If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1375).

6.514.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::StlMap< K, V, COMPARATOR >::get (const K & *key*) const [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1375).

6.514.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::isEmpty ( ) const [inline, virtual]

Returns

if the **Map** (p. 1371) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1376).

6.514.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::StlMap< K, V, COMPARATOR >::keySet ( ) const [inline, virtual]

Returns a **Set** (p. 1857) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1210), **Set.remove** (p. 667), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1376).

6.514.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.514.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.514.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.514.3.15 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) [inline, virtual]

Sets the value for the specified key.

Parameters

key	The target key.
value	The value to be set.

Exceptions

UnsupportedOperation-Exception	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1377).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::putAll().

6.514.3.16 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const StlMap< K, V, COMPARATOR > & *other*) [inline, virtual]

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::copy().

6.514.3.17 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) [inline, virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 1371) in this one.

Parameters

other	A **Map** (p. 1371) instance whose elements are to all be inserted in this **Map** (p. 1371).

Exceptions

UnsupportedOperation-Exception	If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1377).

6.514.3.18 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::StlMap< K, V, COMPARATOR >::remove (const K & *key*) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key	The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException *(p. 1537)*	if this key is not in the **Map** (p. 1371).
UnsupportedOperation-Exception	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1378).

6.514.3.19 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual int decaf::util::StlMap< K, V, COMPARATOR >::size ( ) const [inline, virtual]

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1378).

6.514.3.20 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::StlMap< K, V, COMPARATOR >::tryLock ( ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.514.3.21 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.514.3.22 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::StlMap< K, V, COMPARATOR >::values ( ) const [inline, virtual]

Returns

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1379).

Referenced by decaf::util::StlMap< std::string, cms::Topic * >::values().

6.514.3.23 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.514.3.24 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.514.3.25 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::StlMap< K, V, COMPARATOR >::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.
- T & **getSafeValue** ()

  Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

6.515.1 Detailed Description

template<typename T>class decaf::util::StlQueue< T >

The **Queue** (p. 1723) class accepts messages with an psuh(m) command where m is the message to be queued.

It destructively returns the message with **pop()** (p. 1992). **pop()** (p. 1992) returns messages in the order they were enqueued.

Queue (p. 1723) is implemented with an instance of the STL queue object. The interface is essentially the same as that of the STL queue except that the pop method actually reaturns a reference to the element popped. This frees the app from having to call the `front` method before calling pop.

Queue<string> sq; // make a queue to hold string messages sq.push(s); // enqueues a message m string s = sq.pop(); // dequeues a message

= DESIGN CONSIDERATIONS

The **Queue** (p. 1723) class inherits from the Synchronizable interface and provides methods for locking and unlocking this queue as well as waiting on this queue. In a multi-threaded app this can allow for multiple threads to be reading from and writing to the same **Queue** (p. 1723).

Clients should consider that in a multiple threaded app it is possible that items could be placed on the queue faster than you are taking them off, so protection should be placed in your polling loop to ensure that you don't get stuck there.

6.515.2 Constructor & Destructor Documentation

6.515.2.1 template<typename T> decaf::util::StlQueue< T >::StlQueue ( ) [inline]

6.515.2.2 template<typename T> virtual decaf::util::StlQueue< T >::~StlQueue ( ) [inline, virtual]

6.515.3 Member Function Documentation

6.515.3.1 template<typename T> T& decaf::util::StlQueue< T >::back ( ) [inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.2 template<typename T> const T& decaf::util::StlQueue< T >::back ( ) const [inline]

Returns a Reference to the element at the tail of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.3 template<typename T> void decaf::util::StlQueue< T >::clear ( ) [inline]

Empties this queue.

6.515.3.4 template<typename T> bool decaf::util::StlQueue< T >::empty ( ) const [inline]

Checks if this **Queue** (p. 1723) is currently empty.

Returns

boolean indicating queue emptiness

6.515.3.5 template<typename T> void decaf::util::StlQueue< T >::enqueueFront (const T & *t*) [inline]

Places a new Object at the front of the queue.

Parameters

t	- **Queue** (p. 1723) Object Type reference.

6.515.3.6 template<typename T> T& decaf::util::StlQueue< T >::front ( ) [inline]

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.7 template<typename T> const T& decaf::util::StlQueue< T >::front ( ) const [inline]

Returns a Reference to the element at the head of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.8 template<typename T> T& decaf::util::StlQueue< T >::getSafeValue ( ) [inline]

Fetch a reference to the safe value this object will return when there is nothing to fetch from the queue.

Returns

Reference to this Queues safe object

Referenced by decaf::util::StlQueue< T >::back(), decaf::util::StlQueue< T >::front(), and decaf::util::StlQueue< T >::pop().

6.515.3.9 template<typename T> Iterator<T>* decaf::util::StlQueue< T >::iterator ( ) [inline]

Gets an **Iterator** (p. 1209) over this **Queue** (p. 1723).

Returns

new iterator pointer that is owned by the caller.

6.515.3.10 template<typename T> virtual void decaf::util::StlQueue< T >::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

References decaf::util::concurrent::Mutex::lock().

6.515.3.11 template<typename T> virtual void decaf::util::StlQueue< T >::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

References decaf::util::concurrent::Mutex::notify().

6.515.3.12 template<typename T> virtual void decaf::util::StlQueue< T >::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

References decaf::util::concurrent::Mutex::notifyAll().

6.515.3.13 template<typename T> T decaf::util::StlQueue< T >::pop ( ) [inline]

Removes and returns the element that is at the Head of the queue.

Returns

reference to a queue type object or (safe)

References decaf::util::StlQueue< T >::getSafeValue().

6.515.3.14 template<typename T> void decaf::util::StlQueue< T >::push (const T & *t*) [inline]

Places a new Object at the Tail of the queue.

Parameters

t	- **Queue** (p. 1723) Object Type reference.

6.515.3.15 template<typename T> void decaf::util::StlQueue< T >::reverse (StlQueue< T > & *target*) const [inline]

Reverses the order of the contents of this queue and stores them in the target queue.

