occurs while starting.

Implements **cms::Startable** (p. 1964).

References cms::Startable::start().

6.399.3.30 virtual void activemq::cmsutil::PooledSession::stop ( ) [inline, virtual]

Stops this service.

Exceptions

CMSException	- if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2017).

References cms::Stoppable::stop().

6.399.3.31 virtual void activemq::cmsutil::PooledSession::unsubscribe (const std::string & *name*) [inline, virtual]

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name	The name used to identify this subscription

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1841).

References cms::Session::unsubscribe().

The documentation for this class was generated from the following file:

6.400 decaf::net::PortUnreachableException Class Reference

`#include <src/main/decaf/net/PortUnreachableException.h>`

Inheritance diagram for decaf::net::PortUnreachableException:

Public Member Functions

- **PortUnreachableException** () throw ()

  Default Constructor.
- **PortUnreachableException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **PortUnreachableException** (**const PortUnreachableException** &ex) throw ()

  Copy Constructor.
- **PortUnreachableException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **PortUnreachableException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **PortUnreachableException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **PortUnreachableException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**PortUnreachableException** () throw ()

6.400.1 Constructor & Destructor Documentation

6.400.1.1 decaf::net::PortUnreachableException::PortUnreachableException ( ) throw () [inline]

Default Constructor.

6.400.1.2 decaf::net::PortUnreachableException::PortUnreachableException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.400.1.3 decaf::net::PortUnreachableException::PortUnreachableException (const PortUnreachableException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.400.1.4 decaf::net::PortUnreachableException::PortUnreachableException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.400.1.5 decaf::net::PortUnreachableException::PortUnreachableException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.400.1.6 decaf::net::PortUnreachableException::PortUnreachableException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.400.1.7 virtual decaf::net::PortUnreachableException::~PortUnreachableException ( ) throw () [inline, virtual]

6.400.2 Member Function Documentation

6.400.2.1 virtual PortUnreachableException* decaf::net::PortUnreachableException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 1916).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**PortUnreachableException.h**

6.401 activemq::core::PrefetchPolicy Class Reference

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

`#include <src/main/activemq/core/PrefetchPolicy.h>`

Inheritance diagram for activemq::core::PrefetchPolicy:

Public Member Functions

- virtual ~**PrefetchPolicy** ()
- virtual void **setDurableTopicPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Durable Topic.
- virtual int **getDurableTopicPrefetch** () **const** =0

  Gets the amount of messages to prefetch for a Durable Topic.
- virtual void **setQueuePrefetch** (int value)=0

  Sets the amount of prefetched messages for a Queue.
- virtual int **getQueuePrefetch** () **const** =0

  Gets the amount of messages to prefetch for a Queue.
- virtual void **setQueueBrowserPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Queue Browser.
- virtual int **getQueueBrowserPrefetch** () **const** =0

  Gets the amount of messages to prefetch for a Queue Browser.
- virtual void **setTopicPrefetch** (int value)=0

  Sets the amount of prefetched messages for a Topic.
- virtual int **getTopicPrefetch** () **const** =0

  Gets the amount of messages to prefetch for a Topic.
- virtual int **getMaxPrefetchLimit** (int value) **const** =0

  Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.
- virtual **PrefetchPolicy** * **clone** () **const** =0

  Clone the Policy and return a new pointer to that clone.
- virtual void **configure** (**const decaf::util::Properties** &properties)

  Checks the supplied properties object for properties matching the configurable settings of this class.

Protected Member Functions

- **PrefetchPolicy** ()

6.401.1 Detailed Description

Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.

Since

3.2.0

6.401.2 Constructor & Destructor Documentation

6.401.2.1 activemq::core::PrefetchPolicy::PrefetchPolicy ( ) [protected]

6.401.2.2 virtual activemq::core::PrefetchPolicy::~PrefetchPolicy ( ) [virtual]

6.401.3 Member Function Documentation

6.401.3.1 virtual PrefetchPolicy* activemq::core::PrefetchPolicy::clone ( ) const [pure virtual]

Clone the Policy and return a new pointer to that clone.

Returns

pointer to a new **PrefetchPolicy** (p. 1635) instance that is a clone of this one.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 888).

6.401.3.2 virtual void activemq::core::PrefetchPolicy::configure (const decaf::util::Properties & *properties*) [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix cms.PrefetchPolicy.XXX where XXX is the name of a property with a public setter method. For instance cms.PrefetchPolicy.topicPrefetch will be used to set the value of the topic prefetch limit.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters

properties	The Properties object used to configure this object.

Exceptions

NumberFormatException	if a property that is numeric cannot be converted
IllegalArgumentException	if a property can't be converted to the correct type.

6.401.3.3 virtual int activemq::core::PrefetchPolicy::getDurableTopicPrefetch ( ) const [pure virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 888).

6.401.3.4 virtual int activemq::core::PrefetchPolicy::getMaxPrefetchLimit (int *value*) const [pure virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns

the allowable value for a prefetch limit, either requested or the max.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 888).

6.401.3.5 virtual int activemq::core::PrefetchPolicy::getQueueBrowserPrefetch ( ) const [pure virtual]

Gets the amount of messages to prefetch for a Queue Browser.

Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 889).

6.401.3.6 virtual int activemq::core::PrefetchPolicy::getQueuePrefetch ( ) const [pure virtual]

Gets the amount of messages to prefetch for a Queue.

Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 889).

6.401.3.7 virtual int activemq::core::PrefetchPolicy::getTopicPrefetch ( ) const [pure virtual]

Gets the amount of messages to prefetch for a Topic.

Returns

value of the number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 889).

6.401.3.8 virtual void activemq::core::PrefetchPolicy::setDurableTopicPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Durable Topic.

Parameters

value	The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 889).

6.401.3.9 virtual void activemq::core::PrefetchPolicy::setQueueBrowserPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue Browser.

Parameters

value	The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 889).

6.401.3.10 virtual void activemq::core::PrefetchPolicy::setQueuePrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Queue.

Parameters

value	The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 890).

6.401.3.11 virtual void activemq::core::PrefetchPolicy::setTopicPrefetch (int *value*) [pure virtual]

Sets the amount of prefetched messages for a Topic.

Parameters

value	The number of messages to prefetch.

Implemented in **activemq::core::policies::DefaultPrefetchPolicy** (p. 890).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**PrefetchPolicy.h**

6.402 activemq::util::PrimitiveList Class Reference

List of primitives.

`#include <src/main/activemq/util/PrimitiveList.h>`

Inheritance diagram for activemq::util::PrimitiveList:

Public Member Functions

- **PrimitiveList** ()

  Default Constructor, creates an Empty list.
- virtual ~**PrimitiveList** ()
- **PrimitiveList** (**const decaf::util::List**< **PrimitiveValueNode** > &src)

  Copy Constructor.
- **PrimitiveList** (**const PrimitiveList** &src)

  Copy Constructor.
- std::string **toString** () **const**

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual bool **getBool** (int index) **const**

  Gets the Boolean value at the specified index.
- virtual void **setBool** (int index, bool value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual unsigned char **getByte** (int index) **const**

  Gets the Byte value at the specified index.

- virtual void **setByte** (int index, unsigned char value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual char **getChar** (int index) **const**

  Gets the Character value at the specified index.
- virtual void **setChar** (int index, char value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual short **getShort** (int index) **const**

  Gets the Short value at the specified index.
- virtual void **setShort** (int index, short value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual int **getInt** (int index) **const**

  Gets the Integer value at the specified index.
- virtual void **setInt** (int index, int value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual long long **getLong** (int index) **const**

  Gets the Long value at the specified index.
- virtual void **setLong** (int index, long long value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual float **getFloat** (int index) **const**

  Gets the Float value at the specified index.
- virtual void **setFloat** (int index, float value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual double **getDouble** (int index) **const**

  Gets the Double value at the specified index.
- virtual void **setDouble** (int index, double value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual std::string **getString** (int index) **const**

  Gets the String value at the specified index.
- virtual void **setString** (int index, **const** std::string &value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.
- virtual std::vector< unsigned char > **getByteArray** (int index) **const**

  Gets the Byte Array value at the specified index.
- virtual void **setByteArray** (int index, **const** std::vector< unsigned char > &value)

  Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

6.402.1 Detailed Description

List of primitives.

6.402.2 Constructor & Destructor Documentation

6.402.2.1 activemq::util::PrimitiveList::PrimitiveList ( )

Default Constructor, creates an Empty list.

6.402.2.2 virtual activemq::util::PrimitiveList::~PrimitiveList ( ) [virtual]

6.402.2.3 activemq::util::PrimitiveList::PrimitiveList (const decaf::util::List< PrimitiveValueNode > & *src*)

Copy Constructor.

Parameters

src	- the Decaf List of PrimtiveNodeValues to copy

6.402.2.4 activemq::util::PrimitiveList::PrimitiveList (const PrimitiveList & *src*)

Copy Constructor.

Parameters

src	- the **PrimitiveList** (p. 1638) to copy

6.402.3 Member Function Documentation

6.402.3.1 virtual bool activemq::util::PrimitiveList::getBool (int *index*) const [virtual]

Gets the Boolean value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.2 virtual unsigned char activemq::util::PrimitiveList::getByte (int *index*) const [virtual]

Gets the Byte value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveList::getByteArray (int *index*) const [virtual]

Gets the Byte Array value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.4 virtual char activemq::util::PrimitiveList::getChar (int *index*) const [virtual]

Gets the Character value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.5 virtual double activemq::util::PrimitiveList::getDouble (int *index*) const [virtual]

Gets the Double value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.6 virtual float activemq::util::PrimitiveList::getFloat (int *index*) const [virtual]

Gets the Float value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.7 virtual int activemq::util::PrimitiveList::getInt (int *index*) const [virtual]

Gets the Integer value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.8 virtual long long activemq::util::PrimitiveList::getLong (int *index*) const [virtual]

Gets the Long value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.9 virtual short activemq::util::PrimitiveList::getShort (int *index*) const [virtual]

Gets the Short value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.10 virtual std::string activemq::util::PrimitiveList::getString (int *index*) const [virtual]

Gets the String value at the specified index.

Parameters

index	- index to get value from

Returns

value contained at the given index

Exceptions

IndexOutOfBounds-Exception	if index is > **size()** (p. 1286)
UnsupportedOperation-Exception	if the type at index is not of the type that this method is to return or can convert to.

6.402.3.11 virtual void activemq::util::PrimitiveList::setBool (int *index*, bool *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.12 virtual void activemq::util::PrimitiveList::setByte (int *index*, unsigned char *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.13 virtual void activemq::util::PrimitiveList::setByteArray (int *index*, const std::vector< unsigned char > & *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.14 virtual void activemq::util::PrimitiveList::setChar (int *index*, char *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.15 virtual void activemq::util::PrimitiveList::setDouble (int *index*, double *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.16 virtual void activemq::util::PrimitiveList::setFloat (int *index*, float *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.17 virtual void activemq::util::PrimitiveList::setInt (int *index*, int *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.18 virtual void activemq::util::PrimitiveList::setLong (int *index*, long long *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.19 virtual void activemq::util::PrimitiveList::setShort (int *index*, short *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.20 virtual void activemq::util::PrimitiveList::setString (int *index*, const std::string & *value*) [virtual]

Sets the value at the given index to the new value specified, this method overwrites any data that was previously at the index given, but does not insert a new element if the index is greater than the size of the list.

Parameters

index	- location to set in the list
value	- the new value to assign to the element at index

Exceptions

IndexOutOfBounds-Exception	if index > **size()** (p. 1286).

6.402.3.21 std::string activemq::util::PrimitiveList::toString ( ) const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the list.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveList.h**

6.403 activemq::util::PrimitiveMap Class Reference

Map of named primitives.

`#include <src/main/activemq/util/PrimitiveMap.h>`

Inheritance diagram for activemq::util::PrimitiveMap:

Public Member Functions

- **PrimitiveMap** ()

  Default Constructor, creates an empty map.
- virtual ~**PrimitiveMap** ()
- **PrimitiveMap** (**const decaf::util::Map**< std::string, **PrimitiveValueNode** > &source)

  Copy Constructor.
- **PrimitiveMap** (**const PrimitiveMap** &source)

  Copy Constructor.
- std::string **toString** () **const**

  Converts the contents into a formatted string that can be output in a Log File or other debugging tool.
- virtual bool **getBool** (**const** std::string &key) **const**

  Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setBool** (**const** std::string &key, bool value)

  Sets the value at key to the specified type.
- virtual unsigned char **getByte** (**const** std::string &key) **const**

  Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setByte** (**const** std::string &key, unsigned char value)

  Sets the value at key to the specified type.
- virtual char **getChar** (**const** std::string &key) **const**

  Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setChar** (**const** std::string &key, char value)

  Sets the value at key to the specified type.
- virtual short **getShort** (**const** std::string &key) **const**

  Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setShort** (**const** std::string &key, short value)

  Sets the value at key to the specified type.
- virtual int **getInt** (**const** std::string &key) **const**

  Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setInt** (**const** std::string &key, int value)

  Sets the value at key to the specified type.
- virtual long long **getLong** (**const** std::string &key) **const**

  Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setLong** (**const** std::string &key, long long value)

Sets the value at key to the specified type.

- virtual float **getFloat** (**const** std::string &key) **const**

  Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setFloat** (**const** std::string &key, float value)

  Sets the value at key to the specified type.
- virtual double **getDouble** (**const** std::string &key) **const**

  Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setDouble** (**const** std::string &key, double value)

  Sets the value at key to the specified type.
- virtual std::string **getString** (**const** std::string &key) **const**

  Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setString** (**const** std::string &key, **const** std::string &value)

  Sets the value at key to the specified type.
- virtual std::vector< unsigned char > **getByteArray** (**const** std::string &key) **const**

  Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.
- virtual void **setByteArray** (**const** std::string &key, **const** std::vector< unsigned char > &value)

  Sets the value at key to the specified type.

6.403.1 Detailed Description

Map of named primitives.

6.403.2 Constructor & Destructor Documentation

6.403.2.1 activemq::util::PrimitiveMap::PrimitiveMap ( )

Default Constructor, creates an empty map.

6.403.2.2 virtual activemq::util::PrimitiveMap::~PrimitiveMap ( ) [virtual]

6.403.2.3 activemq::util::PrimitiveMap::PrimitiveMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *source*)

Copy Constructor.

Parameters

source	The Decaf Library Map instance whose elements will be copied into this Map.

6.403.2.4 activemq::util::PrimitiveMap::PrimitiveMap (const PrimitiveMap & *source*)

Copy Constructor.

Parameters

source	The **PrimitiveMap** (p. 1647) whose elements will be copied into this Map.

6.403.3 Member Function Documentation

6.403.3.1 virtual bool activemq::util::PrimitiveMap::getBool (const std::string & *key*) const [virtual]

Gets the Boolean value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.2 virtual unsigned char activemq::util::PrimitiveMap::getByte (const std::string & *key*) const [virtual]

Gets the Byte value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.3 virtual std::vector<unsigned char> activemq::util::PrimitiveMap::getByteArray (const std::string & *key*) const [virtual]

Gets the Byte Array value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.4 virtual char activemq::util::PrimitiveMap::getChar (const std::string & *key*) const [virtual]

Gets the Character value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.5 virtual double activemq::util::PrimitiveMap::getDouble (const std::string & *key*) const [virtual]

Gets the Double value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.6 virtual float activemq::util::PrimitiveMap::getFloat (const std::string & *key*) const [virtual]

Gets the Float value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.7 virtual int activemq::util::PrimitiveMap::getInt (const std::string & *key*) const [virtual]

Gets the Integer value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.8 virtual long long activemq::util::PrimitiveMap::getLong (const std::string & *key*) const [virtual]

Gets the Long value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.9 virtual short activemq::util::PrimitiveMap::getShort (const std::string & *key*) const [virtual]

Gets the Short value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.10 virtual std::string activemq::util::PrimitiveMap::getString (const std::string & *key*) const [virtual]

Gets the String value at the given key, if the key is not in the map or cannot be returned as the requested value then an exception of type NoSuchElementException is thrown.

Parameters

key	- the location to return the value from.

Returns

the value at key in the type requested.

Exceptions

NoSuchElementException	if key is not in the map.
UnSupportedOperation-Exception	if the value cannot be converted to the type this method returns

6.403.3.11 virtual void activemq::util::PrimitiveMap::setBool (const std::string & *key,* bool *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.12 virtual void activemq::util::PrimitiveMap::setByte (const std::string & *key,* unsigned char *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.13 virtual void activemq::util::PrimitiveMap::setByteArray (const std::string & *key,* const std::vector< unsigned char > & *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.14 virtual void activemq::util::PrimitiveMap::setChar (const std::string & *key,* char *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.15 virtual void activemq::util::PrimitiveMap::setDouble (const std::string & *key,* double *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.16 virtual void activemq::util::PrimitiveMap::setFloat (const std::string & *key,* float *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.17 virtual void activemq::util::PrimitiveMap::setInt (const std::string & *key,* int *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.18 virtual void activemq::util::PrimitiveMap::setLong (const std::string & *key,* long long *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.19 virtual void activemq::util::PrimitiveMap::setShort (const std::string & *key,* short *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.20 virtual void activemq::util::PrimitiveMap::setString (const std::string & *key,* const std::string & *value*) [virtual]

Sets the value at key to the specified type.

Overwrites any data that was previously at this key or inserts a new element at key.

Parameters

key	- the map key to set or insert.
value	- the new value to set at the key location.

6.403.3.21 std::string activemq::util::PrimitiveMap::toString ( ) const

Converts the contents into a formatted string that can be output in a Log File or other debugging tool.

Returns

formatted String of all elements in the map.

The documentation for this class was generated from the following file:

- src/main/activemq/util/**PrimitiveMap.h**

6.404 activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller Class Reference

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

`#include <src/main/activemq/wireformat/openwire/marshal/PrimitiveTypesMarshaller.h>`

Public Member Functions

- **PrimitiveTypesMarshaller** ()
- virtual ∼**PrimitiveTypesMarshaller** ()

Static Public Member Functions

- static void **marshal** (**const util::PrimitiveMap** ∗map, std::vector< unsigned char > &buffer)

  Marshal a primitive map object to the given byte buffer.
- static void **unmarshal** (**util::PrimitiveMap** ∗map, **const** std::vector< unsigned char > &buffer)

  Unmarshal a PrimitiveMap from the provided Byte buffer.
- static void **marshal** (**const util::PrimitiveList** ∗list, std::vector< unsigned char > &buffer)

  Marshal a primitive list object to the given byte buffer.
- static void **unmarshal** (**util::PrimitiveList** ∗list, **const** std::vector< unsigned char > &buffer)

  Unmarshal a PrimitiveList from the provided byte buffer.
- static void **marshalMap** (**const util::PrimitiveMap** ∗map, **decaf::io::DataOutputStream** &dataOut)

  Marshal a primitive map object to the given DataOutputStream.
- static **util::PrimitiveMap** ∗ **unmarshalMap** (**decaf::io::DataInputStream** &dataIn)

  Unmarshal a PrimitiveMap from the provided DataInputStream.
- static void **marshalList** (**const util::PrimitiveList** ∗list, **decaf::io::DataOutputStream** &dataOut)

  Marshal a PrimitiveList to the given DataOutputStream.
- static **util::PrimitiveList** ∗ **unmarshalList** (**decaf::io::DataInputStream** &dataIn)

  Unmarshal a PrimitiveList from the given DataInputStream.

Static Protected Member Functions

- static void **marshalPrimitiveMap** (**decaf::io::DataOutputStream** &dataOut, **const decaf::util::Map**< std::string, **util::PrimitiveValueNode** > &map)

  Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.
- static void **marshalPrimitiveList** (**decaf::io::DataOutputStream** &dataOut, **const decaf::util::List**< **util::PrimitiveValueNode** > &list)

  Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.
- static void **marshalPrimitive** (**decaf::io::DataOutputStream** &dataOut, **const util::PrimitiveValueNode** &value)

  Used to Marshal the Primitive types out on the Wire.
- static void **unmarshalPrimitiveMap** (**decaf::io::DataInputStream** &dataIn, **util::PrimitiveMap** &map)

  Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.
- static void **unmarshalPrimitiveList** (**decaf::io::DataInputStream** &dataIn, **decaf::util::LinkedList**< **util::PrimitiveValueNode** > &list)

  Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.
- static **util::PrimitiveValueNode unmarshalPrimitive** (**decaf::io::DataInputStream** &dataIn)

  Unmarshals a Primitive Type from the stream, and returns it as a value Node.

6.404.1 Detailed Description

This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

6.404.2.2 virtual activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::~PrimitiveTypesMarshaller ( ) [inline, virtual]

6.404.3 Member Function Documentation

6.404.3.1 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveMap * *map,* std::vector< unsigned char > & *buffer*) [static]

Marshal a primitive map object to the given byte buffer.

Parameters

map	Map to Marshal.
buffer	The byte buffer to write the marshaled data to.

Exceptions

Exception	if an error occurs during the marshaling process.

6.404.3.2 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal (const util::PrimitiveList * *list,* std::vector< unsigned char > & *buffer*) [static]

Marshal a primitive list object to the given byte buffer.

Parameters

map	The PrimitiveList to Marshal.
buffer	The byte buffer to write the marshaled data to.

Exceptions

Exception	if an error occurs during the marshaling process.

6.404.3.3 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalList (const util::PrimitiveList * *list,* decaf::io::DataOutputStream & *dataOut*) [static]

Marshal a PrimitiveList to the given DataOutputStream.

Parameters

list	The list object to Marshal
dataOut	Reference to a DataOutputStream to write the marshaled data to.

Exceptions

Exception	if an error occurs during the marshaling process.

6.404.3.4 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalMap (const util::PrimitiveMap * *map*, decaf::io::DataOutputStream & *dataOut*) [static]

Marshal a primitive map object to the given DataOutputStream.

Parameters

map	Map to Marshal.
dataOut	Reference to a DataOutputStream to write the marshaled data to.

Exceptions

Exception	if an error occurs during the marshaling process.

6.404.3.5 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive (decaf::io::DataOutputStream & *dataOut*, const util::PrimitiveValueNode & *value*) [static, protected]

Used to Marshal the Primitive types out on the Wire.

Parameters

dataOut	- the DataOutputStream to write to
value	- the ValueNode to write.

Exceptions

IOException	if an I/O error occurs during this operation.

6.404.3.6 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshalPrimitive-List (decaf::io::DataOutputStream & *dataOut*, const decaf::util::List< util::PrimitiveValueNode > & *list*) [static, protected]

Marshal a List of Primitives to the given OutputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataOut	- the DataOutputStream to write to
list	- the ValueNode to write.

Exceptions

IOException	if an I/O error occurs during this operation.

6.404.3.7 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::marshal-PrimitiveMap (decaf::io::DataOutputStream & *dataOut*, const decaf::util::Map< std::string, util::PrimitiveValueNode > & *map*) [static, protected]

Marshal a Map of Primitives to the given OutputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataOut	- the DataOutputStream to write to
map	- the ValueNode to write.

Exceptions

IOException	if an I/O error occurs during this operation.

6.404.3.8 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveMap * *map*, const std::vector< unsigned char > & *buffer*) [static]

Unmarshal a PrimitiveMap from the provided Byte buffer.

Parameters

map	The Map to populate with values from the marshaled data.
buffer	The byte buffer containing the marshaled Map.

Exceptions

Exception	if an error occurs during the unmarshal process.

6.404.3.9 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshal (util::PrimitiveList * *list*, const std::vector< unsigned char > & *buffer*) [static]

Unmarshal a PrimitiveList from the provided byte buffer.

Parameters

map	The List to populate with values from the marshaled data.
buffer	The byte buffer containing the marshaled Map.

Exceptions

Exception	if an error occurs during the unmarshal process.

6.404.3.10 static util::PrimitiveList* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalList (decaf::io::DataInputStream & *dataIn*) [static]

Unmarshal a PrimitiveList from the given DataInputStream.

Parameters

dataIn	The DataInputStream instance to read the marshaled PrimitiveList from.

Returns

a pointer to a newly allocated PrimitiveList instnace.

Exceptions

Exception	if an error occurs during the unmarshal process.

6.404.3.11 static util::PrimitiveMap* activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalMap (decaf::io::DataInputStream & *dataIn*) [static]

Unmarshal a PrimitiveMap from the provided DataInputStream.

Parameters

dataIn	The DataInputStream instance to read the marshaled PrimitiveMap from.

Returns

a pointer to a newly allocated PrimitiveMap instnace.

Exceptions

Exception	if an error occurs during the unmarshal process.

6.404.3.12 static util::PrimitiveValueNode activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitive (decaf::io::DataInputStream & *dataIn*) [static, protected]

Unmarshals a Primitive Type from the stream, and returns it as a value Node.

Parameters

dataIn	- DataInputStream to read from.

Returns

a PrimitiveValueNode containing the data.

Exceptions

IOException	if an I/O error occurs during this operation.

6.404.3.13 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveList (decaf::io::DataInputStream & *dataIn,* decaf::util::LinkedList< util::PrimitiveValueNode > & *list*) [static, protected]

Unmarshals a List of Primitives from the given InputStream, can result in recursive calls to this method if the list contains lists of lists.

Parameters

dataIn	- DataInputStream to read from.
list	- the ValueNode to write.

Exceptions

IOException	if an I/O error occurs during this operation.

6.404.3.14 static void activemq::wireformat::openwire::marshal::PrimitiveTypesMarshaller::unmarshalPrimitiveMap (decaf::io::DataInputStream & *dataIn,* util::PrimitiveMap & *map*) [static, protected]

Unmarshals a Map of Primitives from the given InputStream, can result in recursive calls to this method if the map contains maps of maps.

Parameters

dataIn	- DataInputStream to read from.
map	- the map to fill with data.

Exceptions

IOException	if an I/O error occurs during this operation.

6.405 activemq::util::PrimitiveValueNode::PrimitiveValue Union Reference

Define a union type comprised of the various types.

`#include <src/main/activemq/util/PrimitiveValueNode.h>`

Data Fields

- bool **boolValue**
- unsigned char **byteValue**
- char **charValue**
- short **shortValue**
- int **intValue**
- long long **longValue**
- double **doubleValue**
- float **floatValue**
- std::string * **stringValue**
- std::vector< unsigned char > * **byteArrayValue**
- **decaf::util::List** < **PrimitiveValueNode** > * **listValue**
- **decaf::util::Map**< std::string, **PrimitiveValueNode** > * **mapValue**

6.405.1 Detailed Description

Define a union type comprised of the various types.

6.405.2 Field Documentation

6.405.2.1 bool activemq::util::PrimitiveValueNode::PrimitiveValue::boolValue

6.405.2.2 std::vector<unsigned char>* activemq::util::PrimitiveValueNode::PrimitiveValue::byteArrayValue

6.405.2.3 unsigned char activemq::util::PrimitiveValueNode::PrimitiveValue::byteValue

6.405.2.4 char activemq::util::PrimitiveValueNode::PrimitiveValue::charValue

6.405.2.5 double activemq::util::PrimitiveValueNode::PrimitiveValue::doubleValue

6.405.2.6 float activemq::util::PrimitiveValueNode::PrimitiveValue::floatValue

6.405.2.7 int activemq::util::PrimitiveValueNode::PrimitiveValue::intValue

6.405.2.8 decaf::util::List<PrimitiveValueNode>* activemq::util::PrimitiveValueNode::PrimitiveValue::listValue

6.405.2.9 long long activemq::util::PrimitiveValueNode::PrimitiveValue::longValue

6.405.2.10 decaf::util::Map<std::string, PrimitiveValueNode>* activemq::util::PrimitiveValueNode::PrimitiveValue::mapValue

6.405.2.11 short activemq::util::PrimitiveValueNode::PrimitiveValue::shortValue

6.405.2.12 std::string* activemq::util::PrimitiveValueNode::PrimitiveValue::stringValue

6.406 activemq::util::PrimitiveValueConverter Class Reference

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 1662) from one type to another.

`#include <src/main/activemq/util/PrimitiveValueConverter.h>`

Public Member Functions

- **PrimitiveValueConverter** ()
- virtual ~**PrimitiveValueConverter** ()
- template<typename TO >
  TO **convert** (**const PrimitiveValueNode** &value) **const**

6.406.1 Detailed Description

Class controls the conversion of data contained in a **PrimitiveValueNode** (p. 1662) from one type to another.

If the conversion is supported then calling the convert method will throw an UnsupportedOperationException to indicate that its not possible to perform the conversion.

This class is used to implement the rules of conversion on CMS Message properties, the following conversion table must be implemented. A value written as the row type can be read in the column type.

| | boolean byte short int long float double String |---------- |boolean | X X |byte | X X X X X |short | X X X X |int | X X X |long | X X |float | X X X |double | X X |String | X X X X X X X X |----------

6.407 activemq::util::PrimitiveValueNode Class Reference

Class that wraps around a single value of one of the many types.

`#include <src/main/activemq/util/PrimitiveValueNode.h>`

Data Structures

- union **PrimitiveValue**

  Define a union type comprised of the various types.

Public Types

- enum **PrimitiveType** {
  NULL_TYPE = 0, **BOOLEAN_TYPE** = 1, **BYTE_TYPE** = 2, **CHAR_TYPE** = 3,
  SHORT_TYPE = 4, **INTEGER_TYPE** = 5, **LONG_TYPE** = 6, **DOUBLE_TYPE** = 7,
  FLOAT_TYPE = 8, **STRING_TYPE** = 9, **BYTE_ARRAY_TYPE** = 10, **MAP_TYPE** = 11,
  LIST_TYPE = 12, **BIG_STRING_TYPE** = 13 }

  Enumeration for the various primitive types.

Public Member Functions

- **PrimitiveValueNode** ()

  Default Constructor, creates a value of the NULL_TYPE.
- **PrimitiveValueNode** (bool value)

  Boolean Value Constructor.
- **PrimitiveValueNode** (unsigned char value)

  Byte Value Constructor.
- **PrimitiveValueNode** (char value)

  Char Value Constructor.
- **PrimitiveValueNode** (short value)

  Short Value Constructor.
- **PrimitiveValueNode** (int value)

  Int Value Constructor.
- **PrimitiveValueNode** (long long value)

  Long Value Constructor.

- **PrimitiveValueNode** (float value)

  Float Value Constructor.
- **PrimitiveValueNode** (double value)

  Double Value Constructor.
- **PrimitiveValueNode** (**const** char ∗value)

  String Value Constructor.
- **PrimitiveValueNode** (**const** std::string &value)

  String Value Constructor.
- **PrimitiveValueNode** (**const** std::vector< unsigned char > &value)

  Byte Array Value Constructor.
- **PrimitiveValueNode** (**const decaf::util::List**< **PrimitiveValueNode** > &value)

  Primtive List Constructor.
- **PrimitiveValueNode** (**const decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Primtive Map Value Constructor.
- **PrimitiveValueNode** (**const PrimitiveValueNode** &node)

  Copy constructor.
- ∼**PrimitiveValueNode** ()
- **PrimitiveValueNode** & **operator=** (**const PrimitiveValueNode** &node)

  Assignment operator, copies the data from the other node.
- bool **operator==** (**const PrimitiveValueNode** &node) **const**

  Comparison Operator, compares this node to the other node.
- **PrimitiveType getType** () **const**

  Gets the Value Type of this type wrapper.
- **PrimitiveValue getValue** () **const**

  Gets the internal Primitive Value object from this wrapper.
- void **setValue** (**const PrimitiveValue** &value, **PrimitiveType** valueType)

  Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.
- void **clear** ()

  Clears the value from this wrapper converting it back to a blank NULL_TYPE value.
- void **setBool** (bool value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- bool **getBool** () **const**

  Gets the Boolean value of this Node.
- void **setByte** (unsigned char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- unsigned char **getByte** () **const**

  Gets the Byte value of this Node.
- void **setChar** (char value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- char **getChar** () **const**

  Gets the Character value of this Node.
- void **setShort** (short value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- short **getShort** () **const**

  Gets the Short value of this Node.
- void **setInt** (int value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

- int **getInt** () **const**

  Gets the Integer value of this Node.
- void **setLong** (long long value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- long long **getLong** () **const**

  Gets the Long value of this Node.
- void **setFloat** (float value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- float **getFloat** () **const**

  Gets the Float value of this Node.
- void **setDouble** (double value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- double **getDouble** () **const**

  Gets the Double value of this Node.
- void **setString** (**const** std::string &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::string **getString** () **const**

  Gets the String value of this Node.
- void **setByteArray** (**const** std::vector< unsigned char > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- std::vector< unsigned char > **getByteArray** () **const**

  Gets the Byte Array value of this Node.
- void **setList** (**const decaf::util::List**< **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- **const decaf::util::List**
  < **PrimitiveValueNode** > & **getList** () **const**

  Gets the Primitive List value of this Node.
- void **setMap** (**const decaf::util::Map**< std::string, **PrimitiveValueNode** > &value)

  Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.
- **const decaf::util::Map**
  < std::string,
  PrimitiveValueNode > & **getMap** () **const**

  Gets the Primitive Map value of this Node.
- std::string **toString** () **const**

  Creates a string representation of this value.

6.407.1 Detailed Description

Class that wraps around a single value of one of the many types.

Manages memory for complex types, such as strings. Note: the destructor was left non-virtual so no virtual table will be created. This probably isn't necessary, but will avoid needless memory allocation. Since we'll never extend this class, not having a virtual destructor isn't a concern.

6.407.2 Member Enumeration Documentation

6.407.2.1 enum activemq::util::PrimitiveValueNode::PrimitiveType

Enumeration for the various primitive types.

Enumerator:

NULL_TYPE

BOOLEAN_TYPE

BYTE_TYPE

CHAR_TYPE

SHORT_TYPE

INTEGER_TYPE

LONG_TYPE

DOUBLE_TYPE

FLOAT_TYPE

STRING_TYPE

BYTE_ARRAY_TYPE

MAP_TYPE

LIST_TYPE

BIG_STRING_TYPE

6.407.3 Constructor & Destructor Documentation

6.407.3.1 activemq::util::PrimitiveValueNode::PrimitiveValueNode ( )

Default Constructor, creates a value of the NULL_TYPE.

6.407.3.2 activemq::util::PrimitiveValueNode::PrimitiveValueNode (bool *value*)

Boolean Value Constructor.

Parameters

value	- the new value to store.

6.407.3.3 activemq::util::PrimitiveValueNode::PrimitiveValueNode (unsigned char *value*)

Byte Value Constructor.

Parameters

value	- the new value to store.

6.407.3.4 activemq::util::PrimitiveValueNode::PrimitiveValueNode (char *value*)

Char Value Constructor.

Parameters

value	- the new value to store.

6.407.3.5 activemq::util::PrimitiveValueNode::PrimitiveValueNode (short *value*)

Short Value Constructor.

Parameters

value	- the new value to store.

6.407.3.6 activemq::util::PrimitiveValueNode::PrimitiveValueNode (int *value*)

Int Value Constructor.

Parameters

value	- the new value to store.

6.407.3.7 activemq::util::PrimitiveValueNode::PrimitiveValueNode (long long *value*)

Long Value Constructor.

Parameters

value	- the new value to store.

6.407.3.8 activemq::util::PrimitiveValueNode::PrimitiveValueNode (float *value*)

Float Value Constructor.

Parameters

value	- the new value to store.

6.407.3.9 activemq::util::PrimitiveValueNode::PrimitiveValueNode (double *value*)

Double Value Constructor.

Parameters

value	- the new value to store.

6.407.3.10 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const char * *value*)

String Value Constructor.

Parameters

value	- the new value to store.

6.407.3.11 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::string & *value*)

String Value Constructor.

Parameters

value	- the new value to store.

6.407.3.12 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const std::vector< unsigned char > & *value*)

Byte Array Value Constructor.

Parameters

value	- the new value to store.

6.407.3.13 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::List< PrimitiveValueNode > & *value*)

Primtive List Constructor.

Parameters

value	- the new value to store.

6.407.3.14 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Primtive Map Value Constructor.

Parameters

value	- the new value to store.

6.407.3.15 activemq::util::PrimitiveValueNode::PrimitiveValueNode (const PrimitiveValueNode & *node*)

Copy constructor.

Parameters

node	The instance of another node to copy to this one.

6.407.3.16 activemq::util::PrimitiveValueNode::~PrimitiveValueNode ( ) [inline]

6.407.4 Member Function Documentation

6.407.4.1 void activemq::util::PrimitiveValueNode::clear ( )

Clears the value from this wrapper converting it back to a blank NULL_TYPE value.

6.407.4.2 bool activemq::util::PrimitiveValueNode::getBool ( ) const

Gets the Boolean value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.3 unsigned char activemq::util::PrimitiveValueNode::getByte ( ) const

Gets the Byte value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.4 std::vector<unsigned char> activemq::util::PrimitiveValueNode::getByteArray ( ) const

Gets the Byte Array value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.5 char activemq::util::PrimitiveValueNode::getChar ( ) const

Gets the Character value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.6 double activemq::util::PrimitiveValueNode::getDouble ( ) const

Gets the Double value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.7 float activemq::util::PrimitiveValueNode::getFloat ( ) const

Gets the Float value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.8 int activemq::util::PrimitiveValueNode::getInt ( ) const

Gets the Integer value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.9 const decaf::util::List<PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getList ( ) const

Gets the Primitive List value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.10 long long activemq::util::PrimitiveValueNode::getLong ( ) const

Gets the Long value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.11 const decaf::util::Map<std::string, PrimitiveValueNode>& activemq::util::PrimitiveValueNode::getMap ( ) const

Gets the Primitive Map value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.12 short activemq::util::PrimitiveValueNode::getShort ( ) const

Gets the Short value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.13 std::string activemq::util::PrimitiveValueNode::getString ( ) const

Gets the String value of this Node.

Returns

value contained at the given index

Exceptions

NoSuchElementException	this node cannot be returned as the requested type.

6.407.4.14 PrimitiveType activemq::util::PrimitiveValueNode::getType ( ) const [inline]

Gets the Value Type of this type wrapper.

Returns

the PrimitiveType value for this wrapper.

6.407.4.15 PrimitiveValue activemq::util::PrimitiveValueNode::getValue ( ) const [inline]

Gets the internal Primitive Value object from this wrapper.

Returns

a copy of the contained **PrimitiveValue** (p. 1660)

6.407.4.16 PrimitiveValueNode& activemq::util::PrimitiveValueNode::operator= (const PrimitiveValueNode & *node*)

Assignment operator, copies the data from the other node.

Parameters

node	The instance of another node to copy to this one.

6.407.4.17 bool activemq::util::PrimitiveValueNode::operator== (const PrimitiveValueNode & *node*) const

Comparison Operator, compares this node to the other node.

Returns

true if the values are the same false otherwise.

6.407.4.18 void activemq::util::PrimitiveValueNode::setBool (bool *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.19 void activemq::util::PrimitiveValueNode::setByte (unsigned char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.20 void activemq::util::PrimitiveValueNode::setByteArray (const std::vector< unsigned char > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.21 void activemq::util::PrimitiveValueNode::setChar (char *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.22 void activemq::util::PrimitiveValueNode::setDouble (double *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.23 void activemq::util::PrimitiveValueNode::setFloat (float *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.24 void activemq::util::PrimitiveValueNode::setInt (int *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.25 void activemq::util::PrimitiveValueNode::setList (const decaf::util::List< PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.26 void activemq::util::PrimitiveValueNode::setLong (long long *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.27 void activemq::util::PrimitiveValueNode::setMap (const decaf::util::Map< std::string, PrimitiveValueNode > & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.28 void activemq::util::PrimitiveValueNode::setShort (short *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.29 void activemq::util::PrimitiveValueNode::setString (const std::string & *value*)

Sets the value of this value node to the new value specified, this method overwrites any data that was previously at the index given.

Parameters

value	- the new value to assign to the element at index

6.407.4.30 void activemq::util::PrimitiveValueNode::setValue (const PrimitiveValue & *value,* PrimitiveType *valueType*)

Sets the internal PrimitiveVale object to the new value along with the tag for the type that it consists of.

Parameters

value	The value to set as the value contained in this Node.
valueType	The type of the value being set into this one.

6.407.4.31 std::string activemq::util::PrimitiveValueNode::toString ( ) const

Creates a string representation of this value.

Returns

string value of this type wrapper.

6.408.2.1 virtual decaf::security::Principal::~Principal ( ) [inline, virtual]

6.408.3 Member Function Documentation

6.408.3.1 virtual bool decaf::security::Principal::equals (const Principal & *another*) const [pure virtual]

Compares two principals to see if they are the same.