Parameters

target	- The target queue that will receive the contents of this queue in reverse order.

6.515.3.16 template<typename T> size_t decaf::util::StlQueue< T >::size ( ) const [inline]

Gets the Number of elements currently in the **Queue** (p. 1723).

Returns

Queue (p. 1723) Size

6.515.3.17 template<typename T> virtual std::vector<T> decaf::util::StlQueue< T >::toArray ( ) const [inline, virtual]

Returns

the all values in this queue as a std::vector.

6.515.3.18 template<typename T> virtual bool decaf::util::StlQueue< T >::tryLock ( ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

References decaf::util::concurrent::Mutex::tryLock().

6.515.3.19 template<typename T> virtual void decaf::util::StlQueue< T >::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

References decaf::util::concurrent::Mutex::unlock().

6.515.3.20 template<typename T> virtual void decaf::util::StlQueue< T >::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

References decaf::util::concurrent::Mutex::wait().

6.515.3.21 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

References decaf::util::concurrent::Mutex::wait().

6.515.3.22 template<typename T> virtual void decaf::util::StlQueue< T >::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

References decaf::util::concurrent::Mutex::wait().

The documentation for this class was generated from the following file:

- src/main/decaf/util/**StlQueue.h**

6.516 decaf::util::StlSet< E > Class Template Reference

Set (p. 1857) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

`#include <src/main/decaf/util/StlSet.h>`

Inheritance diagram for decaf::util::StlSet< E >:

Data Structures

- class **ConstSetIterator**
- class **SetIterator**

Public Member Functions

- **StlSet** ()

  Default constructor - does nothing.
- **StlSet** (**const StlSet** &source)

  Copy constructor - copies the content of the given set into this one.
- **StlSet** (**const Collection**< E > &source)

  Copy constructor - copies the content of the given set into this one.
- virtual ~**StlSet** ()
- **Iterator**< E > * **iterator** ()

  Returns

  an iterator over a set of elements of type T.
- **Iterator**< E > * **iterator** () **const**
- virtual bool **equals** (**const Collection**< E > &collection) **const**

  *Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.*

  Parameters

collection	- *The **Collection** (p. 660) to be compared to this one.*

  Returns

  *true if this **Collection** (p. 660) is equal to the one given.*
- virtual void **copy** (**const Collection**< E > &collection)

  *Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).*

*The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.*

Parameters

collection	*The collection to mirror.*

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
IllegalStateException	*if the elements cannot be added at this time due to insertion restrictions.*

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters

value	*The value to check for presence in the collection.*

  Returns

  true if there is at least one of the elements in the collection

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual bool **isEmpty** () **const**
- virtual int **size** () **const**
- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  *Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.*
  If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
  For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

  Parameters

value	*The reference to the element to add to this **Collection** (p. 660).*

  Returns

  *true if the element was added to this **Collection** (p. 660).*

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*

IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters

value	*The reference to the element to remove from this* ***Collection*** *(*p. *660).*

  Returns

  true if the collection was changed, false otherwise.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the* ***Collection*** *(*p. *660) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

6.516.1 Detailed Description

template<typename E>class decaf::util::StlSet< E >

Set (p. 1857) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.

6.516.2 Constructor & Destructor Documentation

6.516.2.1 template<typename E> decaf::util::StlSet< E >::StlSet ( ) [inline]

Default constructor - does nothing.

6.516.2.2 template<typename E> decaf::util::StlSet< E >::StlSet (const StlSet< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source	The source set.

6.516.2.3 template<typename E> decaf::util::StlSet< E >::StlSet (const Collection< E > & *source*) [inline]

Copy constructor - copies the content of the given set into this one.

Parameters

source	The source set.

6.516.2.4 template<typename E> virtual decaf::util::StlSet< E >::~StlSet ( ) [inline, virtual]

6.516.3 Member Function Documentation

6.516.3.1 template<typename E> virtual bool decaf::util::StlSet< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection**< **E** > (p. 662).

6.516.3.2 template<typename E> virtual void decaf::util::StlSet< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 88).

6.516.3.3 template<typename E> virtual bool decaf::util::StlSet< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

6.516.3.4 template<typename E> virtual void decaf::util::StlSet< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

Referenced by decaf::util::StlSet< Resource * >::copy(), and decaf::util::StlSet< Resource * >::StlSet().

6.516.3.5 template<typename E> virtual bool decaf::util::StlSet< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.

Parameters

collection	- The **Collection** (p. 660) to be compared to this one.

Returns

true if this **Collection** (p. 660) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 90).

Referenced by decaf::util::StlSet< Resource * >::equals().

6.516.3.6 template<typename E> virtual bool decaf::util::StlSet< E >::isEmpty ( ) const [inline, virtual]

Returns

if the set contains any element or not, TRUE or FALSE

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 90).

6.516.3.7 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable**< **E** > (p. 1207).

6.516.3.8 template<typename E> Iterator<E>* decaf::util::StlSet< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable**< **E** > (p. 1208).

6.516.3.9 template<typename E> virtual bool decaf::util::StlSet< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

6.516.3.10 template<typename E> virtual int decaf::util::StlSet< E >::size ( ) const [inline, virtual]

Returns

The number of elements in this set.

Implements **decaf::util::Collection< E >** (p. 669).

6.518 activemq::wireformat::stomp::StompFrame Class Reference

A Stomp-level message frame that encloses all messages to and from the broker.

`#include <src/main/activemq/wireformat/stomp/StompFrame.h>`

Public Member Functions

- **StompFrame** ()

  Default constructor.
- virtual ~**StompFrame** ()

  Destruction.
- **StompFrame** * **clone** () **const**

  Clonse this message exactly, returns a new instance that the caller is required to delete.
- void **copy** (**const StompFrame** *src)

  Copies the contents of the passed Frame to this one.
- void **setCommand** (**const** std::string &cmd)

  Sets the command for this stomp frame.
- **const** std::string & **getCommand** () **const**

  Accessor for this frame's command field.
- bool **hasProperty** (**const** std::string &name) **const**

  Checks if the given property is present in the Frame.

- std::string **getProperty** (**const** std::string &name, **const** std::string &fallback="") **const**

  Gets a property from this Frame's properties and returns it, or the default value given.
- std::string **removeProperty** (**const** std::string &name)

  Gets and remove the property specified, if the property is not set, this method returns the empty string.
- void **setProperty** (**const** std::string &name, **const** std::string &value)

  Sets the property given to the value specified in this Frame's Properties.
- **decaf::util::Properties** & **getProperties** ()

  Gets access to the header properties for this frame.
- **const decaf::util::Properties** & **getProperties** () **const**
- **const** std::vector< unsigned char > & **getBody** () **const**

  Accessor for the body data of this frame.
- std::vector< unsigned char > & **getBody** ()

  Non-const version of the body accessor.
- std::size_t **getBodyLength** () **const**

  Return the number of bytes contained in this frames body.
- void **setBody** (**const** unsigned char *bytes, std::size_t numBytes)

  Sets the body data of this frame as a byte sequence.
- void **toStream** (**decaf::io::DataOutputStream** *stream) **const**

  Writes this Frame to an OuputStream in the Stomp Wire Format.
- void **fromStream** (**decaf::io::DataInputStream** *stream)

  Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

6.518.1 Detailed Description

A Stomp-level message frame that encloses all messages to and from the broker.

6.518.2 Constructor & Destructor Documentation

6.518.2.1 activemq::wireformat::stomp::StompFrame::StompFrame ( )

Default constructor.

6.518.2.2 virtual activemq::wireformat::stomp::StompFrame::~StompFrame ( ) [virtual]

Destruction.

6.518.3 Member Function Documentation

6.518.3.1 StompFrame* activemq::wireformat::stomp::StompFrame::clone ( ) const

Clonse this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

6.518.3.2 void activemq::wireformat::stomp::StompFrame::copy (const StompFrame * *src*)

Copies the contents of the passed Frame to this one.

Parameters

src	- Frame to copy

6.518.3.3 void activemq::wireformat::stomp::StompFrame::fromStream (decaf::io::DataInputStream * *stream*)

Reads a Stop Frame from a DataInputStream in the Stomp Wire format.

Parameters

stream	- The stream to read the Frame from.

Exceptions

IOException	if an error occurs while writing the Frame.

6.518.3.4 const std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody ( ) const [inline]

Accessor for the body data of this frame.

Returns

char pointer to body data

6.518.3.5 std::vector<unsigned char>& activemq::wireformat::stomp::StompFrame::getBody ( ) [inline]

Non-const version of the body accessor.

6.518.3.6 std::size_t activemq::wireformat::stomp::StompFrame::getBodyLength ( ) const [inline]

Return the number of bytes contained in this frames body.

Returns

Body bytes length.

6.518.3.7 const std::string& activemq::wireformat::stomp::StompFrame::getCommand ( ) const [inline]

Accessor for this frame's command field.

6.518.3.8 decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties ( ) [inline]

Gets access to the header properties for this frame.

Returns

the Properties object owned by this Frame

6.518.3.9 const decaf::util::Properties& activemq::wireformat::stomp::StompFrame::getProperties ( ) const [inline]

6.518.3.10 std::string activemq::wireformat::stomp::StompFrame::getProperty (const std::string & *name,* const std::string & *fallback* = " ") const [inline]

Gets a property from this Frame's properties and returns it, or the default value given.

Parameters

name	- The name of the property to lookup
fallback	- The default value to return if this value isn't set

Returns

string value of the property asked for.

6.518.3.11 bool activemq::wireformat::stomp::StompFrame::hasProperty (const std::string & *name*) const [inline]

Checks if the given property is present in the Frame.

Parameters

name	- The name of the property to check for.

6.518.3.12 std::string activemq::wireformat::stomp::StompFrame::removeProperty (const std::string & *name*) [inline]

Gets and remove the property specified, if the property is not set, this method returns the empty string.

Parameters

name	- the Name of the property to get and return.

6.518.3.13 void activemq::wireformat::stomp::StompFrame::setBody (const unsigned char * *bytes,* std::size_t *numBytes*)

Sets the body data of this frame as a byte sequence.

Parameters

bytes	The byte buffer to be set in the body.
numBytes	The number of bytes in the buffer.

6.518.3.14 void activemq::wireformat::stomp::StompFrame::setCommand (const std::string & *cmd*) [inline]

Sets the command for this stomp frame.

Parameters

cmd	command The command to be set.

6.518.3.15 void activemq::wireformat::stomp::StompFrame::setProperty (const std::string & *name,* const std::string & *value*) [inline]

Sets the property given to the value specified in this Frame's Properties.

Parameters

name	- Name of the property.
value	- Value to set the property to.

6.518.3.16 void activemq::wireformat::stomp::StompFrame::toStream (decaf::io::DataOutputStream * *stream*) const

Writes this Frame to an OuputStream in the Stomp Wire Format.

Parameters

stream	- The stream to write the Frame to.

Exceptions

IOException	if an error occurs while reading the Frame.

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/stomp/**StompFrame.h**

6.519 activemq::wireformat::stomp::StompHelper Class Reference

Utility Methods used when marshaling to and from **StompFrame** (p. 2005)'s.

`#include <src/main/activemq/wireformat/stomp/StompHelper.h>`

Public Member Functions

- **StompHelper** ()
- virtual ~**StompHelper** ()
- void **convertProperties** (**const Pointer**< **StompFrame** > &frame, **const Pointer**< **Message** > &message)

  Converts the Headers in a Stomp Frame into Headers in the given Message Command.
- void **convertProperties** (**const Pointer**< **Message** > &message, **const Pointer**< **StompFrame** > &frame)

  *Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2005).*
- **Pointer**< **ActiveMQDestination** > **convertDestination** (**const** std::string &destination)

  Converts from a Stomp Destination to an ActiveMQDestination.
- std::string **convertDestination** (**const Pointer**< **ActiveMQDestination** > &destination)

  Converts from a ActiveMQDestination to a Stomp Destination Name.
- std::string **convertMessageId** (**const Pointer**< **MessageId** > &messageId)

  Converts a MessageId instance to a Stomp MessageId String.
- **Pointer**< **MessageId** > **convertMessageId** (**const** std::string &messageId)

  Converts a Stomp MessageId string to a MessageId.
- std::string **convertConsumerId** (**const Pointer**< **ConsumerId** > &consumerId)

  Converts a ConsumerId instance to a Stomp ConsumerId String.