Parameters

another	A principal to be tested for equality to this one.

Returns

true if the given principal is equivalent to this one.

6.408.3.2 virtual std::string decaf::security::Principal::getName ( ) const [pure virtual]

Provides the name of this principal.

Returns

the name of this principal.

Implemented in **decaf::security::auth::x500::X500Principal** (p. 2260).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**Principal.h**

6.409 decaf::util::PriorityQueue< E > Class Template Reference

An unbounded priority queue based on a binary heap algorithm.

  *Assignment operator, assign another **PriorityQueue** (p. 1674) to this one.*
- virtual **decaf::util::Iterator**
  < E > * **iterator** ()
- virtual **decaf::util::Iterator**
  < E > * **iterator** () **const**
- virtual int **size** () **const**

  Returns the number of elements in this collection.
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

  This implementation repeatedly invokes poll until it returns false.
- virtual bool **offer** (**const** E &value)

  Inserts the specified element into the queue provided that the condition allows such an operation.
- virtual bool **poll** (E &result)

  Gets and removes the element in the head of the queue.
- virtual bool **peek** (E &result) **const**

  Gets but not removes the element in the head of the queue.
- virtual E **remove** ()

Gets and removes the element in the head of the queue.
*Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1537)	*if there is no element in the queue.*

This implementation returns the result of poll unless the queue is empty.

- virtual bool **remove** (**const** E &value)

Removes a single instance of the specified element from the collection.
More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	*The reference to the element to remove from this **Collection** (p. 660).*

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **add** (**const** E &value)

Returns true if this collection changed as a result of the call.
(Returns false if this collection does not permit duplicates and already contains the specified element.)
*Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.*
If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	*The reference to the element to add to this **Collection** (p. 660).*

Returns

*true if the element was added to this **Collection** (p. 660).*

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

This implementation returns true if offer succeeds, else throws an IllegalStateException.

- **decaf::lang::Pointer**
  < Comparator< E > > comparator () **const**

*obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 1674) is using to compare the elements in the queue with.*

Friends

- class **PriorityQueueIterator**

6.409.1 Detailed Description

template<typename E>class decaf::util::PriorityQueue< E >

An unbounded priority queue based on a binary heap algorithm.

The elements of the priority queue are ordered according to their natural ordering, or by a **Comparator** (p. 689) provided to one of the constructors that accepts Comparators. A priority queue relying on natural ordering also does not permit insertion of non-comparable objects (doing so may result in a compiler error).

The head of this queue is the least element with respect to the specified ordering. If multiple elements are tied for least value, the head is one of those elements -- ties are broken arbitrarily. The queue retrieval operations poll, remove, peek, and element access the element at the head of the queue.

A priority queue is unbounded, but has an internal capacity governing the size of an array used to store the elements on the queue. It is always at least as large as the queue size. As elements are added to a priority queue, its capacity grows automatically. The details of the growth policy are not specified.

This class and its iterator implement all of the optional methods of the **Collection** (p. 660) and **Iterator** (p. 1209) interfaces. The **Iterator** (p. 1209) provided in method **iterator()** (p. 1680) is not guaranteed to traverse the elements of the priority queue in any particular order. If you need ordered traversal, consider using `Arrays::sort( pq.toArray() )`.

Note that this implementation is not synchronized. Multiple threads should not access a **PriorityQueue** (p. 1674) instance concurrently if any of the threads modifies the queue. Instead, use the thread-safe PriorityBlockingQueue class.

Implementation note: this implementation provides O(log(n)) time for the enqueing and dequeing methods (offer, poll, **remove()** (p. 1681) and add); linear time for the remove(Object) and contains(Object) methods; and constant time for the retrieval methods (peek, element, and size).

Since

1.0

6.409.2 Constructor & Destructor Documentation

6.409.2.1 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue ( ) [inline]

Creates a Priority **Queue** (p. 1723) with the default initial capacity.

6.409.2.2 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int *initialCapacity*) [inline]

Creates a Priority **Queue** (p. 1723) with the capacity value supplied.

Parameters

initialCapacity	The initial number of elements allocated to this **PriorityQueue** (p. 1674).

6.409.2.3 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (int *initialCapacity,* Comparator< E > * *comparator*) [inline]

Creates a Priority **Queue** (p. 1723) with the default initial capacity.

This new **PriorityQueue** (p. 1674) takes ownership of the passed **Comparator** (p. 689) instance and uses that to determine the ordering of the elements in the **Queue** (p. 1723).

Parameters

initialCapacity	The initial number of elements allocated to this **PriorityQueue** (p. 1674).
comparator	The **Comparator** (p. 689) instance to use in sorting the elements in the **Queue** (p. 1723).

Exceptions

NullPointerException	if the passed **Comparator** (p. 689) is NULL.

6.409.2.4 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const Collection< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 1674) containing the elements in the specified **Collection** (p. 660).

Parameters

source	the **Collection** (p. 660) whose elements are to be placed into this priority queue

6.409.2.5 template<typename E> decaf::util::PriorityQueue< E >::PriorityQueue (const PriorityQueue< E > & *source*) [inline]

Creates a **PriorityQueue** (p. 1674) containing the elements in the specified priority queue.

This priority queue will be ordered according to the same ordering as the given priority queue.

Parameters

source	the priority queue whose elements are to be placed into this priority queue

6.409.2.6 template<typename E> virtual decaf::util::PriorityQueue< E >::~PriorityQueue ( ) [inline, virtual]

6.409.3 Member Function Documentation

6.409.3.1 template<typename E> virtual bool decaf::util::PriorityQueue< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an IllegalStateException.

This implementation returns true if offer succeeds, else throws an IllegalStateException.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 109).

References DECAF_CATCH_EXCEPTION_CONVERT, DECAF_CATCH_RETHROW, DECAF_CATCHALL_THROW, and decaf::util::PriorityQueue< E >::offer().

6.409.3.2 template<typename E> virtual void decaf::util::PriorityQueue< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false.

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 110).

6.409.3.3 template<typename E> decaf::lang::Pointer< Comparator<E> > decaf::util::PriorityQueue< E >::comparator ( ) const [inline]

obtains a Copy of the Pointer instance that this **PriorityQueue** (p. 1674) is using to compare the elements in the queue with.

The returned value is a copy, the caller cannot change the value if the internal Pointer value.

Returns

a copy of the **Comparator** (p. 689) Pointer being used by this **Queue** (p. 1723).

6.409.3.4 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

References decaf::util::PriorityQueue< E >::PriorityQueueIterator.

6.409.3.5 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::PriorityQueue< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

6.409.3.6 template<typename E> virtual bool decaf::util::PriorityQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters

value	the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException	if the **Queue** (p. 1723) implementation does not allow Null values to be inserted into the **Queue** (p. 1723).
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 1724).

Referenced by decaf::util::PriorityQueue< E >::add().

6.409.3.7 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const Collection< E > & *source*) [inline]

Assignment operator, assign another **Collection** (p. 660) to this one.

Parameters

source	The **Collection** (p. 660) to copy to this one.

6.409.3.8 template<typename E> PriorityQueue<E>& decaf::util::PriorityQueue< E >::operator= (const PriorityQueue< E > & *source*) [inline]

Assignment operator, assign another **PriorityQueue** (p. 1674) to this one.

Parameters

source	The **PriorityQueue** (p. 1674) to copy to this one.

6.409.3.9 template<typename E> virtual bool decaf::util::PriorityQueue< E >::peek (E & *result*) const [inline, virtual]

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 1725).

References decaf::util::AbstractCollection< E >::isEmpty().

6.409.3.10 template<typename E> virtual bool decaf::util::PriorityQueue< E >::poll (E & *result*) [inline, virtual]

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 1723) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implements **decaf::util::Queue< E >** (p. 1725).

References decaf::util::AbstractCollection< E >::isEmpty().

6.409.3.11 template<typename E> virtual E decaf::util::PriorityQueue< E >::remove ( ) [inline, virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

This implementation returns the result of poll unless the queue is empty.

This implementation returns the result of poll unless the queue is empty.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 111).

References decaf::util::AbstractCollection< E >::isEmpty().

6.409.3.12 template<typename E> virtual bool decaf::util::PriorityQueue< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

6.409.3.13 template<typename E> virtual int decaf::util::PriorityQueue< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

6.410.1 Constructor & Destructor Documentation

6.410.1.1 activemq::commands::ProducerAck::ProducerAck ( )

6.410.1.2 virtual activemq::commands::ProducerAck::~ProducerAck ( ) [virtual]

6.410.2 Member Function Documentation

6.410.2.1 virtual ProducerAck* activemq::commands::ProducerAck::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.410.2.2 virtual void activemq::commands::ProducerAck::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.410.2.3 virtual bool activemq::commands::ProducerAck::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.410.2.4 virtual unsigned char activemq::commands::ProducerAck::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.410.2.5 virtual const Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId ( ) const [virtual]

6.410.2.6 virtual Pointer<ProducerId>& activemq::commands::ProducerAck::getProducerId ( ) [virtual]

6.410.2.7 virtual int activemq::commands::ProducerAck::getSize ( ) const [virtual]

6.410.2.8 virtual bool activemq::commands::ProducerAck::isProducerAck ( ) const [inline, virtual]

Returns

an answer of true to the **isProducerAck()** (p. 1685) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.410.2.9 virtual void activemq::commands::ProducerAck::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.410.2.10 virtual void activemq::commands::ProducerAck::setSize (int *size*) [virtual]

6.410.2.11 virtual std::string activemq::commands::ProducerAck::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.410.2.12 virtual Pointer<Command> activemq::commands::ProducerAck::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.411.3 Member Function Documentation

6.411.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.411.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.411.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.411.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.411.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.411.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.411.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal

dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.412 activemq::cmsutil::ProducerCallback Class Reference

Callback for sending a message to a CMS destination.

`#include <src/main/activemq/cmsutil/ProducerCallback.h>`

Inheritance diagram for activemq::cmsutil::ProducerCallback:

Public Member Functions

- virtual ~**ProducerCallback** () throw ()
- virtual void **doInCms** (**cms::Session** *session, **cms::MessageProducer** *producer)=0

  Execute an action given a session and producer.

6.412.1 Detailed Description

Callback for sending a message to a CMS destination.

6.412.2 Constructor & Destructor Documentation

6.412.2.1 virtual activemq::cmsutil::ProducerCallback::~ProducerCallback ( ) throw () [inline, virtual]

6.412.3 Member Function Documentation

6.412.3.1 virtual void activemq::cmsutil::ProducerCallback::doInCms (cms::Session * *session*, cms::MessageProducer * *producer*) [pure virtual]

Execute an action given a session and producer.

Parameters

session	the CMS `Session`
producer	the CMS `Producer`

Exceptions

cms::CMSException *(p. 640)*	if thrown by CMS API methods

Implemented in **activemq::cmsutil::CmsTemplate::SendExecutor** (p. 1815).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**ProducerCallback.h**

6.413 activemq::cmsutil::CmsTemplate::ProducerExecutor Class Reference

`#include <src/main/activemq/cmsutil/CmsTemplate.h>`

Inheritance diagram for activemq::cmsutil::CmsTemplate::ProducerExecutor:

Public Member Functions

- **ProducerExecutor** (**ProducerCallback** ∗**action**, **CmsTemplate** ∗**parent**, **cms::Destination** ∗**destination**)
- virtual ∼**ProducerExecutor** () throw ()
- virtual void **doInCms** (**cms::Session** ∗session)

  Execute any number of operations against the supplied CMS session.
- virtual **cms::Destination** ∗ **getDestination** (**cms::Session** ∗session AMQCPP_UNUSED)

Protected Attributes

- **ProducerCallback** ∗ **action**
- **CmsTemplate** ∗ **parent**
- **cms::Destination** ∗ **destination**

6.413.1 Constructor & Destructor Documentation

6.413.1.2 virtual activemq::cmsutil::CmsTemplate::ProducerExecutor::∼ProducerExecutor ( ) throw () [inline, virtual]

6.413.2 Member Function Documentation

6.413.2.1 virtual void activemq::cmsutil::CmsTemplate::ProducerExecutor::doInCms (cms::Session ∗ *session*) [virtual]

Execute any number of operations against the supplied CMS session.

Parameters

session	the CMS `Session`

Exceptions

CMSException	if thrown by CMS API methods

Implements **activemq::cmsutil::SessionCallback** (p. 1842).

6.413.2.2 virtual cms::Destination* activemq::cmsutil::CmsTemplate::ProducerExecutor::getDestination (cms::Session *session *AMQCPP_UNUSED*) [inline, virtual]

6.414.1 Member Typedef Documentation

6.414.1.1 typedef decaf::lang::PointerComparator<ProducerId> activemq::commands::ProducerId::COMPARATOR

6.414.2 Constructor & Destructor Documentation

6.414.2.1 activemq::commands::ProducerId::ProducerId ( )

6.414.2.2 activemq::commands::ProducerId::ProducerId (const ProducerId & *other*)

6.414.2.3 activemq::commands::ProducerId::ProducerId (const SessionId & *sessionId,* long long *consumerId*)

6.414.2.4 activemq::commands::ProducerId::ProducerId (std::string *producerId*)

6.414.2.5 virtual activemq::commands::ProducerId::~ProducerId ( ) [virtual]

6.414.3 Member Function Documentation

6.414.3.1 virtual ProducerId* activemq::commands::ProducerId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.414.3.2 virtual int activemq::commands::ProducerId::compareTo (const ProducerId & *value*) const [virtual]

6.414.3.3 virtual void activemq::commands::ProducerId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.414.3.4 virtual bool activemq::commands::ProducerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.414.3.5 virtual bool activemq::commands::ProducerId::equals (const ProducerId & *value*) const [virtual]

6.414.3.6 virtual const std::string& activemq::commands::ProducerId::getConnectionId ( ) const [virtual]

6.414.3.7 virtual std::string& activemq::commands::ProducerId::getConnectionId ( ) [virtual]

6.414.3.8 virtual unsigned char activemq::commands::ProducerId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.414.3.9 const Pointer<SessionId>& activemq::commands::ProducerId::getParentId ( ) const

6.414.3.10 virtual long long activemq::commands::ProducerId::getSessionId ( ) const [virtual]

6.414.3.11 virtual long long activemq::commands::ProducerId::getValue ( ) const [virtual]

6.414.3.12 virtual bool activemq::commands::ProducerId::operator< (const ProducerId & *value*) const [virtual]

6.414.3.13 ProducerId& activemq::commands::ProducerId::operator= (const ProducerId & *other*)

6.414.3.14 virtual bool activemq::commands::ProducerId::operator== (const ProducerId & *value*) const [virtual]

6.414.3.15 virtual void activemq::commands::ProducerId::setConnectionId (const std::string & *connectionId*) [virtual]

6.414.3.16 void activemq::commands::ProducerId::setProducerSessionKey (std::string *sessionKey*)

6.414.3.17 virtual void activemq::commands::ProducerId::setSessionId (long long *sessionId*) [virtual]

6.414.3.18 virtual void activemq::commands::ProducerId::setValue (long long *value*) [virtual]

6.414.3.19 virtual std::string activemq::commands::ProducerId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.414.4 Field Documentation

6.414.4.1 std::string activemq::commands::ProducerId::connectionId [protected]

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller:

Public Member Functions

- **ProducerIdMarshaller** ()
- virtual ~**ProducerIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.415.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 1694).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.415.2 Constructor & Destructor Documentation

6.415.2.1 activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::ProducerIdMarshaller ( ) [inline]

6.415.2.2 virtual activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::∼ProducerIdMarshaller ( ) [inline, virtual]

6.415.3 Member Function Documentation

6.415.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.415.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.415.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.415.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.415.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.415.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.415.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

6.416.1 Constructor & Destructor Documentation

6.416.1.1 activemq::commands::ProducerInfo::ProducerInfo ( )

6.416.1.2 virtual activemq::commands::ProducerInfo::~ProducerInfo ( ) [virtual]

6.416.2 Member Function Documentation

6.416.2.1 virtual ProducerInfo* activemq::commands::ProducerInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.416.2.2 virtual void activemq::commands::ProducerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.416.2.3 Pointer<RemoveInfo> activemq::commands::ProducerInfo::createRemoveCommand ( ) const

6.416.2.4 virtual bool activemq::commands::ProducerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.416.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath ( ) const [virtual]

6.416.2.6 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ProducerInfo::getBrokerPath ( ) [virtual]

6.416.2.7 virtual unsigned char activemq::commands::ProducerInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.416.2.8 virtual const Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination ( ) const [virtual]

6.416.2.9 virtual Pointer<ActiveMQDestination>& activemq::commands::ProducerInfo::getDestination ( ) [virtual]

6.416.2.10 virtual const Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId ( ) const [virtual]

6.416.2.11 virtual Pointer<ProducerId>& activemq::commands::ProducerInfo::getProducerId ( ) [virtual]

6.416.2.12 virtual int activemq::commands::ProducerInfo::getWindowSize ( ) const [virtual]

6.416.2.13 virtual bool activemq::commands::ProducerInfo::isDispatchAsync ( ) const [virtual]

6.416.2.14 virtual bool activemq::commands::ProducerInfo::isProducerInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isProducerInfo()** (p. 1700) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.416.2.15 virtual void activemq::commands::ProducerInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.416.2.16 virtual void activemq::commands::ProducerInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.416.2.17 virtual void activemq::commands::ProducerInfo::setDispatchAsync (bool *dispatchAsync*) [virtual]

6.416.2.18 virtual void activemq::commands::ProducerInfo::setProducerId (const Pointer< ProducerId > & *producerId*) [virtual]

6.416.2.19 virtual void activemq::commands::ProducerInfo::setWindowSize (int *windowSize*) [virtual]

6.416.2.20 virtual std::string activemq::commands::ProducerInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.416.2.21 virtual Pointer<Command> activemq::commands::ProducerInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.417.1 Detailed Description

Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 1701).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.417.2 Constructor & Destructor Documentation

6.417.2.1 activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::ProducerInfoMarshaller ( ) [inline]

6.417.2.2 virtual activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::∼ProducerInfoMarshaller ( ) [inline, virtual]

6.417.3 Member Function Documentation

6.417.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.417.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.417.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.417.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.417.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.417.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.417.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.419 decaf::util::Properties Class Reference

Java-like properties class for mapping string names to string values.

`#include <src/main/decaf/util/Properties.h>`

Public Member Functions

- **Properties** ()
- **Properties** (**const Properties** &src)
- virtual ~**Properties** ()
- **Properties** & **operator=** (**const Properties** &src)

  Assignment Operator.
- bool **isEmpty** () **const**

  Returns true if the properties object is empty.
- int **size** () **const**
- **const** char * **getProperty** (**const** std::string &name) **const**

  Looks up the value for the given property.
- std::string **getProperty** (**const** std::string &name, **const** std::string &defaultValue) **const**

  Looks up the value for the given property.
- std::string **setProperty** (**const** std::string &name, **const** std::string &value)

  Sets the value for a given property.
- bool **hasProperty** (**const** std::string &name) **const**

  Check to see if the Property exists in the set.
- std::string **remove** (**const** std::string &name)

  Removes the property with the given name.
- std::vector< std::string > **propertyNames** () **const**

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

- std::vector< std::pair < std::string, std::string > > **toArray** () **const**

  Method that serializes the contents of the property map to an array.

- void **copy** (**const Properties** &source)

  *Copies the contents of the given properties object to this one, if the given **Properties** (p. 1705) instance in NULL then this **List** (p. 1286) is not modified.*

- **Properties** * **clone** () **const**

  Clones this object.

- void **clear** ()

  Clears all properties from the map.

- bool **equals** (**const Properties** &source) **const**

  *Test whether two **Properties** (p. 1705) objects are equivalent.*

- std::string **toString** () **const**

  *Formats the contents of the **Properties** (p. 1705) Object into a string that can be logged, etc.*

- void **load** (**decaf::io::InputStream** *stream)

  Reads a property list (key and element pairs) from the input byte stream.

- void **load** (**decaf::io::Reader** *reader)

  Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

- void **store** (**decaf::io::OutputStream** *out, **const** std::string &comment)

  *Writes this property list (key and element pairs) in this **Properties** (p. 1705) table to the output stream in a format suitable for loading into a **Properties** (p. 1705) table using the load(InputStream) method.*

- void **store** (**decaf::io::Writer** *writer, **const** std::string &comments)

  *Writes this property list (key and element pairs) in this **Properties** (p. 1705) table to the output character stream in a format that can be read by the load(Reader) method.*

Protected Attributes

- **decaf::lang::Pointer< Properties > defaults**

  Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

6.419.1 Detailed Description

Java-like properties class for mapping string names to string values.

The **Properties** (p. 1705) list contains a key value pair of properties that can be loaded and stored to a stream. Each **Properties** (p. 1705) instance can contain an internal **Properties** (p. 1705) list that contains default values for keys not found in the **Properties** (p. 1705) **List** (p. 1286).

The **Properties** (p. 1705) list if a Thread Safe class, it can be shared amongst objects in multiple threads without the need for additional synchronization.

Since

1.0

6.419.2 Constructor & Destructor Documentation

6.419.2.1 decaf::util::Properties::Properties ( )

6.419.2.2 decaf::util::Properties::Properties (const Properties & *src*)

6.419.2.3 virtual decaf::util::Properties::~Properties ( ) [virtual]

6.419.3 Member Function Documentation

6.419.3.1 void decaf::util::Properties::clear ( )

Clears all properties from the map.

6.419.3.2 Properties* decaf::util::Properties::clone ( ) const

Clones this object.

Returns

a replica of this object.

6.419.3.3 void decaf::util::Properties::copy (const Properties & *source*)

Copies the contents of the given properties object to this one, if the given **Properties** (p. 1705) instance in NULL then this **List** (p. 1286) is not modified.

Parameters

source	The source properties object.

6.419.3.4 bool decaf::util::Properties::equals (const Properties & *source*) const

Test whether two **Properties** (p. 1705) objects are equivalent.

Two **Properties** (p. 1705) Objects are considered equivalent when they each contain the same number of elements and each key / value pair contained within the two are equal.

This comparison does not check the contents of the Defaults instance.

Parameters

source	The **Properties** (p. 1705) object to compare this instance to.

Returns

true if the contents of the two **Properties** (p. 1705) objects are the same.

6.419.3.5 const char* decaf::util::Properties::getProperty (const std::string & *name*) const

Looks up the value for the given property.

Parameters

name	The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

6.419.3.6 std::string decaf::util::Properties::getProperty (const std::string & *name,* const std::string & *defaultValue*) const

Looks up the value for the given property.

Parameters

name	The name of the property to be looked up.
defaultValue	The value to be returned if the given property does not exist.

Returns

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

6.419.3.7 bool decaf::util::Properties::hasProperty (const std::string & *name*) const

Check to see if the Property exists in the set.

Parameters

name	The property name to check for in this properties set.

Returns

true if property exists, false otherwise.

6.419.3.8 bool decaf::util::Properties::isEmpty ( ) const

Returns true if the properties object is empty.

Returns

true if empty

6.419.3.9 void decaf::util::Properties::load (decaf::io::InputStream * *stream*)

Reads a property list (key and element pairs) from the input byte stream.

The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use the ISO 8859-1 character encoding.

This method does not close the stream upon its return.

Parameters

stream	The stream to read the properties data from.

Exceptions

IOException	if there is an error while reading from the stream.
IllegalArgumentException	if malformed data is found while reading the properties.
NullPointerException	if the passed stream is Null.

6.419.3.10 void decaf::util::Properties::load (decaf::io::Reader * *reader*)

Reads a property list (key and element pairs) from the input character stream in a simple line-oriented format.

Properties (p. 1705) are processed in terms of lines. There are two kinds of line, natural lines and logical lines. A natural line is defined as a line of characters that is terminated either by a set of line terminator characters (

or or

) or by the end of the stream. A natural line may be either a blank line, a comment line, or hold all or some of a key-element pair. A logical line holds all the data of a key-element pair, which may be spread out across several adjacent natural lines by escaping the line terminator sequence with a backslash character . Note that a comment line cannot be extended in this manner; every natural line that is a comment must have its own comment indicator, as described below. Lines are read from input until the end of the stream is reached.

A natural line that contains only white space characters is considered blank and is ignored. A comment line has an ASCII '#' or '!' as its first non-white space character; comment lines are also ignored and do not encode key-element information. In addition to line terminators, this format considers the characters space (' '), tab (''), and form feed ('') to be white space.

If a logical line is spread across several natural lines, the backslash escaping the line terminator sequence, the line terminator sequence, and any white space at the start of the following line have no affect on the key or element values. The remainder of the discussion of key and element parsing (when loading) will assume all the characters constituting the key and element appear on a single natural line after line continuation characters have been removed. Note that it is not sufficient to only examine the character preceding a line terminator sequence to decide if the line terminator is escaped; there must be an odd number of contiguous backslashes for the line terminator to be escaped. Since the input is processed from left to right, a non-zero even number of 2n contiguous backslashes before a line terminator (or elsewhere) encodes n backslashes after escape processing.

The key contains all of the characters in the line starting with the first non-white space character and up to, but not including, the first unescaped '=', ':', or white space character other than a line terminator. All of these key termination characters may be included in the key by escaping them with a preceding backslash character; for example,

\:\=

would be the two-character key ":=". Line terminator characters can be included using and

escape sequences. Any white space after the key is skipped; if the first non-white space character after the key is '=' or ':', then it is ignored and any white space characters after it are also skipped. All remaining characters on the line become part of the associated element string; if there are no remaining characters, the element is the empty string "". Once the raw character sequences constituting the key and element are identified, escape processing is performed as described above.

As an example, each of the following three lines specifies the key "Truth" and the associated element value "Beauty":

Truth = Beauty Truth:Beauty Truth :Beauty

As another example, the following three lines specify a single property:

fruits apple, banana, pear, \ cantaloupe, watermelon, \ kiwi, mango

The key is "fruits" and the associated element is: "apple, banana, pear, cantaloupe, watermelon, kiwi, mango"

Note that a space appears before each \ so that a space will appear after each comma in the final result; the \, line terminator, and leading white space on the continuation line are merely discarded and are not replaced by one or more other characters.

As a third example, the line:

cheeses

specifies that the key is "cheeses" and the associated element is the empty string "".

Characters in keys and elements can be represented in escape sequences similar to those used for character and string literals (see §3.3 and §3.10.6 of the Java Language Specification). The differences from the character escape sequences and Unicode escapes used for characters and strings are:

- Octal escapes are not recognized.
  - The character sequence **does** not represent a backspace character.
  - The method does not treat a backslash character, \, before a non-valid escape character as an error; the backslash is silently dropped. For example, in a C++ string the sequence "\z" would cause a compile time error. In contrast, this method silently drops the backslash. Therefore, this method treats the two character sequence "\b" as equivalent to the single character 'b'.
  - Escapes are not necessary for single and double quotes; however, by the rule above, single and double quote characters preceded by a backslash still yield single and double quote characters, respectively.

This method does not close the Reader upon its return.

Parameters

reader	The Reader that provides an character stream as input.

Exceptions

IOException	if there is an error while reading from the stream.
IllegalArgumentException	if malformed data is found while reading the properties.
NullPointerException	if the passed stream is Null.

6.419.3.11 Properties& decaf::util::Properties::operator= (const Properties & *src*)

Assignment Operator.

Parameters

src	The **Properties** (p. 1705) list to copy to this **List** (p. 1286).

Returns

a reference to this **List** (p. 1286) for use in chaining.

6.419.3.12 std::vector<std::string> decaf::util::Properties::propertyNames ( ) const

Returns an enumeration of all the keys in this property list, including distinct keys in the default property list if a key of the same name has not already been found from the main properties list.

Returns

a set of keys in this property list where the key and its corresponding value are strings, including the keys in the default property list.

6.419.3.13 std::string decaf::util::Properties::remove (const std::string & *name*)

Removes the property with the given name.

Parameters

name	The name of the property to remove.

Returns

the previous value of the property if set, or empty string.

6.419.3.14 std::string decaf::util::Properties::setProperty (const std::string & *name,* const std::string & *value*)

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name	The name of the value to be written.
value	The value to be written.

Returns

the old value of the property or empty string if not set.

6.419.3.15 int decaf::util::Properties::size ( ) const

Returns

The number of **Properties** (p. 1705) in this **Properties** (p. 1705) Object.

6.419.3.16 void decaf::util::Properties::store (decaf::io::OutputStream * *out,* const std::string & *comment*)

Writes this property list (key and element pairs) in this **Properties** (p. 1705) table to the output stream in a format suitable for loading into a **Properties** (p. 1705) table using the load(InputStream) method.

Properties (p. 1705) from the defaults table of this **Properties** (p. 1705) table (if any) are not written out by this method.

This method outputs the comments, properties keys and values in the same format as specified in store(Writer), with the following differences:

- The stream is written using the ISO 8859-1 character encoding.
  - Characters not in Latin-1 in the comments are written as for their appropriate unicode hexadecimal value xxxx.
  - Characters less than and characters greater than in property keys or values are written as for the appropriate hexadecimal value xxxx.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

out	The OutputStream instance to write the properties to.
comment	A description of these properties that is written to the output stream.

Exceptions

IOException	if there is an error while writing from the stream.
NullPointerException	if the passed stream is Null.

6.419.3.17 void decaf::util::Properties::store (decaf::io::Writer * *writer,* const std::string & *comments*)

Writes this property list (key and element pairs) in this **Properties** (p. 1705) table to the output character stream in a format that can be read by the load(Reader) method.

Properties (p. 1705) from the defaults table of this **Properties** (p. 1705) table (if any) are not written out by this method.

If the comments argument is not empty, then an ASCII # character, the comments string, and a line separator are first written to the output stream. Thus, the comments can serve as an identifying comment. Any one of a line feed ('

'), a carriage return (''), or a carriage return followed immediately by a line feed in comments is replaced by a line separator generated by the Writer and if the next character in comments is not character # or character ! then an ASCII # is written out after that line separator.

Next, a comment line is always written, consisting of an ASCII # character, the current date and time (as if produced by the toString method of **Date** (p. 882) for the current time), and a line separator as generated by the Writer.

Then every entry in this **Properties** (p. 1705) table is written out, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with a preceding \ character. For the element, leading space characters, but not embedded or trailing space characters, are written with a preceding \ character. The key and element characters #, !, =, and : are written with a preceding backslash to ensure that they are properly loaded.

After the entries have been written, the output stream is flushed. The output stream remains open after this method returns.

Parameters

writer	The Writer instance to use to output the properties.
comments	A description of these properties that is written before writing the properties.

Exceptions

IOException	if there is an error while writing from the stream.
NullPointerException	if the passed stream is Null.

6.419.3.18 std::vector< std::pair< std::string, std::string > > decaf::util::Properties::toArray ( ) const

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

6.419.3.19 std::string decaf::util::Properties::toString ( ) const

Formats the contents of the **Properties** (p. 1705) Object into a string that can be logged, etc.

Returns

string value of this object.

6.419.4 Field Documentation

6.419.4.1 decaf::lang::Pointer<Properties> decaf::util::Properties::defaults [protected]

Default list used to answer for any keys not found in the properties list, can be filled in by another implementation of this class.

The documentation for this class was generated from the following file:

Default Constructor.

6.421.1.2 decaf::net::ProtocolException::ProtocolException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.421.1.3 decaf::net::ProtocolException::ProtocolException (const ProtocolException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.421.1.4 decaf::net::ProtocolException::ProtocolException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.421.1.5 decaf::net::ProtocolException::ProtocolException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.421.1.6 decaf::net::ProtocolException::ProtocolException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.421.1.7 virtual decaf::net::ProtocolException::~ProtocolException ( ) throw () [inline, virtual]

6.421.2 Member Function Documentation

6.421.2.1 virtual ProtocolException* decaf::net::ProtocolException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

6.423.1 Detailed Description

A **PushbackInputStream** (p. 1716) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.

This is useful in situations where it is convenient for a fragment of code to read an indefinite number of data bytes that are delimited by a particular byte value; after reading the terminating byte, the code fragment can "unread" it, so that the next read operation on the input stream will reread the byte that was pushed back. For example, bytes representing the characters constituting an identifier might be terminated by a byte representing an operator character; a method whose job is to read just an identifier can read until it sees the operator and then push the operator back to be re-read.

Since

1.0

6.423.2 Constructor & Destructor Documentation

6.423.2.1 decaf::io::PushbackInputStream::PushbackInputStream (InputStream * *stream,* bool *own* = `false`)

Creates a **PushbackInputStream** (p. 1716) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

stream	The **InputStream** (p. 1134) instance to wrap.
Boolean	value indicating if this **FilterInputStream** (p. 1032) owns the wrapped stream.

6.423.2.2 decaf::io::PushbackInputStream::PushbackInputStream (InputStream * *stream,* int *bufSize,* bool *own* = `false`)

Creates a **PushbackInputStream** (p. 1716) and saves its argument, the input stream in, for later use.

Initially, there is no pushed-back byte.

Parameters

stream	The **InputStream** (p. 1134) instance to wrap.
bufSize	The number of byte to allocate for pushback into this stream.
Boolean	value indicating if this **FilterInputStream** (p. 1032) owns the wrapped stream.

Exceptions

IllegalArgumentException	if the bufSize argument is $<$ zero.

6.423.2.3 virtual decaf::io::PushbackInputStream::~PushbackInputStream ( ) [virtual]

6.423.3 Member Function Documentation

6.423.3.1 virtual int decaf::io::PushbackInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Returns the sum of the number of pushed back bytes if any and the amount of bytes available in the underlying stream via a call to available.

Reimplemented from **decaf::io::FilterInputStream** (p. 1034).

6.423.3.2 virtual int decaf::io::PushbackInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.423.3.3 virtual int decaf::io::PushbackInputStream::doReadByte ( ) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.423.3.4 virtual void decaf::io::PushbackInputStream::mark (int *readLimit*) [virtual]

Does nothing except throw an **IOException** (p. 1198).

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.423.3.5 virtual bool decaf::io::PushbackInputStream::markSupported ( ) const [inline, virtual]

Does nothing except throw an **IOException** (p. 1198).

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.423.3.6 virtual void decaf::io::PushbackInputStream::reset ( ) [virtual]

Does nothing except throw an **IOException** (p. 1198).

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

6.423.3.7 virtual long long decaf::io::PushbackInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

This method first skips bytes in the local pushed back buffer before attempting to complete the request by calling the underlying stream skip method with the remainder of bytes that needs to be skipped.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

6.423.3.8 void decaf::io::PushbackInputStream::unread (unsigned char *value*)

Pushes back the given byte, the byte is copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back byte.

Parameters

value	The byte that is to be placed at the front of the push back buffer.

Exceptions

IOException *(p. 1198)*	if there is not enough space in the pushback buffer or this stream has already been closed.

6.423.3.9 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer,* int *size*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

buffer	The bytes to copy to the front of push back buffer.
size	The size of the array to be copied.

Exceptions

NullPointerException	if the buffer passed is NULL.
IndexOutOfBounds-Exception	if the size value given is negative.
IOException *(p. 1198)*	if there is not enough space in the pushback buffer or this stream has already been closed.

6.423.3.10 void decaf::io::PushbackInputStream::unread (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Pushes back the given array of bytes, the bytes are copied to the front of the pushback buffer, future calls to read start reading from the beginning of these pushed back bytes.

Parameters

buffer	The bytes to copy to the front of push back buffer.
size	The size of the array to be copied.
offset	The position in the buffer to start copying from.
length	The number of bytes to push back from the passed buffer.

Exceptions

NullPointerException	if the buffer passed is NULL.
IndexOutOfBounds-Exception	if the offset + length is greater than the buffer size.

IOException *(p. 1198)*	if there is not enough space in the pushback buffer or this stream has already been closed.

6.424 cms::Queue Class Reference

An interface encapsulating a provider-specific queue name.

`#include <src/main/cms/Queue.h>`

Inheritance diagram for cms::Queue:

Public Member Functions

- virtual ~**Queue** () throw ()
- virtual std::string **getQueueName** () **const** =0

  Gets the name of this queue.

6.424.1 Detailed Description

An interface encapsulating a provider-specific queue name.

Messages sent to a **Queue** (p. 1722) are sent to a Single Subscriber on that **Queue** (p. 1722) **Destination** (p. 936). This allows for Queues to be used as load balances implementing a SEDA based architecture. The length of time that a Provider will store a **Message** (p. 1426) in a **Queue** (p. 1722) is not defined by the CMS API, consult your Provider documentation for this information.

Since

  Gets and removes the element in the head of the queue.
- virtual E **remove** ()=0

  Gets and removes the element in the head of the queue.
- virtual bool **peek** (E &result) **const** =0

  Gets but not removes the element in the head of the queue.
- virtual E **element** () **const** =0

  Gets but not removes the element in the head of the queue.

6.425.1 Detailed Description

template<typename E>class decaf::util::Queue< E >

A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Generally, a queue orders its elements by means of first-in-first-out. While priority queue orders its elements according to a comparator specified or the elements' natural order. Furthermore, a stack orders its elements last-in-first out.

Queue (p. 1723) does not provide blocking queue methods, which will block until the operation of the method is allowed. BlockingQueue interface defines such methods.

Unlike the Java **Queue** (p. 1723) interface the methods of this class cannot return null to indicate that a **Queue** (p. 1723) is empty since null has no meaning for elements such as classes, structs and primitive types and cannot be used in a meaningful way to check for an empty queue. Methods that would have returned null in the Java **Queue** (p. 1723) interface have been altered to return a boolean value indicating if the operation succeeded and take single argument that is a reference to the location where the returned value is to be assigned. This implies that elements in the **Queue** (p. 1723) must be *assignable* in order to utilize these methods.

Since

1.0

6.425.2 Constructor & Destructor Documentation

6.425.2.1 template<typename E> virtual decaf::util::Queue< E >::~Queue ( ) [inline, virtual]

6.425.3 Member Function Documentation

6.425.3.1 template<typename E> virtual E decaf::util::Queue< E >::element ( ) const [pure virtual]

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

Implemented in **decaf::util::LinkedList< E >** (p. 1276), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1276), **decaf::util::LinkedList< CompositeTask * >** (p. 1276), **decaf::util::LinkedList< URI >** (p. 1276), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1276), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1276), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1276), **decaf::util::LinkedList< Pointer< Command > >** (p. 1276), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1276), **decaf::util::LinkedList< cms::Destination * >** (p. 1276), **decaf::util::LinkedList< cms::Session * >** (p. 1276), **decaf::util::LinkedList< cms::Connection * >** (p. 1276), and **decaf::util::AbstractQueue< E >** (p. 111).

6.425.3.2 template<typename E> virtual bool decaf::util::Queue< E >::offer (const E & *value*) [pure virtual]

Inserts the specified element into the queue provided that the condition allows such an operation.

The method is generally preferable to the collection.add(E), since the latter might throw an exception if the operation fails.

Parameters

value	the specified element to insert into the queue.

Returns

true if the operation succeeds and false if it fails.

Exceptions

NullPointerException	if the **Queue** (p. 1723) implementation does not allow Null values to be inserted into the **Queue** (p. 1723).
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1262), **decaf::util::LinkedList< E >** (p. 1279), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1279), **decaf::util::LinkedList< CompositeTask * >** (p. 1279), **decaf::util::LinkedList< URI >** (p. 1279), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1279), **decaf-**

::util::LinkedList< Pointer< DestinationInfo > > (p. 1279), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1279), **decaf::util::LinkedList< Pointer< Command > >** (p. 1279), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1279), **decaf::util::LinkedList< cms::Destination * >** (p. 1279), **decaf::util::LinkedList< cms::Session * >** (p. 1279), **decaf::util::LinkedList< cms::Connection * >** (p. 1279), **decaf::util::PriorityQueue< E >** (p. 1680), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2062).

Referenced by decaf::util::AbstractQueue< E >::add().

6.425.3.3 template<typename E> virtual bool decaf::util::Queue< E >::peek (E & *result*) const [pure virtual]

Gets but not removes the element in the head of the queue.

The result if successful is assigned to the result parameter.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1263), **decaf::util::LinkedList< E >** (p. 1280), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1280), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1280), **decaf::util::LinkedList< CompositeTask * >** (p. 1280), **decaf::util::LinkedList< URI >** (p. 1280), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1280), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1280), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1280), **decaf::util::LinkedList< Pointer< Command > >** (p. 1280), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1280), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1280), **decaf::util::LinkedList< cms::Destination * >** (p. 1280), **decaf::util::LinkedList< cms::Session * >** (p. 1280), **decaf::util::LinkedList< cms::Connection * >** (p. 1280), and **decaf::util::PriorityQueue< E >** (p. 1681).