- **Pointer**< **ConsumerId** > **convertConsumerId** (**const** std::string &consumerId)

  Converts a Stomp ConsumerId string to a ConsumerId.
- std::string **convertProducerId** (**const Pointer**< **ProducerId** > &producerId)

  Converts a ProducerId instance to a Stomp ProducerId String.
- **Pointer**< **ProducerId** > **convertProducerId** (**const** std::string &producerId)

  Converts a Stomp ProducerId string to a ProducerId.
- std::string **convertTransactionId** (**const Pointer**< **TransactionId** > &transactionId)

  Converts a TransactionId instance to a Stomp TransactionId String.
- **Pointer**< **TransactionId** > **convertTransactionId** (**const** std::string &transactionId)

  Converts a Stomp TransactionId string to a TransactionId.

6.519.1 Detailed Description

Utility Methods used when marshaling to and from **StompFrame** (p. 2005)'s.

Since

3.0

6.519.2 Constructor & Destructor Documentation

6.519.2.1 activemq::wireformat::stomp::StompHelper::StompHelper ( )

6.519.2.2 virtual activemq::wireformat::stomp::StompHelper::~StompHelper ( ) [virtual]

6.519.3 Member Function Documentation

6.519.3.1 std::string activemq::wireformat::stomp::StompHelper::convertConsumerId (const Pointer< ConsumerId > & *consumerId*)

Converts a ConsumerId instance to a Stomp ConsumerId String.

Parameters

consumerId	- the Consumer instance to convert.

Returns

a Stomp Consumer Id String.

6.519.3.2 Pointer<ConsumerId> activemq::wireformat::stomp::StompHelper::convertConsumerId (const std::string & *consumerId*)

Converts a Stomp ConsumerId string to a ConsumerId.

Parameters

consumerId	- the String Consumer Id to convert.

Returns

Pointer to a new ConsumerId.

6.519.3.3 Pointer<ActiveMQDestination> activemq::wireformat::stomp::StompHelper::convertDestination (const std::string & *destination*)

Converts from a Stomp Destination to an ActiveMQDestination.

Parameters

destination	- The Stomp Destination name string.

Returns

Pointer to a new ActiveMQDestination.

6.519.3.4 std::string activemq::wireformat::stomp::StompHelper::convertDestination (const Pointer< ActiveMQDestination > & *destination*)

Converts from a ActiveMQDestination to a Stomp Destination Name.

Parameters

destination	- The ActiveMQDestination to Convert

Returns

the Stomp String name that defines the destination.

6.519.3.5 std::string activemq::wireformat::stomp::StompHelper::convertMessageId (const Pointer< MessageId > & *messageId*)

Converts a MessageId instance to a Stomp MessageId String.

Parameters

messageId	- the MessageId instance to convert.

Returns

a Stomp Message Id String.

6.519.3.6 Pointer<MessageId> activemq::wireformat::stomp::StompHelper::convertMessageId (const std::string & *messageId*)

Converts a Stomp MessageId string to a MessageId.

Parameters

messageId	- the String message Id to convert.

Returns

Pointer to a new MessageId.

6.519.3.7 std::string activemq::wireformat::stomp::StompHelper::convertProducerId (const Pointer< ProducerId > & *producerId*)

Converts a ProducerId instance to a Stomp ProducerId String.

Parameters

producerId	- the Producer instance to convert.

Returns

a Stomp Producer Id String.

6.519.3.8 Pointer<ProducerId> activemq::wireformat::stomp::StompHelper::convertProducerId (const std::string & *producerId*)

Converts a Stomp ProducerId string to a ProducerId.

Parameters

producerId	- the String Producer Id to convert.

Returns

Pointer to a new ProducerId.

6.519.3.9 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< StompFrame > & *frame,* const Pointer< Message > & *message*)

Converts the Headers in a Stomp Frame into Headers in the given Message Command.

Parameters

frame	- The frame to extract headers from.
message	- The message to move the Headers to.

6.519.3.10 void activemq::wireformat::stomp::StompHelper::convertProperties (const Pointer< Message > & *message,* const Pointer< StompFrame > & *frame*)

Converts the Properties in a Message Command to Valid Headers and Properties in the **StompFrame** (p. 2005).

Parameters

message	- The message to move the Headers to.
frame	- The frame to extract headers from.

6.519.3.11 std::string activemq::wireformat::stomp::StompHelper::convertTransactionId (const Pointer< TransactionId > & *transactionId*)

Converts a TransactionId instance to a Stomp TransactionId String.

Parameters

transactionId	- the Transaction instance to convert.

Returns

a Stomp Transaction Id String.

6.519.3.12 Pointer<TransactionId> activemq::wireformat::stomp::StompHelper::convertTransactionId (const std::string & *transactionId*)

Converts a Stomp TransactionId string to a TransactionId.

Parameters

transactionId	- the String Transaction Id to convert.

Returns

Pointer to a new TransactionId.