Referenced by decaf::util::AbstractQueue< E >::element().

6.425.3.4 template<typename E> virtual bool decaf::util::Queue< E >::poll (E & *result*) [pure virtual]

Gets and removes the element in the head of the queue.

If the operation succeeds the value of the element at the head of the **Queue** (p. 1723) is assigned to the result parameter and the method returns true. If the operation fails the method returns false and the value of the result parameter is undefined.

Parameters

result	Reference to an instance of the contained type to assigned the removed value to.

Returns

true if the element at the head of the queue was removed and assigned to the result parameter.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1264), **decaf::util::LinkedList< E >** (p. 1281), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1281), **decaf::util::LinkedList< CompositeTask * >** (p. 1281), **decaf::util::LinkedList< URI >** (p. 1281), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1281), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1281), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1281), **decaf::util::LinkedList< Pointer< Command > >** (p. 1281), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1281), **decaf::util-**

::LinkedList< cms::Destination * > (p. 1281), **decaf::util::LinkedList< cms::Session * >** (p. 1281), **decaf::util::LinkedList< cms::Connection * >** (p. 1281), **decaf::util::PriorityQueue< E >** (p. 1681), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2063).

Referenced by decaf::util::AbstractQueue< E >::clear(), and decaf::util::AbstractQueue< E >::remove().

6.425.3.5 template<typename E> virtual E decaf::util::Queue< E >::remove ( ) [pure virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

Implemented in **decaf::util::LinkedList< E >** (p. 1283), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1283), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1283), **decaf::util::LinkedList< CompositeTask * >** (p. 1283), **decaf::util::LinkedList< URI >** (p. 1283), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1283), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1283), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1283), **decaf::util::LinkedList< Pointer< Command > >** (p. 1283), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1283), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1283), **decaf::util::LinkedList< cms::Destination * >** (p. 1283), **decaf::util::LinkedList< cms::Session * >** (p. 1283), **decaf::util::LinkedList< cms::Connection * >** (p. 1283), **decaf::util::PriorityQueue< E >** (p. 1681), and **decaf::util::AbstractQueue< E >** (p. 111).

6.426 cms::QueueBrowser Class Reference

This class implements in interface for browsing the messages in a **Queue** (p. 1722) without removing them.

`#include <src/main/cms/QueueBrowser.h>`

Inheritance diagram for cms::QueueBrowser:

Public Member Functions

- virtual ~**QueueBrowser** () throw ()
- virtual **const Queue * getQueue** () **const** =0
- virtual std::string **getMessageSelector** () **const** =0
- virtual **cms::MessageEnumeration * getEnumeration** ()=0

  *Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 1722) in the order that a client would receive them.*

6.426.1 Detailed Description

This class implements in interface for browsing the messages in a **Queue** (p. 1722) without removing them.

To browse the contents of the **Queue** (p. 1722) the client calls the `getEnumeration` method to retrieve a new instance of a **Queue** (p. 1722) Enumerator. The client then calls the hasMoreMessages method of the Enumeration, if it returns true the client can safely call the nextMessage method of the Enumeration instance.

```
Enumeration* enumeration = queueBrowser->getEnumeration();

while( enumeration->hasMoreMessages() ) {
    cms::Message* message = enumeration->nextMessage();

    // ... Do something with the Message.

    delete message;
}
```

6.426.3 Member Function Documentation

6.426.3.1 virtual cms::MessageEnumeration* cms::QueueBrowser::getEnumeration ( ) [pure virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the **Queue** (p. 1722) in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

Returns

a pointer to a **Queue** (p. 1722) Enumeration, this Pointer is owned by the **QueueBrowser** (p. 1726) and should not be deleted by the client.

Exceptions

CMSException *(p. 640)*	if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 253).

6.426.3.2 virtual std::string cms::QueueBrowser::getMessageSelector ( ) const [pure virtual]

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

CMSException *(p. 640)*	if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 254).

6.426.3.3 virtual const Queue* cms::QueueBrowser::getQueue ( ) const [pure virtual]

Returns

the **Queue** (p. 1722) that this browser is listening on.

Exceptions

CMSException *(p. 640)*	if an internal error occurs.

Implemented in **activemq::core::ActiveMQQueueBrowser** (p. 254).

6.427 decaf::util::Random Class Reference

Random (p. 1728) Value Generator which is used to generate a stream of pseudorandom numbers.

`#include <src/main/decaf/util/Random.h>`

Inheritance diagram for decaf::util::Random:

Public Member Functions

- **Random** ()

  Construct a random generator with the current time of day in milliseconds as the initial state.
- **Random** (unsigned long long seed)

  Construct a random generator with the given `seed` as the initial state.
- virtual ∼**Random** ()
- bool **nextBoolean** ()

  Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.
- double **nextDouble** ()

  Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.
- float **nextFloat** ()

  Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.
- double **nextGaussian** ()

  Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of `1.0` using the polar method of G.
- int **nextInt** ()

  Generates a uniformly distributed 32-bit `int` value from the this random number sequence.
- int **nextInt** (int n)

  Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).
- long long **nextLong** ()

  Generates a uniformly distributed 64-bit `int` value from the this random number sequence.
- virtual void **nextBytes** (std::vector< unsigned char > &buf)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.
- virtual void **nextBytes** (unsigned char *buf, int size)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.
- virtual void **setSeed** (unsigned long long seed)

  Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

Protected Member Functions

- virtual int **next** (int bits)

  Answers a pseudo-random uniformly distributed `int` *value of the number of bits specified by the argument* `bits` *as described by Donald E.*

6.427.1 Detailed Description

Random (p. 1728) Value Generator which is used to generate a stream of pseudorandom numbers.

The algorithms implemented by class **Random** (p. 1728) use a protected utility method that on each invocation can supply up to 32 pseudorandomly generated bits.

Since

1.0

6.427.2 Constructor & Destructor Documentation

6.427.2.1 decaf::util::Random::Random ( )

Construct a random generator with the current time of day in milliseconds as the initial state.

See also

setSeed (p. 1732)

6.427.2.2 decaf::util::Random::Random (unsigned long long *seed*)

Construct a random generator with the given `seed` as the initial state.

Parameters

seed	the seed that will determine the initial state of this random number generator

See also

setSeed (p. 1732)

6.427.2.3 virtual decaf::util::Random::~Random ( ) [virtual]

6.427.3 Member Function Documentation

6.427.3.1 virtual int decaf::util::Random::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits	number of bits of the returned value

See also

nextBytes (p. 1730)
nextDouble (p. 1730)
nextFloat (p. 1731)
nextInt() (p. 1731)
nextInt(int) (p. 1731)
nextGaussian (p. 1731)
nextLong (p. 1732)

Reimplemented in **decaf::security::SecureRandom** (p. 1801).

6.427.3.2 bool decaf::util::Random::nextBoolean ( )

Answers the next pseudo-random, uniformly distributed boolean value generated by this generator.

Returns

boolean a pseudo-random, uniformly distributed boolean value

6.427.3.3 virtual void decaf::util::Random::nextBytes (std::vector< unsigned char > & *buf*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes

See also

next (p. 1729)

Reimplemented in **decaf::security::SecureRandom** (p. 1801).

6.427.3.4 virtual void decaf::util::Random::nextBytes (unsigned char * *buf*, int *size*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes

See also

next (p. 1729)

Exceptions

NullPointerException	if buff is NULL
IllegalArgumentException	if size is negative

Reimplemented in **decaf::security::SecureRandom** (p. 1802).

6.427.3.5 double decaf::util::Random::nextDouble ( )

Generates a normally distributed random double number between 0.0 inclusively and 1.0 exclusively.

Returns

double

See also

nextFloat (p. 1731)

6.427.3.6 float decaf::util::Random::nextFloat ( )

Generates a normally distributed random float number between 0.0 inclusively and 1.0 exclusively.

Returns

float a random float number between 0.0 and 1.0

See also

nextDouble (p. 1730)

6.427.3.7 double decaf::util::Random::nextGaussian ( )

Pseudo-randomly generates (approximately) a normally distributed `double` value with mean 0.0 and a standard deviation value of `1.0` using the *polar method* of G.

E. P. Box, M. E. Muller, and G. Marsaglia, as described by Donald E. Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.4.1, subsection C, algorithm P

Returns

double

See also

nextDouble (p. 1730)

6.427.3.8 int decaf::util::Random::nextInt ( )

Generates a uniformly distributed 32-bit `int` value from the this random number sequence.

Returns

int uniformly distributed `int` value

See also

next (p. 1729)
nextLong (p. 1732)

6.427.3.9 int decaf::util::Random::nextInt (int *n*)

Returns to the caller a new pseudo-random integer value which is uniformly distributed between 0 (inclusively) and the value of `n` (exclusively).

Parameters

n	The int value that defines the max value of the return.

Returns

the next pseudo random int value.

Exceptions

IllegalArgumentException	if n is less than or equal to zero.

6.427.3.10 long long decaf::util::Random::nextLong ( )

Generates a uniformly distributed 64-bit `int` value from the this random number sequence.

Returns

64-bit `int` random number

See also

next (p. 1729)
nextInt() (p. 1731)
nextInt(int) (p. 1731)

6.427.3.11 virtual void decaf::util::Random::setSeed (unsigned long long *seed*) [virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

seed	the seed that alters the state of the random number generator

See also

next (p. 1729)
Random() (p. 1729)
#Random(long)

Reimplemented in **decaf::security::SecureRandom** (p. 1802).

The documentation for this class was generated from the following file:

6.428 decaf::lang::Readable Class Reference

A **Readable** (p. 1732) is a source of characters.

`#include <src/main/decaf/lang/Readable.h>`

Inheritance diagram for decaf::lang::Readable:

Public Member Functions

- virtual ~**Readable** ()
- virtual int **read** (**decaf::nio::CharBuffer** *charBuffer)=0

  Attempts to read characters into the specified character buffer.

6.428.1 Detailed Description

A **Readable** (p. 1732) is a source of characters.

Characters from a **Readable** (p. 1732) are made available to callers of the read method via a CharBuffer.

Since

1.0

6.428.2 Constructor & Destructor Documentation

6.428.2.1 virtual decaf::lang::Readable::~Readable ( ) [inline, virtual]

6.428.3 Member Function Documentation

6.428.3.1 virtual int decaf::lang::Readable::read (decaf::nio::CharBuffer * *charBuffer*) [pure virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

charBuffer	The Buffer to read Characters into.

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

IOException	if an I/O error occurs.
NullPointerException	if buffer is NULL.
ReadOnlyBufferException	if charBuffer is a read only buffer.

Implemented in **decaf::io::Reader** (p. 1738).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Readable.h**

6.429 activemq::transport::inactivity::ReadChecker Class Reference

Runnable class that is used by the {.

  *Override this method to customize the functionality of the method **read()** (p. 1737).*
- virtual int **doReadCharBuffer** (**decaf::nio::CharBuffer** *charBuffer)

  Override this method to customize the functionality of the method read(CharBuffer charBuffer).*

6.430.1 Constructor & Destructor Documentation

6.430.1.1 decaf::io::Reader::Reader ( ) [protected]

6.430.1.2 virtual decaf::io::Reader::~Reader ( ) [virtual]

6.430.2 Member Function Documentation

6.430.2.1 virtual int decaf::io::Reader::doReadArray (char * *buffer,* int *length*) [protected, virtual]

Override this method to customize the functionality of the method read(char* buffer, std::size_t length).

6.430.2.2 virtual int decaf::io::Reader::doReadArrayBounded (char * *buffer,* int *size,* int *offset,* int *length*) [protected, pure virtual]

Override this method to customize the functionality of the method read(unsigned char* buffer, int size, int offset, int length).

All subclasses must override this method to provide the basic **Reader** (p. 1734) functionality.

Implemented in **decaf::io::InputStreamReader** (p. 1144).

6.430.2.3 virtual int decaf::io::Reader::doReadChar ( ) [protected, virtual]

Override this method to customize the functionality of the method **read()** (p. 1737).

6.430.2.4 virtual int decaf::io::Reader::doReadCharBuffer (decaf::nio::CharBuffer * *charBuffer*) [protected, virtual]

Override this method to customize the functionality of the method read(CharBuffer* charBuffer).

6.430.2.5 virtual int decaf::io::Reader::doReadVector (std::vector< char > & *buffer*) [protected, virtual]

Override this method to customize the functionality of the method **read(std::vector<char>& buffer)** (p. 1736).

6.430.2.6 virtual void decaf::io::Reader::mark (int *readAheadLimit*) [virtual]

Marks the present position in the stream.

Subsequent calls to **reset()** (p. 1738) will attempt to reposition the stream to this point. Not all character-input streams support the **mark()** (p. 1736) operation.

Parameters

readAheadLimit	Limit on the number of characters that may be read while still preserving the mark. After reading this many characters, attempting to reset the stream may fail.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs, or the stream does not support mark.

6.430.2.7 virtual bool decaf::io::Reader::markSupported ( ) const [inline, virtual]

Tells whether this stream supports the **mark()** (p. 1736) operation.

The default implementation always returns false. Subclasses should override this method.

Returns

true if and only if this stream supports the mark operation.

6.430.2.8 virtual int decaf::io::Reader::read (std::vector< char > & *buffer*) [virtual]

Reads characters into an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer	The buffer to read characters into.

Returns

The number of characters read, or -1 if the end of the stream has been reached

Exceptions

IOException *(p. 1198)*	thrown if an I/O error occurs.

6.430.2.9 virtual int decaf::io::Reader::read (char * *buffer,* int *size*) [virtual]

Reads characters into an array, the method will attempt to read as much data as the size of the array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer	The target char buffer.
size	The size in bytes of the target buffer.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

IOException *(p. 1198)*	thrown if an I/O error occurs.
NullPointerException	if buffer is NULL.

6.430.2.10 virtual int decaf::io::Reader::read (char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Reads characters into a portion of an array.

This method will block until some input is available, an I/O error occurs, or the end of the stream is reached.

Parameters

buffer	The target char buffer.
size	The size in bytes of the target buffer.
offset	The position in the buffer to start filling.
length	The maximum number of bytes to read.

Returns

The number of bytes read or -1 if the end of stream is reached.

Exceptions

IOException *(p. 1198)*	thrown if an I/O error occurs.
NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length is greater than the array size.

6.430.2.11 virtual int decaf::io::Reader::read ( ) [virtual]

Reads a single character.

This method will block until a character is available, an I/O error occurs, or the end of the stream is reached.

Subclasses that intend to support efficient single-character input should override this method.

Returns

The character read, as an integer in the range 0 to 65535 (0x00-0xffff), or -1 if the end of the stream has been reached.

Exceptions

IOException *(p. 1198)*	thrown if an I/O error occurs.

6.430.2.12 virtual int decaf::io::Reader::read (decaf::nio::CharBuffer * *charBuffer*) [virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

charBuffer	The Buffer to read Characters into.

Returns

The number of char values added to the buffer, or -1 if this source of characters is at its end

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	if buffer is NULL.
ReadOnlyBufferException	if charBuffer is a read only buffer.

Implements **decaf::lang::Readable** (p. 1733).

6.430.2.13 virtual bool decaf::io::Reader::ready ( ) const [virtual]

Tells whether this stream is ready to be read.

Returns

True if the next **read()** (p. 1737) is guaranteed not to block for input, false otherwise. Note that returning false does not guarantee that the next read will block.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented in **decaf::io::InputStreamReader** (p. 1144).

6.430.2.14 virtual void decaf::io::Reader::reset ( ) [virtual]

Resets the stream.

If the stream has been marked, then attempt to reposition it at the mark. If the stream has not been marked, then attempt to reset it in some way appropriate to the particular stream, for example by repositioning it to its starting point. Not all character-input streams support the **reset()** (p. 1738) operation, and some support **reset()** (p. 1738) without supporting **mark()** (p. 1736).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

6.430.2.15 virtual long long decaf::io::Reader::skip (long long *count*) [virtual]

Skips characters.

This method will block until some characters are available, an I/O error occurs, or the end of the stream is reached.

Parameters

count	The number of character to skip.

Returns

the number of Character actually skipped.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

  Clones this exception.
- virtual ∼**ReadOnlyBufferException** () throw ()

6.431.1 Constructor & Destructor Documentation

6.431.1.1 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException ( ) throw () [inline]

Default Constructor.

6.431.1.2 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.431.1.3 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const ReadOnlyBufferException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.431.1.4 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.431.1.5 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const std::exception ∗ *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.431.1.6 decaf::nio::ReadOnlyBufferException::ReadOnlyBufferException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.431.1.7 virtual decaf::nio::ReadOnlyBufferException::~ReadOnlyBufferException ( ) throw () [inline, virtual]

6.431.2 Member Function Documentation

6.431.2.1 virtual ReadOnlyBufferException* decaf::nio::ReadOnlyBufferException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::UnsupportedOperationException** (p. 2189).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ReadOnlyBufferException.h**

6.432 decaf::util::concurrent::locks::ReadWriteLock Class Reference

A **ReadWriteLock** (p. 1741) maintains a pair of associated locks, one for read-only operations and one for writing.

`#include <src/main/decaf/util/concurrent/locks/ReadWriteLock.h>`

Public Member Functions

- virtual ~**ReadWriteLock** ()
- virtual **Lock** & **readLock** ()=0

  Returns the lock used for reading.
- virtual **Lock** & **writeLock** ()=0

  Returns the lock used for writing.

6.432.1 Detailed Description

A **ReadWriteLock** (p. 1741) maintains a pair of associated locks, one for read-only operations and one for writing.

The read lock may be held simultaneously by multiple reader threads, so long as there are no writers. The write lock is exclusive.

All **ReadWriteLock** (p. 1741) implementations must guarantee that the memory synchronization effects of writeLock operations (as specified in the **Lock** (p. 1305) interface) also hold with respect to the associated readLock. That is, a thread successfully acquiring the read lock will see all updates made upon previous release of the write lock.

A read-write lock allows for a greater level of concurrency in accessing shared data than that permitted by a mutual exclusion lock. It exploits the fact that while only a single thread at a time (a writer thread) can modify the shared data, in many cases any number of threads can concurrently read the data (hence reader threads). In theory, the increase in concurrency permitted by the use of a read-write lock will lead to performance improvements over the use of a mutual exclusion lock. In practice this increase in concurrency will only be fully realized on a multi-processor, and then only if the access patterns for the shared data are suitable.

Whether or not a read-write lock will improve performance over the use of a mutual exclusion lock depends on the frequency that the data is read compared to being modified, the duration of the read and write operations, and the contention for the data - that is, the number of threads that will try to read or write the data at the same time. For example, a collection that is initially populated with data and thereafter infrequently modified, while being frequently searched (such as a directory of some kind) is an ideal candidate for the use of a read-write lock. However, if updates become frequent then the data spends most of its time being exclusively locked and there is little, if any increase in concurrency. Further, if the read operations are too short the overhead of the read-write lock implementation (which is inherently more complex than a mutual exclusion lock) can dominate the execution cost, particularly as many read-write lock implementations still serialize all threads through a small section of code. Ultimately, only profiling and measurement will establish whether the use of a read-write lock is suitable for your application.

Although the basic operation of a read-write lock is straight-forward, there are many policy decisions that an implementation must make, which may affect the effectiveness of the read-write lock in a given application. Examples of these policies include:

- Determining whether to grant the read lock or the write lock, when both readers and writers are waiting, at the time that a writer releases the write lock. Writer preference is common, as writes are expected to be short and infrequent. Reader preference is less common as it can lead to lengthy delays for a write if the readers are frequent and long-lived as expected. Fair, or "in-order" implementations are also possible.
  - Determining whether readers that request the read lock while a reader is active and a writer is waiting, are granted the read lock. Preference to the reader can delay the writer indefinitely, while preference to the writer can reduce the potential for concurrency.
  - Determining whether the locks are reentrant: can a thread with the write lock reacquire it? Can it acquire a read lock while holding the write lock? Is the read lock itself reentrant?
  - Can the write lock be downgraded to a read lock without allowing an intervening writer? Can a read lock be upgraded to a write lock, in preference to other waiting readers or writers?

You should consider all of these things when evaluating the suitability of a given implementation for your application.

6.434.1 Detailed Description

Interface for a **RedeliveryPolicy** (p. 1744) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.

Since

3.2.0

6.434.2 Constructor & Destructor Documentation

6.434.2.1 activemq::core::RedeliveryPolicy::RedeliveryPolicy ( ) [protected]

6.434.2.2 virtual activemq::core::RedeliveryPolicy::∼RedeliveryPolicy ( ) [virtual]

6.434.3 Member Function Documentation

6.434.3.1 virtual RedeliveryPolicy∗ activemq::core::RedeliveryPolicy::clone ( ) const [pure virtual]

Create a copy of this Policy and return it.

Returns

pointer to a new **RedeliveryPolicy** (p. 1744) that is a copy of this one.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 891).

6.434.3.2 virtual void activemq::core::RedeliveryPolicy::configure (const decaf::util::Properties & *properties*) [virtual]

Checks the supplied properties object for properties matching the configurable settings of this class.

The default implementation looks for properties named with the prefix cms.RedeliveryPolicy.XXX where XXX is the name of a property with a public setter method. For instance cms.RedeliveryPolicy.useExponentialBackOff will be used to set the value of the use exponential back off toggle.

Subclasses can override this method to add more configuration options or to exclude certain parameters from being set via the properties object.

Parameters

properties	The Properties object used to configure this object.

Exceptions

NumberFormatException	if a property that is numeric cannot be converted
IllegalArgumentException	if a property can't be converted to the correct type.

6.434.3.3 virtual double activemq::core::RedeliveryPolicy::getBackOffMultiplier ( ) const [pure virtual]

Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 891).

6.434.3.4 virtual short activemq::core::RedeliveryPolicy::getCollisionAvoidancePercent ( ) const [pure virtual]

Returns

the currently set Collision Avoidance percentage.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 892).

6.434.3.5 virtual long long activemq::core::RedeliveryPolicy::getInitialRedeliveryDelay ( ) const [pure virtual]

Gets the initial time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed initially.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 892).

6.434.3.6 virtual int activemq::core::RedeliveryPolicy::getMaximumRedeliveries ( ) const [pure virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns

maximum allowed redeliveries for a message.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 892).

6.434.3.7 virtual long long activemq::core::RedeliveryPolicy::getNextRedeliveryDelay (long long *previousDelay*) [pure virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters

previousDelay	The last delay that was used between message redeliveries.

Returns

the new delay to use before attempting another redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 892).

6.434.3.8 virtual long long activemq::core::RedeliveryPolicy::getRedeliveryDelay ( ) const [pure virtual]

Gets the time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 892).

6.434.3.9 virtual bool activemq::core::RedeliveryPolicy::isUseCollisionAvoidance ( ) const [pure virtual]

Returns

whether or not collision avoidance is enabled for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.10 virtual bool activemq::core::RedeliveryPolicy::isUseExponentialBackOff ( ) const [pure virtual]

Returns

whether or not the exponential back off option is enabled.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.11 virtual void activemq::core::RedeliveryPolicy::setBackOffMultiplier (double *value*) [pure virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters

value	The new value for the back-off multiplier.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.12 virtual void activemq::core::RedeliveryPolicy::setCollisionAvoidancePercent (short *value*) [pure virtual]

Parameters

value	The collision avoidance percentage setting.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.13 virtual void activemq::core::RedeliveryPolicy::setInitialRedeliveryDelay (long long *value*) [pure virtual]

Sets the initial time that redelivery will be delayed.

Parameters

value	Time in Milliseconds to wait before starting redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.14 virtual void activemq::core::RedeliveryPolicy::setMaximumRedeliveries (int *maximumRedeliveries*) [pure virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters

maximum-Redeliveries	The maximum number of times that a message will be redelivered.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 893).

6.434.3.15 virtual void activemq::core::RedeliveryPolicy::setRedeliveryDelay (long long *value*) [pure virtual]

Sets the time that redelivery will be delayed.

Parameters

value	Time in Milliseconds to wait before the next redelivery.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 894).

6.434.3.16 virtual void activemq::core::RedeliveryPolicy::setUseCollisionAvoidance (bool *value*) [pure virtual]

Parameters

value	Enable or Disable collision avoidance for this Policy.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 894).

6.434.3.17 virtual void activemq::core::RedeliveryPolicy::setUseExponentialBackOff (bool *value*) [pure virtual]

Parameters

value	Enable or Disable the exponential back off multiplier option.

Implemented in **activemq::core::policies::DefaultRedeliveryPolicy** (p. 894).

6.434.4 Field Documentation

6.434.4.1 const long long activemq::core::RedeliveryPolicy::NO_MAXIMUM_REDELIVERIES [static]

6.435 decaf::util::concurrent::locks::ReentrantLock Class Reference

A reentrant mutual exclusion **Lock** (p. 1305) with extended capabilities.

`#include <src/main/decaf/util/concurrent/locks/ReentrantLock.h>`

Inheritance diagram for decaf::util::concurrent::locks::ReentrantLock:

Public Member Functions

- **ReentrantLock** ()
- virtual ~**ReentrantLock** ()
- virtual void **lock** ()

  Acquires the lock.
- virtual void **lockInterruptibly** ()

  Acquires the lock unless the current thread is interrupted.
- virtual bool **tryLock** ()

  Acquires the lock only if it is not held by another thread at the time of invocation.
- virtual bool **tryLock** (long long time, **const TimeUnit** &unit)

  Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.
- virtual void **unlock** ()

  Attempts to release this lock.
- virtual **Condition** * **newCondition** ()

  *Returns a **Condition** (p. 715) instance for use with this **Lock** (p. 1305) instance.*
- int **getHoldCount** () **const**

Queries the number of holds on this lock by the current thread.

- bool **isHeldByCurrentThread** () **const**

  Queries if this lock is held by the current thread.

- bool **isLocked** () **const**

  Queries if this lock is held by any thread.

- bool **isFair** () **const**

  Returns true if this lock has fairness set true.

- std::string **toString** () **const**

  Returns a string identifying this lock, as well as its lock state.

6.435.1 Detailed Description

A reentrant mutual exclusion **Lock** (p. 1305) with extended capabilities.

A **ReentrantLock** (p. 1749) is owned by the thread last successfully locking, but not yet unlocking it. A thread invoking lock will return, successfully acquiring the lock, when the lock is not owned by another thread. The method will return immediately if the current thread already owns the lock. This can be checked using methods **isHeldBy-CurrentThread()** (p. 1751), and **getHoldCount()** (p. 1750).

The constructor for this class accepts an optional fairness parameter. When set true, under contention, locks favor granting access to the longest-waiting thread. Otherwise this lock does not guarantee any particular access order. Programs using fair locks accessed by many threads may display lower overall throughput (i.e., are slower; often much slower) than those using the default setting, but have smaller variances in times to obtain locks and guarantee lack of starvation. Note however, that fairness of locks does not guarantee fairness of thread scheduling. Thus, one of many threads using a fair lock may obtain it multiple times in succession while other active threads are not progressing and not currently holding the lock. Also note that the untimed tryLock method does not honor the fairness setting. It will succeed if the lock is available even if other threads are waiting.

It is recommended practice to always immediately follow a call to lock with a try block, most typically in a before/after construction such as:

class X { private:

```
ReentrantLock lock;
// ...
```

public:

```
void m() {
    lock.lock();  // block until condition holds

    try {
        // ... method body
    } finally {
        lock.unlock()
    }
}
```

}

In addition to implementing the **Lock** (p. 1305) interface, this class defines methods isLocked and getLockQueue-Length, as well as some associated protected access methods that may be useful for instrumentation and monitoring.

Since

1.0

6.435.2 Constructor & Destructor Documentation

6.435.2.1 decaf::util::concurrent::locks::ReentrantLock::ReentrantLock ( )

6.435.2.2 virtual decaf::util::concurrent::locks::ReentrantLock::~ReentrantLock ( ) [virtual]

6.435.3 Member Function Documentation

6.435.3.1 int decaf::util::concurrent::locks::ReentrantLock::getHoldCount ( ) const

Queries the number of holds on this lock by the current thread.

A thread has a hold on a lock for each lock action that is not matched by an unlock action.

The hold count information is typically only used for testing and debugging purposes. For example, if a certain section of code should not be entered with the lock already held then we can assert that fact:

class X { private:

```
ReentrantLock lock;
// ...
```

public:

```
void m() {
    assert( lock.getHoldCount() == 0 );
    lock.lock();
    try {
        // ... method body
    } catch(...) {
       lock.unlock();
   }
}
```

}

Returns

the number of holds on this lock by the current thread, or zero if this lock is not held by the current thread

6.435.3.2 bool decaf::util::concurrent::locks::ReentrantLock::isFair ( ) const

Returns true if this lock has fairness set true.

Returns

true if this lock has fairness set true

6.435.3.3 bool decaf::util::concurrent::locks::ReentrantLock::isHeldByCurrentThread ( ) const

Queries if this lock is held by the current thread.

This method is typically used for debugging and testing. For example, a method that should only be called while a lock is held can assert that this is the case:

class X { private: **ReentrantLock** (p. 1749) lock; // ...

public: void m() { assert(lock.isHeldByCurrentThread()); // ... method body } }

It can also be used to ensure that a reentrant lock is used in a non-reentrant manner, for example:

class X { private: **ReentrantLock** (p. 1749) lock; // ...

public: void m() { assert !lock.**isHeldByCurrentThread()** (p. 1751); lock.lock(); try { // ... method body } finally { lock.unlock(); } } }

Returns

true if current thread holds this lock and false otherwise

6.435.3.4 bool decaf::util::concurrent::locks::ReentrantLock::isLocked ( ) const

Queries if this lock is held by any thread.

This method is designed for use in monitoring of the system state, not for synchronization control.

Returns

true if any thread holds this lock and false otherwise

6.435.3.5 virtual void decaf::util::concurrent::locks::ReentrantLock::lock ( ) [virtual]

Acquires the lock.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds the lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until the lock has been acquired, at which time the lock hold count is set to one.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1306).

6.435.3.6 virtual void decaf::util::concurrent::locks::ReentrantLock::lockInterruptibly ( ) [virtual]

Acquires the lock unless the current thread is interrupted.

Acquires the lock if it is not held by another thread and returns immediately, setting the lock hold count to one.

If the current thread already holds this lock then the hold count is incremented by one and the method returns immediately.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

- The lock is acquired by the current thread; or
  - Some other thread interrupts the current thread.

If the lock is acquired by the current thread then the lock hold count is set to one.

If the current thread:

```
* has its interrupted status set on entry to this method; or
* is interrupted while acquiring the lock,
```

then InterruptedException is thrown and the current thread's interrupted status is cleared.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.
InterruptedException	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported).

Implements **decaf::util::concurrent::locks::Lock** (p. 1307).

6.435.3.7 virtual Condition* decaf::util::concurrent::locks::ReentrantLock::newCondition ( ) [virtual]

Returns a **Condition** (p. 715) instance for use with this **Lock** (p. 1305) instance.

The returned **Condition** (p. 715) instance supports the same usages as do the **Mutex** (p. 1519) Class' methods (wait, notify, and notifyAll).

- If this lock is not held when any of the **Condition** (p. 715) waiting or signalling methods are called, then an IllegalMonitorStateException is thrown.
  - When the condition waiting methods are called the lock is released and, before they return, the lock is reacquired and the lock hold count restored to what it was when the method was called.
  - If a thread is interrupted while waiting then the wait will terminate, an InterruptedException will be thrown, and the thread's interrupted status will be cleared.
  - Waiting threads are signaled in FIFO order.
  - The ordering of lock reacquisition for threads returning from waiting methods is the same as for threads initially acquiring the lock, which is in the default case not specified, but for fair locks favors those threads that have been waiting the longest.

Exceptions

RuntimeException	if an error occurs while creating the **Condition** (p. 715).
UnsupportedOperationException	if this **Lock** (p. 1305) implementation does not support conditions

Implements **decaf::util::concurrent::locks::Lock** (p. 1307).

6.435.3.8 std::string decaf::util::concurrent::locks::ReentrantLock::toString ( ) const

Returns a string identifying this lock, as well as its lock state.

The state, in brackets, includes either the String "Unlocked" or the String "Locked by" followed by the name of the owning thread.

Returns

a string identifying this lock, as well as its lock state

6.435.3.9 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock ( ) [virtual]

Acquires the lock only if it is not held by another thread at the time of invocation.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. Even when this lock has been set to use a fair ordering policy, a call to **tryLock()** (p. 1753) will immediately acquire the lock if it is available, whether or not other threads are currently waiting for the lock. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting for this lock, then use tryLock(0, **TimeUnit.SECONDS** (p. 2141)) which is almost equivalent (it also detects interruption).

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then this method will return immediately with the value false.

Returns

true if the lock was acquired and false otherwise

Exceptions

RuntimeException	if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1308).

6.435.3.10 virtual bool decaf::util::concurrent::locks::ReentrantLock::tryLock (long long *time,* const TimeUnit & *unit*) [virtual]

Acquires the lock if it is not held by another thread within the given waiting time and the current thread has not been interrupted.

Acquires the lock if it is not held by another thread and returns immediately with the value true, setting the lock hold count to one. If this lock has been set to use a fair ordering policy then an available lock will not be acquired if any other threads are waiting for the lock. This is in contrast to the **tryLock()** (p. 1753) method. If you want a timed tryLock that does permit barging on a fair lock then combine the timed and un-timed forms together:

if (lock.tryLock() || lock.tryLock(timeout, unit)) { ... }

If the current thread already holds this lock then the hold count is incremented by one and the method returns true.

If the lock is held by another thread then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

```
* The lock is acquired by the current thread; or
* Some other thread interrupts the current thread; or
* The specified waiting time elapses
```

If the lock is acquired then the value true is returned and the lock hold count is set to one.

If the current thread:

```
* has its interrupted status set on entry to this method; or
* is interrupted while acquiring the lock,
```

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

In this implementation, as this method is an explicit interruption point, preference is given to responding to the interrupt over normal or reentrant acquisition of the lock, and over reporting the elapse of the waiting time.

Parameters

time	the maximum time to wait for the lock
unit	the time unit of the time argument

Returns

true if the lock was acquired and false if the waiting time elapsed before the lock was acquired

Exceptions

RuntimeException	if an error occurs while acquiring the lock.
InterruptedException	if the current thread is interrupted while acquiring the lock (and interruption of lock acquisition is supported)

Implements **decaf::util::concurrent::locks::Lock** (p. 1308).

6.435.3.11 virtual void decaf::util::concurrent::locks::ReentrantLock::unlock ( ) [virtual]

Attempts to release this lock.

If the current thread is the holder of this lock then the hold count is decremented. If the hold count is now zero then the lock is released. If the current thread is not the holder of this lock then IllegalMonitorStateException is thrown.

Exceptions

RuntimeException	if an error occurs while acquiring the lock.

Implements **decaf::util::concurrent::locks::Lock** (p. 1309).

The documentation for this class was generated from the following file:

  Constructor - Initializes the file name and line number where this message occurred.
- virtual
  RejectedExecutionException ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**RejectedExecutionException** () throw ()

6.436.1 Constructor & Destructor Documentation

6.436.1.1 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException ( ) throw () [inline]

Default Constructor.

6.436.1.2 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.436.1.3 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const RejectedExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	- The Exception to copy in this new instance.

6.436.1.4 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.436.1.5 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.436.1.6 decaf::util::concurrent::RejectedExecutionException::RejectedExecutionException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
cause	- The exception that was the cause for this one to be thrown.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.436.1.7 virtual decaf::util::concurrent::RejectedExecutionException::~RejectedExecutionException ( ) throw () [inline, virtual]

6.436.2 Member Function Documentation

6.436.2.1 virtual RejectedExecutionException* decaf::util::concurrent::RejectedExecutionException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance this exception type with a copy the current state.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

6.437.3 Member Function Documentation

6.437.3.1 virtual void decaf::util::concurrent::RejectedExecutionHandler::rejectedExecution (decaf::lang::Runnable * *r*, ThreadPoolExecutor * *executer*) [pure virtual]

Method that may be invoked by a **ThreadPoolExecutor** (p. 2104) when **execute** (p. 2110) cannot accept a task.

This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1004).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 1755), which will be propagated to the caller of **execute** (p. 2110).

Parameters

r	The pointer to the runnable task requested to be executed.
executor	The pointer to the executor attempting to execute this task.

Exceptions

RejectedExecution-Exception *(p. 1755)*	if there is no remedy.

Implemented in **decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy** (p. 948).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**RejectedExecutionHandler.h**

- virtual void **setLastDeliveredSequenceId** (long long **lastDeliveredSequenceId**)
- virtual bool **isRemoveInfo** () **const**
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_REMOVEINFO** = 12

Protected Attributes

- **Pointer**< **DataStructure** > **objectId**
- long long **lastDeliveredSequenceId**

6.438.1 Constructor & Destructor Documentation

6.438.1.1 activemq::commands::RemoveInfo::RemoveInfo ( )

6.438.1.2 virtual activemq::commands::RemoveInfo::∼RemoveInfo ( ) [virtual]

6.438.2 Member Function Documentation

6.438.2.1 virtual RemoveInfo∗ activemq::commands::RemoveInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.438.2.2 virtual void activemq::commands::RemoveInfo::copyDataStructure (const DataStructure ∗ *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.438.2.3 virtual bool activemq::commands::RemoveInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.438.2.4 virtual unsigned char activemq::commands::RemoveInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.438.2.5 virtual long long activemq::commands::RemoveInfo::getLastDeliveredSequenceId ( ) const [virtual]

6.438.2.6 virtual const Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId ( ) const [virtual]

Referenced by activemq::state::CommandVisitorAdapter::processRemoveInfo().

6.438.2.7 virtual Pointer<DataStructure>& activemq::commands::RemoveInfo::getObjectId ( ) [virtual]

6.438.2.8 virtual bool activemq::commands::RemoveInfo::isRemoveInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isRemoveInfo()** (p. 1760) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 384).

6.438.2.9 virtual void activemq::commands::RemoveInfo::setLastDeliveredSequenceId (long long *lastDeliveredSequenceId*) [virtual]

6.438.2.10 virtual void activemq::commands::RemoveInfo::setObjectId (const Pointer< DataStructure > & *objectId*) [virtual]

6.438.2.11 virtual std::string activemq::commands::RemoveInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.438.2.12 virtual Pointer<Command> activemq::commands::RemoveInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.438.3 Field Documentation

6.438.3.1 const unsigned char activemq::commands::RemoveInfo::ID_REMOVEINFO = 12 [static]

6.438.3.2 long long activemq::commands::RemoveInfo::lastDeliveredSequenceId [protected]

6.438.3.3 Pointer<DataStructure> activemq::commands::RemoveInfo::objectId [protected]

  Tight Marhsal to the given stream.

6.439.1 Detailed Description

Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 1761).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.439.2 Constructor & Destructor Documentation

6.439.2.1 activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::RemoveInfoMarshaller ( ) [inline]

6.439.2.2 virtual activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::∼RemoveInfoMarshaller ( ) [inline, virtual]

6.439.3 Member Function Documentation

6.439.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.439.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.439.3.3 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseMarshal (OpenWireFormat ∗ *format*, commands::DataStructure ∗ *command*, decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.439.3.4 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.439.3.5 virtual int activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.439.3.6 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.439.3.7 virtual void activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

6.440.1 Constructor & Destructor Documentation

6.440.1.1 activemq::commands::RemoveSubscriptionInfo::RemoveSubscriptionInfo ( )

6.440.1.2 virtual activemq::commands::RemoveSubscriptionInfo::~RemoveSubscriptionInfo ( ) [virtual]

6.440.2 Member Function Documentation

6.440.2.1 virtual RemoveSubscriptionInfo* activemq::commands::RemoveSubscriptionInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.440.2.2 virtual void activemq::commands::RemoveSubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.440.2.3 virtual bool activemq::commands::RemoveSubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.440.2.4 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getClientId ( ) const [virtual]

6.440.2.5 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getClientId ( ) [virtual]

6.440.2.7 virtual Pointer<ConnectionId>& activemq::commands::RemoveSubscriptionInfo::getConnectionId ( ) [virtual]

6.440.2.8 virtual unsigned char activemq::commands::RemoveSubscriptionInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.440.2.9 virtual const std::string& activemq::commands::RemoveSubscriptionInfo::getSubcriptionName ( ) const [virtual]

6.440.2.10 virtual std::string& activemq::commands::RemoveSubscriptionInfo::getSubcriptionName ( ) [virtual]

6.440.2.11 virtual bool activemq::commands::RemoveSubscriptionInfo::isRemoveSubscriptionInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isRemoveSubscriptionInfo()** (p. 1766) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 385).

6.440.2.12 virtual void activemq::commands::RemoveSubscriptionInfo::setClientId (const std::string & *clientId*) [virtual]

6.440.2.13 virtual void activemq::commands::RemoveSubscriptionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.440.2.14 virtual void activemq::commands::RemoveSubscriptionInfo::setSubcriptionName (const std::string & *subcriptionName*) [virtual]

6.440.2.15 virtual std::string activemq::commands::RemoveSubscriptionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.440.2.16 virtual Pointer<Command> activemq::commands::RemoveSubscriptionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.441.3 Member Function Documentation

6.441.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal-::generated::RemoveSubscriptionInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.441.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.441.3.3 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.441.3.4 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.441.3.5 virtual int activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.441.3.6 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.441.3.7 virtual void activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

6.442.1 Constructor & Destructor Documentation

6.442.1.1 activemq::commands::ReplayCommand::ReplayCommand ( )

6.442.1.2 virtual activemq::commands::ReplayCommand::~ReplayCommand ( ) [virtual]

6.442.2 Member Function Documentation

6.442.2.1 virtual ReplayCommand* activemq::commands::ReplayCommand::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.442.2.2 virtual void activemq::commands::ReplayCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.442.2.3 virtual bool activemq::commands::ReplayCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.442.2.4 virtual unsigned char activemq::commands::ReplayCommand::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.442.2.5 virtual int activemq::commands::ReplayCommand::getFirstNakNumber ( ) const [virtual]

6.442.2.6 virtual int activemq::commands::ReplayCommand::getLastNakNumber ( ) const [virtual]

6.442.2.8 virtual void activemq::commands::ReplayCommand::setLastNakNumber (int *lastNakNumber*) [virtual]

6.442.2.9 virtual std::string activemq::commands::ReplayCommand::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.442.2.10 virtual Pointer<Command> activemq::commands::ReplayCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.442.3 Field Documentation

6.442.3.1 int activemq::commands::ReplayCommand::firstNakNumber [protected]

6.442.3.2 const unsigned char activemq::commands::ReplayCommand::ID_REPLAYCOMMAND = 65 [static]

6.443 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller Class Reference

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 1773).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ReplayCommandMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller:

Public Member Functions

- **ReplayCommandMarshaller** ()
- virtual ~**ReplayCommandMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.443.1 Detailed Description

Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 1773).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.443.2 Constructor & Destructor Documentation

6.443.2.1 activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::ReplayCommandMarshaller ( ) [inline]

6.443.2.2 virtual activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::∼ReplayCommandMarshaller ( ) [inline, virtual]

6.443.3 Member Function Documentation

6.443.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.443.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.443.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseMarshal (OpenWireFormat ∗ *format*, commands::DataStructure ∗ *command*, decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.443.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.443.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.443.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.443.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.446 decaf::internal::util::Resource Class Reference

Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.

`#include <src/main/decaf/internal/util/Resource.h>`

Inheritance diagram for decaf::internal::util::Resource:

Public Member Functions

- virtual ~**Resource** ()

6.446.1 Detailed Description

Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.

Since

1.0

6.446.2 Constructor & Destructor Documentation

6.446.2.1 virtual decaf::internal::util::Resource::~Resource ( ) [virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**Resource.h**

6.447 activemq::cmsutil::ResourceLifecycleManager Class Reference

Manages the lifecycle of a set of CMS resources.

`#include <src/main/activemq/cmsutil/ResourceLifecycleManager.h>`

Public Member Functions

- **ResourceLifecycleManager** ()
- virtual ~**ResourceLifecycleManager** ()

  Destructor - calls `destroy`
- void **addConnection** (**cms::Connection** *connection)

  Adds a connection so that its life will be managed by this object.
- void **addSession** (**cms::Session** *session)

  Adds a session so that its life will be managed by this object.
- void **addDestination** (**cms::Destination** *dest)

  Adds a destination so that its life will be managed by this object.
- void **addMessageProducer** (**cms::MessageProducer** *producer)

  Adds a message producer so that its life will be managed by this object.
- void **addMessageConsumer** (**cms::MessageConsumer** *consumer)

  Adds a message consumer so that its life will be managed by this object.
- void **destroy** ()

  Closes and destroys the contained CMS resources.
- void **releaseAll** ()

  Releases all of the contained resources so that this object will no longer control their lifetimes.

Protected Member Functions

- **ResourceLifecycleManager** (**const ResourceLifecycleManager** &)
- **ResourceLifecycleManager** & **operator=** (**const ResourceLifecycleManager** &)

6.447.1 Detailed Description

Manages the lifecycle of a set of CMS resources.

A call to `destroy` will close and destroy all of the contained resources in the appropriate manner.

6.447.2 Constructor & Destructor Documentation

6.447.2.1 activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager (const ResourceLifecycleManager &) [protected]

6.447.2.2 activemq::cmsutil::ResourceLifecycleManager::ResourceLifecycleManager ( )

6.447.2.3 virtual activemq::cmsutil::ResourceLifecycleManager::~ResourceLifecycleManager ( ) [virtual]

Destructor - calls `destroy`

6.447.3 Member Function Documentation

6.447.3.1 void activemq::cmsutil::ResourceLifecycleManager::addConnection (cms::Connection * *connection*)

Adds a connection so that its life will be managed by this object.

Parameters

connection	the object to be managed

Exceptions

CMSException	if an error occurs while performing this operation.

6.447.3.2 void activemq::cmsutil::ResourceLifecycleManager::addDestination (cms::Destination * *dest*)

Adds a destination so that its life will be managed by this object.

Parameters

dest	the object to be managed

Exceptions

CMSException	if an error occurs while performing this operation.

6.447.3.3 void activemq::cmsutil::ResourceLifecycleManager::addMessageConsumer (cms::MessageConsumer * *consumer*)

Adds a message consumer so that its life will be managed by this object.

Parameters

consumer	the object to be managed

Exceptions

CMSException	if an error occurs while performing this operation.

6.447.3.4 void activemq::cmsutil::ResourceLifecycleManager::addMessageProducer (cms::MessageProducer * *producer*)

Adds a message producer so that its life will be managed by this object.

Parameters

producer	the object to be managed

Exceptions

CMSException	if an error occurs while performing this operation.

6.447.3.5 void activemq::cmsutil::ResourceLifecycleManager::addSession (cms::Session * *session*)

Adds a session so that its life will be managed by this object.

Parameters

session	the object to be managed

Exceptions

CMSException	if an error occurs while performing this operation.

6.447.3.6 void activemq::cmsutil::ResourceLifecycleManager::destroy ( )

Closes and destroys the contained CMS resources.

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.447.3.7 ResourceLifecycleManager& activemq::cmsutil::ResourceLifecycleManager::operator= (const ResourceLifecycleManager &) [protected]

6.447.3.8 void activemq::cmsutil::ResourceLifecycleManager::releaseAll ( )

Releases all of the contained resources so that this object will no longer control their lifetimes.

The documentation for this class was generated from the following file:

Protected Attributes

- int **correlationId**

6.449.1 Constructor & Destructor Documentation

6.449.1.1 activemq::commands::Response::Response ( )

6.449.1.2 virtual activemq::commands::Response::∼Response ( ) [virtual]

6.449.2 Member Function Documentation

6.449.2.1 virtual Response∗ activemq::commands::Response::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 829), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 997), and **activemq::commands::IntegerResponse** (p. 1176).

6.449.2.2 virtual void activemq::commands::Response::copyDataStructure (const DataStructure ∗ *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 829), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 997), and **activemq::commands::IntegerResponse** (p. 1176).

6.449.2.3 virtual bool activemq::commands::Response::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 998), and **activemq::commands::IntegerResponse** (p. 1176).

6.449.2.4 virtual int activemq::commands::Response::getCorrelationId ( ) const [virtual]

6.449.2.5 virtual unsigned char activemq::commands::Response::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 998), and **activemq::commands::IntegerResponse** (p. 1176).

6.449.2.6 virtual bool activemq::commands::Response::isResponse ( ) const [inline, virtual]

Returns

an answer of true to the **isResponse()** (p. 1783) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 385).

6.449.2.7 virtual void activemq::commands::Response::setCorrelationId (int *correlationId*) [virtual]

6.449.2.8 virtual std::string activemq::commands::Response::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

Reimplemented in **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 865), **activemq::commands::ExceptionResponse** (p. 998), and **activemq::commands::IntegerResponse** (p. 1176).

6.449.2.9 virtual Pointer<Command> activemq::commands::Response::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.449.3 Field Documentation

6.449.3.1 int activemq::commands::Response::correlationId [protected]

6.450 activemq::transport::mock::ResponseBuilder Class Reference

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

`#include <src/main/activemq/transport/mock/ResponseBuilder.h>`

Inheritance diagram for activemq::transport::mock::ResponseBuilder:

Public Member Functions

- virtual ~**ResponseBuilder** ()
- virtual **Pointer**< **Response** > **buildResponse** (**const Pointer**< **Command** > &command)=0

  Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.
- virtual void **buildIncomingCommands** (**const Pointer**< **Command** > &command, **decaf::util::LinkedList**< **Pointer**< **Command** > > &queue)=0

  *When called the **ResponseBuilder** (p. 1784) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.*

6.450.1 Detailed Description

Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

6.450.2 Constructor & Destructor Documentation

6.450.2.1 virtual activemq::transport::mock::ResponseBuilder::~ResponseBuilder ( ) [inline, virtual]

6.450.3 Member Function Documentation

6.450.3.1 virtual void activemq::transport::mock::ResponseBuilder::buildIncomingCommands (const Pointer< Command > & *command*, decaf::util::LinkedList< Pointer< Command > > & *queue*) [pure virtual]

When called the **ResponseBuilder** (p. 1784) must construct all the Responses or Asynchronous commands that would be sent to this client by the Broker upon receipt of the passed command.

Parameters

command	- The Command being sent to the Broker.
queue	- Queue of Command sent back from the broker.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 1600).

6.450.3.2 virtual Pointer<Response> activemq::transport::mock::ResponseBuilder::buildResponse (const Pointer< Command > & *command*) [pure virtual]

Given a Command, check if it requires a response and return the appropriate Response that the Broker would send for this Command.

Parameters

command	- The command to build a response for

Returns

A Response object pointer, or NULL if no response.

Implemented in **activemq::wireformat::openwire::OpenWireResponseBuilder** (p. 1600).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/mock/**ResponseBuilder.h**

6.451 activemq::transport::correlator::ResponseCorrelator Class Reference

This type of transport filter is responsible for correlating asynchronous responses with requests.

`#include <src/main/activemq/transport/correlator/ResponseCorrelator.h>`

Inheritance diagram for activemq::transport::correlator::ResponseCorrelator:

Public Member Functions

- **ResponseCorrelator** (**const Pointer< Transport >** &**next**)

  Constructor.
- virtual ~**ResponseCorrelator** ()

- virtual void **oneway** (**const Pointer**< **Command** > &command)

  Sends a one-way command.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command)

  Sends the given command to the broker and then waits for the response.
- virtual **Pointer**< **Response** > **request** (**const Pointer**< **Command** > &command, unsigned int timeout)

  Sends the given command to the broker and then waits for the response.
- virtual void **start** ()

  *Starts the **Transport*** (p. *2161), the send methods of a **Transport*** (p. *2161) will throw an exception if used before the **Transport*** (p. *2161) is started.*
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual void **onCommand** (**const Pointer**< **Command** > &command)

  This is called in the context of the nested transport's reading thread.
- virtual void **onTransportException** (**Transport** *source, **const decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.

6.451.1 Detailed Description

This type of transport filter is responsible for correlating asynchronous responses with requests.

Non-response messages are simply sent directly to the CommandListener. It owns the transport that it

6.451.2 Constructor & Destructor Documentation

6.451.2.1 activemq::transport::correlator::ResponseCorrelator::ResponseCorrelator (const Pointer< Transport > & *next*)

Constructor.

Parameters

next	the next transport in the chain

6.451.2.2 virtual activemq::transport::correlator::ResponseCorrelator::~ResponseCorrelator ( ) [virtual]

6.451.3 Member Function Documentation

6.451.3.1 virtual void activemq::transport::correlator::ResponseCorrelator::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Reimplemented from **activemq::transport::TransportFilter** (p. 2170).

6.451.3.2 virtual void activemq::transport::correlator::ResponseCorrelator::onCommand (const Pointer< Command > & *command*) [virtual]

This is called in the context of the nested transport's reading thread.

In the case of a response object, updates the request map and notifies those waiting on the response. Non-response messages are just delegated to the command listener.

Parameters

command	The received from the nested transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.451.3.3 virtual void activemq::transport::correlator::ResponseCorrelator::oneway (const Pointer< Command > & *command*) [virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2173).

6.451.3.4 virtual void activemq::transport::correlator::ResponseCorrelator::onTransportException (Transport * *source,* const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

source	The source of the exception.
ex	The exception that was caught.

6.451.3.5 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

6.451.3.6 virtual Pointer<Response> activemq::transport::correlator::ResponseCorrelator::request (const Pointer< Command > & *command,* unsigned int *timeout*) [virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Reimplemented from **activemq::transport::TransportFilter** (p. 2174).

6.451.3.7 virtual void activemq::transport::correlator::ResponseCorrelator::start ( ) [virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Reimplemented from **activemq::transport::TransportFilter** (p. 2175).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/correlator/**ResponseCorrelator.h**

6.452 activemq::wireformat::openwire::marshal::generated::ResponseMarshaller Class Reference

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 1788).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ResponseMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ResponseMarshaller:

Public Member Functions

- **ResponseMarshaller** ()
- virtual ~**ResponseMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.452.1 Detailed Description

Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 1788).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.452.2 Constructor & Destructor Documentation

6.452.2.1 activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::ResponseMarshaller ( ) [inline]

6.452.2.2 virtual activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::~ResponseMarshaller ( ) [inline, virtual]

6.452.3 Member Function Documentation

6.452.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 866), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1178).

6.452.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 866), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1178).

6.452.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 866), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1178).

6.452.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 867), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179).

6.452.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 867), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179).

6.452.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 867), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179).

6.452.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ResponseMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 868), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), and **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1180).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ResponseMarshaller.h**

6.453 decaf::lang::Runnable Class Reference

Interface for a runnable object - defines a task that can be run by a thread.

`#include <src/main/decaf/lang/Runnable.h>`

Inheritance diagram for decaf::lang::Runnable:

Public Member Functions

- virtual ~**Runnable** ()
- virtual void **run** ()=0

  *Run method - called by the **Thread** (p. 2094) class in the context of the thread.*

6.453.1 Detailed Description

Interface for a runnable object - defines a task that can be run by a thread.

6.453.2 Constructor & Destructor Documentation

6.453.2.1 virtual decaf::lang::Runnable::~Runnable ( ) [inline, virtual]

6.453.3 Member Function Documentation

6.453.3.1 virtual void decaf::lang::Runnable::run ( ) [pure virtual]

Run method - called by the **Thread** (p. 2094) class in the context of the thread.

Implemented in **activemq::transport::IOTransport** (p. 1205), **decaf::lang::Thread** (p. 2100), **activemq::threads::CompositeTaskRunner** (p. 694), **activemq::threads::DedicatedTaskRunner** (p. 886), **activemq::transport::mock::InternalCommandListener** (p. 1184), **activemq::transport::inactivity::WriteChecker** (p. 2255), **activemq::transport::inactivity::ReadChecker** (p. 1734), and **activemq::threads::SchedulerTimerTask** (p. 1798).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::rejectedExecution().

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runnable.h**

6.454 decaf::lang::Runtime Class Reference

`#include <src/main/decaf/lang/Runtime.h>`

Inheritance diagram for decaf::lang::Runtime:

Public Member Functions

- virtual ~**Runtime** ()

Static Public Member Functions

- static **Runtime** * **getRuntime** ()

  *Gets the single instance of the Decaf **Runtime** (p. 1793) for this Process.*
- static void **initializeRuntime** (int argc, char **argv)

  Initialize the Decaf Library passing it the args that were passed to the application at startup.
- static void **initializeRuntime** ()

  Initialize the Decaf Library.
- static void **shutdownRuntime** ()

  Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

6.454.1 Constructor & Destructor Documentation

6.454.1.1 virtual decaf::lang::Runtime::~Runtime ( ) [inline, virtual]

6.454.2 Member Function Documentation

6.454.2.1 static Runtime* decaf::lang::Runtime::getRuntime ( ) [static]

Gets the single instance of the Decaf **Runtime** (p. 1793) for this Process.

Returns

pointer to the single Decaf **Runtime** (p. 1793) instance that exists for this process

6.454.2.2 static void decaf::lang::Runtime::initializeRuntime (int *argc*, char ** *argv*) [static]

Initialize the Decaf Library passing it the args that were passed to the application at startup.

Parameters

argc	- The number of args passed
argv	- Array of char* values passed to the Process on start.

Exceptions

runtime_error	if the library is already initialized or an error occurs during initialization.

6.454.2.3 static void decaf::lang::Runtime::initializeRuntime ( ) [static]

Initialize the Decaf Library.

Exceptions

runtime_error	if the library is already initialized or an error occurs during initialization.

6.454.2.4 static void decaf::lang::Runtime::shutdownRuntime ( ) [static]

Shutdown the Decaf Library, this call should take places after all objects that were created from the Decaf library have been deallocated.

Exceptions

runtime_error	if the library has not already been initialized or an error occurs during shutdown.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Runtime.h**

6.455 decaf::lang::exceptions::RuntimeException Class Reference

`#include <src/main/decaf/lang/exceptions/RuntimeException.h>`

Inheritance diagram for decaf::lang::exceptions::RuntimeException:

Public Member Functions

- **RuntimeException** () throw ()

  Default Constructor.
- **RuntimeException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other ActiveMQException.
- **RuntimeException** (**const RuntimeException** &ex) throw ()

  Copy Constructor.
- **RuntimeException** (**const** char *file, **const** int lineNumber, **const** std::exception ***cause**, **const** char *msg,...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

- **RuntimeException** (**const** std::exception ∗**cause**) throw ()

  Constructor.

- **RuntimeException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **RuntimeException** ∗ **clone** () **const**

  Clones this exception.

- virtual ∼**RuntimeException** () throw ()

6.455.1 Constructor & Destructor Documentation

6.455.1.1 decaf::lang::exceptions::RuntimeException::RuntimeException ( ) throw () [inline]

Default Constructor.

6.455.1.2 decaf::lang::exceptions::RuntimeException::RuntimeException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other ActiveMQException.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.455.1.3 decaf::lang::exceptions::RuntimeException::RuntimeException (const RuntimeException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.455.1.4 decaf::lang::exceptions::RuntimeException::RuntimeException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.455.1.5 decaf::lang::exceptions::RuntimeException::RuntimeException (const std::exception ∗ *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.455.1.6 decaf::lang::exceptions::RuntimeException::RuntimeException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.455.1.7 virtual decaf::lang::exceptions::RuntimeException::~RuntimeException ( ) throw () [inline, virtual]

6.455.2 Member Function Documentation

6.455.2.1 virtual RuntimeException* decaf::lang::exceptions::RuntimeException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

Reimplemented in **decaf::util::NoSuchElementException** (p. 1539), and **decaf::util::ConcurrentModificationException** (p. 701).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**RuntimeException.h**

6.456 activemq::threads::Scheduler Class Reference

Scheduler (p. 1796) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

`#include <src/main/activemq/threads/Scheduler.h>`

Inheritance diagram for activemq::threads::Scheduler:

Public Member Functions

- **Scheduler** (**const** std::string &name)
- virtual ~**Scheduler** ()
- void **executePeriodically** (**decaf::lang::Runnable** *task, long long period, bool ownsTask=true)
- void **schedualPeriodically** (**decaf::lang::Runnable** *task, long long period, bool ownsTask=true)
- void **cancel** (**decaf::lang::Runnable** *task)
- void **executeAfterDelay** (**decaf::lang::Runnable** *task, long long delay, bool ownsTask=true)
- void **shutdown** ()

Protected Member Functions

- virtual void **doStart** ()

  Performs the actual start operation on the service, acquiring all the resources needed to run the service.
- virtual void **doStop** (**activemq::util::ServiceStopper** *stopper)

  Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

6.456.1 Detailed Description

Scheduler (p. 1796) class for use in executing Runnable Tasks either periodically or one time only with optional delay.

Since

3.3.0

6.456.2 Constructor & Destructor Documentation

6.456.2.1 activemq::threads::Scheduler::Scheduler (const std::string & *name*)

6.456.2.2 virtual activemq::threads::Scheduler::~Scheduler ( ) [virtual]

6.456.3 Member Function Documentation

6.456.3.1 void activemq::threads::Scheduler::cancel (decaf::lang::Runnable * *task*)

6.456.3.2 virtual void activemq::threads::Scheduler::doStart ( ) [protected, virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service.

Must be implemented in derived class.

Implements **activemq::util::ServiceSupport** (p. 1829).

6.456.3.3 virtual void activemq::threads::Scheduler::doStop (activemq::util::ServiceStopper * *stopper*) [protected, virtual]

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implements **activemq::util::ServiceSupport** (p. 1830).

6.456.3.4 void **activemq::threads::Scheduler::executeAfterDelay** (**decaf::lang::Runnable** * *task,* long long *delay,* bool *ownsTask* = `true`)

6.456.3.5 void **activemq::threads::Scheduler::executePeriodically** (**decaf::lang::Runnable** * *task,* long long *period,* bool *ownsTask* = `true`)

6.456.3.6 void **activemq::threads::Scheduler::schedualPeriodically** (**decaf::lang::Runnable** * *task,* long long *period,* bool *ownsTask* = `true`)

6.456.3.7 void **activemq::threads::Scheduler::shutdown** ( )

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**Scheduler.h**

6.457 activemq::threads::SchedulerTimerTask Class Reference

Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.

`#include <src/main/activemq/threads/SchedulerTimerTask.h>`

Inheritance diagram for activemq::threads::SchedulerTimerTask:

Public Member Functions

- **SchedulerTimerTask** (**decaf::lang::Runnable** *task, bool ownsTask=true)
- virtual ~**SchedulerTimerTask** ()
- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.457.1 Detailed Description

Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.

Since

3.3.0

6.457.2 Constructor & Destructor Documentation

6.457.2.1 activemq::threads::SchedulerTimerTask::SchedulerTimerTask (**decaf::lang::Runnable** * *task,* bool *ownsTask* = `true`)

6.457.3 Member Function Documentation

6.457.3.1 virtual void **activemq::threads::SchedulerTimerTask::run** ( ) `[virtual]`

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 1793).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**SchedulerTimerTask.h**

6.458 decaf::security::SecureRandom Class Reference

`#include <src/main/decaf/security/SecureRandom.h>`

Inheritance diagram for decaf::security::SecureRandom:

Public Member Functions

- **SecureRandom** ()

  Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (**const** std::vector< unsigned char > &seed)

  Creates a new instance of a secure random number generator that implements the default random number algorithm.
- **SecureRandom** (**const** unsigned char *seed, int size)

  Creates a new instance of a secure random number generator that implements the default random number algorithm.
- virtual ~**SecureRandom** ()
- virtual void **nextBytes** (std::vector< unsigned char > &buf)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.

  Parameters

buf	*non-null array to contain the new random bytes*

  See also

  next *(*p. *1729)*
- virtual void **nextBytes** (unsigned char *buf, int size)

  Modifies the byte array by a random sequence of bytes generated by this random number generator.

  Parameters

buf	*non-null array to contain the new random bytes*

  See also

  next *(*p. *1729)*

  Exceptions

NullPointerException	*if buff is NULL*
IllegalArgumentException	*if size is negative*

- virtual void **setSeed** (unsigned long long seed)

  Modifies the seed using linear congruential formula presented in The Art of Computer Programming, Volume 2, Section 3.2.1.

  Parameters

seed	*the seed that alters the state of the random number generator*

  See also

  next *(*p. *1729)*
  Random() *(*p. *1729)*
  #Random(long)
- virtual void **setSeed** (**const** std::vector< unsigned char > &seed)

  Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.
- virtual void **setSeed** (**const** unsigned char *seed, int size)

  Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Protected Member Functions

- virtual int **next** (int bits)

  Answers a pseudo-random uniformly distributed `int` *value of the number of bits specified by the argument* `bits` *as described by Donald E.*
  Knuth in The Art of Computer Programming, Volume 2: Seminumerical Algorithms, section 3.2.1.

  Returns

  int a pseudo-random generated int number

  Parameters

bits	*number of bits of the returned value*

  See also

  nextBytes (p. *1730*)
  nextDouble (p. *1730*)
  nextFloat (p. *1731*)
  nextInt() (p. *1731*)
  nextInt(int) (p. *1731*)
  nextGaussian (p. *1731*)
  nextLong (p. *1732*)

6.458.1 Detailed Description

Since

1.0

6.458.2 Constructor & Destructor Documentation

6.458.2.1 decaf::security::SecureRandom::SecureRandom ( )

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 1799) instance that is created with this constructor is unseeded and can be seeded by calling the setSeed method. Calls to nextBytes on an unseeded **SecureRandom** (p. 1799) result in the object seeding itself.

6.458.2.2 decaf::security::SecureRandom::SecureRandom (const std::vector< unsigned char > & *seed*)

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 1799) instance created by this constructor is seeded using the passed byte array.

Parameters

seed	The seed bytes to use to seed this secure random number generator.

6.458.2.3 decaf::security::SecureRandom::SecureRandom (const unsigned char * *seed*, int *size*)

Creates a new instance of a secure random number generator that implements the default random number algorithm.

The **SecureRandom** (p. 1799) instance created by this constructor is seeded using the passed byte array.

Parameters

seed	The seed bytes to use to seed this secure random number generator.
size	The number of bytes in the seed buffer.

Exceptions

NullPointerException	if the seed buffer is NULL.
IllegalArgumentException	if the size value is negative.

6.458.2.4 virtual decaf::security::SecureRandom::~SecureRandom ( ) [virtual]

6.458.3 Member Function Documentation

6.458.3.1 virtual int decaf::security::SecureRandom::next (int *bits*) [protected, virtual]

Answers a pseudo-random uniformly distributed `int` value of the number of bits specified by the argument `bits` as described by Donald E.

Knuth in *The Art of Computer Programming, Volume 2: Seminumerical Algorithms*, section 3.2.1.

Returns

int a pseudo-random generated int number

Parameters

bits	number of bits of the returned value

See also

nextBytes (p. 1730)
nextDouble (p. 1730)
nextFloat (p. 1731)
nextInt() (p. 1731)
nextInt(int) (p. 1731)
nextGaussian (p. 1731)
nextLong (p. 1732)

Reimplemented from **decaf::util::Random** (p. 1729).

6.458.3.2 virtual void decaf::security::SecureRandom::nextBytes (std::vector< unsigned char > & *buf*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes

See also

next (p. 1729)

Reimplemented from **decaf::util::Random** (p. 1730).

6.458.3.3 virtual void decaf::security::SecureRandom::nextBytes (unsigned char * *buf*, int *size*) [virtual]

Modifies the byte array by a random sequence of bytes generated by this random number generator.

Parameters

buf	non-null array to contain the new random bytes

See also

next (p. 1729)

Exceptions

NullPointerException	if buff is NULL
IllegalArgumentException	if size is negative

Reimplemented from **decaf::util::Random** (p. 1730).

6.458.3.4 virtual void decaf::security::SecureRandom::setSeed (unsigned long long *seed*) [virtual]

Modifies the seed using linear congruential formula presented in *The Art of Computer Programming, Volume 2*, Section 3.2.1.

Parameters

seed	the seed that alters the state of the random number generator

See also

next (p. 1729)
Random() (p. 1729)
#Random(long)

Reimplemented from **decaf::util::Random** (p. 1732).

6.458.3.5 virtual void decaf::security::SecureRandom::setSeed (const std::vector< unsigned char > & *seed*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

seed	A vector of bytes that is used update the seed of the RNG.

6.458.3.6 virtual void decaf::security::SecureRandom::setSeed (const unsigned char * *seed*, int *size*) [virtual]

Supplements or sets the seed of this secure random number generator, calls to this method never reduces randomness.

Parameters

seed	The seed bytes to use to seed this secure random number generator.
size	The number of bytes in the seed buffer.

Exceptions

NullPointerException	if the seed buffer is NULL.
IllegalArgumentException	if the size value is negative.

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SecureRandom.h**

6.459 decaf::internal::security::SecureRandomImpl Class Reference

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

`#include <src/main/decaf/internal/security/unix/SecureRandomImpl.h>`

Inheritance diagram for decaf::internal::security::SecureRandomImpl:

Public Member Functions

- **SecureRandomImpl** ()
- virtual ∼**SecureRandomImpl** ()
- virtual void **providerSetSeed** (**const** unsigned char ∗seed, int size)

  Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.
- virtual void **providerNextBytes** (unsigned char ∗bytes, int numBytes)

  Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.
- virtual unsigned char ∗ **providerGenerateSeed** (int numBytes)

  Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.
- **SecureRandomImpl** ()
- virtual ∼**SecureRandomImpl** ()
- virtual void **providerSetSeed** (**const** unsigned char ∗seed, int size)

  Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.
- virtual void **providerNextBytes** (unsigned char ∗bytes, int numBytes)

  Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.
- virtual unsigned char ∗ **providerGenerateSeed** (int numBytes)

  Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

6.459.1 Detailed Description

Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

Secure Random Number Generator for Windows based platforms that attempts to obtain secure bytes with high entropy from known sources.

If the platform does not have a source of secure bytes then the platform random number generator is used if one exists otherwise the Decaf RNG is used as a last resort.

6.459.3 Member Function Documentation

6.459.3.1 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes	The number of bytes that should be generated for the new seed array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.459.3.2 virtual unsigned char* decaf::internal::security::SecureRandomImpl::providerGenerateSeed (int *numBytes*) [virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes	The number of bytes that should be generated for the new seed array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.459.3.3 virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * *bytes,* int *numBytes*) [virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes	The array that will be filled with random bytes equal to size.
numBytes	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.459.3.4 virtual void decaf::internal::security::SecureRandomImpl::providerNextBytes (unsigned char * *bytes,* int *numBytes*) [virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes	The array that will be filled with random bytes equal to size.
numBytes	The number of bytes to generate and write into the bytes array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.459.3.5 virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * *seed,* int *size*) [virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed	The array of bytes used to update the generators seed.
size	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.459.3.6 virtual void decaf::internal::security::SecureRandomImpl::providerSetSeed (const unsigned char * *seed,* int *size*) [virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed	The array of bytes used to update the generators seed.
size	The size of the passed byte array.

Implements **decaf::security::SecureRandomSpi** (p. 1806).

6.460.3.1 virtual unsigned char* decaf::security::SecureRandomSpi::providerGenerateSeed (int *numBytes*) [pure virtual]

Generates a new set of seed bytes, the returned value may be used to seed another Random Number Generator.

The caller owns the returned array and must delete it.

Parameters

numBytes	The number of bytes that should be generated for the new seed array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 1804), and **decaf::internal::security::SecureRandomImpl** (p. 1804).

6.460.3.2 virtual void decaf::security::SecureRandomSpi::providerNextBytes (unsigned char * *bytes,* int *numBytes*) [pure virtual]

Generates the number of random bytes specified by the size parameter and write them to the passed bytes array.

The array must have already been allocated and be of the correct size to prevent segmentation faults.

Parameters

bytes	The array that will be filled with random bytes equal to size.
numBytes	The number of bytes to generate and write into the bytes array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 1804), and **decaf::internal::security::SecureRandomImpl** (p. 1804).

6.460.3.3 virtual void decaf::security::SecureRandomSpi::providerSetSeed (const unsigned char * *seed,* int *size*) [pure virtual]

Reseed the Random Number Generator, the value given supplements the previous seed value if any instead of replacing it.

Parameters

seed	The array of bytes used to update the generators seed.
size	The size of the passed byte array.

Implemented in **decaf::internal::security::SecureRandomImpl** (p. 1805), and **decaf::internal::security::-SecureRandomImpl** (p. 1805).

  Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.
- void **acquireUninterruptibly** (int permits)

  Acquires the given number of permits from this semaphore, blocking until all are available.
- bool **tryAcquire** (int permits)

  Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.
- bool **tryAcquire** (int permits, long long timeout, **const TimeUnit** &unit)

  Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.
- void **release** (int permits)

  Releases the given number of permits, returning them to the semaphore.
- int **availablePermits** () **const**

  Returns the current number of permits available in this semaphore.
- int **drainPermits** ()

  Acquires and returns all permits that are immediately available.
- bool **isFair** () **const**
- std::string **toString** () **const**

  Returns a string identifying this semaphore, as well as its state.

6.461.1 Detailed Description

A counting semaphore.

Conceptually, a semaphore maintains a set of permits. Each **acquire()** (p. 1809) blocks if necessary until a permit is available, and then takes it. Each **release()** (p. 1811) adds a permit, potentially releasing a blocking acquirer. However, no actual permit objects are used; the **Semaphore** (p. 1807) just keeps a count of the number available and acts accordingly.

Semaphores are often used to restrict the number of threads than can access some (physical or logical) resource.

class Pool { private:

static const int MAX_AVAILABLE = 100; **Semaphore** (p. 1807) available;

std::vector<std::string> items; std::vector<bool> used;

Mutex (p. 1519) lock;

public:

Pool() : available(MAX_AVAILABLE, true) { used.resize(MAX_AVAILABLE); items.resize(MAX_AVAILABLE); }

std::string getItem() throws InterruptedException { available.acquire(); return getNextAvailableItem(); }

void putItem(std::string x) { if(markAsUnused(x)) { available.release(); } }

std::string getNextAvailableItem() {

synchronized(&lock) (p. 2533) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(!used[i]) { used[i] = true; return items[i]; } }

return std::string(); // not reached }

bool markAsUnused(const std::string& item) { **synchronized(&lock)** (p. 2533) { for(int i = 0; i < MAX_AVAILABLE; ++i) { if(item == items[i]) { if(used[i]) { used[i] = false; return true; } else return false; } } } return false; } };

Before obtaining an item each thread must acquire a permit from the semaphore, guaranteeing that an item is available for use. When the thread has finished with the item it is returned back to the pool and a permit is returned to the semaphore, allowing another thread to acquire that item. Note that no synchronization lock is held when **acquire()** (p. 1809) is called as that would prevent an item from being returned to the pool. The semaphore encapsulates the synchronization needed to restrict access to the pool, separately from any synchronization needed to maintain the consistency of the pool itself.

A semaphore initialized to one, and which is used such that it only has at most one permit available, can serve as a mutual exclusion lock. This is more commonly known as a binary semaphore, because it only has two states: one permit available, or zero permits available. When used in this way, the binary semaphore has the property (unlike many **Lock** (p. 1304) implementations), that the "lock" can be released by a thread other than the owner (as semaphores have no notion of ownership). This can be useful in some specialized contexts, such as deadlock recovery.

The constructor for this class optionally accepts a fairness parameter. When set false, this class makes no guarantees about the order in which threads acquire permits. In particular, barging is permitted, that is, a thread invoking **acquire()** (p. 1809) can be allocated a permit ahead of a thread that has been waiting - logically the new thread places itself at the head of the queue of waiting threads. When fairness is set true, the semaphore guarantees that threads invoking any of the acquire methods are selected to obtain permits in the order in which their invocation of those methods was processed (first-in-first-out; FIFO). Note that FIFO ordering necessarily applies to specific internal points of execution within these methods. So, it is possible for one thread to invoke acquire before another, but reach the ordering point after the other, and similarly upon return from the method. Also note that the untimed tryAcquire methods do not honor the fairness setting, but will take any permits that are available.

Generally, semaphores used to control resource access should be initialized as fair, to ensure that no thread is starved out from accessing a resource. When using semaphores for other kinds of synchronization control, the throughput advantages of non-fair ordering often outweigh fairness considerations.

This class also provides convenience methods to acquire and release multiple permits at a time. Beware of the increased risk of indefinite postponement when these methods are used without fairness set true.

Since

1.0

6.461.2 Constructor & Destructor Documentation

6.461.2.1 decaf::util::concurrent::Semaphore::Semaphore (int *permits*)

Creates a **Semaphore** (p. 1807) with the given number of permits and nonfair fairness setting.

Parameters

permits	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.

6.461.2.2 decaf::util::concurrent::Semaphore::Semaphore (int *permits,* bool *fair*)

Creates a **Semaphore** (p. 1807) with the given number of permits and the given fairness setting.

Parameters

permits	the initial number of permits available. This value may be negative, in which case releases must occur before any acquires will be granted.
fair	true if this semaphore will guarantee first-in first-out granting of permits under contention, else false

6.461.2.3 virtual decaf::util::concurrent::Semaphore::~Semaphore ( ) [virtual]

6.461.3 Member Function Documentation

6.461.3.1 void decaf::util::concurrent::Semaphore::acquire ( )

Acquires a permit from this semaphore, blocking until one is available, or the thread is interrupted.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

- Some other thread invokes the **release()** (p. 1811) method for this semaphore and the current thread is next to be assigned a permit; or
  - Some other thread interrupts the current thread.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions

InterruptedException	- if the current thread is interrupted.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.2 void decaf::util::concurrent::Semaphore::acquire (int *permits*)

Acquires the given number of permits from this semaphore, blocking until all are available, or the thread is interrupted.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happens:

- Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or
  - Some other thread interrupts the current thread.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting for a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread are instead assigned to other threads trying to acquire permits, as if permits had been made available by a call to **release()** (p. 1811).

Parameters

permits	the number of permits to acquire.

Exceptions

InterruptedException	if the current thread is interrupted.
IllegalArgumentException	if the permits argument is negative.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.3 void decaf::util::concurrent::Semaphore::acquireUninterruptibly ( )

Acquires a permit from this semaphore, blocking until one is available.

Acquires a permit, if one is available and returns immediately, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes the **release()** (p. 1811) method for this semaphore and the current thread is next to be assigned a permit.

If the current thread is interrupted while waiting for a permit then it will continue to wait, but the time at which the thread is assigned a permit may change compared to the time it would have received the permit had no interruption occurred. When the thread does return from this method its interrupt status will be set.

Exceptions

RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.4 void decaf::util::concurrent::Semaphore::acquireUninterruptibly (int *permits*)

Acquires the given number of permits from this semaphore, blocking until all are available.

Acquires the given number of permits, if they are available, and returns immediately, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request.

If the current thread is interrupted while waiting for permits then it will continue to wait and its position in the queue is not affected. When the thread does return from this method its interrupt status will be set.

Parameters

permits	the number of permits to acquire.

Exceptions

IllegalArgumentException	if the permits argument is negative.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.5 int decaf::util::concurrent::Semaphore::availablePermits ( ) const

Returns the current number of permits available in this semaphore.

This method is typically used for debugging and testing purposes.

Returns

the number of permits available in this semaphore

6.461.3.6 int decaf::util::concurrent::Semaphore::drainPermits ( )

Acquires and returns all permits that are immediately available.

Returns

the number of permits acquired

Exceptions

RuntimeException	if an unexpected error occurs while draining the **Semaphore** (p. 1807).

6.461.3.7 bool decaf::util::concurrent::Semaphore::isFair ( ) const

Returns

true if this semaphore has fairness set true

6.461.3.8 void decaf::util::concurrent::Semaphore::release ( )

Releases a permit, returning it to the semaphore.

Releases a permit, increasing the number of available permits by one. If any threads are trying to acquire a permit, then one is selected and given the permit that was just released. That thread is (re)enabled for thread scheduling purposes.

There is no requirement that a thread that releases a permit must have acquired that permit by calling **acquire()** (p. 1809). Correct usage of a semaphore is established by programming convention in the application.

Exceptions

RuntimeException	if an unexpected error occurs while releasing the **Semaphore** (p. 1807).

6.461.3.9 void decaf::util::concurrent::Semaphore::release (int *permits*)

Releases the given number of permits, returning them to the semaphore.

Releases the given number of permits, increasing the number of available permits by that amount. If any threads are trying to acquire permits, then one is selected and given the permits that were just released. If the number of available permits satisfies that thread's request then that thread is (re)enabled for thread scheduling purposes; otherwise the thread will wait until sufficient permits are available. If there are still permits available after this thread's request has been satisfied, then those permits are assigned in turn to other threads trying to acquire permits.