The documentation for this class was generated from the following file:

6.520 activemq::wireformat::stomp::StompWireFormat Class Reference

`#include <src/main/activemq/wireformat/stomp/StompWireFormat.h>`

Inheritance diagram for activemq::wireformat::stomp::StompWireFormat:

Public Member Functions

- **StompWireFormat** ()
- virtual ~**StompWireFormat** ()
- virtual void **marshal** (**const Pointer**< **commands::Command** > &command, **const activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer** < **commands::Command** > **unmarshal** (**const activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)

  Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version AMQCPP_UNUSED)

  Set the Version.
- virtual int **getVersion** () **const**

  Get the Version.
- virtual bool **inReceive** () **const**

  Is there a Message being unmarshaled?
- virtual bool **hasNegotiator** () **const**

*Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual **Pointer**
  < **transport::Transport** > **createNegotiator** (**const Pointer**< **transport::Transport** > &transport)

  If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

6.520.1 Constructor & Destructor Documentation

6.520.1.1 activemq::wireformat::stomp::StompWireFormat::StompWireFormat ( )

6.520.1.2 virtual activemq::wireformat::stomp::StompWireFormat::~StompWireFormat ( ) [virtual]

6.520.2 Member Function Documentation

6.520.2.1 virtual Pointer<transport::Transport> activemq::wireformat::stomp::StompWireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) [virtual]

If the Transport Provides a Negotiator this method will create and return a news instance of the Negotiator.

Returns

new instance of a **WireFormatNegotiator** (p. 2251).

Exceptions

UnsupportedOperation-Exception	if the **WireFormat** (p. 2236) doesn't have a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.520.2.2 virtual int activemq::wireformat::stomp::StompWireFormat::getVersion ( ) const [inline, virtual]

Get the Version.

Returns

the version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.520.2.3 virtual bool activemq::wireformat::stomp::StompWireFormat::hasNegotiator ( ) const [inline, virtual]

Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 2236) provides a Negotiator.

Implements **activemq::wireformat::WireFormat** (p. 2237).

6.520.2.4 virtual bool activemq::wireformat::stomp::StompWireFormat::inReceive ( ) const [inline, virtual]

Is there a Message being unmarshaled?

Returns

true while in the doUnmarshal method.

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.520.2.5 virtual void activemq::wireformat::stomp::StompWireFormat::marshal (const Pointer< commands::Command > & *command*, const activemq::transport::Transport * *transport*, decaf::io::DataOutputStream * *out*) [virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command	The Command to Marshal to the output stream.
transport	The Transport that initiated this marshal call.
out	The output stream to write the command to.

Exceptions

IOException	

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.520.2.6 virtual void activemq::wireformat::stomp::StompWireFormat::setVersion (int version *AMQCPP_UNUSED*) [inline, virtual]

Set the Version.

Parameters

the	version of the wire format

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.520.2.7 virtual Pointer<commands::Command> activemq::wireformat::stomp::StompWireFormat::unmarshal (const activemq::transport::Transport * *transport*, decaf::io::DataInputStream * *in*) [virtual]

Stream based un-marshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

transport	- Pointer to the transport that is making this request.
in	- the input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException	

Implements **activemq::wireformat::WireFormat** (p. 2238).

6.521 activemq::wireformat::stomp::StompWireFormatFactory Class Reference

Factory used to create the Stomp Wire Format instance.

`#include <src/main/activemq/wireformat/stomp/StompWireFormatFactory.h>`

Inheritance diagram for activemq::wireformat::stomp::StompWireFormatFactory:

Public Member Functions

- **StompWireFormatFactory** ()
- virtual ∼**StompWireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (**const decaf::util::Properties** &properties)

  *Creates a new **WireFormat** (p. 2236) Object passing it a set of properties from which it can obtain any optional settings.*

6.521.1 Detailed Description

Factory used to create the Stomp Wire Format instance.

6.521.2 Constructor & Destructor Documentation

6.521.2.1 activemq::wireformat::stomp::StompWireFormatFactory::StompWireFormatFactory ( ) [inline]

6.521.2.2 virtual activemq::wireformat::stomp::StompWireFormatFactory::∼StompWireFormatFactory ( ) [inline, virtual]

6.521.3 Member Function Documentation

6.521.3.1 virtual Pointer<WireFormat> activemq::wireformat::stomp::StompWireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) [virtual]

Creates a new **WireFormat** (p. 2236) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties	- the Properties for this **WireFormat** (p. 2236)

Implements **activemq::wireformat::WireFormatFactory** (p. 2239).

The documentation for this class was generated from the following file:

6.522 cms::Stoppable Class Reference

Interface for a class that implements the stop method.

`#include <src/main/cms/Stoppable.h>`

Inheritance diagram for cms::Stoppable:

Public Member Functions

- virtual ~**Stoppable** ()
- virtual void **stop** ()=0

  Stops this service.

6.522.1 Detailed Description

Interface for a class that implements the stop method.

An object that implements this interface implies that it will halt all operations that result in events being propagated to external users, internally the Object can continue to process data but not events will be generated to clients and methods that return data will not return valid results until the object is started again.

Since

1.0

6.522.2 Constructor & Destructor Documentation

6.522.2.1 virtual cms::Stoppable::~Stoppable ( ) [virtual]

6.522.3 Member Function Documentation

6.522.3.1 virtual void cms::Stoppable::stop ( ) [pure virtual]

Stops this service.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while stopping the Service.

Implemented in **activemq::core::ActiveMQConnection** (p. 164), **activemq::core::ActiveMQSession** (p. 274), **activemq::core::ActiveMQConsumer** (p. 189), **activemq::cmsutil::PooledSession** (p. 1632), and **activemq::cmsutil::CachedConsumer** (p. 572).

Referenced by activemq::cmsutil::PooledSession::stop().

The documentation for this class was generated from the following file:

- src/main/cms/**Stoppable.h**

6.523 decaf::util::logging::StreamHandler Class Reference

Stream based logging **Handler** (p. 1085).

`#include <src/main/decaf/util/logging/StreamHandler.h>`

Inheritance diagram for decaf::util::logging::StreamHandler:

Public Member Functions

- **StreamHandler** ()

  *Create a **StreamHandler** (p. 2017), with no current output stream.*
- **StreamHandler** (**decaf::io::OutputStream** ∗stream, **Formatter** ∗formatter)

  *Create a **StreamHandler** (p. 2017), with no current output stream.*
- virtual ∼**StreamHandler** ()
- virtual void **close** ()

  Close the current output stream.
- virtual void **flush** ()

  *Flush the **Handler** (p. 1085)'s output, clears any buffers.*
- virtual void **publish** (**const LogRecord** &record)

  *Publish the Log Record to this **Handler** (p. 1085).*
- virtual bool **isLoggable** (**const LogRecord** &record) **const**

  *Check if this **Handler** (p. 1085) would actually log a given **LogRecord** (p. 1333).*

Protected Member Functions

- virtual void **setOuputStream** (**decaf::io::OutputStream** ∗stream)

  Change the output stream.
- void **close** (bool closeStream)

  Closes this handler, but the underlying output stream is only closed if closeStream is true.