Parameters

permits	the number of permits to release

Exceptions

IllegalArgumentException	if the permits argument is negative.
RuntimeException	if an unexpected error occurs while releasing the **Semaphore** (p. 1807).

6.461.3.10 std::string decaf::util::concurrent::Semaphore::toString ( ) const

Returns a string identifying this semaphore, as well as its state.

The state, in brackets, includes the String "Permits =" followed by the number of permits.

Returns

a string identifying this semaphore, as well as its state

6.461.3.11 bool decaf::util::concurrent::Semaphore::tryAcquire ( )

Acquires a permit from this semaphore, only if one is available at the time of invocation.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then this method will return immediately with the value false.

Even when this semaphore has been set to use a fair ordering policy, a call to **tryAcquire()** (p. 1812) will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(0, **TimeUnit.SECONDS** (p. 2141)) which is almost equivalent (it also detects interruption).

Returns

true if a permit was acquired and false otherwise

Exceptions

RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.12 bool decaf::util::concurrent::Semaphore::tryAcquire (long long *timeout,* const TimeUnit & *unit*)

Acquires a permit from this semaphore, if one becomes available within the given waiting time and the current thread has not been interrupted.

Acquires a permit, if one is available and returns immediately, with the value true, reducing the number of available permits by one.

If no permit is available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- Some other thread invokes the **release()** (p. 1811) method for this semaphore and the current thread is next to be assigned a permit; or
  - Some other thread interrupts the current thread; or
  - The specified waiting time elapses.

If a permit is acquired then the value true is returned.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting to acquire a permit,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

timeout	the maximum time to wait for a permit
unit	the time unit of the timeout argument

Returns

true if a permit was acquired and false if the waiting time elapsed before a permit was acquired

Exceptions

InterruptedException	if the current thread is interrupted.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.13 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits*)

Acquires the given number of permits from this semaphore, only if all are available at the time of invocation.

Acquires the given number of permits, if they are available, and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then this method will return immediately with the value false and the number of available permits is unchanged.

Even when this semaphore has been set to use a fair ordering policy, a call to tryAcquire will immediately acquire a permit if one is available, whether or not other threads are currently waiting. This "barging" behavior can be useful in certain circumstances, even though it breaks fairness. If you want to honor the fairness setting, then use tryAcquire(permits, 0, **TimeUnit.SECONDS** (p. 2141)) which is almost equivalent (it also detects interruption).

Parameters

permits	the number of permits to acquire

Returns

true if the permits were acquired and false otherwise.

Exceptions

IllegalArgumentException	if the permits argument is negative.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.461.3.14 bool decaf::util::concurrent::Semaphore::tryAcquire (int *permits,* long long *timeout,* const TimeUnit & *unit*)

Acquires the given number of permits from this semaphore, if all become available within the given waiting time and the current thread has not been interrupted.

Acquires the given number of permits, if they are available and returns immediately, with the value true, reducing the number of available permits by the given amount.

If insufficient permits are available then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- Some other thread invokes one of the release methods for this semaphore, the current thread is next to be assigned permits and the number of available permits satisfies this request; or
  - Some other thread interrupts the current thread; or
  - The specified waiting time elapses.

If the permits are acquired then the value true is returned.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting to acquire the permits,

then InterruptedException is thrown and the current thread's interrupted status is cleared. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 1811).

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all. Any permits that were to be assigned to this thread, are instead assigned to other threads trying to acquire permits, as if the permits had been made available by a call to **release()** (p. 1811).

Parameters

permits	the number of permits to acquire
timeout	the maximum amount of time to wait to acquire the permits.
unit	the units that the timeout param represents.

Returns

true if all permits were acquired and false if the waiting time elapsed before all permits were acquired

Exceptions

IllegalArgumentException	if the permits argument is negative.
RuntimeException	if an unexpected error occurs while acquiring the **Semaphore** (p. 1807).

6.463 decaf::net::ServerSocket Class Reference

This class implements server sockets.

`#include <src/main/decaf/net/ServerSocket.h>`

Inheritance diagram for decaf::net::ServerSocket:

Public Member Functions

- **ServerSocket** ()

  Creates a non-bound server socket.
- **ServerSocket** (int port)

  *Creates a new **ServerSocket** (*p. *1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **ServerSocket** (int port, int backlog)

  *Creates a new **ServerSocket** (*p. *1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **ServerSocket** (int port, int backlog, **const InetAddress** ∗address)

  *Creates a new **ServerSocket** (*p. *1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- virtual ∼**ServerSocket** ()

  *Releases socket handle if **close()** (*p. *1820) hasn't been called.*
- virtual void **bind** (**const** std::string &host, int port)

  Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual void **bind** (**const** std::string &host, int port, int backlog)

  Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.
- virtual **Socket** ∗ **accept** ()

  *Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (*p. *1816), the caller blocks until a connection is made.*
- virtual void **close** ()

  Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.
- virtual bool **isClosed** () **const**
- virtual bool **isBound** () **const**
- virtual int **getReceiveBufferSize** () **const**

  Gets the receive buffer size for this socket, SO_RCVBUF.
- virtual void **setReceiveBufferSize** (int size)

  Sets the receive buffer size for this socket, SO_RCVBUF.
- virtual bool **getReuseAddress** () **const**

  Gets the reuse address flag, SO_REUSEADDR.
- virtual void **setReuseAddress** (bool reuse)

  Sets the reuse address flag, SO_REUSEADDR.
- virtual int **getSoTimeout** () **const**

  Gets the timeout for socket operations, SO_TIMEOUT.
- virtual void **setSoTimeout** (int timeout)

  Sets the timeout for socket operations, SO_TIMEOUT.
- virtual int **getLocalPort** () **const**

  *Gets the port number on the Local machine that this **ServerSocket** (*p. *1816) is bound to.*
- virtual std::string **toString** () **const**

Static Public Member Functions

- static void **setSocketImplFactory** (**SocketImplFactory** *factory)

  *Sets the instance of a **SocketImplFactory** (p. 1928) that the **ServerSocket** (p. 1816) class should use when new instances of this class are created.*

Protected Member Functions

- **ServerSocket** (**SocketImpl** *impl)

  *Creates a **ServerSocket** (p. 1816) wrapping the provided **SocketImpl** (p. 1921) instance, this **Socket** (p. 1900) is considered unconnected.*
- virtual void **implAccept** (**Socket** *socket)

  *Virtual method that allows a **ServerSocket** (p. 1816) subclass to override the accept call and provide its own **SocketImpl** (p. 1921) for the socket.*
- virtual int **getDefaultBacklog** ()

  Allows a subclass to override what is considered the default backlog.
- void **checkClosed** () **const**
- void **ensureCreated** () **const**
- void **setupSocketImpl** (int port, int backlog, **const InetAddress** *ifAddress)

6.463.1 Detailed Description

This class implements server sockets.

A server socket waits for requests to come in over the network.

The actual work of the server socket is performed by an instance of the **SocketImpl** (p. 1921) class. An application can change the socket factory that creates the socket implementation to configure itself to create sockets of a particular type.

Since

1.0

6.463.2 Constructor & Destructor Documentation

6.463.2.1 decaf::net::ServerSocket::ServerSocket ( )

Creates a non-bound server socket.

6.463.2.2 decaf::net::ServerSocket::ServerSocket (int *port*)

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.463.2.3 decaf::net::ServerSocket::ServerSocket (int *port,* int *backlog*)

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The the number of incoming connection attempts to queue before connections are refused.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.463.2.4 decaf::net::ServerSocket::ServerSocket (int *port,* int *backlog,* const InetAddress * *address*)

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The the number of incoming connection attempts to queue before connections are refused.
ifAddress	The IP Address to bind to on the local machine.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.463.2.5 virtual decaf::net::ServerSocket::~ServerSocket ( ) [virtual]

Releases socket handle if **close()** (p. 1820) hasn't been called.

6.463.2.6 decaf::net::ServerSocket::ServerSocket (SocketImpl * *impl*) [protected]

Creates a **ServerSocket** (p. 1816) wrapping the provided **SocketImpl** (p. 1921) instance, this **Socket** (p. 1900) is considered unconnected.

The **ServerSocket** (p. 1816) class takes ownership of this **SocketImpl** (p. 1921) pointer and will delete it when the **Socket** (p. 1900) class is destroyed.

Parameters

impl	The **SocketImpl** (p. 1921) instance to wrap.

Exceptions

NullPointerException	if the passed **SocketImpl** (p. 1921) is Null.

6.463.3 Member Function Documentation

6.463.3.1 virtual Socket* decaf::net::ServerSocket::accept ( ) [virtual]

Listens for a connection request on the bound IPAddress and Port for this **ServerSocket** (p. 1816), the caller blocks until a connection is made.

If the SO_TIMEOUT option is set this method could throw a **SocketTimeoutException** (p. 1932) if the operation times out.

Returns

a new **Socket** (p. 1900) object pointer. Never returns NULL, the returned pointer is owned by the caller and must be explicitly freed by them.

Exceptions

IOException	if an I/O error occurs while binding the socket.
SocketException *(p. 1915)*	if an error occurs while blocking on the accept call.
SocketTimeoutException *(p. 1932)*	if the SO_TIMEOUT option was used and the accept timed out.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1554).

6.463.3.2 virtual void decaf::net::ServerSocket::bind (const std::string & *host,* int *port*) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

Parameters

host	The IP address or host name.
port	The TCP port between 1..655535.

Exceptions

IOException	if an I/O error occurs while binding the socket.
IllegalArgumentException	if the parameters are not valid.

6.463.3.3 virtual void decaf::net::ServerSocket::bind (const std::string & *host,* int *port,* int *backlog*) [virtual]

Bind and listen to given local IPAddress and port, if the address is empty than a valid local address will be chosen, and if the port of 0 than an available open port will be chosen.

If the backlog is greater than zero it will be used instead of the default value, otherwise the default value is used and no error is generated.

Parameters

host	The IP address or host name.
port	The TCP port between 1..655535.
backlog	The size of listen backlog.

Exceptions

IOException	if an I/O error occurs while binding the socket.
IllegalArgumentException	if the parameters are not valid.

6.463.3.4 void decaf::net::ServerSocket::checkClosed ( ) const [protected]

6.463.3.5 virtual void decaf::net::ServerSocket::close ( ) [virtual]

Closes the server socket, causing any Threads blocked on an accept call to throw an Exception.

Exceptions

IOException	if an I/O error occurs while performing this operation.

6.463.3.6 void decaf::net::ServerSocket::ensureCreated ( ) const [protected]

6.463.3.7 virtual int decaf::net::ServerSocket::getDefaultBacklog ( ) [protected, virtual]

Allows a subclass to override what is considered the default backlog.

Returns

the default backlog for connections.

6.463.3.8 virtual int decaf::net::ServerSocket::getLocalPort ( ) const [virtual]

Gets the port number on the Local machine that this **ServerSocket** (p. 1816) is bound to.

Returns

the port number of this machine that is bound, if not bound returns -1.

6.463.3.9 virtual int decaf::net::ServerSocket::getReceiveBufferSize ( ) const [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.463.3.10 virtual bool decaf::net::ServerSocket::getReuseAddress ( ) const [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.463.3.11 virtual int decaf::net::ServerSocket::getSoTimeout ( ) const [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException *(p. 1915)*	Thrown if unable to retrieve the information.

6.463.3.12 virtual void decaf::net::ServerSocket::implAccept (Socket * *socket*) [protected, virtual]

Virtual method that allows a **ServerSocket** (p. 1816) subclass to override the accept call and provide its own **SocketImpl** (p. 1921) for the socket.

Parameters

socket	The socket object whose **SocketImpl** (p. 1921) should be used for the accept call.

Exceptions

IOException	if an I/O error occurs while performing this operation.

6.463.3.13 virtual bool decaf::net::ServerSocket::isBound ( ) const [virtual]

Returns

true of the server socket is bound.

6.463.3.14 virtual bool decaf::net::ServerSocket::isClosed ( ) const [virtual]

Returns

true if the close method has been called on the **ServerSocket** (p. 1816).

6.463.3.15 virtual void decaf::net::ServerSocket::setReceiveBufferSize (int *size*) [virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

size	Number of bytes to set the receive buffer to.

Exceptions

SocketException *(p. 1915)*	if the operation fails.
IllegalArgumentException	if the value is zero or negative.

6.463.3.16 virtual void decaf::net::ServerSocket::setReuseAddress (bool *reuse*) [virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters

reuse	If true, sets the flag.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.463.3.17 static void decaf::net::ServerSocket::setSocketImplFactory (SocketImplFactory * *factory*) [static]

Sets the instance of a **SocketImplFactory** (p. 1928) that the **ServerSocket** (p. 1816) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

factory	The instance of a **SocketImplFactory** (p. 1928) to use when new **SocketImpl** (p. 1921) objects are created.

Exceptions

IOException	if an I/O error occurs while performing this operation.
SocketException *(p. 1915)*	if this method has already been called with a valid factory.

6.463.3.18 virtual void decaf::net::ServerSocket::setSoTimeout (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

timeout	The timeout in milliseconds for socket operations.

Exceptions

SocketException *(p. 1915)*	Thrown if unable to set the information.
IllegalArgumentException	if the timeout value is negative.

6.463.3.19 void decaf::net::ServerSocket::setupSocketImpl (int *port,* int *backlog,* const InetAddress * *ifAddress*) [protected]

6.463.3.20 virtual std::string decaf::net::ServerSocket::toString ( ) const [virtual]

Returns

a string representing this **ServerSocket** (p. 1816).

6.464.1 Detailed Description

Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.

Since

1.0

6.464.2 Constructor & Destructor Documentation

6.464.2.1 decaf::net::ServerSocketFactory::ServerSocketFactory ( ) [protected]

6.464.2.2 virtual decaf::net::ServerSocketFactory::~ServerSocketFactory ( ) [virtual]

6.464.3 Member Function Documentation

6.464.3.1 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket ( ) [virtual]

Create a new **ServerSocket** (p. 1816) that is unbound.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1558), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 904), and **decaf::internal::net::DefaultServerSocketFactory** (p. 896).

6.464.3.2 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port*) [pure virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1558), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 904), and **decaf::internal::net::DefaultServerSocketFactory** (p. 896).

6.464.3.3 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port,* int *backlog*) [pure virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will use the specified connection backlog setting.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1559), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 905), and **decaf::internal::net::DefaultServerSocketFactory** (p. 896).

6.464.3.4 virtual ServerSocket* decaf::net::ServerSocketFactory::createServerSocket (int *port,* int *backlog,* const InetAddress * *address*) [pure virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 1816) will listen on all interfaces.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.
address	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1559), **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 905), and **decaf::internal::net::DefaultServerSocketFactory** (p. 897).

6.464.3.5 static ServerSocketFactory* decaf::net::ServerSocketFactory::getDefault ( ) [static]

Returns the Default **ServerSocket** (p. 1816) factory, the pointer is owned by the Decaf runtime and should not be deleted by the caller.

Only one default **ServerSocketFactory** (p. 1823) exists for the lifetime of the Application.

Returns

the default **ServerSocketFactory** (p. 1823) for this application.

Reimplemented in **decaf::net::ssl::SSLServerSocketFactory** (p. 1946).

The documentation for this class was generated from the following file:

  Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.
- virtual void **doStart** ()=0

  Performs the actual start operation on the service, acquiring all the resources needed to run the service.

6.468.1 Detailed Description

Provides a base class for **Service** (p. 1826) implementations.

Since

3.3.0

6.468.2 Constructor & Destructor Documentation

6.468.2.1 activemq::util::ServiceSupport::ServiceSupport (const ServiceSupport &)

6.468.2.2 activemq::util::ServiceSupport::ServiceSupport ( )

6.468.2.3 virtual activemq::util::ServiceSupport::∼ServiceSupport ( ) [virtual]

6.468.3 Member Function Documentation

6.468.3.1 void activemq::util::ServiceSupport::addServiceListener (ServiceListener ∗ *listener*)

Adds the given listener to this **Service** (p. 1826)'s list of listeners, call retains ownership of the pointer.

6.468.3.2 static void activemq::util::ServiceSupport::dispose (Service ∗ *service*) [static]

Safely shuts down a service.

Parameters

service	The service to stop.

6.468.3.3 virtual void activemq::util::ServiceSupport::doStart ( ) [protected, pure virtual]

Performs the actual start operation on the service, acquiring all the resources needed to run the service.

Must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 1797).

6.468.3.4 virtual void activemq::util::ServiceSupport::doStop (ServiceStopper * *stopper*) [protected, pure virtual]

Performs the actual stop operation on the service, ensuring that all resources held are released, must be implemented in derived class.

Implemented in **activemq::threads::Scheduler** (p. 1797).

6.468.3.5 bool activemq::util::ServiceSupport::isStarted ( ) const

Returns

true if this service has been started

6.468.3.6 bool activemq::util::ServiceSupport::isStopped ( ) const

Returns

true if this service is closed

6.468.3.7 bool activemq::util::ServiceSupport::isStopping ( ) const

Returns

true if this service is in the process of closing

6.468.3.8 ServiceSupport& activemq::util::ServiceSupport::operator= (const ServiceSupport &)

6.468.3.9 void activemq::util::ServiceSupport::removeServiceListener (ServiceListener * *llistener*)

Removes the given listener to this **Service** (p. 1826)'s list of listeners, call retains ownership of the pointer.

6.468.3.10 void activemq::util::ServiceSupport::start ( ) [virtual]

Starts the **Service** (p. 1826), notifying any registered listeners of the start if it is successful.

Implements **activemq::util::Service** (p. 1826).

6.468.3.11 void activemq::util::ServiceSupport::stop ( ) [virtual]

Stops the **Service** (p. 1826).

Implements **activemq::util::Service** (p. 1826).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**ServiceSupport.h**

6.469 cms::Session Class Reference

A **Session** (p. 1830) object is a single-threaded context for producing and consuming messages.

`#include <src/main/cms/Session.h>`

Inheritance diagram for cms::Session:

Public Types

- enum **AcknowledgeMode** {
  AUTO_ACKNOWLEDGE, **DUPS_OK_ACKNOWLEDGE**, **CLIENT_ACKNOWLEDGE**, **SESSION_TRANSACTED**,
  INDIVIDUAL_ACKNOWLEDGE }

Public Member Functions

- virtual ~**Session** () throw ()
- virtual void **close** ()=0

  Closes this session as well as any active child consumers or producers.
- virtual void **commit** ()=0

  Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()=0

  Rolls back all messages done in this transaction and releases any locks currently held.
- virtual void **recover** ()=0

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.
- virtual **MessageConsumer** * **createConsumer** (**const Destination** *destination)=0

  *Creates a **MessageConsumer*** (p. *1455) for the specified destination.*
- virtual **MessageConsumer** * **createConsumer** (**const Destination** *destination, **const** std::string &selector)=0

  *Creates a **MessageConsumer*** (p. *1455) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createConsumer** (**const Destination** *destination, **const** std::string &selector, bool noLocal)=0

  *Creates a **MessageConsumer*** (p. *1455) for the specified destination, using a message selector.*
- virtual **MessageConsumer** * **createDurableConsumer** (**const Topic** *destination, **const** std::string &name, **const** std::string &selector, bool noLocal=false)=0

  *Creates a durable subscriber to the specified topic, using a **Message*** (p. *1426) selector.*
- virtual **MessageProducer** * **createProducer** (**const Destination** *destination=NULL)=0

  *Creates a **MessageProducer*** (p. *1491) to send messages to the specified destination.*
- virtual **QueueBrowser** * **createBrowser** (**const cms::Queue** *queue)=0

  *Creates a new **QueueBrowser*** (p. *1726) to peek at Messages on the given **Queue*** (p. *1722).*
- virtual **QueueBrowser** * **createBrowser** (**const cms::Queue** *queue, **const** std::string &selector)=0

  *Creates a new **QueueBrowser*** (p. *1726) to peek at Messages on the given **Queue*** (p. *1722).*
- virtual **Queue** * **createQueue** (**const** std::string &queueName)=0

- virtual **MapMessage** * **createMapMessage** ()=0

  *Creates a new **MapMessage** (p. 1379).*
- virtual **AcknowledgeMode getAcknowledgeMode** () **const** =0

  Returns the acknowledgment mode of the session.
- virtual bool **isTransacted** () **const** =0

  *Gets if the Sessions is a Transacted **Session** (p. 1830).*
- virtual void **unsubscribe** (**const** std::string &name)=0

  Unsubscribes a durable subscription that has been created by a client.

6.469.1 Detailed Description

A **Session** (p. 1830) object is a single-threaded context for producing and consuming messages.

A session serves several purposes:

- It is a factory for its message producers and consumers.
  - It supplies provider-optimized message factories.
  - It is a factory for TemporaryTopics and TemporaryQueues.
  - It provides a way to create **Queue** (p. 1722) or **Topic** (p. 2141) objects for those clients that need to dynamically manipulate provider-specific destination names.
  - It supports a single series of transactions that combine work spanning its producers and consumers into atomic units.
  - It defines a serial order for the messages it consumes and the messages it produces.
  - It retains messages it consumes until they have been acknowledged.
  - It serializes execution of message listeners registered with its message consumers.

A session can create and service multiple message producers and consumers.

One typical use is to have a thread block on a synchronous **MessageConsumer** (p. 1455) until a message arrives. The thread may then use one or more of the **Session** (p. 1830)'s MessageProducers.

If a client desires to have one thread produce messages while others consume them, the client should use a separate session for its producing thread.

Certain rules apply to a session's `close` method and are detailed below.

- There is no need to close the producers and consumers of a closed session.
  - The close call will block until a receive call or message listener in progress has completed. A blocked message consumer receive call returns null when this session is closed.
  - Closing a transacted session must roll back the transaction in progress.
  - The close method is the only **Session** (p. 1830) method that can be called concurrently.
  - Invoking any other **Session** (p. 1830) method on a closed session must throw an **IllegalStateException** (p. 1098). Closing a closed session must not throw any exceptions.

Transacted Sessions

When a **Session** (p. 1830) is created it can be set to operate in a Transaction based mode. Each **Session** (p. 1830) then operates in a single transaction for all Producers and Consumers of that **Session** (p. 1830). Messages sent and received within a Transaction are grouped into an atomic unit that is committed or rolled back together.

For a **MessageProducer** (p. 1491) this implies that all messages sent by the producer are not sent to the Provider unit the commit call is made. Rolling back the Transaction results in all produced Messages being dropped.

For a **MessageConsumer** (p. 1455) this implies that all received messages are not Acknowledged until the Commit call is made. Rolling back the Transaction results in all Consumed **Message** (p. 1426) being redelivered to the client, the Provider may allow configuration that limits the Maximum number of redeliveries for a **Message** (p. 1426).

While the **Session** (p. 1830) interface implements the **Startable** (p. 1963) and **Stoppable** (p. 2016) interfaces it is not required to implement these methods and can throw an UnsupportedOperation exception if they are not available for the given CMS provider.

Since

1.0

6.469.2 Member Enumeration Documentation

6.469.2.1 enum cms::Session::AcknowledgeMode

Enumerator:

AUTO_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns.

DUPS_OK_ACKNOWLEDGE With this acknowledgment mode, the session automatically acknowledges a client's receipt of a message either when the session has successfully returned from a call to receive or when the message listener the session has called to process the message successfully returns. Acknowledgments may be delayed in this mode to increase performance at the cost of the message being redelivered this client fails.

CLIENT_ACKNOWLEDGE With this acknowledgment mode, the client acknowledges a consumed message by calling the message's acknowledge method.

SESSION_TRANSACTED Messages will be consumed when the transaction commits.

INDIVIDUAL_ACKNOWLEDGE **Message** (p. 1426) will be acknowledged individually. Normally the acks sent acknowledge the given message and all messages received before it, this mode only acknowledges one message.

6.469.3 Constructor & Destructor Documentation

6.469.3.1 virtual cms::Session::~Session ( ) throw () [virtual]

6.469.4 Member Function Documentation

6.469.4.1 virtual void cms::Session::close ( ) [pure virtual]

Closes this session as well as any active child consumers or producers.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implements **cms::Closeable** (p. 633).

Implemented in **activemq::core::ActiveMQSession** (p. 262), and **activemq::cmsutil::PooledSession** (p. 1623).

6.469.4.2 virtual void cms::Session::commit ( ) [pure virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
IllegalStateException *(p. 1098)*	- if the method is not called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 262), **activemq::cmsutil::PooledSession** (p. 1623), and **activemq::core::ActiveMQXASession** (p. 339).

Referenced by activemq::cmsutil::PooledSession::commit().

6.469.4.3 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue*) [pure virtual]

Creates a new **QueueBrowser** (p. 1726) to peek at Messages on the given **Queue** (p. 1722).

Parameters

queue	the **Queue** (p. 1722) to browse

Returns

New **QueueBrowser** (p. 1726) that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if the destination given is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 263), and **activemq::cmsutil::PooledSession** (p. 1623).

6.469.4.4 virtual QueueBrowser* cms::Session::createBrowser (const cms::Queue * *queue,* const std::string & *selector*) [pure virtual]

Creates a new **QueueBrowser** (p. 1726) to peek at Messages on the given **Queue** (p. 1722).

Parameters

queue	the **Queue** (p. 1722) to browse
selector	the **Message** (p. 1426) selector to filter which messages are browsed.

Returns

New **QueueBrowser** (p. 1726) that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if the destination given is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 263), and **activemq::cmsutil::PooledSession** (p. 1624).

6.469.4.5 virtual BytesMessage* cms::Session::createBytesMessage ( ) [pure virtual]

Creates a **BytesMessage** (p. 557).

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 263), and **activemq::cmsutil::PooledSession** (p. 1624).

Referenced by activemq::cmsutil::PooledSession::createBytesMessage().

6.469.4.6 virtual BytesMessage* cms::Session::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [pure virtual]

Creates a **BytesMessage** (p. 557) and sets the payload to the passed value.

Parameters

bytes	an array of bytes to set in the message
bytesSize	the size of the bytes array, or number of bytes to use

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 264), and **activemq::cmsutil::PooledSession** (p. 1624).

6.469.4.7 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination*) [pure virtual]

Creates a **MessageConsumer** (p. 1455) for the specified destination.

Parameters

destination	the **Destination** (p. 936) that this consumer receiving messages for.

Returns

pointer to a new **MessageConsumer** (p. 1455) that is owned by the caller (caller deletes)

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if an invalid destination is specified.

Implemented in **activemq::core::ActiveMQSession** (p. 264), and **activemq::cmsutil::PooledSession** (p. 1625).

Referenced by activemq::cmsutil::PooledSession::createConsumer().

6.469.4.8 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination,* const std::string & *selector*) [pure virtual]

Creates a **MessageConsumer** (p. 1455) for the specified destination, using a message selector.

Parameters

destination	the **Destination** (p. 936) that this consumer receiving messages for.
selector	the **Message** (p. 1426) Selector to use

Returns

pointer to a new **MessageConsumer** (p. 1455) that is owned by the caller (caller deletes)

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if an invalid destination is specified.
InvalidSelectorException *(p. 1195)*	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 264), and **activemq::cmsutil::PooledSession** (p. 1626).

6.469.4.9 virtual MessageConsumer* cms::Session::createConsumer (const Destination * *destination,* const std::string & *selector,* bool *noLocal*) [pure virtual]

Creates a **MessageConsumer** (p. 1455) for the specified destination, using a message selector.

Parameters

destination	the **Destination** (p. 936) that this consumer receiving messages for.
selector	the **Message** (p. 1426) Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new **MessageConsumer** (p. 1455) that is owned by the caller (caller deletes)

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if an invalid destination is specified.
InvalidSelectorException *(p. 1195)*	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 265), and **activemq::cmsutil::PooledSession** (p. 1626).

6.469.4.10 virtual MessageConsumer* cms::Session::createDurableConsumer (const Topic * *destination,* const std::string & *name,* const std::string & *selector,* bool *noLocal* = false) [pure virtual]

Creates a durable subscriber to the specified topic, using a **Message** (p. 1426) selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination	the topic to subscribe to
name	The name used to identify the subscription
selector	the **Message** (p. 1426) Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable **MessageConsumer** (p. 1455) that is owned by the caller (caller deletes)

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if an invalid destination is specified.
InvalidSelectorException *(p. 1195)*	- if the message selector is invalid.

Implemented in **activemq::core::ActiveMQSession** (p. 265), and **activemq::cmsutil::PooledSession** (p. 1627).

Referenced by activemq::cmsutil::PooledSession::createDurableConsumer().

6.469.4.11 virtual MapMessage* cms::Session::createMapMessage ( ) [pure virtual]

Creates a new **MapMessage** (p. 1379).

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 266), and **activemq::cmsutil::PooledSession** (p. 1627).

Referenced by activemq::cmsutil::PooledSession::createMapMessage().

6.469.4.12 virtual Message* cms::Session::createMessage ( ) [pure virtual]

Creates a new **Message** (p. 1426).

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 266), and **activemq::cmsutil::PooledSession** (p. 1627).

Referenced by activemq::cmsutil::PooledSession::createMessage().

6.469.4.13 virtual MessageProducer* cms::Session::createProducer (const Destination * *destination* = NULL) [pure virtual]

Creates a **MessageProducer** (p. 1491) to send messages to the specified destination.

Parameters

destination	the **Destination** (p. 936) to send on

Returns

New **MessageProducer** (p. 1491) that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
InvalidDestination-Exception *(p. 1190)*	- if an invalid destination is specified.

Implemented in **activemq::core::ActiveMQSession** (p. 266), and **activemq::cmsutil::PooledSession** (p. 1628).

Referenced by activemq::cmsutil::PooledSession::createProducer().

6.469.4.14 virtual Queue* cms::Session::createQueue (const std::string & *queueName*) [pure virtual]

Creates a queue identity given a **Queue** (p. 1722) name.

Parameters

queueName	the name of the new **Queue** (p. 1722)

Returns

new **Queue** (p. 1722) pointer that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 266), and **activemq::cmsutil::PooledSession** (p. 1628).

Referenced by activemq::cmsutil::PooledSession::createQueue().

6.469.4.15 virtual StreamMessage* cms::Session::createStreamMessage ( ) [pure virtual]

Creates a new **StreamMessage** (p. 2020).

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 267), and **activemq::cmsutil::PooledSession** (p. 1628).

Referenced by activemq::cmsutil::PooledSession::createStreamMessage().

6.469.4.16 virtual TemporaryQueue* cms::Session::createTemporaryQueue ( ) [pure virtual]

Creates a **TemporaryQueue** (p. 2090) object.

Returns

new **TemporaryQueue** (p. 2090) pointer that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 267), and **activemq::cmsutil::PooledSession** (p. 1629).

Referenced by activemq::cmsutil::PooledSession::createTemporaryQueue().

6.469.4.17 virtual TemporaryTopic* cms::Session::createTemporaryTopic ( ) [pure virtual]

Creates a **TemporaryTopic** (p. 2091) object.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 267), and **activemq::cmsutil::PooledSession** (p. 1629).

Referenced by activemq::cmsutil::PooledSession::createTemporaryTopic().

6.469.4.18 virtual TextMessage* cms::Session::createTextMessage ( ) [pure virtual]

Creates a new **TextMessage** (p. 2093).

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 267), and **activemq::cmsutil::PooledSession** (p. 1629).

Referenced by activemq::cmsutil::PooledSession::createTextMessage().

6.469.4.19 virtual TextMessage* cms::Session::createTextMessage (const std::string & *text*) [pure virtual]

Creates a new **TextMessage** (p. 2093) and set the text to the value given.

Parameters

text	the initial text for the message

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 268), and **activemq::cmsutil::PooledSession** (p. 1629).

6.469.4.20 virtual Topic* cms::Session::createTopic (const std::string & *topicName*) [pure virtual]

Creates a topic identity given a **Queue** (p. 1722) name.

Parameters

topicName	the name of the new **Topic** (p. 2141)

Returns

new **Topic** (p. 2141) pointer that is owned by the caller.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 268), and **activemq::cmsutil::PooledSession** (p. 1630).

Referenced by activemq::cmsutil::PooledSession::createTopic().

6.469.4.21 virtual AcknowledgeMode cms::Session::getAcknowledgeMode ( ) const [pure virtual]

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 269), and **activemq::cmsutil::PooledSession** (p. 1630).

Referenced by activemq::cmsutil::PooledSession::getAcknowledgeMode().

6.469.4.22 virtual bool cms::Session::isTransacted ( ) const [pure virtual]

Gets if the Sessions is a Transacted **Session** (p. 1830).

Returns

transacted true - false.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 271), **activemq::cmsutil::PooledSession** (p. 1631), and **activemq::core::ActiveMQXASession** (p. 340).

Referenced by activemq::cmsutil::PooledSession::isTransacted().

6.469.4.23 virtual void cms::Session::recover ( ) [pure virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
  - Mark all messages that might have been delivered but not acknowledged as "redelivered"
  - Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to stop and restart message delivery due to some internal error.
IllegalStateException *(p. 1098)*	- if the method is called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 272), and **activemq::cmsutil::PooledSession** (p. 1631).

Referenced by activemq::cmsutil::PooledSession::recover().

6.469.4.24 virtual void cms::Session::rollback ( ) [pure virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
IllegalStateException *(p. 1098)*	- if the method is not called by a transacted session.

Implemented in **activemq::core::ActiveMQSession** (p. 273), **activemq::cmsutil::PooledSession** (p. 1631), and **activemq::core::ActiveMQXASession** (p. 340).

Referenced by activemq::cmsutil::PooledSession::rollback().

6.469.4.25 virtual void cms::Session::unsubscribe (const std::string & *name*) [pure virtual]

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active **MessageConsumer** (p. 1455) or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name	The name used to identify this subscription

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::core::ActiveMQSession** (p. 274), and **activemq::cmsutil::PooledSession** (p. 1632).

Referenced by activemq::cmsutil::PooledSession::unsubscribe().

6.471.3 Member Function Documentation

6.471.3.1 virtual SessionId* activemq::commands::SessionId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.471.3.2 virtual int activemq::commands::SessionId::compareTo (const SessionId & *value*) const [virtual]

6.471.3.3 virtual void activemq::commands::SessionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.471.3.4 virtual bool activemq::commands::SessionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.471.3.5 virtual bool activemq::commands::SessionId::equals (const SessionId & *value*) const [virtual]

6.471.3.6 virtual const std::string& activemq::commands::SessionId::getConnectionId ( ) const [virtual]

6.471.3.7 virtual std::string& activemq::commands::SessionId::getConnectionId ( ) [virtual]

6.471.3.8 virtual unsigned char activemq::commands::SessionId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.471.3.9 const Pointer<ConnectionId>& activemq::commands::SessionId::getParentId ( ) const

6.471.3.10 virtual long long activemq::commands::SessionId::getValue ( ) const [virtual]

6.471.3.11 virtual bool activemq::commands::SessionId::operator< (const SessionId & *value*) const [virtual]

6.471.3.12 SessionId& activemq::commands::SessionId::operator= (const SessionId & *other*)

6.471.3.13 virtual bool activemq::commands::SessionId::operator== (const SessionId & *value*) const [virtual]

6.471.3.14 virtual void activemq::commands::SessionId::setConnectionId (const std::string & *connectionId*) [virtual]

6.471.3.15 virtual void activemq::commands::SessionId::setValue (long long *value*) [virtual]

6.471.3.16 virtual std::string activemq::commands::SessionId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.471.4 Field Documentation

6.471.4.1 std::string activemq::commands::SessionId::connectionId [protected]

6.471.4.2 const unsigned char activemq::commands::SessionId::ID_SESSIONID = 121 [static]

Referenced by activemq::state::CommandVisitorAdapter::processRemoveInfo().

6.471.4.3 long long activemq::commands::SessionId::value [protected]

- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.472.1 Detailed Description

Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 1846).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.472.2 Constructor & Destructor Documentation

6.472.2.1 activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::SessionIdMarshaller ( ) [inline]

6.472.2.2 virtual activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::∼SessionIdMarshaller ( ) [inline, virtual]

6.472.3 Member Function Documentation

6.472.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.472.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.472.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.472.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.472.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.472.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.472.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SessionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SessionIdMarshaller.h**

6.473 activemq::commands::SessionInfo Class Reference

`#include <src/main/activemq/commands/SessionInfo.h>`

Inheritance diagram for activemq::commands::SessionInfo:

Public Member Functions

- **SessionInfo** ()
- virtual ∼**SessionInfo** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **SessionInfo** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*

- virtual void **setSessionId** (**const Pointer**< **SessionId** > &**sessionId**)
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_SESSIONINFO** = 4

Protected Attributes

- **Pointer**< **SessionId** > **sessionId**

6.473.1 Constructor & Destructor Documentation

6.473.1.1 activemq::commands::SessionInfo::SessionInfo ( )

6.473.1.2 virtual activemq::commands::SessionInfo::~SessionInfo ( ) [virtual]

6.473.2 Member Function Documentation

6.473.2.1 virtual SessionInfo* activemq::commands::SessionInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.473.2.2 virtual void activemq::commands::SessionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.473.2.3 Pointer<RemoveInfo> activemq::commands::SessionInfo::createRemoveCommand ( ) const

6.473.2.4 virtual bool activemq::commands::SessionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.473.2.5 unsigned int activemq::commands::SessionInfo::getAckMode ( ) const [inline]

6.473.2.6 virtual unsigned char activemq::commands::SessionInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.473.2.7 virtual const Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ( ) const [virtual]

Referenced by activemq::state::ConnectionState::addSession().

6.473.2.8 virtual Pointer<SessionId>& activemq::commands::SessionInfo::getSessionId ( ) [virtual]

6.473.2.9 void activemq::commands::SessionInfo::setAckMode (unsigned int *mode*) [inline]

6.473.2.10 virtual void activemq::commands::SessionInfo::setSessionId (const Pointer< SessionId > & *sessionId*) [virtual]

6.473.2.11 virtual std::string activemq::commands::SessionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.473.2.12 virtual Pointer<Command> activemq::commands::SessionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.473.3 Field Documentation

6.473.3.1 const unsigned char activemq::commands::SessionInfo::ID_SESSIONINFO = 4 [static]

6.474.3 Member Function Documentation

6.474.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.474.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.474.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.474.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.474.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.474.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.474.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

6.475 activemq::cmsutil::SessionPool Class Reference

A pool of CMS sessions from the same connection and with the same acknowledge mode.

`#include <src/main/activemq/cmsutil/SessionPool.h>`

Public Member Functions

- **SessionPool** (**cms::Connection** *connection, **cms::Session::AcknowledgeMode** ackMode, **ResourceLifecycleManager** *resourceLifecycleManager)

  Constructs a session pool.
- virtual ~**SessionPool** ()

  Destroys the pooled session objects, but not the underlying session resources.
- virtual **PooledSession** * **takeSession** ()

  Takes a session from the pool, creating one if necessary.
- virtual void **returnSession** (**PooledSession** *session)

  Returns a session to the pool.
- **ResourceLifecycleManager** * **getResourceLifecycleManager** ()

6.475.1 Detailed Description

A pool of CMS sessions from the same connection and with the same acknowledge mode.

Internal session resources are managed through a provided **ResourceLifecycleManager** (p. 1778), not by this pool. This class is thread-safe.

6.475.2 Constructor & Destructor Documentation

6.475.2.1 activemq::cmsutil::SessionPool::SessionPool (cms::Connection * *connection,* cms::Session::AcknowledgeMode *ackMode,* ResourceLifecycleManager * *resourceLifecycleManager*)

Constructs a session pool.

Parameters

connection	the connection to be used for creating all sessions.
ackMode	the acknowledge mode to be used for all sessions
resource-Lifecycle-Manager	the object responsible for managing the lifecycle of any allocated **cms::Session** (p. 1830) resources.

6.475.2.2 virtual activemq::cmsutil::SessionPool::~SessionPool ( ) [virtual]

Destroys the pooled session objects, but not the underlying session resources.

That is the job of the **ResourceLifecycleManager** (p. 1778).

6.475.3 Member Function Documentation

6.475.3.1 ResourceLifecycleManager* activemq::cmsutil::SessionPool::getResourceLifecycleManager ( ) [inline]

6.475.3.2 virtual void activemq::cmsutil::SessionPool::returnSession (PooledSession * *session*) [virtual]

Returns a session to the pool.

Parameters

session	the session to be returned.

6.475.3.3 virtual PooledSession* activemq::cmsutil::SessionPool::takeSession ( ) [virtual]

Takes a session from the pool, creating one if necessary.

Returns

the pooled session object

Exceptions

CMSException	if an error occurred

6.477 decaf::util::Set< E > Class Template Reference

A collection that contains no duplicate elements.

`#include <src/main/decaf/util/Set.h>`

Inheritance diagram for decaf::util::Set< E >:

Public Member Functions

- virtual ~**Set** ()

6.477.1 Detailed Description

template<typename E>class decaf::util::Set< E >

A collection that contains no duplicate elements.

More formally, sets contain no pair of elements e1 and e2 such that e1 == e2, and at most one null element. As implied by its name, this interface models the mathematical set abstraction.

The additional stipulation on constructors is, not surprisingly, that all constructors must create a set that contains no duplicate elements (as defined above).

Note: Great care must be exercised if mutable objects are used as set elements. The behavior of a set is not specified if the value of an object is changed in a manner that affects equals comparisons while the object is an element in the set.

Since

1.0

6.478 decaf::lang::Short Class Reference

`#include <src/main/decaf/lang/Short.h>`

Inheritance diagram for decaf::lang::Short:

Public Member Functions

- **Short** (short value)
- **Short** (**const** std::string &value)
- virtual ~**Short** ()
- virtual int **compareTo** (**const Short** &s) **const**

  *Compares this **Short*** (p. *1858*) *instance with another.*
- bool **equals** (**const Short** &s) **const**
- virtual bool **operator==** (**const Short** &s) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Short** &s) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** short &s) **const**

  *Compares this **Short*** (p. *1858*) *instance with another.*
- bool **equals** (**const** short &s) **const**
- virtual bool **operator==** (**const** short &s) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** short &s) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.

- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (short value)
- static **Short decode** (**const** std::string &value)

  *Decodes a **String** (p. 2031) into a **Short** (p. 1858).*
- static short **reverseBytes** (short value)

  Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.
- static short **parseShort** (**const** std::string &s, int radix)

  Parses the string argument as a signed short in the radix specified by the second argument.
- static short **parseShort** (**const** std::string &s)

  Parses the string argument as a signed decimal short.
- static **Short valueOf** (short value)

  *Returns a **Short** (p. 1858) instance representing the specified short value.*
- static **Short valueOf** (**const** std::string &value)

  *Returns a **Short** (p. 1858) object holding the value given by the specified std::string.*
- static **Short valueOf** (**const** std::string &value, int radix)

  *Returns a **Short** (p. 1858) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static **const** int **SIZE** = 16

  Size of this objects primitive type in bits.
- static **const** short **MAX_VALUE** = (short)0x7FFF

  Max Value for this Object's primitive type.
- static **const** short **MIN_VALUE** = (short)0x8000

  Max Value for this Object's primitive type.

6.478.1 Constructor & Destructor Documentation

6.478.1.1 decaf::lang::Short::Short (short *value*)

Parameters

value	- short to wrap

6.478.1.2 decaf::lang::Short::Short (const std::string & *value*)

Parameters

value	The string value to convert to short and wrap.

Exceptions

NumberFormatException	if the string is not well formed number value.

6.478.1.3 virtual decaf::lang::Short::~Short ( ) [inline, virtual]

6.478.2 Member Function Documentation

6.478.2.1 virtual unsigned char decaf::lang::Short::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.478.2.2 virtual int decaf::lang::Short::compareTo (const Short & *s*) const [virtual]

Compares this **Short** (p. 1858) instance with another.

Parameters

s	- the **Short** (p. 1858) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Short** > (p. 687).

6.478.2.3 virtual int decaf::lang::Short::compareTo (const short & *s*) const [virtual]

Compares this **Short** (p. 1858) instance with another.

Parameters

s	- the **Short** (p. 1858) instance to be compared

Returns

zero if this object represents the same short value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **short** > (p. 687).

6.478.2.4 static Short decaf::lang::Short::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2031) into a **Short** (p. 1858).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Short.parseShort** (p. 1863) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2031) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value	- The string to decode

Returns

a **Short** (p. 1858) object containing the decoded value

Exceptions

NumberFomatException	if the string is not formatted correctly.

6.478.2.5 virtual double decaf::lang::Short::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.478.2.6 bool decaf::lang::Short::equals (const Short & *s*) const [inline, virtual]

Returns

true if the two **Short** (p. 1858) Objects have the same value.

Implements **decaf::lang::Comparable**< **Short** > (p. 688).

6.478.2.7 bool decaf::lang::Short::equals (const short & *s*) const [inline, virtual]

Returns

true if the two **Short** (p. 1858) Objects have the same value.

Implements **decaf::lang::Comparable**< **short** > (p. 688).

6.478.2.8 virtual float decaf::lang::Short::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.478.2.9 virtual int decaf::lang::Short::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.478.2.10 virtual long long decaf::lang::Short::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.478.2.11 virtual bool decaf::lang::Short::operator< (const Short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Short >** (p. 688).

6.478.2.12 virtual bool decaf::lang::Short::operator< (const short & *s*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

s	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< short >** (p. 688).

6.478.2.13 virtual bool decaf::lang::Short::operator== (const Short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

s	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Short** > (p. 688).

6.478.2.14 virtual bool decaf::lang::Short::operator== (const short & *s*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

s	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **short** > (p. 688).

6.478.2.15 static short decaf::lang::Short::parseShort (const std::string & *s*, int *radix*) [static]

Parses the string argument as a signed short in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 595) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs:

- The first argument is null or is a string of length zero.
- The radix is either smaller than **Character.MIN_RADIX** (p. 599) or larger than **Character.MAX_RADIX** (p. 599).
- Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1.
- The value represented by the string is not a value of type short.

Parameters

s	- the **String** (p. 2031) containing the short representation to be parsed
radix	- the radix to be used while parsing s

Returns

the short represented by the string argument in the specified radix.

Exceptions

NumberFormatException	- If **String** (p. 2031) does not contain a parsable short.

6.478.2.16 static short decaf::lang::Short::parseShort (const std::string & *s*) [static]

Parses the string argument as a signed decimal short.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting short value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseShort(const std::string, int) method.

Parameters

s	- **String** (p. 2031) to convert to a short

Returns

the converted short value

Exceptions

NumberFormatException	if the string is not a short.

6.478.2.17 static short decaf::lang::Short::reverseBytes (short *value*) [static]

Returns the value obtained by reversing the order of the bytes in the two's complement representation of the specified short value.

Parameters

value	- the short whose bytes we are to reverse

Returns

the reversed short.

6.478.2.18 virtual short decaf::lang::Short::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.478.2.19 std::string decaf::lang::Short::toString ( ) const

Returns

this **Short** (p. 1858) Object as a **String** (p. 2031) Representation

6.478.2.20 static std::string decaf::lang::Short::toString (short *value*) [static]

Returns

a string representing the primitive value as Base 10

6.478.2.21 static Short decaf::lang::Short::valueOf (short *value*) [static]

Returns a **Short** (p. 1858) instance representing the specified short value.

Parameters

value	- the short to wrap

Returns

the new **Short** (p. 1858) object wrapping value.

6.478.2.22 static Short decaf::lang::Short::valueOf (const std::string & *value*) [static]

Returns a **Short** (p. 1858) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal short, exactly as if the argument were given to the parseShort(std::string) method. The result is a **Short** (p. 1858) object that represents the short value specified by the string.

Parameters

value	- std::string to parse as base 10

Returns

new **Short** (p. 1858) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a decimal short.

6.478.2.23 static Short decaf::lang::Short::valueOf (const std::string & *value,* int *radix*) [static]

Returns a **Short** (p. 1858) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed short in the radix specified by the second argument, exactly as if the argument were given to the parseShort(std::string, int) method. The result is a **Short** (p. 1858) object that represents the short value specified by the string.

Parameters

value	- std::string to parse as base (radix)
radix	- base of the string to parse.

Returns

new **Short** (p. 1858) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a valid short.

6.478.3 Field Documentation

6.478.3.1 const short decaf::lang::Short::MAX_VALUE = (short)0x7FFF [static]

Max Value for this Object's primitive type.

6.478.3.2 const short decaf::lang::Short::MIN_VALUE = (short)0x8000 [static]

Max Value for this Object's primitive type.

6.478.3.3 const int decaf::lang::Short::SIZE = 16 [static]

Size of this objects primitive type in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Short.h**

6.479 decaf::internal::nio::ShortArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/ShortArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::ShortArrayBuffer:

Public Member Functions

- **ShortArrayBuffer** (int size, bool readOnly=false)

  *Creates a **ShortArrayBuffer** (p. 1866) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ShortArrayBuffer** (short ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **ShortArrayBuffer** (p. 1866) object that wraps the given array.*
- **ShortArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **ShortArrayBuffer** (**const ShortArrayBuffer** &other)

  *Create a **ShortArrayBuffer** (p. 1866) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual ∼**ShortArrayBuffer** ()
- virtual short ∗ **array** ()

  Returns the short array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  *the array that backs this **Buffer** (p. 451)*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The offset into the backing array where index zero starts.

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual **ShortBuffer** * **asReadOnlyBuffer** () **const**

  Creates a new, read-only short buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

  Returns

  The new, read-only short buffer which the caller then owns.

- virtual **ShortBuffer** & **compact** ()

  Compacts this buffer.
  *The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

  Returns

  *a reference to this **ShortBuffer** (p. 1874).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ShortBuffer** * **duplicate** ()

  Creates a new short buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *a new short **Buffer** (p. 451) which the caller owns.*

- virtual short **get** ()

  Relative get method.
  Reads the value at this buffer's current position, and then increments the position.

  Returns

  the short at the current position.

  Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return.*

- virtual short **get** (int index) **const**

  Absolute get method.
  Reads the value at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the short is to be read.*

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or the index is negative.*

- virtual bool **hasArray** () **const**

  Tells whether or not this buffer is backed by an accessible short array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

  Returns

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual bool **isReadOnly** () **const**

  Tells whether or not this buffer is read-only.

  Returns

  true if, and only if, this buffer is read-only.

- virtual **ShortBuffer** & **put** (short value)

  Writes the given shorts into this buffer at the current position, and then increments the position.

  Parameters

value	*The shorts value to be written.*

  Returns

  a reference to this buffer.

  Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ShortBuffer** & **put** (int index, short value)

  Writes the given shorts into this buffer at the given index.

  Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The shorts to write.*

  Returns

  a reference to this buffer.

  Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ShortBuffer** * **slice** () **const**

  *Creates a new **ShortBuffer** (p. 1874) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create ***ShortBuffer*** *(*p. *1874) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  Sets this ***ShortArrayBuffer*** *(*p. *1866) as Read-Only.*

6.479.1 Constructor & Destructor Documentation

6.479.1.1 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **ShortArrayBuffer** (p. 1866) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.479.1.2 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (short * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **ShortArrayBuffer** (p. 1866) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.479.1.3 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ShortArrayBuffer** (p. 1866) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.479.1.4 decaf::internal::nio::ShortArrayBuffer::ShortArrayBuffer (const ShortArrayBuffer & *other*)

Create a **ShortArrayBuffer** (p. 1866) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **ShortArrayBuffer** (p. 1866) this one is to mirror.

6.479.1.5 virtual decaf::internal::nio::ShortArrayBuffer::~ShortArrayBuffer ( ) [virtual]

6.479.2 Member Function Documentation

6.479.2.1 virtual short* decaf::internal::nio::ShortArrayBuffer::array ( ) [virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451)

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 1876).

6.479.2.2 virtual int decaf::internal::nio::ShortArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::ShortBuffer** (p. 1877).

6.479.2.3 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implements **decaf::nio::ShortBuffer** (p. 1877).

6.479.2.4 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 1874).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 1877).

6.479.2.5 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::duplicate ( ) [virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 1878).

6.479.2.6 virtual short decaf::internal::nio::ShortArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implements **decaf::nio::ShortBuffer** (p. 1878).

6.479.2.7 virtual short decaf::internal::nio::ShortArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the short is to be read.

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or the index is negative.

Implements **decaf::nio::ShortBuffer** (p. 1878).

6.479.2.8 virtual bool decaf::internal::nio::ShortArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ShortBuffer** (p. 1880).

6.479.2.9 virtual bool decaf::internal::nio::ShortArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.479.2.10 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (short *value*) [virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value	The shorts value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 1881).

6.479.2.11 virtual ShortBuffer& decaf::internal::nio::ShortArrayBuffer::put (int *index*, short *value*) [virtual]

Writes the given shorts into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The shorts to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ShortBuffer** (p. 1882).

6.479.2.12 virtual void decaf::internal::nio::ShortArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ShortArrayBuffer** (p. 1866) as Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.479.2.13 virtual ShortBuffer* decaf::internal::nio::ShortArrayBuffer::slice ( ) const [virtual]

Creates a new **ShortBuffer** (p. 1874) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 1874) which the caller owns.

Implements **decaf::nio::ShortBuffer** (p. 1882).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ShortArrayBuffer.h**

6.480 decaf::nio::ShortBuffer Class Reference

This class defines four categories of operations upon short buffers:

`#include <src/main/decaf/nio/ShortBuffer.h>`

Inheritance diagram for decaf::nio::ShortBuffer:

Public Member Functions

- virtual ~**ShortBuffer** ()
- virtual std::string **toString** () **const**
- virtual short * **array** ()=0

  Returns the short array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **ShortBuffer** * **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only short buffer that shares this buffer's content.
- virtual **ShortBuffer** & **compact** ()=0

  Compacts this buffer.
- virtual **ShortBuffer** * **duplicate** ()=0

  Creates a new short buffer that shares this buffer's content.

- virtual short **get** ()=0

  Relative get method.
- virtual short **get** (int index) **const** =0

  Absolute get method.
- **ShortBuffer** & **get** (std::vector< short > buffer)

  Relative bulk get method.
- **ShortBuffer** & **get** (short *buffer, int size, int offset, int length)

  Relative bulk get method.
- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible short array.
- **ShortBuffer** & **put** (**ShortBuffer** &src)

  This method transfers the shorts remaining in the given source buffer into this buffer.
- **ShortBuffer** & **put** (**const** short *buffer, int size, int offset, int length)

  This method transfers shorts into this buffer from the given source array.
- **ShortBuffer** & **put** (std::vector< short > &buffer)

  This method transfers the entire content of the given source shorts array into this buffer.
- virtual **ShortBuffer** & **put** (short value)=0

  Writes the given shorts into this buffer at the current position, and then increments the position.
- virtual **ShortBuffer** & **put** (int index, short value)=0

  Writes the given shorts into this buffer at the given index.
- virtual **ShortBuffer** * **slice** () **const** =0

  *Creates a new **ShortBuffer** (p. 1874) whose content is a shared subsequence of this buffer's content.*
- virtual int **compareTo** (**const ShortBuffer** &value) **const**
- virtual bool **equals** (**const ShortBuffer** &value) **const**
- virtual bool **operator==** (**const ShortBuffer** &value) **const**
- virtual bool **operator<** (**const ShortBuffer** &value) **const**

Static Public Member Functions

- static **ShortBuffer** * **allocate** (int **capacity**)

  Allocates a new Double buffer.
- static **ShortBuffer** * **wrap** (short ***array**, int size, int offset, int length)

  *Wraps the passed buffer with a new **ShortBuffer** (p. 1874).*
- static **ShortBuffer** * **wrap** (std::vector< short > &buffer)

  *Wraps the passed STL short Vector in a **ShortBuffer** (p. 1874).*

Protected Member Functions

- **ShortBuffer** (int **capacity**)

  *Creates a **ShortBuffer** (p. 1874) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.480.1 Detailed Description

This class defines four categories of operations upon short buffers:

o Absolute and relative get and put methods that read and write single shorts; o Relative bulk get methods that transfer contiguous sequences of shorts from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of shorts from a short array or some other short buffer into this buffer o Methods for compacting, duplicating, and slicing a short buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing short array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

6.480.2 Constructor & Destructor Documentation

6.480.2.1 decaf::nio::ShortBuffer::ShortBuffer (int *capacity*) [protected]

Creates a **ShortBuffer** (p. 1874) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size and limit of the **Buffer** (p. 451) in doubles

Exceptions

IllegalArguementException	if capacity is negative.

6.480.2.2 virtual decaf::nio::ShortBuffer::~ShortBuffer ( ) [inline, virtual]

6.480.3 Member Function Documentation

6.480.3.1 static ShortBuffer* decaf::nio::ShortBuffer::allocate (int *capacity*) [static]

Allocates a new Double buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Double buffer in shorts.

Returns

the **ShortBuffer** (p. 1874) that was allocated, caller owns.

6.480.3.2 virtual short* decaf::nio::ShortBuffer::array ( ) [pure virtual]

Returns the short array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451)

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1870).

6.480.3.3 virtual int decaf::nio::ShortBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1870).

6.480.3.4 virtual ShortBuffer* decaf::nio::ShortBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only short buffer which the caller then owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1871).

6.480.3.5 virtual ShortBuffer& decaf::nio::ShortBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ShortBuffer** (p. 1874).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1871).

6.480.3.6 virtual int decaf::nio::ShortBuffer::compareTo (const ShortBuffer & *value*) const [virtual]

6.480.3.7 virtual ShortBuffer* decaf::nio::ShortBuffer::duplicate ( ) [pure virtual]

Creates a new short buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new short **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1871).

6.480.3.8 virtual bool decaf::nio::ShortBuffer::equals (const ShortBuffer & *value*) const [virtual]

6.480.3.9 virtual short decaf::nio::ShortBuffer::get ( ) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the short at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1872).

6.480.3.10 virtual short decaf::nio::ShortBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the short is to be read.

Returns

the short that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or the index is negative.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1872).

6.480.3.11 ShortBuffer& decaf::nio::ShortBuffer::get (std::vector< short > *buffer*)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length shorts remaining in this buffer.

6.480.3.12 ShortBuffer& decaf::nio::ShortBuffer::get (short * *buffer,* int *size,* int *offset,* int *length*)

Relative bulk get method.

This method transfers shorts from this buffer into the given destination array. If there are fewer shorts remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length shorts from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the buffer provided.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length shorts remaining in this buffer
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.480.3.13 virtual bool decaf::nio::ShortBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible short array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1872).

6.480.3.14 virtual bool decaf::nio::ShortBuffer::operator< (const ShortBuffer & *value*) const [virtual]

6.480.3.15 virtual bool decaf::nio::ShortBuffer::operator== (const ShortBuffer & *value*) const [virtual]

6.480.3.16 ShortBuffer& decaf::nio::ShortBuffer::put (ShortBuffer & *src*)

This method transfers the shorts remaining in the given source buffer into this buffer.

If there are more shorts remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no shorts are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() shorts from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take shorts from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining shorts in the source buffer.
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.480.3.17 ShortBuffer& decaf::nio::ShortBuffer::put (const short * *buffer,* int *size,* int *offset,* int *length*)

This method transfers shorts into this buffer from the given source array.

If there are more shorts to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no shorts are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which shorts are to be read.
size	The size of the buffer passed.
offset	The offset within the array of the first char to be read.
length	The number of shorts to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.480.3.18 ShortBuffer& decaf::nio::ShortBuffer::put (std::vector< short > & *buffer*)

This method transfers the entire content of the given source shorts array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **ShortBuffer** (p. 1874).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.480.3.19 virtual ShortBuffer& decaf::nio::ShortBuffer::put (short *value*) [pure virtual]

Writes the given shorts into this buffer at the current position, and then increments the position.

Parameters

value	The shorts value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1873).

6.480.3.20 virtual ShortBuffer& decaf::nio::ShortBuffer::put (int *index*, short *value*) [pure virtual]

Writes the given shorts into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The shorts to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1873).

6.480.3.21 virtual ShortBuffer* decaf::nio::ShortBuffer::slice ( ) const [pure virtual]

Creates a new **ShortBuffer** (p. 1874) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ShortBuffer** (p. 1874) which the caller owns.

Implemented in **decaf::internal::nio::ShortArrayBuffer** (p. 1874).

6.480.3.22 virtual std::string decaf::nio::ShortBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.480.3.23 static ShortBuffer* decaf::nio::ShortBuffer::wrap (short * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **ShortBuffer** (p. 1874).

The new buffer will be backed by the given short array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the passed in array.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **ShortBuffer** (p. 1874) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.480.3.24 static ShortBuffer* decaf::nio::ShortBuffer::wrap (std::vector< short > & *buffer*) [static]

Wraps the passed STL short Vector in a **ShortBuffer** (p. 1874).

The new buffer will be backed by the given short array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **ShortBuffer** (p. 1874) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual bool **isShutdownInfo** () **const**
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_SHUTDOWNINFO** = 11

6.481.1 Constructor & Destructor Documentation

6.481.1.1 activemq::commands::ShutdownInfo::ShutdownInfo ( )

6.481.1.2 virtual activemq::commands::ShutdownInfo::∼ShutdownInfo ( ) [virtual]

6.481.2 Member Function Documentation

6.481.2.1 virtual ShutdownInfo∗ activemq::commands::ShutdownInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.481.2.2 virtual void activemq::commands::ShutdownInfo::copyDataStructure (const DataStructure ∗ *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.481.2.3 virtual bool activemq::commands::ShutdownInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.481.2.4 virtual unsigned char activemq::commands::ShutdownInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.481.2.5 virtual bool activemq::commands::ShutdownInfo::isShutdownInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isShutdownInfo()** (p. 1885) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 385).

6.481.2.6 virtual std::string activemq::commands::ShutdownInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.481.2.7 virtual Pointer<Command> activemq::commands::ShutdownInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.481.3 Field Documentation

6.481.3.1 const unsigned char activemq::commands::ShutdownInfo::ID_SHUTDOWNINFO = 11 [static]

6.482.2.2 virtual activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::~ShutdownInfoMarshaller ( ) [inline, virtual]

6.482.3 Member Function Documentation

6.482.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.482.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.482.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.482.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.482.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.482.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.482.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ShutdownInfoMarshaller.h**

6.483 decaf::security::SignatureException Class Reference

`#include <src/main/decaf/security/SignatureException.h>`

Inheritance diagram for decaf::security::SignatureException:

Public Member Functions

- **SignatureException** () throw ()

  Default Constructor.
- **SignatureException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **SignatureException** (**const SignatureException** &ex) throw ()

  Copy Constructor.
- **SignatureException** (**const** char *file, **const** int lineNumber, **const** std::exception ***cause**, **const** char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **SignatureException** (**const** std::exception ***cause**) throw ()

  Constructor.
- **SignatureException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **SignatureException** * **clone** () **const**

  Clones this exception.
- virtual ~**SignatureException** () throw ()

6.483.1 Constructor & Destructor Documentation

6.483.1.1 decaf::security::SignatureException::SignatureException ( ) throw () [inline]

Default Constructor.

6.483.1.2 decaf::security::SignatureException::SignatureException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.483.1.3 decaf::security::SignatureException::SignatureException (const SignatureException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.483.1.4 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.483.1.5 decaf::security::SignatureException::SignatureException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.483.1.6 decaf::security::SignatureException::SignatureException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.483.1.7 virtual decaf::security::SignatureException::~SignatureException ( ) throw () [inline, virtual]

6.483.2 Member Function Documentation

6.483.2.1 virtual SignatureException* decaf::security::SignatureException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::GeneralSecurityException** (p. 1081).

The documentation for this class was generated from the following file:

- src/main/decaf/security/**SignatureException.h**

6.484 decaf::util::logging::SimpleFormatter Class Reference

Print a brief summary of the **LogRecord** (p. 1333) in a human readable format.

`#include <src/main/decaf/util/logging/SimpleFormatter.h>`

Inheritance diagram for decaf::util::logging::SimpleFormatter:

Public Member Functions

- **SimpleFormatter** ()
- virtual ~**SimpleFormatter** ()
- virtual std::string **format** (**const LogRecord** &record) **const**

  Format the given log record and return the formatted string.

6.484.1 Detailed Description

Print a brief summary of the **LogRecord** (p. 1333) in a human readable format.

The summary will typically be 1 or 2 lines.

Since

1.0

6.484.2 Constructor & Destructor Documentation

6.484.2.1 decaf::util::logging::SimpleFormatter::SimpleFormatter ( )

6.484.2.2 virtual decaf::util::logging::SimpleFormatter::~SimpleFormatter ( ) [virtual]

6.484.3 Member Function Documentation

6.484.3.1 virtual std::string decaf::util::logging::SimpleFormatter::format (const LogRecord & *record*) const [virtual]

Format the given log record and return the formatted string.

Parameters

record	The Log Record to Format.

Implements **decaf::util::logging::Formatter** (p. 1074).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**SimpleFormatter.h**

6.485 decaf::util::logging::SimpleLogger Class Reference

Destructor.

6.485.2 Member Function Documentation

6.485.2.1 virtual void decaf::util::logging::SimpleLogger::debug (const std::string & *file,* const int *line,* const std::string & *message*) [virtual]

Log a Debug **Level** (p. 1253) Log.

6.485.2.2 virtual void decaf::util::logging::SimpleLogger::error (const std::string & *file,* const int *line,* const std::string & *message*) [virtual]

Log a Error **Level** (p. 1253) Log.

6.485.2.3 virtual void decaf::util::logging::SimpleLogger::fatal (const std::string & *file,* const int *line,* const std::string & *message*) [virtual]

Log a Fatal **Level** (p. 1253) Log.

6.485.2.4 virtual void decaf::util::logging::SimpleLogger::info (const std::string & *file,* const int *line,* const std::string & *message*) [virtual]

Log a Informational **Level** (p. 1253) Log.

6.485.2.5 virtual void decaf::util::logging::SimpleLogger::log (const std::string & *message*) [virtual]

No-frills log.

6.485.2.6 virtual void decaf::util::logging::SimpleLogger::mark (const std::string & *message*) [virtual]

Log a Mark Block **Level** (p. 1253) Log.

6.485.2.7 virtual void decaf::util::logging::SimpleLogger::warn (const std::string & *file,* const int *line,* const std::string & *message*) [virtual]

Log a Warning **Level** (p. 1253) Log.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**SimpleLogger.h**

6.486 activemq::core::SimplePriorityMessageDispatchChannel Class Reference

`#include <src/main/activemq/core/SimplePriorityMessageDispatchChannel.h>`

Inheritance diagram for activemq::core::SimplePriorityMessageDispatchChannel:

Public Member Functions

- **SimplePriorityMessageDispatchChannel** ()
- virtual ~**SimplePriorityMessageDispatchChannel** ()
- virtual void **enqueue** (**const Pointer**< **MessageDispatch** > &message)

  Add a Message to the Channel behind all pending message.
- virtual void **enqueueFirst** (**const Pointer**< **MessageDispatch** > &message)

  Add a message to the front of the Channel.
- virtual bool **isEmpty** () **const**
- virtual bool **isClosed** () **const**
- virtual bool **isRunning** () **const**
- virtual **Pointer**< **MessageDispatch** > **dequeue** (long long timeout)

  Used to get an enqueued message.
- virtual **Pointer**< **MessageDispatch** > **dequeueNoWait** ()

  Used to get an enqueued message if there is one queued right now.
- virtual **Pointer**< **MessageDispatch** > **peek** () **const**

  Peek in the Queue and return the first message in the Channel without removing it from the channel.
- virtual void **start** ()

  Starts dispatch of messages from the Channel.
- virtual void **stop** ()

  Stops dispatch of message from the Channel.
- virtual void **close** ()

  Close this channel no messages will be dispatched after this method is called.
- virtual void **clear** ()

  Clear the Channel, all pending messages are removed.
- virtual int **size** () **const**
- virtual std::vector< **Pointer**
  < **MessageDispatch** > > **removeAll** ()

  Remove all messages that are currently in the Channel and return them as a list of Messages.
- virtual void **lock** () throw (decaf::lang::exceptions::RuntimeException)

  Locks the object.
- virtual bool **tryLock** () throw (decaf::lang::exceptions::RuntimeException)

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.
- virtual void **unlock** () throw (decaf::lang::exceptions::RuntimeException)

  Unlocks the object.
- virtual void **wait** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** () throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException)

  Signals the waiters on this object that it can now wake up and continue.

6.486.1 Constructor & Destructor Documentation

6.486.1.1 activemq::core::SimplePriorityMessageDispatchChannel::SimplePriorityMessageDispatchChannel ( )

6.486.1.2 virtual activemq::core::SimplePriorityMessageDispatchChannel::~SimplePriorityMessageDispatchChannel ( ) [virtual]

6.486.2 Member Function Documentation

6.486.2.1 virtual void activemq::core::SimplePriorityMessageDispatchChannel::clear ( ) [virtual]

Clear the Channel, all pending messages are removed.

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.486.2.2 virtual void activemq::core::SimplePriorityMessageDispatchChannel::close ( ) [virtual]

Close this channel no messages will be dispatched after this method is called.

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.486.2.3 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeue (long long *timeout*) [virtual]

Used to get an enqueued message.

The amount of time this method blocks is based on the timeout value. - if timeout==-1 then it blocks until a message is received. - if timeout==0 then it it tries to not block at all, it returns a message if it is available - if timeout>0 then it blocks up to timeout amount of time. Expired messages will consumed by this method.

Returns

null if we timeout or if the consumer is closed.

Exceptions

ActiveMQException	

Implements **activemq::core::MessageDispatchChannel** (p. 1463).

6.486.2.4 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::dequeueNoWait ( ) [virtual]

Used to get an enqueued message if there is one queued right now.

If there is no waiting message than this method returns Null.

Returns

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.486.2.5 virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueue (const Pointer< MessageDispatch > & *message*) [virtual]

Add a Message to the Channel behind all pending message.

Parameters

message	- The message to add to the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.486.2.6 virtual void activemq::core::SimplePriorityMessageDispatchChannel::enqueueFirst (const Pointer< MessageDispatch > & *message*) [virtual]

Add a message to the front of the Channel.

Parameters

message	- The Message to add to the front of the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.486.2.7 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isClosed ( ) const [inline, virtual]

Returns

has the Queue been closed.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.486.2.8 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isEmpty ( ) const [virtual]

Returns

true if there are no messages in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1464).

6.486.2.9 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::isRunning ( ) const [inline, virtual]

Returns

true if the Channel currently running and will dequeue message.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.10 virtual void activemq::core::SimplePriorityMessageDispatchChannel::lock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.486.2.11 virtual void activemq::core::SimplePriorityMessageDispatchChannel::notify ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.486.2.12 virtual void activemq::core::SimplePriorityMessageDispatchChannel::notifyAll ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.486.2.13 virtual Pointer<MessageDispatch> activemq::core::SimplePriorityMessageDispatchChannel::peek ( ) const [virtual]

Peek in the Queue and return the first message in the Channel without removing it from the channel.

Returns

a message if there is one in the queue.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.14 virtual std::vector< Pointer<MessageDispatch> > activemq::core::SimplePriorityMessageDispatchChannel::removeAll ( ) [virtual]

Remove all messages that are currently in the Channel and return them as a list of Messages.

Returns

a list of Messages that was previously in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.15 virtual int activemq::core::SimplePriorityMessageDispatchChannel::size ( ) const [virtual]

Returns

the number of Messages currently in the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.16 virtual void activemq::core::SimplePriorityMessageDispatchChannel::start ( ) [virtual]

Starts dispatch of messages from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.17 virtual void activemq::core::SimplePriorityMessageDispatchChannel::stop ( ) [virtual]

Stops dispatch of message from the Channel.

Implements **activemq::core::MessageDispatchChannel** (p. 1465).

6.486.2.18 virtual bool activemq::core::SimplePriorityMessageDispatchChannel::tryLock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.486.2.19 virtual void activemq::core::SimplePriorityMessageDispatchChannel::unlock ( ) throw (decaf::lang::exceptions::RuntimeException) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.486.2.20 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait ( ) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.486.2.21 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long *millisecs*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.486.2.22 virtual void activemq::core::SimplePriorityMessageDispatchChannel::wait (long long *millisecs,* int *nanos*) throw (decaf::lang::exceptions::RuntimeException, decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::IllegalMonitorStateException, decaf::lang::exceptions::InterruptedException) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**SimplePriorityMessageDispatchChannel.h**

6.487 decaf::net::Socket Class Reference

`#include <src/main/decaf/net/Socket.h>`

Inheritance diagram for decaf::net::Socket:

Public Member Functions

- **Socket** ()

  *Creates an unconnected **Socket** (p. 1900) using the set **SocketImplFactory** (p. 1928) or if non is set than the default SockImpl type is created.*
- **Socket** (**SocketImpl** ∗**impl**)

  *Creates a **Socket** (p. 1900) wrapping the provided **SocketImpl** (p. 1921) instance, this **Socket** (p. 1900) is considered unconnected.*
- **Socket** (**const InetAddress** ∗address, int port)

  *Creates a new **Socket** (p. 1900) instance and connects it to the given address and port.*
- **Socket** (**const InetAddress** ∗address, int port, **const InetAddress** ∗localAddress, int localPort)

  *Creates a new **Socket** (p. 1900) instance and connects it to the given address and port.*
- **Socket** (**const** std::string &host, int port)

  *Creates a new **Socket** (p. 1900) instance and connects it to the given host and port.*
- **Socket** (**const** std::string &host, int port, **const InetAddress** ∗localAddress, int localPort)

  *Creates a new **Socket** (p. 1900) instance and connects it to the given host and port.*
- virtual ∼**Socket** ()
- virtual void **bind** (**const** std::string &ipaddress, int port)

  *Binds this **Socket** (p. 1900) to the given local address and port.*
- virtual void **close** ()

  *Closes the **Socket** (p. 1900).*
- virtual void **connect** (**const** std::string &host, int port)

  Connects to the specified destination.
- virtual void **connect** (**const** std::string &host, int port, int timeout)

  Connects to the specified destination, with a specified timeout value.
- bool **isConnected** () **const**

  Indicates whether or not this socket is connected to am end point.
- bool **isClosed** () **const**
- bool **isBound** () **const**
- bool **isInputShutdown** () **const**
- bool **isOutputShutdown** () **const**
- virtual **decaf::io::InputStream** ∗ **getInputStream** ()

  Gets the InputStream for this socket if its connected.
- virtual **decaf::io::OutputStream** ∗ **getOutputStream** ()

  Gets the OutputStream for this socket if it is connected.
- int **getPort** () **const**

  *Gets the on the remote host this **Socket** (p. 1900) is connected to.*
- int **getLocalPort** () **const**

  Gets the local port the socket is bound to.
- std::string **getInetAddress** () **const**

  Returns the address to which the socket is connected.

- std::string **getLocalAddress** () **const**

  Gets the local address to which the socket is bound.
- virtual void **shutdownInput** ()

  Shuts down the InputStream for this socket essentially marking it as EOF.
- virtual void **shutdownOutput** ()

  Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.
- virtual int **getSoLinger** () **const**

  Gets the linger time for the socket, SO_LINGER.
- virtual void **setSoLinger** (bool state, int timeout)

  Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.
- virtual bool **getKeepAlive** () **const**

  Gets the keep alive flag for this socket, SO_KEEPALIVE.
- virtual void **setKeepAlive** (bool keepAlive)

  Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.
- virtual int **getReceiveBufferSize** () **const**

  Gets the receive buffer size for this socket, SO_RCVBUF.
- virtual void **setReceiveBufferSize** (int size)

  Sets the receive buffer size for this socket, SO_RCVBUF.
- virtual bool **getReuseAddress** () **const**

  Gets the reuse address flag, SO_REUSEADDR.
- virtual void **setReuseAddress** (bool reuse)

  Sets the reuse address flag, SO_REUSEADDR.
- virtual int **getSendBufferSize** () **const**

  Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.
- virtual void **setSendBufferSize** (int size)

  Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.
- virtual int **getSoTimeout** () **const**

  Gets the timeout for socket operations, SO_TIMEOUT.
- virtual void **setSoTimeout** (int timeout)

  Sets the timeout for socket operations, SO_TIMEOUT.
- virtual bool **getTcpNoDelay** () **const**

  Gets the Status of the TCP_NODELAY setting for this socket.
- virtual void **setTcpNoDelay** (bool value)

  *Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 1900).*
- virtual int **getTrafficClass** () **const**

  *Gets the Traffic Class setting for this **Socket** (p. 1900), sometimes referred to as Type of Service setting.*
- virtual void **setTrafficClass** (int value)

  *Gets the Traffic Class setting for this **Socket** (p. 1900), sometimes referred to as Type of Service setting.*
- virtual bool **getOOBInline** () **const**

  Gets the value of the OOBINLINE for this socket.
- virtual void **setOOBInline** (bool value)

  Sets the value of the OOBINLINE for this socket, by default this option is disabled.
- virtual void **sendUrgentData** (int data)

  *Sends on byte of urgent data to the **Socket** (p. 1900).*
- virtual std::string **toString** () **const**

Static Public Member Functions

- static void **setSocketImplFactory** (**SocketImplFactory** *factory)

  *Sets the instance of a **SocketImplFactory** (p. 1928) that the **Socket** (p. 1900) class should use when new instances of this class are created.*

Protected Member Functions

- void **accepted** ()
- void **initSocketImpl** (**const** std::string &address, int port, **const InetAddress** *localAddress, int localPort)

6.487.2 Constructor & Destructor Documentation

6.487.2.1 decaf::net::Socket::Socket ( )

Creates an unconnected **Socket** (p. 1900) using the set **SocketImplFactory** (p. 1928) or if non is set than the default SockImpl type is created.

6.487.2.2 decaf::net::Socket::Socket (SocketImpl * *impl*)

Creates a **Socket** (p. 1900) wrapping the provided **SocketImpl** (p. 1921) instance, this **Socket** (p. 1900) is considered unconnected.

The **Socket** (p. 1900) class takes ownership of this **SocketImpl** (p. 1921) pointer and will delete it when the **Socket** (p. 1900) class is destroyed.

Parameters

impl	The **SocketImpl** (p. 1921) instance to wrap.

Exceptions

NullPointerException	if the passed **SocketImpl** (p. 1921) is Null.

6.487.2.3 decaf::net::Socket::Socket (const InetAddress * *address,* int *port*)

Creates a new **Socket** (p. 1900) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 1928) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 1900) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

address	The address to connect to.
port	The port number to connect to [0...65535]

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
NullPointerException	if the **InetAddress** (p. 1113) instance in NULL.
IllegalArgumentException	if the port if not in range [0...65535]

6.487.2.4 decaf::net::Socket::Socket (const InetAddress * *address*, int *port*, const InetAddress * *localAddress*, int *localPort*)

Creates a new **Socket** (p. 1900) instance and connects it to the given address and port.

If there is a **SocketImplFactory** (p. 1928) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 1900) implementation is used. The **Socket** (p. 1900) will also bind to the local address and port specified.

Parameters

address	The address to connect to.
port	The port number to connect to [0...65535]
localAddress	The IP address on the local machine to bind to.
localPort	The port on the local machine to bind to.

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
NullPointerException	if the **InetAddress** (p. 1113) instance in NULL.
IllegalArgumentException	if the port if not in range [0...65535]

6.487.2.5 decaf::net::Socket::Socket (const std::string & *host*, int *port*)

Creates a new **Socket** (p. 1900) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 1928) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 1900) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

host	The host name or IP address to connect to, empty string means loopback.
port	The port number to connect to [0...65535]

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
IllegalArgumentException	if the port if not in range [0...65535]

6.487.2.6 decaf::net::Socket::Socket (const std::string & *host,* int *port,* const InetAddress * *localAddress,* int *localPort*)

Creates a new **Socket** (p. 1900) instance and connects it to the given host and port.

If there is a **SocketImplFactory** (p. 1928) set then the SokcetImpl is created using the factory otherwise the default **Socket** (p. 1900) implementation is used.

If the host parameter is empty then the loop back address is used.

Parameters

host	The host name or IP address to connect to, empty string means loopback.
port	The port number to connect to [0...65535]
localAddress	The IP address on the local machine to bind to.
localPort	The port on the local machine to bind to.

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
IllegalArgumentException	if the port if not in range [0...65535]

6.487.2.7 virtual decaf::net::Socket::~Socket ( ) [virtual]

6.487.3 Member Function Documentation

6.487.3.1 void decaf::net::Socket::accepted ( ) [protected]

6.487.3.2 virtual void decaf::net::Socket::bind (const std::string & *ipaddress,* int *port*) [virtual]

Binds this **Socket** (p. 1900) to the given local address and port.

If the **SocketAddress** (p. 1913) value is NULL then the **Socket** (p. 1900) will be bound to an available local address and port.

Parameters

ipaddress	The local address and port to bind the socket to.
port	The port on the local machine to bind to.

Exceptions

IOException	if an error occurs during the bind operation.
IllegalArgumentException	if the **Socket** (p. 1900) can't process the subclass of **SocketAddress** (p. 1913) that has been provided.