6.523.1 Detailed Description

Stream based logging **Handler** (p. 1085).

This is primarily intended as a base class or support class to be used in implementing other logging Handlers.

LogRecords are published to a given **`decaf::io::OutputStream`** (p. 1600).

Configuration: By default each **StreamHandler** (p. 2017) is initialized using the following **LogManager** (p. 1327) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

- decaf.util.logging.StreamHandler.level specifies the default level for the **Handler** (p. 1085) (defaults to **Level.-INFO** (p. 1256)).
  - decaf.util.logging.StreamHandler.filter specifies the name of a **Filter** (p. 1031) class to use (defaults to no **Filter** (p. 1031)).
  - decaf.util.logging.StreamHandler.formatter specifies the name of a **Formatter** (p. 1074) class to use (defaults to **decaf.util.logging.SimpleFormatter** (p. 1891)).

Since

1.0

6.523.2 Constructor & Destructor Documentation

6.523.2.1 decaf::util::logging::StreamHandler::StreamHandler ( )

Create a **StreamHandler** (p. 2017), with no current output stream.

6.523.2.2 decaf::util::logging::StreamHandler::StreamHandler (decaf::io::OutputStream * *stream,* Formatter * *formatter*)

Create a **StreamHandler** (p. 2017), with no current output stream.

6.523.2.3 virtual decaf::util::logging::StreamHandler::~StreamHandler ( ) [virtual]

6.523.3 Member Function Documentation

6.523.3.1 virtual void decaf::util::logging::StreamHandler::close ( ) [virtual]

Close the current output stream.

The close method will perform a flush and then close the **Handler** (p. 1085). After close has been called this **Handler** (p. 1085) should no longer be used. Method calls may either be silently ignored or may throw runtime exceptions.

Exceptions

IOException	if an I/O error occurs.

Implements **decaf::io::Closeable** (p. 633).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 769).

6.523.3.2 void decaf::util::logging::StreamHandler::close (bool *closeStream*) [protected]

Closes this handler, but the underlying output stream is only closed if closeStream is true.

Parameters

closeStream	whether to close the underlying output stream.

6.523.3.3 virtual void decaf::util::logging::StreamHandler::flush ( ) [virtual]

Flush the **Handler** (p. 1085)'s output, clears any buffers.

Implements **decaf::util::logging::Handler** (p. 1086).

6.523.3.4 virtual bool decaf::util::logging::StreamHandler::isLoggable (const LogRecord & *record*) const [virtual]

Check if this **Handler** (p. 1085) would actually log a given **LogRecord** (p. 1333).

Parameters

record	**LogRecord** (p. 1333) to check

Returns

true if the record can be logged with current settings.

Reimplemented from **decaf::util::logging::Handler** (p. 1087).

6.523.3.5 virtual void decaf::util::logging::StreamHandler::publish (const LogRecord & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1085).

Parameters

record	The **LogRecord** (p. 1333) to Publish

Implements **decaf::util::logging::Handler** (p. 1087).

Reimplemented in **decaf::util::logging::ConsoleHandler** (p. 769).

6.523.3.6 virtual void decaf::util::logging::StreamHandler::setOuputStream (decaf::io::OutputStream * *stream*) [protected, virtual]

Change the output stream.

If there is a current output stream then the **Formatter** (p. 1074)'s tail string is written and the stream is flushed and closed. Then the output stream is replaced with the new output stream.

Parameters

stream	The new output stream. May not be NULL.

Exceptions

NullPointerException	if the passed stream is NULL.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**StreamHandler.h**

6.524 cms::StreamMessage Class Reference

Interface for a **StreamMessage** (p. 2020).

`#include <src/main/cms/StreamMessage.h>`

Inheritance diagram for cms::StreamMessage:

Public Member Functions

- virtual ~**StreamMessage** () throw ()
- virtual bool **readBoolean** () **const** =0

  Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the Stream message stream as a 1-byte value.
- virtual unsigned char **readByte** () **const** =0

Reads a Byte from the Stream message stream.

- virtual void **writeByte** (unsigned char value)=0

  Writes a byte to the Stream message stream as a 1-byte value.

- virtual int **readBytes** (std::vector< unsigned char > &value) **const** =0

  Reads a byte array from the Stream message stream.

- virtual void **writeBytes** (**const** std::vector< unsigned char > &value)=0

  Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

- virtual int **readBytes** (unsigned char *buffer, int length) **const** =0

  Reads a portion of the Stream message stream.

- virtual void **writeBytes** (**const** unsigned char *value, int offset, int length)=0

  Writes a portion of a byte array to the Stream message stream.

- virtual char **readChar** () **const** =0

  Reads a Char from the Stream message stream.

- virtual void **writeChar** (char value)=0

  Writes a char to the Stream message stream as a 1-byte value.

- virtual float **readFloat** () **const** =0

  Reads a 32 bit float from the Stream message stream.

- virtual void **writeFloat** (float value)=0

  Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () **const** =0

  Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)=0

  Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () **const** =0

  Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)=0

  Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () **const** =0

  Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () **const** =0

  Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)=0

  Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () **const** =0

  Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)=0

  Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () **const** =0

  Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (**const** std::string &value)=0

  Writes an ASCII String to the Stream message stream.

6.524.1 Detailed Description

Interface for a **StreamMessage** (p. 2020).

The stream Messages provides a **Message** (p. 1426) type whose body is a stream of self describing primitive types. The primitive values are read and written using accessors specific to the given types.

StreamMessage (p. 2020) objects support the following conversion table. The marked cases must be supported. The unmarked cases must throw a **CMSException** (p. 640). The string-to- primitive conversions may throw a runtime exception if the primitive's valueOf() method does not accept it as a valid String representation of the primitive.