6.487.3.3 void decaf::net::Socket::checkClosed ( ) const [protected]

6.487.3.4 virtual void decaf::net::Socket::close ( ) [virtual]

Closes the **Socket** (p. 1900).

Once closed a **Socket** (p. 1900) cannot be connected or otherwise operated upon, a new **Socket** (p. 1900) instance must be created.

Exceptions

IOException	if an I/O error occurs while closing the **Socket** (p. 1900).

Implements **decaf::io::Closeable** (p. 633).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1565).

6.487.3.5 virtual void decaf::net::Socket::connect (const std::string & *host,* int *port*) [virtual]

Connects to the specified destination.

Parameters

host	The host name or IP address of the remote host to connect to.
port	The port on the remote host to connect to.

Exceptions

IOException	Thrown if a failure occurred in the connect.
IllegalArguementException	if the timeout value is negative or the endpoint is invalid.

6.487.3.6 virtual void decaf::net::Socket::connect (const std::string & *host,* int *port,* int *timeout*) [virtual]

Connects to the specified destination, with a specified timeout value.

If a connection to the remote host is not established within the specified timeout interval than an **SocketTimeoutException** (p. 1932) is thrown. A timeout value of zero is treated as an inifinite timeout.

Parameters

host	The host name or IP address of the remote host to connect to.
port	The port on the remote host to connect to.
timeout	The number of Milliseconds to wait before treating the connection as failed.

Exceptions

IOException	Thrown if a failure occurred in the connect.
SocketTimeoutException *(p. 1932)*	if the timeout for connection is exceeded.
IllegalArguementException	if the timeout value is negative or the endpoint is invalid.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1565).

6.487.3.7 void decaf::net::Socket::ensureCreated ( ) const [protected]

6.487.3.8 std::string decaf::net::Socket::getInetAddress ( ) const

Returns the address to which the socket is connected.

Returns

the remote IP address to which this socket is connected, or null if the socket is not connected.

6.487.3.9 virtual decaf::io::InputStream* decaf::net::Socket::getInputStream ( ) [virtual]

Gets the InputStream for this socket if its connected.

The pointer returned is the property of the associated **Socket** (p. 1900) and should not be deleted by the caller.

When the returned InputStream is performing a blocking operation and the underlying connection is closed or otherwise broker the read calls will normally throw an exception to indicate the failure.

Closing the InputStream will also close the underlying **Socket** (p. 1900).

Returns

The InputStream for this socket.

Exceptions

IOException	if an error occurs during creation of the InputStream, also if the **Socket** (p. 1900) is not connected or the input has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1566).

6.487.3.10 virtual bool decaf::net::Socket::getKeepAlive ( ) const [virtual]

Gets the keep alive flag for this socket, SO_KEEPALIVE.

Returns

true if keep alive is enabled for this socket.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.11 std::string decaf::net::Socket::getLocalAddress ( ) const

Gets the local address to which the socket is bound.

Returns

the local address to which the socket is bound or InetAddress.anyLocalAddress() if the socket is not bound yet.

6.487.3.12 int decaf::net::Socket::getLocalPort ( ) const

Gets the local port the socket is bound to.

Returns

the local port the socket was bound to, or -1 if the socket is not bound.

6.487.3.13 virtual bool decaf::net::Socket::getOOBInline ( ) const [virtual]

Gets the value of the OOBINLINE for this socket.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException *(p. 1915)*	if an error is encountered while performing this operation.

6.487.3.14 virtual decaf::io::OutputStream* decaf::net::Socket::getOutputStream ( ) [virtual]

Gets the OutputStream for this socket if it is connected.

The pointer returned is the property of the **Socket** (p. 1900) instance and should not be deleted by the caller.

Closing the returned **Socket** (p. 1900) will also close the underlying **Socket** (p. 1900).

Returns

the OutputStream for this socket.

Exceptions

IOException	if an error occurs during the creation of this OutputStream, or if the **Socket** (p. 1900) is closed or the output has been shutdown previously.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1566).

6.487.3.15 int decaf::net::Socket::getPort ( ) const

Gets the on the remote host this **Socket** (p. 1900) is connected to.

Returns

the port on the remote host the socket is connected to, or 0 if not connected.

6.487.3.16 virtual int decaf::net::Socket::getReceiveBufferSize ( ) const [virtual]

Gets the receive buffer size for this socket, SO_RCVBUF.

This is the buffer used by the underlying platform socket to buffer received data.

Returns

the receive buffer size in bytes.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.17 virtual bool decaf::net::Socket::getReuseAddress ( ) const [virtual]

Gets the reuse address flag, SO_REUSEADDR.

Returns

True if the address can be reused.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.18 virtual int decaf::net::Socket::getSendBufferSize ( ) const [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Returns

the size in bytes of the send buffer.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.19 virtual int decaf::net::Socket::getSoLinger ( ) const [virtual]

Gets the linger time for the socket, SO_LINGER.

A return value of -1 indicates that the option is disabled.

Returns

The linger time in seconds.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.20 virtual int decaf::net::Socket::getSoTimeout ( ) const [virtual]

Gets the timeout for socket operations, SO_TIMEOUT.

Returns

The timeout in milliseconds for socket operations.

Exceptions

SocketException *(p. 1915)*	Thrown if unable to retrieve the information.

6.487.3.21 virtual bool decaf::net::Socket::getTcpNoDelay ( ) const [virtual]

Gets the Status of the TCP_NODELAY setting for this socket.

Returns

true if TCP_NODELAY is enabled for the socket.

Exceptions

SocketException *(p. 1915)*	Thrown if unable to set the information.

6.487.3.22 virtual int decaf::net::Socket::getTrafficClass ( ) const [virtual]

Gets the Traffic Class setting for this **Socket** (p. 1900), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 1900) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Returns

the bitset result of querying the traffic class setting.

Exceptions

SocketException *(p. 1915)*	if an error is encountered while performing this operation.

6.487.3.23 void decaf::net::Socket::initSocketImpl (const std::string & *address,* int *port,* const InetAddress * *localAddress,* int *localPort*) [protected]

6.487.3.24 bool decaf::net::Socket::isBound ( ) const [inline]

Returns

true if this **Socket** (p. 1900) has been bound to a Local address.

6.487.3.25 bool decaf::net::Socket::isClosed ( ) const [inline]

Returns

true if the **Socket** (p. 1900) has been closed.

6.487.3.26 bool decaf::net::Socket::isConnected ( ) const [inline]

Indicates whether or not this socket is connected to am end point.

Returns

true if connected, false otherwise.

6.487.3.27 bool decaf::net::Socket::isInputShutdown ( ) const [inline]

Returns

true if input on this **Socket** (p. 1900) has been shutdown.

6.487.3.28 bool decaf::net::Socket::isOutputShutdown ( ) const [inline]

Returns

true if output on this **Socket** (p. 1900) has been shutdown.

6.487.3.29 virtual void decaf::net::Socket::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 1900).

Parameters

data	The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1568).

6.487.3.30 virtual void decaf::net::Socket::setKeepAlive (bool *keepAlive*) [virtual]

Enables/disables the keep alive flag for this socket, SO_KEEPALIVE.

Parameters

keepAlive	If true, enables the flag.

Exceptions

SocketException *(p. 1915)*	if the operation fails.

6.487.3.31 virtual void decaf::net::Socket::setOOBInline (bool *value*) [virtual]

Sets the value of the OOBINLINE for this socket, by default this option is disabled.

If enabled the urgent data is read inline on the **Socket** (p. 1900)'s InputStream, no notification is give.

Returns

true if OOBINLINE is enabled, false otherwise.

Exceptions

SocketException *(p. 1915)*	if an error is encountered while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1569).

6.487.3.32 virtual void decaf::net::Socket::setReceiveBufferSize (int *size*) [virtual]

Sets the receive buffer size for this socket, SO_RCVBUF.

Parameters

size	Number of bytes to set the receive buffer to.

Exceptions

SocketException *(*p. *1915)*	if the operation fails.
IllegalArgumentException	if the value is zero or negative.

6.487.3.33 virtual void decaf::net::Socket::setReuseAddress (bool *reuse*) [virtual]

Sets the reuse address flag, SO_REUSEADDR.

Parameters

reuse	If true, sets the flag.

Exceptions

SocketException *(*p. *1915)*	if the operation fails.

6.487.3.34 virtual void decaf::net::Socket::setSendBufferSize (int *size*) [virtual]

Gets the send buffer size for this socket, SO_SNDBUF, this value is used by the platform socket to buffer data written to the socket.

Parameters

size	The number of bytes to set the send buffer to, must be larger than zero.

Exceptions

SocketException *(*p. *1915)*	if the operation fails.
IllegalArgumentException	if the value is zero or negative.

6.487.3.35 static void decaf::net::Socket::setSocketImplFactory (SocketImplFactory * *factory*) [static]

Sets the instance of a **SocketImplFactory** (p. 1928) that the **Socket** (p. 1900) class should use when new instances of this class are created.

This method is only allowed to be used once during the lifetime of the application.

Parameters

factory	The instance of a **SocketImplFactory** (p. 1928) to use when new **Socket** (p. 1900) objects are created.

Exceptions

IOException	if an I/O error occurs while performing this operation.
SocketException *(*p. *1915)*	if this method has already been called with a valid factory.

6.487.3.36 virtual void decaf::net::Socket::setSoLinger (bool *state,* int *timeout*) [virtual]

Sets the linger time (SO_LINGER) using a specified time value, this limits of this value are platform specific.

Parameters

state	The state of SO_LINGER, true is on.
timeout	The linger time in seconds, must be non-negative.

Exceptions

SocketException *(*p. *1915)*	if the operation fails.
IllegalArgumentException	if state is true and timeout is negative.

6.487.3.37 virtual void decaf::net::Socket::setSoTimeout (int *timeout*) [virtual]

Sets the timeout for socket operations, SO_TIMEOUT.

A value of zero indicates that timeout is infinite for operations on this socket.

Parameters

timeout	The timeout in milliseconds for socket operations.

Exceptions

SocketException *(*p. *1915)*	Thrown if unable to set the information.
IllegalArgumentException	if the timeout value is negative.

6.487.3.38 virtual void decaf::net::Socket::setTcpNoDelay (bool *value*) [virtual]

Sets the Status of the TCP_NODELAY param for this socket., this setting is used to disable or enable Nagle's algorithm on the **Socket** (p. 1900).

Parameters

value	The setting for the socket's TCP_NODELAY option, true to enable.

Exceptions

SocketException *(*p. *1915)*	Thrown if unable to set the information.

6.487.3.39 virtual void decaf::net::Socket::setTrafficClass (int *value*) [virtual]

Gets the Traffic Class setting for this **Socket** (p. 1900), sometimes referred to as Type of Service setting.

This setting is dependent on the underlying network implementation for the platform this **Socket** (p. 1900) runs on and is not guaranteed to have any effect.

Refer to your platforms network documentation regarding support for this setting.

Parameters

value	The integer value representing the traffic class setting bitset.

Exceptions

SocketException *(p. 1915)*	if an error is encountered while performing this operation.
IllegalArgumentException	if the value is not in the range [0..255].

6.487.3.40 virtual void decaf::net::Socket::shutdownInput ( ) [virtual]

Shuts down the InputStream for this socket essentially marking it as EOF.

The stream returns EOF for any calls to read after this method has been called.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1570).

6.487.3.41 virtual void decaf::net::Socket::shutdownOutput ( ) [virtual]

Shuts down the OutputStream for this socket, any data already written to the socket will be sent, any further calls to OuputStream::write will throw an IOException.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1570).

6.487.3.42 virtual std::string decaf::net::Socket::toString ( ) const [virtual]

Returns

a string representing this **Socket** (p. 1900).

6.487.4 Friends And Related Function Documentation

6.487.4.1 friend class ServerSocket [friend]

6.487.5 Field Documentation

6.487.5.1 SocketImpl* decaf::net::Socket::impl [mutable, protected]

The documentation for this class was generated from the following file:

- src/main/decaf/net/**Socket.h**

6.488 decaf::net::SocketAddress Class Reference

Base class for protocol specific **Socket** (p. 1900) addresses.

`#include <src/main/decaf/net/SocketAddress.h>`

Inheritance diagram for decaf::net::SocketAddress:

Public Member Functions

- virtual ~**SocketAddress** ()

6.488.1 Detailed Description

Base class for protocol specific **Socket** (p. 1900) addresses.

These classes provide an immutable address object that is used by the **Socket** (p. 1900) classes.

Since

1.0

6.488.2 Constructor & Destructor Documentation

6.488.2.1 virtual decaf::net::SocketAddress::~SocketAddress ( ) [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketAddress.h**

6.489 decaf::net::SocketError Class Reference

Static utility class to simplify handling of error codes for socket operations.

`#include <src/main/decaf/net/SocketError.h>`

Static Public Member Functions

- static int **getErrorCode** ()

  Gets the last error appropriate for the platform.
- static std::string **getErrorString** ()

  Gets the string description for the last error.

6.489.1 Detailed Description

Static utility class to simplify handling of error codes for socket operations.

6.489.2 Member Function Documentation

6.489.2.1 static int decaf::net::SocketError::getErrorCode ( ) [static]

Gets the last error appropriate for the platform.

6.489.2.2 static std::string decaf::net::SocketError::getErrorString ( ) [static]

Gets the string description for the last error.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketError.h**

6.490 decaf::net::SocketException Class Reference

Exception for errors when manipulating sockets.

`#include <src/main/decaf/net/SocketException.h>`

Inheritance diagram for decaf::net::SocketException:

Public Member Functions

- **SocketException** () throw ()
- **SocketException** (**const lang::Exception** &ex) throw ()
- **SocketException** (**const SocketException** &ex) throw ()
- **SocketException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **SocketException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **SocketException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**SocketException** () throw ()

6.490.1 Detailed Description

Exception for errors when manipulating sockets.

6.490.2 Constructor & Destructor Documentation

6.490.2.1 decaf::net::SocketException::SocketException ( ) throw () [inline]

6.490.2.2 decaf::net::SocketException::SocketException (const lang::Exception & *ex*) throw () [inline]

6.490.2.3 decaf::net::SocketException::SocketException (const SocketException & *ex*) throw () [inline]

6.490.2.4 decaf::net::SocketException::SocketException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.490.2.5 decaf::net::SocketException::SocketException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.490.2.6 decaf::net::SocketException::SocketException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.490.2.7 virtual decaf::net::SocketException::~SocketException ( ) throw () [inline, virtual]

6.490.3 Member Function Documentation

6.490.3.1 virtual SocketException* decaf::net::SocketException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 1574), **decaf::net::BindException** (p. 413), **decaf::net::ConnectException** (p. 724), **decaf::net::NoRouteToHostException** (p. 1534), and **decaf::net::PortUnreachableException** (p. 1634).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketException.h**

6.491 decaf::net::SocketFactory Class Reference

The **SocketFactory** (p. 1916) is used to create **Socket** (p. 1900) objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.

`#include <src/main/decaf/net/SocketFactory.h>`

Inheritance diagram for decaf::net::SocketFactory:

Public Member Functions

- virtual ~**SocketFactory** ()
- virtual **Socket** * **createSocket** ()

  *Creates an unconnected **Socket** (p. 1900) object.*
- virtual **Socket** * **createSocket** (**const InetAddress** *host, int port)=0

  *Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).*
- virtual **Socket** * **createSocket** (**const InetAddress** *host, int port, **const InetAddress** *ifAddress, int localPort)=0

6.491.2 Constructor & Destructor Documentation

6.491.2.1 decaf::net::SocketFactory::SocketFactory ( ) [protected]

6.491.2.2 virtual decaf::net::SocketFactory::~SocketFactory ( ) [virtual]

6.491.3 Member Function Documentation

6.491.3.1 virtual Socket* decaf::net::SocketFactory::createSocket ( ) [virtual]

Creates an unconnected **Socket** (p. 1900) object.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if the **Socket** (p. 1900) cannot be created.

Reimplemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1577), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 909), and **decaf::internal::net::DefaultSocketFactory** (p. 899).

6.491.3.2 virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * *host,* int *port*) [pure virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1577), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 909), and **decaf::internal::net::DefaultSocketFactory** (p. 899).

6.491.3.3 virtual Socket* decaf::net::SocketFactory::createSocket (const InetAddress * *host,* int *port,* const InetAddress * *ifAddress,* int *localPort*) [pure virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

The **Socket** (p. 1900) will be bound to the specified local address and port.

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1577), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 909), and **decaf::internal::net::DefaultSocketFactory** (p. 900).

6.491.3.4 virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & *name,* int *port*) [pure virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1578), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 910), and **decaf::internal::net::DefaultSocketFactory** (p. 900).

6.491.3.5 virtual Socket* decaf::net::SocketFactory::createSocket (const std::string & *name,* int *port,* const InetAddress * *ifAddress,* int *localPort*) [pure virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1578), **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 910), and **decaf::internal::net::DefaultSocketFactory** (p. 901).

6.491.3.6 static SocketFactory* decaf::net::SocketFactory::getDefault ( ) [static]

Returns an pointer to the default **SocketFactory** (p. 1916) for this Application, there is only one default **SocketFactory** (p. 1916) per application, the pointer returned by this method is owned by the **SocketFactory** (p. 1916) class and in not to be deleted by the caller.

Returns

pointer to the applications default **SocketFactory** (p. 1916).

Exceptions

SocketException *(p. 1915)*	if an error occurs while getting the default instance.

Reimplemented in **decaf::net::ssl::SSLSocketFactory** (p. 1955).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketFactory.h**

6.492 decaf::internal::net::SocketFileDescriptor Class Reference

File Descriptor type used internally by Decaf Socket objects.

`#include <src/main/decaf/internal/net/SocketFileDescriptor.h>`

Inheritance diagram for decaf::internal::net::SocketFileDescriptor:

Public Member Functions

- **SocketFileDescriptor** (long value)
- virtual ~**SocketFileDescriptor** ()
- long **getValue** () **const**

  Gets the OS Level FileDescriptor.

6.492.1 Detailed Description

File Descriptor type used internally by Decaf Socket objects.

Since

1.0

6.492.2 Constructor & Destructor Documentation

6.492.2.1 decaf::internal::net::SocketFileDescriptor::SocketFileDescriptor (long *value*)

6.493.1 Detailed Description

Acts as a base class for all physical **Socket** (p. 1900) implementations.

Since

1.0

6.493.2 Constructor & Destructor Documentation

6.493.2.1 decaf::net::SocketImpl::SocketImpl ( )

6.493.2.2 virtual decaf::net::SocketImpl::~SocketImpl ( ) [virtual]

6.493.3 Member Function Documentation

6.493.3.1 virtual void decaf::net::SocketImpl::accept (SocketImpl * *socket*) [pure virtual]

Accepts a new connection on the given **Socket** (p. 1900).

Parameters

socket	The accepted connection.

Exceptions

IOException	if an I/O error occurs while attempting this operation.
SocketException *(p. 1915)*	if an error occurs while performing an Accept on the socket.
SocketTimeoutException *(p. 1932)*	if the accept call times out due to SO_TIMEOUT being set.

6.493.3.2 virtual int decaf::net::SocketImpl::available ( ) [pure virtual]

Gets the number of bytes that can be read from the **Socket** (p. 1900) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 1900) without blocking.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2077).

6.493.3.3 virtual void decaf::net::SocketImpl::bind (const std::string & *ipaddress*, int *port*) [pure virtual]

Binds this **Socket** (p. 1900) instance to the local ip address and port number given.

Parameters

ipaddress	The address of local ip to bind to.
port	The port number on the host to bind to.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2078).

6.493.3.4 virtual void decaf::net::SocketImpl::close ( ) [pure virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2078).

6.493.3.5 virtual void decaf::net::SocketImpl::connect (const std::string & *hostname*, int *port*, int *timeout*) [pure virtual]

Connects this socket to the given host and port.

Parameters

hostname	The name of the host to connect to, or IP address.
port	The port number on the host to connect to.
timeout	Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

IOException	if an I/O error occurs while attempting this operation.
SocketTimeoutException *(p. 1932)*	if the connect call times out due to timeout being set.
IllegalArguementException	if a parameter has an illegal value.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2078).

6.493.3.6 virtual void decaf::net::SocketImpl::create ( ) [pure virtual]

Creates the underlying platform **Socket** (p. 1900) data structures which allows for **Socket** (p. 1900) options to be applied.

The created socket is in an unconnected state.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2079).

6.493.3.7 const decaf::io::FileDescriptor* decaf::net::SocketImpl::getFileDescriptor ( ) const [inline]

Gets the FileDescriptor for this **Socket** (p. 1900), the Object is owned by this **Socket** (p. 1900) and should not be deleted by the caller.

Returns

a pointer to this **Socket** (p. 1900)'s FileDescriptor object.

6.493.3.8 std::string decaf::net::SocketImpl::getInetAddress ( ) const [inline]

Gets the value of this **SocketImpl** (p. 1921)'s address field.

Returns

the value of the address field.

6.493.3.9 virtual decaf::io::InputStream* decaf::net::SocketImpl::getInputStream ( ) [pure virtual]

Gets the InputStream linked to this **Socket** (p. 1900).

Returns

an InputStream pointer owned by the **Socket** (p. 1900) object.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2079).

6.493.3.10 virtual std::string decaf::net::SocketImpl::getLocalAddress ( ) const [pure virtual]

Gets the value of the local Inet address the **Socket** (p. 1900) is bound to if bound, otherwise return the **InetAddress** (p. 1113) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2079).

6.493.3.11 int decaf::net::SocketImpl::getLocalPort ( ) const [inline]

Gets the value of this **SocketImpl** (p. 1921)'s local port field.

Returns

the value of localPort.

6.493.3.12 virtual int decaf::net::SocketImpl::getOption (int *option*) const [pure virtual]

Gets the specified **Socket** (p. 1900) option.

Parameters

option	The **Socket** (p. 1900) options whose value is to be retrieved.

Returns

the value of the given socket option.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2079).

6.493.3.13 virtual decaf::io::OutputStream* decaf::net::SocketImpl::getOutputStream ( ) [pure virtual]

Gets the OutputStream linked to this **Socket** (p. 1900).

Returns

an OutputStream pointer owned by the **Socket** (p. 1900) object.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2080).

6.493.3.14 int decaf::net::SocketImpl::getPort ( ) const [inline]

Gets the port that this socket has been assigned.

Returns

the **Socket** (p. 1900)'s port number.

6.493.3.15 virtual void decaf::net::SocketImpl::listen (int *backlog*) [pure virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

backlog	The maximum length of the connection queue.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2080).

6.493.3.16 virtual void decaf::net::SocketImpl::sendUrgentData (int *data*) [virtual]

Sends on byte of urgent data to the **Socket** (p. 1900).

Parameters

data	The value to write as urgent data, only the lower eight bits are sent.

Exceptions

IOException	if an I/O error occurs while performing this operation.

6.493.3.17 virtual void decaf::net::SocketImpl::setOption (int *option,* int *value*) [pure virtual]

Sets the specified option on the **Socket** (p. 1900) if supported.

Parameters

option	The **Socket** (p. 1900) option to set.
value	The value of the socket option to apply to the socket.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2081).

6.493.3.18 virtual void decaf::net::SocketImpl::shutdownInput ( ) [pure virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 1926) on the socket, the stream will return EOF.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2081).

6.493.3.19 virtual void decaf::net::SocketImpl::shutdownOutput ( ) [pure virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 1927) on the socket, the stream will throw an IOException.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implemented in **decaf::internal::net::tcp::TcpSocket** (p. 2081).

6.493.3.20 virtual bool decaf::net::SocketImpl::supportsUrgentData ( ) const [inline, virtual]

Returns

true if this **SocketImpl** (p. 1921) supports sending Urgent Data. The default implementation always returns false.

6.493.3.21 std::string decaf::net::SocketImpl::toString ( ) const

Returns a string containing the address and port of this **Socket** (p. 1900) instance.

Returns

a string containing the address and port of this socket.

6.493.4 Field Documentation

6.493.4.1 std::string decaf::net::SocketImpl::address [protected]

The Remote Address that the **Socket** (p. 1900) is connected to.

6.493.4.2 io::FileDescriptor* decaf::net::SocketImpl::fd [protected]

The File Descriptor for this **Socket** (p. 1900).

6.493.4.3 int decaf::net::SocketImpl::localPort [protected]

The port on the Local Machine that this **Socket** (p. 1900) is Bound to.

6.493.4.4 int decaf::net::SocketImpl::port [protected]

The remote port that this **Socket** (p. 1900) is connected to.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketImpl.h**

6.494 decaf::net::SocketImplFactory Class Reference

Factory class interface for a Factory that creates ScoketImpl objects.

`#include <src/main/decaf/net/SocketImplFactory.h>`

Public Member Functions

- virtual ~**SocketImplFactory** ()
- virtual **SocketImpl** * **createSocketImpl** ()=0

  *Creates a new SokcetImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 1921).*

6.494.1 Detailed Description

Factory class interface for a Factory that creates ScoketImpl objects.

These factories can be used to create various types of Sockets, e.g. Streaming, Multicast, SSL, or platform specific variations of these types.

6.494.3 Member Function Documentation

6.494.3.1 virtual SocketImpl* decaf::net::SocketImplFactory::createSocketImpl ( ) [pure virtual]

Creates a new SokcetImpl instance and returns it, the caller then owns the instance and must delete it when finished with the **SocketImpl** (p. 1921).

Returns

new **SocketImpl** (p. 1921) instance that is owned by the caller.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketImplFactory.h**

6.495 decaf::net::SocketOptions Class Reference

`#include <src/main/decaf/net/SocketOptions.h>`

Inheritance diagram for decaf::net::SocketOptions:

Public Member Functions

- virtual ~**SocketOptions** ()

Static Public Attributes

- static **const** int **SOCKET_OPTION_TCP_NODELAY**

  Disable Nagle's algorithm for this connection.
- static **const** int **SOCKET_OPTION_BINDADDR**

  Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).
- static **const** int **SOCKET_OPTION_REUSEADDR**

  Sets SO_REUSEADDR for a socket.
- static **const** int **SOCKET_OPTION_BROADCAST**

  Sets SO_BROADCAST for a socket.
- static **const** int **SOCKET_OPTION_IP_MULTICAST_IF**

  Set which outgoing interface on which to send multicast packets.
- static **const** int **SOCKET_OPTION_IP_MULTICAST_IF2**

  Same as above.
- static **const** int **SOCKET_OPTION_IP_MULTICAST_LOOP**

  This option enables or disables local loopback of multicast datagrams.
- static **const** int **SOCKET_OPTION_IP_TOS**

  This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.
- static **const** int **SOCKET_OPTION_LINGER**

  Specify a linger-on-close timeout.
- static **const** int **SOCKET_OPTION_TIMEOUT**

  *Set a timeout on blocking **Socket** (p. 1900) operations.*
- static **const** int **SOCKET_OPTION_SNDBUF**

  Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.
- static **const** int **SOCKET_OPTION_RCVBUF**

  Set a hint the size of the underlying buffers used by the platform for incoming network I/O.
- static **const** int **SOCKET_OPTION_KEEPALIVE**

  When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.
- static **const** int **SOCKET_OPTION_OOBINLINE**

  When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

6.495.1 Detailed Description

Since

1.0

6.495.2 Constructor & Destructor Documentation

6.495.2.1 virtual decaf::net::SocketOptions::~SocketOptions ( ) [virtual]

6.495.3 Field Documentation

6.495.3.1 const int decaf::net::SocketOptions::SOCKET_OPTION_BINDADDR [static]

Fetch the local address binding of a socket (this option cannot be "set" only "gotten", since sockets are bound at creation time, and so the locally bound address cannot be changed).

The default local address of a socket is INADDR_ANY, meaning any local address on a multi-homed host. A multi-homed host can use this option to accept connections to only one of its addresses (in the case of a **ServerSocket** (p. 1816) or DatagramSocket), or to specify its return address to the peer (for a **Socket** (p. 1900) or DatagramSocket). The parameter of this option is an **InetAddress** (p. 1113).

6.495.3.2 const int decaf::net::SocketOptions::SOCKET_OPTION_BROADCAST [static]

Sets SO_BROADCAST for a socket.

This option enables and disables the ability of the process to send broadcast messages. It is supported for only datagram sockets and only on networks that support the concept of a broadcast message (e.g. Ethernet, token ring, etc.), and it is set by default for DatagramSockets.

6.495.3.3 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_IF [static]

Set which outgoing interface on which to send multicast packets.

Useful on hosts with multiple network interfaces, where applications want to use other than the system default. Takes/returns an **InetAddress** (p. 1113).

Valid for Multicast: DatagramSocketImpl.

6.495.3.4 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_IF2 [static]

Same as above.

This option is introduced so that the behaviour with IP_MULTICAST_IF will be kept the same as before, while this new option can support setting outgoing interfaces with either IPv4 and IPv6 addresses.

6.495.3.5 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_MULTICAST_LOOP [static]

This option enables or disables local loopback of multicast datagrams.

This option is enabled by default for Multicast Sockets.

6.495.3.6 const int decaf::net::SocketOptions::SOCKET_OPTION_IP_TOS [static]

This option sets the type-of-service or traffic class field in the IP header for a TCP or UDP socket.

6.495.3.7 const int decaf::net::SocketOptions::SOCKET_OPTION_KEEPALIVE [static]

When the keepalive option is set for a TCP socket and no data has been exchanged across the socket in either direction for 2 hours (NOTE: the actual value is implementation dependent), TCP automatically sends a keepalive probe to the peer.

This probe is a TCP segment to which the peer must respond. One of three responses is expected: 1. The peer responds with the expected ACK. The application is not notified (since everything is OK). TCP will send another probe following another 2 hours of inactivity. 2. The peer responds with an RST, which tells the local TCP that the peer host has crashed and rebooted. The socket is closed. 3. There is no response from the peer. The socket is closed. The purpose of this option is to detect if the peer host crashes.

Valid only for TCP socket: **SocketImpl** (p. 1921)

6.495.3.8 const int decaf::net::SocketOptions::SOCKET_OPTION_LINGER [static]

Specify a linger-on-close timeout.

This option disables/enables immediate return from a close() of a TCP **Socket** (p. 1900). Enabling this option with a non-zero Integer timeout means that a close() will block pending the transmission and acknowledgment of all data written to the peer, at which point the socket is closed gracefully. Upon reaching the linger timeout, the socket is closed forcefully, with a TCP RST. Enabling the option with a timeout of zero does a forceful close immediately. If the specified timeout value exceeds 65,535 it will be reduced to 65,535.

Valid only for TCP: **SocketImpl** (p. 1921)

6.495.3.9 const int decaf::net::SocketOptions::SOCKET_OPTION_OOBINLINE [static]

When the OOBINLINE option is set, any TCP urgent data received on the socket will be received through the socket input stream.

When the option is disabled (which is the default) urgent data is silently discarded.

6.495.3.10 const int decaf::net::SocketOptions::SOCKET_OPTION_RCVBUF [static]

Set a hint the size of the underlying buffers used by the platform for incoming network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be received over the socket. When used in get, this must return the size of the buffer actually used by the platform when receiving in data on this socket. Valid for all sockets: **SocketImpl** (p. 1921), DatagramSocketImpl.

6.495.3.11 const int decaf::net::SocketOptions::SOCKET_OPTION_REUSEADDR [static]

Sets SO_REUSEADDR for a socket.

This is used only for MulticastSockets in decaf, and it is set by default for MulticastSockets.

6.495.3.12 const int decaf::net::SocketOptions::SOCKET_OPTION_SNDBUF [static]

Set a hint the size of the underlying buffers used by the platform for outgoing network I/O.

When used in set, this is a suggestion to the kernel from the application about the size of buffers to use for the data to be sent over the socket. When used in get, this must return the size of the buffer actually used by the platform when sending out data on this socket. Valid for all sockets: **SocketImpl** (p. 1921), DatagramSocketImpl

6.495.3.13 const int decaf::net::SocketOptions::SOCKET_OPTION_TCP_NODELAY [static]

Disable Nagle's algorithm for this connection.

Written data to the network is not buffered pending acknowledgment of previously written data. Valid for TCP sockets.

6.495.3.14 const int decaf::net::SocketOptions::SOCKET_OPTION_TIMEOUT [static]

Set a timeout on blocking **Socket** (p. 1900) operations.

The option must be set prior to entering a blocking operation to take effect.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**SocketOptions.h**

6.496 decaf::net::SocketTimeoutException Class Reference

`#include <src/main/decaf/net/SocketTimeoutException.h>`

Inheritance diagram for decaf::net::SocketTimeoutException:

Public Member Functions

- **SocketTimeoutException** () throw ()
  Default Constructor.
- **SocketTimeoutException** (**const Exception** &ex) throw ()
  Conversion Constructor from some other Exception.
- **SocketTimeoutException** (**const SocketTimeoutException** &ex) throw ()
  Copy Constructor.
- **SocketTimeoutException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **SocketTimeoutException** (**const** std::exception ∗**cause**) throw ()
  Constructor.
- **SocketTimeoutException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- virtual **SocketTimeoutException** ∗ **clone** () **const**
  Clones this exception.
- virtual ∼**SocketTimeoutException** () throw ()

6.496.1 Constructor & Destructor Documentation

6.496.1.1 decaf::net::SocketTimeoutException::SocketTimeoutException ( ) throw () [inline]

Default Constructor.

6.496.1.2 decaf::net::SocketTimeoutException::SocketTimeoutException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.496.1.3 decaf::net::SocketTimeoutException::SocketTimeoutException (const SocketTimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.496.1.4 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.496.1.5 decaf::net::SocketTimeoutException::SocketTimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.496.1.6 decaf::net::SocketTimeoutException::SocketTimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.496.1.7 virtual decaf::net::SocketTimeoutException::~SocketTimeoutException ( ) throw () [inline, virtual]

6.496.2 Member Function Documentation

6.496.2.1 virtual SocketTimeoutException* decaf::net::SocketTimeoutException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::InterruptedIOException** (p. 1189).

6.497.1 Detailed Description

Represents on implementation of the Secure **Socket** (p. 1900) Layer for streaming based sockets.

This class servers a a source of factories to be used to create new SSL **Socket** (p. 1900) instances.

Since

1.0

6.497.2 Constructor & Destructor Documentation

6.497.2.1 decaf::net::ssl::SSLContext::SSLContext (SSLContextSpi * *contextImpl*)

6.497.2.2 virtual decaf::net::ssl::SSLContext::~SSLContext ( ) [virtual]

6.497.3 Member Function Documentation

6.497.3.1 static SSLContext* decaf::net::ssl::SSLContext::getDefault ( ) [static]

Gets the Default **SSLContext** (p. 1934).

The default instance of the **SSLContext** (p. 1934) should be immediately usable without any need for the client to initialize this context.

Returns

a pointer to the Default **SSLContext** (p. 1934) instance.

6.497.3.2 SSLParameters* decaf::net::ssl::SSLContext::getDefaultSSLParameters ( )

Returns

a new instance of an **SSLParameters** (p. 1938) object containing the default set of settings for this **SSLContext** (p. 1934).

Exceptions

UnsupportedOperation-Exception	if the parameters cannot be retrieved.

6.497.3.3 ServerSocketFactory* decaf::net::ssl::SSLContext::getServerSocketFactory ( )

Returns an **ServerSocketFactory** (p. 1823) instance for use with this Context, the **ServerSocketFactory** (p. 1823) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this **SSLContext** (p. 1934)'s **ServerSocketFactory** (p. 1823) for creating **SSLServerSocket** (p. 1941) objects.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) requires initialization but it has not yet been initialized.

6.497.3.4 SocketFactory* decaf::net::ssl::SSLContext::getSocketFactory ( )

Returns an **SocketFactory** (p. 1916) instance for use with this Context, the **SocketFactory** (p. 1916) is owned by the Context and should not be deleted by the caller.

Returns

a pointer to this **SSLContext** (p. 1934)'s **SocketFactory** (p. 1916) for creating **SSLSocket** (p. 1947) objects.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) requires initialization but it has not yet been initialized.

6.497.3.5 SSLParameters* decaf::net::ssl::SSLContext::getSupportedSSLParameters ( )

Returns

a new instance of an **SSLParameters** (p. 1938) object containing the complete set of settings for this **SSLContext** (p. 1934).

Exceptions

UnsupportedOperationException	if the parameters cannot be retrieved.

6.497.3.6 static void decaf::net::ssl::SSLContext::setDefault (SSLContext * *context*) [static]

Sets the default **SSLContext** (p. 1934) to be returned from future calls to getDefault.

The set **SSLContext** (p. 1934) must be fully initialized and usable. The caller is responsible for deleting this object before the Library shutdown methods are called.

Exceptions

NullPointerException	if the context passed is NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLContext.h**

6.498 decaf::net::ssl::SSLContextSpi Class Reference

Defines the interface that should be provided by an **SSLContext** (p. 1934) provider.

`#include <src/main/decaf/net/ssl/SSLContextSpi.h>`

Inheritance diagram for decaf::net::ssl::SSLContextSpi:

Public Member Functions

- virtual ~**SSLContextSpi** ()
- virtual void **providerInit** (**security::SecureRandom** *random)=0

  Perform the initialization of this Context.
- virtual **SSLParameters** * **providerGetDefaultSSLParameters** ()

  *Creates a returns a new **SSLParameters** (p. 1938) instance that contains the default settings for this Providers **SSLContext** (p. 1934).*
- virtual **SSLParameters** * **providerGetSupportedSSLParameters** ()

  *Creates and returns a new **SSLParameters** (p. 1938) instance that contains the full set of supported parameters for this SSL Context.*
- virtual **SocketFactory** * **providerGetSocketFactory** ()=0

  *Returns a **SocketFactory** (p. 1916) instance that can be used to create new **SSLSocket** (p. 1947) objects.*

- virtual **ServerSocketFactory** * **providerGetServerSocketFactory** ()=0

  *Returns a **ServerSocketFactory** (p. 1823) instance that can be used to create new **SSLServerSocket** (p. 1941) objects.*

6.498.1 Detailed Description

Defines the interface that should be provided by an **SSLContext** (p. 1934) provider.

Since

1.0

6.498.2 Constructor & Destructor Documentation

6.498.2.1 virtual decaf::net::ssl::SSLContextSpi::~SSLContextSpi ( ) [virtual]

6.498.3 Member Function Documentation

6.498.3.1 virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetDefaultSSLParameters ( ) [virtual]

Creates a returns a new **SSLParameters** (p. 1938) instance that contains the default settings for this Providers **SSLContext** (p. 1934).

The returned **SSLParameters** (p. 1938) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

new **SSLParameters** (p. 1938) instance with the **SSLContext** (p. 1934) defaults.

Exceptions

UnsupportedOperationException	if the defaults cannot be obtained.

6.498.3.2 virtual ServerSocketFactory* decaf::net::ssl::SSLContextSpi::providerGetServerSocketFactory ( ) [pure virtual]

Returns a **ServerSocketFactory** (p. 1823) instance that can be used to create new **SSLServerSocket** (p. 1941) objects.

The **ServerSocketFactory** (p. 1823) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 1916) instance that can be used to create new SSLServerSockets.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 1549).

6.498.3.3 virtual SocketFactory* decaf::net::ssl::SSLContextSpi::providerGetSocketFactory ( ) [pure virtual]

Returns a **SocketFactory** (p. 1916) instance that can be used to create new **SSLSocket** (p. 1947) objects.

The **SocketFactory** (p. 1916) is owned by the Service Provider and should not be destroyed by the caller.

Returns

SocketFactory (p. 1916) instance that can be used to create new SSLSockets.

Exceptions

IllegalStateException	if the **SSLContextSpi** (p. 1936) object requires initialization but has not been initialized yet.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 1549).

6.498.3.4 virtual SSLParameters* decaf::net::ssl::SSLContextSpi::providerGetSupportedSSLParameters ( ) [virtual]

Creates and returns a new **SSLParameters** (p. 1938) instance that contains the full set of supported parameters for this SSL Context.

The returned **SSLParameters** (p. 1938) instance is requires to have non-empty values in its ciphersuites and protocols.

Returns

a new **SSLParameters** (p. 1938) instance with the full set of settings that are supported.

Exceptions

UnsupportedOperationException	if the supported parameters cannot be obtained.

6.498.3.5 virtual void decaf::net::ssl::SSLContextSpi::providerInit (security::SecureRandom * *random*) [pure virtual]

Perform the initialization of this Context.

Parameters

random	Pointer to an instance of a secure random number generator.