A value written as the row type can be read as the column type.

	boolean	byte	short	char	int	long	float	double	String	byte[]
boolean	X								X	
byte		X	X		X	X			X	
short			X		X	X			X	
char				X					X	
int					X	X			X	
long						X			X	
float							X	X	X	
double								X	X	
String	X	X	X		X	X	X	X	X	
byte[]										X

Since

1.3

6.524.2 Constructor & Destructor Documentation

6.524.2.1 virtual cms::StreamMessage::~StreamMessage ( ) throw () [virtual]

6.524.3 Member Function Documentation

6.524.3.1 virtual bool cms::StreamMessage::readBoolean ( ) const [pure virtual]

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 282).

6.524.3.2 virtual unsigned char cms::StreamMessage::readByte ( ) const [pure virtual]

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 282).

6.524.3.3 virtual int cms::StreamMessage::readBytes (std::vector< unsigned char > & *value*) const [pure virtual]

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value	buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 282).

6.524.3.4 virtual int cms::StreamMessage::readBytes (unsigned char * *buffer,* int *length*) const [pure virtual]

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an **CMSException** (p. 640) is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer	the buffer into which the data is read
length	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 283).

6.524.3.5 virtual char cms::StreamMessage::readChar ( ) const [pure virtual]

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 283).

6.524.3.6 virtual double cms::StreamMessage::readDouble ( ) const [pure virtual]

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 284).

6.524.3.7 virtual float cms::StreamMessage::readFloat ( ) const [pure virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 284).

6.524.3.8 virtual int cms::StreamMessage::readInt ( ) const [pure virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 284).

6.524.3.9 virtual long long cms::StreamMessage::readLong ( ) const [pure virtual]

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 285).

6.524.3.10 virtual short cms::StreamMessage::readShort ( ) const [pure virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 285).

6.524.3.11 virtual std::string cms::StreamMessage::readString ( ) const [pure virtual]

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 285).

6.524.3.12 virtual unsigned short cms::StreamMessage::readUnsignedShort ( ) const [pure virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of message stream has been reached.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 286).

6.524.3.13 virtual void cms::StreamMessage::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value	boolean to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 286).

6.524.3.14 virtual void cms::StreamMessage::writeByte (unsigned char *value*) [pure virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

value	byte to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 287).

6.524.3.15 virtual void cms::StreamMessage::writeBytes (const std::vector< unsigned char > & *value*) [pure virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

value	bytes to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 287).

6.524.3.16 virtual void cms::StreamMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [pure virtual]

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

Parameters

value	bytes to write to the stream
offset	the initial offset within the byte array
length	the number of bytes to use

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 287).

6.524.3.17 virtual void cms::StreamMessage::writeChar (char *value*) [pure virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters

value	char to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 288).

6.524.3.18 virtual void cms::StreamMessage::writeDouble (double *value*) [pure virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters

value	double to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 288).

6.524.3.19 virtual void cms::StreamMessage::writeFloat (float *value*) [pure virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters

value	float to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 288).

6.524.3.20 virtual void cms::StreamMessage::writeInt (int *value*) [pure virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

value	signed int to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 289).

6.524.3.21 virtual void cms::StreamMessage::writeLong (long long *value*) [pure virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

value	signed long long to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 289).

6.524.3.22 virtual void cms::StreamMessage::writeShort (short *value*) [pure virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

value	signed short to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 289).

6.524.3.23 virtual void cms::StreamMessage::writeString (const std::string & *value*) [pure virtual]

Writes an ASCII String to the Stream message stream.

Parameters

value	String to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 289).

6.524.3.24 virtual void cms::StreamMessage::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

value	unsigned short to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQStreamMessage** (p. 290).

The documentation for this class was generated from the following file:

6.525 decaf::lang::String Class Reference

The **String** (p. 2031) class represents an immutable sequence of chars.

`#include <src/main/decaf/lang/String.h>`

Inheritance diagram for decaf::lang::String:

Public Member Functions

- **String** ()

  *Creates a new empty **String** (p. 2031) object.*
- **String** (**const String** &source)

  *Create a new **String** (p. 2031) object that represents the given STL string.*
- **String** (**const** std::string &source)

  *Create a new **String** (p. 2031) object that represents the given STL string.*
- **String** (**const** char *array, int size)

  *Create a new **String** (p. 2031) object that represents the given array of characters.*
- **String** (**const** char *array, int size, int offset, int **length**)

  *Create a new **String** (p. 2031) object that represents the given array of characters.*
- virtual ~**String** ()
- **String** & **operator=** (**const String** &)
- **String** & **operator=** (**const** std::string &)

- bool **isEmpty** () **const**
- virtual int **length** () **const**

  Returns

  the length of the underlying character sequence.
- virtual char **charAt** (int index) **const**

  Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

  Parameters

index	*The position to return the char at.*

  Returns

  the char at the given position.

  Exceptions

IndexOutOfBoundsException	*if index is > than* ***length()*** *(p. 624) or negative*

- virtual **CharSequence** * **subSequence** (int start, int end) **const**

  Returns a new ***CharSequence*** *(p. 623) that is a subsequence of this sequence.*
  The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

  Parameters

start	*The start index, inclusive.*
end	*The end index, exclusive.*

  Returns

  a new ***CharSequence*** *(p. 623)*

  Exceptions

IndexOutOfBoundsException	*if start or end >* ***length()*** *(p. 624) or start or end are negative.*

- virtual std::string **toString** () **const**

  Returns

  the string representation of this ***CharSequence*** *(p. 623)*

Static Public Member Functions

- static **String valueOf** (bool value)

  Returns a ***String*** *(p. 2031) that represents the value of the given boolean value.*

  Returns a ***String*** *(p. 2031) that represents the value of the given char value.*
- static **String valueOf** (float value)

  Returns a ***String*** *(p. 2031) that represents the value of the given float value.*
- static **String valueOf** (double value)

  Returns a ***String*** *(p. 2031) that represents the value of the given double value.*
- static **String valueOf** (short value)

  Returns a ***String*** *(p. 2031) that represents the value of the given short value.*
- static **String valueOf** (int value)

  Returns a ***String*** *(p. 2031) that represents the value of the given integer value.*
- static **String valueOf** (long long value)

  Returns a ***String*** *(p. 2031) that represents the value of the given 64bit long value.*

6.525.1 Detailed Description

The **String** (p. 2031) class represents an immutable sequence of chars.