Exceptions

NullPointerException	if the SecureRandom instance is NULL.
KeyManagementException	if an error occurs while initializing the context.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLContextSpi** (p. 1550).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLContextSpi.h**

6.499 decaf::net::ssl::SSLParameters Class Reference

`#include <src/main/decaf/net/ssl/SSLParameters.h>`

Public Member Functions

- **SSLParameters** ()

  *Creates a new **SSLParameters** (p. 1938) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.*
- **SSLParameters** (**const** std::vector< std::string > &cipherSuites)

  *Creates a new **SSLParameters** (p. 1938) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.*
- **SSLParameters** (**const** std::vector< std::string > &cipherSuites, **const** std::vector< std::string > &protocols)

  *Creates a new **SSLParameters** (p. 1938) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.*
- virtual ~**SSLParameters** ()
- std::vector< std::string > **getCipherSuites** () **const**
- void **setCipherSuites** (**const** std::vector< std::string > &cipherSuites)

  Sets the vector of ciphersuites.
- std::vector< std::string > **getProtocols** () **const**
- void **setProtocols** (**const** std::vector< std::string > &protocols)

  Sets the vector of protocols.
- bool **getWantClientAuth** () **const**
- void **setWantClientAuth** (bool wantClientAuth)

  Sets whether client authentication should be requested.
- bool **getNeedClientAuth** () **const**
- void **setNeedClientAuth** (bool needClientAuth)

  Sets whether client authentication should be required.

6.499.1 Constructor & Destructor Documentation

6.499.1.1 decaf::net::ssl::SSLParameters::SSLParameters ( )

Creates a new **SSLParameters** (p. 1938) instance with empty vectors for the protocols and the cipherSuites, the wantClientAuth and needClientAuth flags are set to false.

6.499.1.2 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & *cipherSuites*)

Creates a new **SSLParameters** (p. 1938) instance with the given cipherSuites value, the protocols vector is empty and the wantClientAuth and needClientAuth flags are set to false.

Parameters

cipherSuites	The vector of cipherSuites for this **SSLParameters** (p. 1938) instance (can be empty).

6.499.1.3 decaf::net::ssl::SSLParameters::SSLParameters (const std::vector< std::string > & *cipherSuites,* const std::vector< std::string > & *protocols*)

Creates a new **SSLParameters** (p. 1938) instance with the given cipherSuites value and protocols value, the wantClientAuth and needClientAuth flags are set to false.

Parameters

cipherSuites	The vector of cipherSuites for this **SSLParameters** (p. 1938) instance (can be empty).
protocols	The vector of protocols for this **SSLParameters** (p. 1938) instance (can be empty).

6.499.1.4 virtual decaf::net::ssl::SSLParameters::~SSLParameters ( ) [virtual]

6.499.2 Member Function Documentation

6.499.2.1 std::vector<std::string> decaf::net::ssl::SSLParameters::getCipherSuites ( ) const [inline]

Returns

a copy of the vector of ciphersuites or an empty vector if none have been set.

6.499.2.2 bool decaf::net::ssl::SSLParameters::getNeedClientAuth ( ) const [inline]

Returns

whether client authentication should be required.

6.499.2.3 std::vector<std::string> decaf::net::ssl::SSLParameters::getProtocols ( ) const [inline]

Returns

a copy of the vector of protocols or an empty vector if none have been set.

6.499.2.4 bool decaf::net::ssl::SSLParameters::getWantClientAuth ( ) const [inline]

Returns

whether client authentication should be requested.

6.499.2.5 void decaf::net::ssl::SSLParameters::setCipherSuites (const std::vector< std::string > & *cipherSuites*) [inline]

Sets the vector of ciphersuites.

Parameters

cipherSuites	The vector of cipherSuites (can be an empty vector).

6.499.2.6 void decaf::net::ssl::SSLParameters::setNeedClientAuth (bool *needClientAuth*) [inline]

Sets whether client authentication should be required.

Calling this method clears the wantClientAuth flag.

Parameters

needClientAuth	whether client authentication should be required.

6.499.2.7 void decaf::net::ssl::SSLParameters::setProtocols (const std::vector< std::string > & *protocols*) [inline]

Sets the vector of protocols.

Parameters

protocols	the vector of protocols (or an empty vector)

6.499.2.8 void decaf::net::ssl::SSLParameters::setWantClientAuth (bool *wantClientAuth*) [inline]

Sets whether client authentication should be requested.

Calling this method clears the needClientAuth flag.

Parameters

whether	client authentication should be requested.

- virtual void **setNeedClientAuth** (bool value)=0

  *Sets whether or not this **Socket** (p. 1900) will require Client Authentication.*

Protected Member Functions

- **SSLServerSocket** ()

  Creates a non-bound server socket.
- **SSLServerSocket** (int port)

  *Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **SSLServerSocket** (int port, int backlog)

  *Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*
- **SSLServerSocket** (int port, int backlog, **const decaf::net::InetAddress** *address)

  *Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.*

6.500.1 Detailed Description

Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.

The main function of this class is to create **SSLSocket** (p. 1947) objects by accepting connections from client sockets over SSL.

Since

1.0

6.500.2 Constructor & Destructor Documentation

6.500.2.1 decaf::net::ssl::SSLServerSocket::SSLServerSocket ( ) [protected]

Creates a non-bound server socket.

6.500.2.2 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port*) [protected]

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at 50, connections that arrive after the backlog has been reached are refused.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.500.2.3 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port,* int *backlog*) [protected]

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The the number of incoming connection attempts to queue before connections are refused.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.500.2.4 decaf::net::ssl::SSLServerSocket::SSLServerSocket (int *port,* int *backlog,* const decaf::net::InetAddress * *address*) [protected]

Creates a new **ServerSocket** (p. 1816) bound to the specified port, if the value of port is 0, then any free port is chosen.

If the value of the ifAddress is empty or NULL then the ANY address is used.

When this constructor is called the size of the backlog queue is set at backlog, connections that arrive after the backlog has been reached are refused. If backlog is zero or negative then the default backlog value of 50 is used.

If a **SocketImplFactory** (p. 1928) is registered then the createSocketImpl method on the factory will be called otherwise a default **SocketImpl** (p. 1921) is created.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The the number of incoming connection attempts to queue before connections are refused.
ifAddress	The IP Address to bind to on the local machine.

Exceptions

IOException	if there is an I/O error while performing this operation.
IllegalArgumentException	if the port value is negative or greater than 65535.

6.500.2.5 virtual decaf::net::ssl::SSLServerSocket::~SSLServerSocket ( ) [virtual]

6.500.3 Member Function Documentation

6.500.3.1 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledCipherSuites ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this **SSLServerSocket** (p. 1941).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1554).

6.500.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getEnabledProtocols ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this **SSLServerSocket** (p. 1941).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1554).

6.500.3.3 virtual bool decaf::net::ssl::SSLServerSocket::getNeedClientAuth ( ) const [pure virtual]

Returns

true if the **Socket** (p. 1900) requires client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1554).

6.500.3.4 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedCipherSuites ( ) const [pure virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLServerSocket** (p. 1941).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1555).

6.500.3.5 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocket::getSupportedProtocols ( ) const [pure virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLServerSocket** (p. 1941) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1555).

6.500.3.6 virtual bool decaf::net::ssl::SSLServerSocket::getWantClientAuth ( ) const [pure virtual]

Returns

true if the **Socket** (p. 1900) request client Authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1555).

6.500.3.7 virtual void decaf::net::ssl::SSLServerSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [pure virtual]

Sets the Cipher Suites that are to be enabled on the **SSLServerSocket** (p. 1941) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites	An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1555).

6.500.3.8 virtual void decaf::net::ssl::SSLServerSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [pure virtual]

Sets the Protocols that are to be enabled on the **SSLServerSocket** (p. 1941) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols	An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1555).

6.500.3.9 virtual void decaf::net::ssl::SSLServerSocket::setNeedClientAuth (bool *value*) [pure virtual]

Sets whether or not this **Socket** (p. 1900) will require Client Authentication.

If set to true the **Socket** (p. 1900) (when used in server mode) will require that the client authenticate itself, if the client doesn't send authentication the socket will not allow negotiation to continue.

Parameters

value	Whether the server socket should require client authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1556).

6.500.3.10 virtual void decaf::net::ssl::SSLServerSocket::setWantClientAuth (bool *value*) [pure virtual]

Sets whether or not this **Socket** (p. 1900) will request Client Authentication.

If set to true the **Socket** (p. 1900) (when used in server mode) will request that the client authenticate itself, if the client doesn't send authentication the socket will still allow negotiation to continue.

Parameters

value	Whether the server socket should request client authentication.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocket** (p. 1556).

The documentation for this class was generated from the following file:

- src/main/decaf/net/ssl/**SSLServerSocket.h**

6.501 decaf::net::ssl::SSLServerSocketFactory Class Reference

Factory class interface that provides methods to create SSL Server Sockets.

`#include <src/main/decaf/net/ssl/SSLServerSocketFactory.h>`

Inheritance diagram for decaf::net::ssl::SSLServerSocketFactory:

Public Member Functions

- virtual ∼**SSLServerSocketFactory** ()
- virtual std::vector< std::string > **getDefaultCipherSuites** ()=0

  Returns the list of cipher suites which are enabled by default.
- virtual std::vector< std::string > **getSupportedCipherSuites** ()=0

  Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Static Public Member Functions

- static **ServerSocketFactory** ∗ **getDefault** ()

  *Returns the current default SSL **ServerSocketFactory** (p. 1823), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.*

Protected Member Functions

- **SSLServerSocketFactory** ()

6.501.1 Detailed Description

Factory class interface that provides methods to create SSL Server Sockets.

Since

1.0

6.501.2 Constructor & Destructor Documentation

6.501.2.1 decaf::net::ssl::SSLServerSocketFactory::SSLServerSocketFactory ( ) [protected]

6.501.2.2 virtual decaf::net::ssl::SSLServerSocketFactory::∼SSLServerSocketFactory ( ) [virtual]

6.501.3 Member Function Documentation

6.501.3.1 static ServerSocketFactory* decaf::net::ssl::SSLServerSocketFactory::getDefault ( ) [static]

Returns the current default SSL **ServerSocketFactory** (p. 1823), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 1935)->getServerSocketFactory(). If that call fails, a non-functional factory is returned.

Returns

the default SSL **ServerSocketFactory** (p. 1823) pointer.

See also

decaf::net::ssl::SSLContext::getDefault() (p. 1935)

Reimplemented from **decaf::net::ServerSocketFactory** (p. 1825).

6.501.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getDefaultCipherSuites ( ) [pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1947)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1560), and **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 905).

6.501.3.3 virtual std::vector<std::string> decaf::net::ssl::SSLServerSocketFactory::getSupportedCipherSuites ( ) [pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() (p. 1947)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLServerSocketFactory** (p. 1560), and **decaf::internal::net::ssl::DefaultSSLServerSocketFactory** (p. 906).

The documentation for this class was generated from the following file:

  *Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 1900).*
- virtual void **setEnabledProtocols** (**const** std::vector< std::string > &protocols)=0

  *Sets the Protocols that are to be enabled on the SSL **Socket** (p. 1900) connection.*
- virtual **SSLParameters getSSLParameters** () **const**

  *Returns an **SSLParameters** (p. 1938) object for this **SSLSocket** (p. 1947) instance.*
- virtual void **setSSLParameters** (**const SSLParameters** &value)

  *Sets the **SSLParameters** (p. 1938) for this **SSLSocket** (p. 1947) using the supplied **SSLParameters** (p. 1938) instance.*
- virtual void **startHandshake** ()=0

  Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.
- virtual void **setUseClientMode** (bool value)=0

  Determines the mode that the socket uses when a handshake is initiated, client or server.
- virtual bool **getUseClientMode** () **const** =0

  *Gets whether this **Socket** (p. 1900) is in Client or Server mode, true indicates that the mode is set to Client.*
- virtual void **setNeedClientAuth** (bool value)=0

  *Sets the **Socket** (p. 1900) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*
- virtual bool **getNeedClientAuth** () **const** =0

  Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.
- virtual void **setWantClientAuth** (bool value)=0

  *Sets the **Socket** (p. 1900) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.*

- virtual bool **getWantClientAuth** () **const** =0

  Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.

6.502.1 Detailed Description

Since

1.0

6.502.2 Constructor & Destructor Documentation

6.502.2.1 decaf::net::ssl::SSLSocket::SSLSocket ( )

6.502.2.2 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address,* int *port*)

Creates a new **SSLSocket** (p. 1947) instance and connects it to the given address and port.

If the host parameter is empty then the loop back address is used.

Parameters

address	The address to connect to.
port	The port number to connect to [0...65535]

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
NullPointerException	if the **InetAddress** (p. 1113) instance in NULL.
IllegalArgumentException	if the port if not in range [0...65535]

6.502.2.3 decaf::net::ssl::SSLSocket::SSLSocket (const InetAddress * *address,* int *port,* const InetAddress * *localAddress,* int *localPort*)

Creates a new **SSLSocket** (p. 1947) instance and connects it to the given address and port.

The **Socket** (p. 1900) will also bind to the local address and port specified.

Parameters

address	The address to connect to.
port	The port number to connect to [0...65535]
localAddress	The IP address on the local machine to bind to.
localPort	The port on the local machine to bind to.

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
NullPointerException	if the **InetAddress** (p. 1113) instance in NULL.
IllegalArgumentException	if the port if not in range [0...65535]

6.502.2.4 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & *host,* int *port*)

Creates a new **SSLSocket** (p. 1947) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

Parameters

host	The host name or IP address to connect to, empty string means loopback.
port	The port number to connect to [0...65535]

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
IllegalArgumentException	if the port if not in range [0...65535]

6.502.2.5 decaf::net::ssl::SSLSocket::SSLSocket (const std::string & *host,* int *port,* const InetAddress * *localAddress,* int *localPort*)

Creates a new **SSLSocket** (p. 1947) instance and connects it to the given host and port.

If the host parameter is empty then the loop back address is used.

Parameters

host	The host name or IP address to connect to, empty string means loopback.
port	The port number to connect to [0...65535]
localAddress	The IP address on the local machine to bind to.
localPort	The port on the local machine to bind to.

Exceptions

UnknownHostException *(p. 2181)*	if the host cannot be resolved.
IOException	if an I/O error occurs while connecting the **Socket** (p. 1900).
IllegalArgumentException	if the port if not in range [0...65535]

6.502.2.6 virtual decaf::net::ssl::SSLSocket::~SSLSocket ( ) [virtual]

6.502.3 Member Function Documentation

6.502.3.1 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledCipherSuites ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Cipher Suites for this SSL **Socket** (p. 1900).

Returns

vector of the names of all enabled Cipher Suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1565).

6.502.3.2 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getEnabledProtocols ( ) const [pure virtual]

Returns a vector containing the names of all the currently enabled Protocols for this SSL **Socket** (p. 1900).

Returns

vector of the names of all enabled Protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1565).

6.502.3.3 virtual bool decaf::net::ssl::SSLSocket::getNeedClientAuth ( ) const [pure virtual]

Returns if this socket is configured to require client authentication, true means that is has and that clients that failed to authenticate will be rejected.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1566).

6.502.3.4 virtual SSLParameters decaf::net::ssl::SSLSocket::getSSLParameters ( ) const [virtual]

Returns an **SSLParameters** (p. 1938) object for this **SSLSocket** (p. 1947) instance.

The cipherSuites and protocols vectors in the returned **SSLParameters** (p. 1938) reference will never be empty.

Returns

an **SSLParameters** (p. 1938) object with the settings in use for the **SSLSocket** (p. 1947).

6.502.3.5 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedCipherSuites ( ) const [pure virtual]

Gets a vector containing the names of all the cipher suites that are supported by this **SSLSocket** (p. 1947).

Normally not all of these cipher suites will be enabled on the **Socket** (p. 1900).

Returns

a vector containing the names of all the supported cipher suites.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1567).

6.502.3.6 virtual std::vector<std::string> decaf::net::ssl::SSLSocket::getSupportedProtocols ( ) const [pure virtual]

Gets a vector containing the names of all the protocols that could be enabled for this **SSLSocket** (p. 1947) instance.

Returns

a vector containing the names of all the supported protocols.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1567).

6.502.3.7 virtual bool decaf::net::ssl::SSLSocket::getUseClientMode ( ) const [pure virtual]

Gets whether this **Socket** (p. 1900) is in Client or Server mode, true indicates that the mode is set to Client.

Returns

true if the **Socket** (p. 1900) is in Client mode, false otherwise.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1567).

6.502.3.8 virtual bool decaf::net::ssl::SSLSocket::getWantClientAuth ( ) const [pure virtual]

Returns if this socket is configured to request client authentication, true means that is has and that clients that failed to authenticate will be rejected but that cleints that do not send a certificate are not considered to have failed authentication.

This option is only useful when the socket is operating in server mode.

Returns

true if client authentication is required.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1567).

6.502.3.9 virtual void decaf::net::ssl::SSLSocket::setEnabledCipherSuites (const std::vector< std::string > & *suites*) [pure virtual]

Sets the Cipher Suites that are to be enabled on the SSL **Socket** (p. 1900) connection.

Each of the named Cipher Suites must appear in the list of supported cipher suites for this connection or an exception will be thrown.

Parameters

suites	An Vector of names for all the Cipher Suites that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1568).

6.502.3.10 virtual void decaf::net::ssl::SSLSocket::setEnabledProtocols (const std::vector< std::string > & *protocols*) [pure virtual]

Sets the Protocols that are to be enabled on the SSL **Socket** (p. 1900) connection.

Each of the named Protocols must appear in the list of supported protocols suites for this connection or an exception will be thrown.

Parameters

protocols	An Vector of names for all the Protocols that are to be enabled.

Exceptions

IllegalArgumentException	if the vector is empty or one of the names is invalid.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1568).

6.502.3.11 virtual void decaf::net::ssl::SSLSocket::setNeedClientAuth (bool *value*) [pure virtual]

Sets the **Socket** (p. 1900) to require that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered failed and the connection is refused. Calling this method resets any previous value for this option as well as clears any value set in the setWantClientAuth method.

Parameters

value	The value indicating if a client is required to authenticate itself or not.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1569).

6.502.3.12 virtual void decaf::net::ssl::SSLSocket::setSSLParameters (const SSLParameters & *value*) [virtual]

Sets the **SSLParameters** (p. 1938) for this **SSLSocket** (p. 1947) using the supplied **SSLParameters** (p. 1938) instance.

If the cipherSutes vector in the **SSLParameters** (p. 1938) instance is not empty them the setEnabledCipherSuites method is called with that vector, if the protocols vector in the **SSLParameters** (p. 1938) instance is not empty then the setEnabledProtocols method is called with that vector. If the needClientAuth value or the wantClientAuth value is true then the setNeedClientAuth and setWantClientAuth methods are called respectively with a value of true, otherwise the setWantClientAuth method is called with a value of false.

Parameters

value	The **SSLParameters** (p. 1938) instance that is used to update this **SSLSocket** (p. 1947)'s settings.

Exceptions

IllegalArgumentException	if an error occurs while calling setEnabledCipherSuites or setEnabledProtocols.

6.502.3.13 virtual void decaf::net::ssl::SSLSocket::setUseClientMode (bool *value*) [pure virtual]

Determines the mode that the socket uses when a handshake is initiated, client or server.

This method must be called prior to any handshake attempts on this **Socket** (p. 1900), once a handshake has be initiated this socket remains the the set mode; client or server, for the life of this object.

Parameters

value	The mode setting, true for client or false for server.

Exceptions

IllegalArguementException	if the handshake process has begun and mode is lcoked.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1569).

6.502.3.14 virtual void decaf::net::ssl::SSLSocket::setWantClientAuth (bool *value*) [pure virtual]

Sets the **Socket** (p. 1900) to request that a client authenticate itself by sending a valid Certificate that is trusted by this Server mode socket.

This option only applies to sockets in the Server mode.

If the option is enabled an the client does not provide a certificate then the handshake is considered to have succeeded, if it does send a certificate and that certificate is invalid the the handshake will fail. Calling this method resets any previous value for this option as well as clears any value set in the setNeedClientAuth method.

Parameters

value	The value indicating if a client is requested to authenticate itself or not.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1570).

6.502.3.15 virtual void decaf::net::ssl::SSLSocket::startHandshake ( ) [pure virtual]

Initiates a handshake for this SSL Connection, this can be necessary for several reasons such as using new encryption keys, or starting a new session.

When called for the first time after the socket connects this method blocks until the handshake is completed. The provider is not require to support multiple handshakes and can throw an IOException to indicate an error.

Exceptions

IOException	if an I/O error occurs while performing the Handshake

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1570).

6.503.1 Detailed Description

Factory class interface for a **SocketFactory** (p. 1916) that can create **SSLSocket** (p. 1947) objects.

Since

1.0

6.503.2 Constructor & Destructor Documentation

6.503.2.1 decaf::net::ssl::SSLSocketFactory::SSLSocketFactory ( ) [protected]

6.503.2.2 virtual decaf::net::ssl::SSLSocketFactory::~SSLSocketFactory ( ) [virtual]

6.503.3 Member Function Documentation

6.503.3.1 virtual Socket* decaf::net::ssl::SSLSocketFactory::createSocket (Socket * *socket,* std::string *host,* int *port,* bool *autoClose*) [pure virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket	The existing socket to layer over.
host	The server host the original **Socket** (p. 1900) is connected to.
port	The server port the original **Socket** (p. 1900) is connected to.
autoClose	Should the layered over **Socket** (p. 1900) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 1900) instance that wraps the given **Socket** (p. 1900).

Exceptions

IOException	if an I/O exception occurs while performing this operation.
UnknownHostException *(p. 2181)*	if the host is unknown.

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1579), and **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 911).

6.503.3.2 static SocketFactory* decaf::net::ssl::SSLSocketFactory::getDefault ( ) [static]

Returns the current default SSL **SocketFactory** (p. 1916), the factory is returned as a pointer however the caller does not own this pointer and should not delete it.

This method returns **SSLContext::getDefault()** (p. 1935)->getSocketFactory(). If that call fails, a non-functional factory is returned.

Returns

the default SSL **SocketFactory** (p. 1916) pointer.

See also

decaf::net::ssl::SSLContext::getDefault() (p. 1935)

Reimplemented from **decaf::net::SocketFactory** (p. 1920).

6.503.3.3 virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getDefaultCipherSuites ( ) [pure virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1956)

Implemented in **decaf::internal::net::ssl::openssl::OpenSSLSocketFactory** (p. 1579), and **decaf::internal::net::ssl::DefaultSSLSocketFactory** (p. 911).

6.503.3.4 virtual std::vector<std::string> decaf::net::ssl::SSLSocketFactory::getSupportedCipherSuites ( ) [pure virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

6.504 activemq::transport::tcp::SslTransport Class Reference

Transport (p. 2161) for connecting to a Broker using an SSL Socket.

`#include <src/main/activemq/transport/tcp/SslTransport.h>`

Inheritance diagram for activemq::transport::tcp::SslTransport:

Public Member Functions

- **SslTransport** (**const Pointer**< **Transport** > &**next**)

  *Creates a new instance of the **SslTransport** (p. 1956), the transport will not attempt to connect to a remote host until the connect method is called.*
- virtual ~**SslTransport** ()

Protected Member Functions

- virtual **decaf::net::Socket** * **createSocket** ()

  Create an unconnected Socket instance to be used by the transport to communicate with the broker.

  Returns

  a newly created unconnected Socket instance.

  Exceptions

IOException	*if there is an error while creating the unconnected Socket.*

- virtual void **configureSocket** (**decaf::net::Socket** *socket, **decaf::util::Properties** &properties)

6.504.1 Detailed Description

Transport (p. 2161) for connecting to a Broker using an SSL Socket.

This transport simply wraps the **TcpTransport** (p. 2086) and provides the **TcpTransport** (p. 2086) an SSL based Socket pointer allowing the core **TcpTransport** (p. 2086) logic to be reused.

Since

3.2.0

6.504.2 Constructor & Destructor Documentation

6.504.2.1 activemq::transport::tcp::SslTransport::SslTransport (const Pointer< Transport > & *next*)

Creates a new instance of the **SslTransport** (p. 1956), the transport will not attempt to connect to a remote host until the connect method is called.

Parameters

next	the next transport in the chain

6.504.2.2 virtual activemq::transport::tcp::SslTransport::~SslTransport ( ) [virtual]

6.504.3 Member Function Documentation

6.504.3.1 virtual void activemq::transport::tcp::SslTransport::configureSocket (decaf::net::Socket * *socket,* decaf::util::Properties & *properties*) [protected, virtual]

6.504.3.2 virtual decaf::net::Socket* activemq::transport::tcp::SslTransport::createSocket ( ) [protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

Exceptions

IOException	if there is an error while creating the unconnected Socket.

Reimplemented from **activemq::transport::tcp::TcpTransport** (p. 2088).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**SslTransport.h**

6.505 activemq::transport::tcp::SslTransportFactory Class Reference

6.507 decaf::internal::io::StandardErrorOutputStream Class Reference

Wrapper Around the Standard error Output facility on the current platform.

`#include <src/main/decaf/internal/io/StandardErrorOutputStream.h>`

Inheritance diagram for decaf::internal::io::StandardErrorOutputStream:

Public Member Functions

- **StandardErrorOutputStream** ()
- virtual ~**StandardErrorOutputStream** ()
- virtual void **flush** ()

  Flushes this stream by writing any buffered output to the underlying stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

The default implementation of this method does nothing.

- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

  Exceptions

IOException (p. 1198)	*if an error occurs while closing.*

The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (**const** unsigned char *buffer, int size, int offset, int length)

6.507.1 Detailed Description

Wrapper Around the Standard error Output facility on the current platform.

This allows for the use of alternate output methods on platforms or compilers that do not support `std::cerr`.

6.507.2 Constructor & Destructor Documentation

6.507.2.1 decaf::internal::io::StandardErrorOutputStream::StandardErrorOutputStream ( )

6.507.2.2 virtual decaf::internal::io::StandardErrorOutputStream::~StandardErrorOutputStream ( ) [virtual]

6.507.3 Member Function Documentation

6.507.3.1 virtual void decaf::internal::io::StandardErrorOutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.507.3.2 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.507.3.3 virtual void decaf::internal::io::StandardErrorOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 1602).

6.507.3.4 virtual void decaf::internal::io::StandardErrorOutputStream::flush ( ) [virtual]

Flushes this stream by writing any buffered output to the underlying stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardErrorOutputStream.h**

6.508 decaf::internal::io::StandardInputStream Class Reference

`#include <src/main/decaf/internal/io/StandardInputStream.h>`

Inheritance diagram for decaf::internal::io::StandardInputStream:

Public Member Functions

- **StandardInputStream** ()
- virtual ~**StandardInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.

Protected Member Functions

- virtual int **doReadByte** ()

6.508.1 Constructor & Destructor Documentation

6.508.1.1 decaf::internal::io::StandardInputStream::StandardInputStream ( )

6.508.1.2 virtual decaf::internal::io::StandardInputStream::~StandardInputStream ( ) [virtual]

6.508.2 Member Function Documentation

6.508.2.1 virtual int decaf::internal::io::StandardInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.508.2.2 virtual int decaf::internal::io::StandardInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/io/**StandardInputStream.h**

6.509 decaf::internal::io::StandardOutputStream Class Reference

`#include <src/main/decaf/internal/io/StandardOutputStream.h>`

Inheritance diagram for decaf::internal::io::StandardOutputStream:

Public Member Functions

- **StandardOutputStream** ()
- virtual ∼**StandardOutputStream** ()

6.510 cms::Startable Class Reference

Interface for a class that implements the start method.

`#include <src/main/cms/Startable.h>`

Inheritance diagram for cms::Startable:

Public Member Functions

- virtual ~**Startable** () throw ()
- virtual void **start** ()=0

  Starts the service.

6.510.1 Detailed Description

Interface for a class that implements the start method.

An object that implements the **Startable** (p. 1963) interface implies that until its start method is called it will be considered to be in a closed or stopped state and will throw an Exception to indicate that it is not in an started state if one of its methods is called.

Since

1.0

6.510.2 Constructor & Destructor Documentation

6.510.2.1 virtual cms::Startable::~Startable ( ) throw () [virtual]

6.510.3 Member Function Documentation

6.510.3.1 virtual void cms::Startable::start ( ) [pure virtual]

Starts the service.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while starting.

Implemented in **activemq::core::ActiveMQConnection** (p. 164), **activemq::core::ActiveMQSession** (p. 273), **activemq::core::ActiveMQConsumer** (p. 189), **activemq::cmsutil::PooledSession** (p. 1632), and **activemq::cmsutil::CachedConsumer** (p. 572).

Referenced by activemq::cmsutil::PooledSession::start().

The documentation for this class was generated from the following file:

6.513 decaf::util::StlList< E > Class Template Reference

List (p. 1286) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

`#include <src/main/decaf/util/StlList.h>`

Inheritance diagram for decaf::util::StlList< E >:

Data Structures

- class **ConstStlListIterator**
- class **StlListIterator**

Public Member Functions

- **StlList** ()

  Default constructor - does nothing.

- **StlList** (**const StlList** &source)

  Copy constructor - copies the content of the given set into this one.

- **StlList** (**const Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.

- virtual bool **equals** (**const Collection**< E > &collection) **const**

  *Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.*

  Parameters

collection	*- The **Collection** (p. 660) to be compared to this one.*

  Returns

  *true if this **Collection** (p. 660) is equal to the one given.*

- virtual void **copy** (**const Collection**< E > &collection)

  *Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).*
  *The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.*

  Parameters

collection	*The collection to mirror.*

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
IllegalStateException	*if the elements cannot be added at this time due to insertion restrictions.*

- virtual **Iterator**< E > * **iterator** ()

  Returns

  an iterator over a set of elements of type T.

- virtual **Iterator**< E > * **iterator** () **const**
- virtual **ListIterator**< E > * **listIterator** ()

  Returns

  a list iterator over the elements in this list (in proper sequence).

- virtual **ListIterator**< E > * **listIterator** () **const**
- virtual **ListIterator**< E > * **listIterator** (int index)

  Parameters

index	*index of first element to be returned from the list iterator (by a call to the next method).*

  Returns

  a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

  Exceptions

IndexOutOfBoundsException	*if the index is out of range (index < 0 || index > **size()** (p. 669))*

- virtual **ListIterator**< E > * **listIterator** (int index) **const**
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.
  *This implementation returns **size()** (p. 669) == 0.*

  Returns

  true if the size method return 0.

- virtual int **size** () **const**

  Returns the number of elements in this collection.
  If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

  Returns

  the number of elements in this collection

- virtual E **get** (int index) **const**

  Gets the element contained at position passed.

  Parameters

index	*The position to get.*

  Returns

  value at index specified.

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*

- virtual E **set** (int index, **const** E &element)

  Replaces the element at the specified position in this list with the specified element.

  Parameters

index	*The index of the element to replace.*
element	*The element to be stored at the specified position.*

  Returns

  the element previously at the specified position.

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

- virtual void **add** (int index, **const** E &element)

  Inserts the specified element at the specified position in this list.

- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.

- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
  The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

  Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

  Returns

  true if this collection changed as a result of the call

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual bool **addAll** (int index, **const Collection**< E > &collection)

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	*The index at which to insert the first element from the specified collection*
source	*The **Collection** (p. 660) containing elements to be added to this list*

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **remove** (**const** E &value)

Removes a single instance of the specified element from the collection.
More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	*The reference to the element to remove from this **Collection** (p. 660).*

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual E **removeAt** (int index)

Removes the element at the specified position in this list.
Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	*- the index of the element to be removed.*

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*

- virtual int **indexOf** (**const** E &value) **const**

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual int **lastIndexOf** (**const** E &value) **const**

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters

value	*The value to check for presence in the collection.*

  Returns

  true if there is at least one of the elements in the collection

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

6.513.1 Detailed Description

template<typename E>class decaf::util::StlList< E >

List (p. 1286) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.

6.513.2 Constructor & Destructor Documentation

6.513.2.1 template<typename E> decaf::util::StlList< E >::StlList ( ) [inline]

Default constructor - does nothing.

6.513.2.2 template<typename E> decaf::util::StlList< E >::StlList (const StlList< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source	The source set.

References decaf::util::StlList< E >::copy().

6.513.2.3 template<typename E> decaf::util::StlList< E >::StlList (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source	The source set.

References decaf::util::StlList< E >::copy().

6.513.3 Member Function Documentation

6.513.3.1 template<typename E> virtual void decaf::util::StlList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1287).

References decaf::util::StlList< E >::size().

6.513.3.2 template<typename E> virtual bool decaf::util::StlList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 98).

6.513.3.3 template<typename E> virtual bool decaf::util::StlList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 87).

References decaf::util::Collection< E >::isEmpty(), decaf::util::StlList< E >::listIterator(), and decaf::util::-Collection< E >::toArray().

6.513.3.4 template<typename E> virtual bool decaf::util::StlList< E >::addAll (int *index*, const Collection< E > & *collection*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 99).

References decaf::util::Collection< E >::isEmpty(), decaf::util::StlList< E >::listIterator(), decaf::util::StlList< E >::size(), and decaf::util::Collection< E >::toArray().

6.513.3.5 template<typename E> virtual void decaf::util::StlList< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

6.513.3.6 template<typename E> virtual bool decaf::util::StlList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ?

e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

6.513.3.7 template<typename E> virtual void decaf::util::StlList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

Referenced by decaf::util::StlList< E >::StlList().

6.513.3.8 template<typename E> virtual bool decaf::util::StlList< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.

Parameters

collection	- The **Collection** (p. 660) to be compared to this one.

Returns

true if this **Collection** (p. 660) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.513.3.9 template<typename E> virtual E decaf::util::StlList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

Implements **decaf::util::List< E >** (p. 1289).

References decaf::util::StlList< E >::size().

6.513.3.10 template<typename E> virtual int decaf::util::StlList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

6.513.3.11 template<typename E> virtual bool decaf::util::StlList< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 669) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.513.3.12 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList< E >** (p. 101).

6.513.3.13 template<typename E> virtual Iterator<E>* decaf::util::StlList< E >::iterator ( ) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 101).

6.513.3.14 template<typename E> virtual int decaf::util::StlList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 102).

References decaf::util::StlList< E >::size().

6.513.3.15 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator ( ) [inline, virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList< E >** (p. 102).

Referenced by decaf::util::StlList< E >::addAll().

6.513.3.16 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator ( ) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

6.513.3.17 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) [inline, virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 669))

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

References decaf::util::StlList< E >::size().

6.513.3.18 template<typename E> virtual ListIterator<E>* decaf::util::StlList< E >::listIterator (int index) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

References decaf::util::StlList< E >::size().

6.513.3.19 template<typename E> virtual bool decaf::util::StlList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

References decaf::util::StlList< E >::size().

6.513.3.20 template<typename E> virtual E decaf::util::StlList< E >::removeAt (int index) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList< E >** (p. 104).

References decaf::util::StlList< E >::size().

6.513.3.21 template<typename E> virtual E decaf::util::StlList< E >::set (int index , const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1294).

References decaf::util::StlList< E >::size().

6.513.3.22 template<typename E> virtual int decaf::util::StlList< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

Referenced by decaf::util::StlList< E >::add(), decaf::util::StlList< E >::addAll(), decaf::util::StlList< E >::get(), decaf::util::StlList< E >::lastIndexOf(), decaf::util::StlList< E >::listIterator(), decaf::util::StlList< E >::remove(), decaf::util::StlList< E >::removeAt(), and decaf::util::StlList< E >::set().

The documentation for this class was generated from the following file:

6.514 decaf::util::StlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

`#include <src/main/decaf/util/StlMap.h>`

Inheritance diagram for decaf::util::StlMap< K, V, COMPARATOR >:

Public Member Functions

- **StlMap** ()

  Default constructor - does nothing.
- **StlMap** (**const StlMap** &source)

  Copy constructor - copies the content of the given map into this one.
- **StlMap** (**const Map**< K, V, COMPARATOR > &source)

  Copy constructor - copies the content of the given map into this one.
- virtual ~**StlMap** ()
- virtual bool **equals** (**const StlMap** &source) **const**
- virtual bool **equals** (**const Map**< K, V, COMPARATOR > &source) **const**

  Comparison, equality is dependent on the method of determining if the element are equal.

  Parameters

source	- ***Map*** *(p. 1371) to compare to this one.*

  Returns

  *true if the **Map** (p. 1371) passed is equal in value to this one.*
- virtual void **copy** (**const StlMap** &source)
- virtual void **copy** (**const Map**< K, V, COMPARATOR > &source)

Copies the content of the source map into this map.
Erases all existing data in this map.

Parameters

source	*The source object to copy from.*

- virtual void **clear** ()

  Removes all keys and values from this map.

  Exceptions

UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual bool **containsKey** (**const** K &key) **const**

  Indicates whether or this map contains a value for the given key.

  Parameters

key	*The key to look up.*

  Returns

  true if this map contains the value, otherwise false.

- virtual bool **containsValue** (**const** V &value) **const**

  Indicates whether or this map contains a value for the given value, i.e.
  they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

  Parameters

value	*The Value to look up.*

  Returns

  true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () **const**

  Returns

  *if the **Map** (p. 1371) contains any element or not, TRUE or FALSE*

- virtual int **size** () **const**

  Returns

  The number of elements (key/value pairs) in this map.

- virtual V & **get** (**const** K &key)

  *Gets the value mapped to the specified key in the **Map** (p. 1371).*
  *If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.*

  Parameters

key	*The search key.*

  Returns

  A reference to the value for the given key.

  Exceptions

NoSuchElementException (p. 1537)	*if the key requests doesn't exist in the **Map** (p. 1371).*

- virtual **const** V & **get** (**const** K &key) **const**

  *Gets the value mapped to the specified key in the **Map** (p. 1371).*
  *If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.*

  Parameters

key	*The search key.*

  Returns

  A {const} reference to the value for the given key.

Exceptions

NoSuchElementException (p. 1537)	*if the key requests doesn't exist in the **Map** (p. 1371).*

- virtual void **put** (**const** K &key, **const** V &value)

  Sets the value for the specified key.

  Parameters

key	*The target key.*
value	*The value to be set.*

  Exceptions

UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual void **putAll** (**const StlMap**< K, V, COMPARATOR > &other)

- virtual void **putAll** (**const Map**< K, V, COMPARATOR > &other)

  *Stores a copy of the Mappings contained in the other **Map** (p. 1371) in this one.*

  Parameters

other	*A **Map** (p. 1371) instance whose elements are to all be inserted in this **Map** (p. 1371).*

  Exceptions

UnsupportedOperation-Exception	*If the implementing class does not support the putAll operation.*

- virtual V **remove** (**const** K &key)

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

  Parameters

key	*The search key.*

  Returns

  a copy of the element that was previously mapped to the given key

  Exceptions

NoSuchElementException (p. 1537)	*if this key is not in the **Map** (p. 1371).*
UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () **const**

  *Returns a **Set** (p. 1857) view of the mappings contained in this map.*
  *The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1210), **Set.remove** (p. 667), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

  Returns

  the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () **const**

  Returns

  the entire set of values in this map as a std::vector.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.514.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>>class decaf::util::StlMap< K, V, COMPARATOR >

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

Since

1.0

6.514.2 Constructor & Destructor Documentation

6.514.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap ( ) [inline]

Default constructor - does nothing.

6.514.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const StlMap< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

source	The source map.

6.514.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::StlMap< K, V, COMPARATOR >::StlMap (const Map< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

source	The source map.

6.514.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::StlMap< K, V, COMPARATOR >::~StlMap ( ) [inline, virtual]

6.514.3 Member Function Documentation

6.514.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::clear ( ) [inline, virtual]

Removes all keys and values from this map.

Exceptions

UnsupportedOperation-Exception	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1373).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.514.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsKey (const K & *key*) const [inline, virtual]

Indicates whether or this map contains a value for the given key.

Parameters

key	The key to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1373).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::equals().

6.514.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::containsValue (const V & *value*) const [inline, virtual]

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.514.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const StlMap< K, V, COMPARATOR > & *source*) [inline, virtual]

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::StlMap().

6.514.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & *source*) [inline, virtual]

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source	The source object to copy from.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.514.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const StlMap< K, V, COMPARATOR > & *source*) const [inline, virtual]

6.514.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & *source*) const [inline, virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source	- **Map** (p. 1371) to compare to this one.

Returns

true if the **Map** (p. 1371) passed is equal in value to this one.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.514.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).