Since

1.0

6.525.2 Constructor & Destructor Documentation

6.525.2.1 decaf::lang::String::String ( )

Creates a new empty **String** (p. 2031) object.

6.525.2.2 decaf::lang::String::String (const String & *source*)

Create a new **String** (p. 2031) object that represents the given STL string.

Parameters

source	The string to copy into this new **String** (p. 2031) object.

6.525.2.3 decaf::lang::String::String (const std::string & *source*)

Create a new **String** (p. 2031) object that represents the given STL string.

Parameters

source	The string to copy into this new **String** (p. 2031) object.

6.525.2.4 decaf::lang::String::String (const char * *array,* int *size*)

Create a new **String** (p. 2031) object that represents the given array of characters.

The method takes the size of the array as a parameter to allow for strings that are not NULL terminated, the caller can pass strlen(array) in the case where the array is properly NULL terminated.

Parameters

array	The character buffer to copy into this new **String** (p. 2031) object.
size	The size of the string buffer given, in case the string is not NULL terminated.

Exceptions

NullPointerException	if the character array parameter is NULL.
IndexOutOfBounds-Exception	if the size parameter is negative.

6.525.2.5 decaf::lang::String::String (const char * *array,* int *size,* int *offset,* int *length*)

Create a new **String** (p. 2031) object that represents the given array of characters.

The method takes the size of the array as a parameter to allow for strings that are not NULL terminated, the caller can pass strlen(array) in the case where the array is properly NULL terminated.

Parameters

array	The character buffer to copy into this new **String** (p. 2031) object.
size	The size of the string buffer given, in case the string is not NULL terminated.

offset	The position to start copying from in the given buffer.
length	The number of bytes to copy from the given buffer starting from the offset.

Exceptions

NullPointerException	if the character array parameter is NULL.
IndexOutOfBounds-Exception	if the size, offset or length parameter is negative or if the length to copy is greater than the span of size - offset.

6.525.2.6 virtual decaf::lang::String::~String ( ) [virtual]

6.525.3 Member Function Documentation

6.525.3.1 virtual char decaf::lang::String::charAt (int *index*) const [virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index	The position to return the char at.

Returns

the char at the given position.

Exceptions

IndexOutOfBounds-Exception	if index is $>$ than **length()** (p. 624) or negative

Implements **decaf::lang::CharSequence** (p. 623).

6.525.3.2 bool decaf::lang::String::isEmpty ( ) const

Returns

true if the length of this **String** (p. 2031) is zero.

6.525.3.3 virtual int decaf::lang::String::length ( ) const [virtual]

Returns

the length of the underlying character sequence.

Implements **decaf::lang::CharSequence** (p. 624).

6.525.3.4 String& decaf::lang::String::operator= (const String &)

6.525.3.5 String& decaf::lang::String::operator= (const std::string &)

6.525.3.6 virtual CharSequence* decaf::lang::String::subSequence (int *start,* int *end*) const [virtual]

Returns a new **CharSequence** (p. 623) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

start	The start index, inclusive.
end	The end index, exclusive.

Returns

a new **CharSequence** (p. 623)

Exceptions

IndexOutOfBounds-Exception	if start or end $>$ **length()** (p. 624) or start or end are negative.

Implements **decaf::lang::CharSequence** (p. 624).

6.525.3.7 virtual std::string decaf::lang::String::toString ( ) const [virtual]

Returns

the string representation of this **CharSequence** (p. 623)

Implements **decaf::lang::CharSequence** (p. 624).

6.525.3.8 static String decaf::lang::String::valueOf (bool *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given boolean value.

Parameters

value	The value whose string representation is to be returned.

Returns

"true" if the boolean is true, "false" otherwise.

6.525.3.9 static String decaf::lang::String::valueOf (char *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given char value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the single character value given.

6.525.3.10 static String decaf::lang::String::valueOf (float *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given float value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the string representation of the float value given.

6.525.3.11 static String decaf::lang::String::valueOf (double *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given double value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the string representation of the double value given.

6.525.3.12 static String decaf::lang::String::valueOf (short *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given short value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the string representation of the short value given.

6.525.3.13 static String decaf::lang::String::valueOf (int *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given integer value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the string representation of the integer value given.

6.525.3.14 static String decaf::lang::String::valueOf (long long *value*) [static]

Returns a **String** (p. 2031) that represents the value of the given 64bit long value.

Parameters

value	The value whose string representation is to be returned.

Returns

a **String** (p. 2031) that contains the string representation of the 64 bit long value given.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**String.h**

6.526 decaf::util::StringTokenizer Class Reference

Class that allows for parsing of string based on Tokens.

`#include <src/main/decaf/util/StringTokenizer.h>`

Public Member Functions

- **StringTokenizer** (**const** std::string &str, **const** std::string &delim=" \t\n\r\f", bool returnDelims=false)

  Constructs a string tokenizer for the specified string.
- virtual ~**StringTokenizer** ()
- virtual int **countTokens** () **const**

  Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.
- virtual bool **hasMoreTokens** () **const**

  Tests if there are more tokens available from this tokenizer's string.
- virtual std::string **nextToken** ()

  Returns the next token from this string tokenizer.
- virtual std::string **nextToken** (**const** std::string &delim)

  Returns the next token in this string tokenizer's string.
- virtual unsigned int **toArray** (std::vector< std::string > &array)

  Grab all remaining tokens in the String and return them in the vector that is passed in by reference.
- virtual void **reset** (**const** std::string &str="", **const** std::string &delim="", bool returnDelims=false)

  Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

6.526.1 Detailed Description

Class that allows for parsing of string based on Tokens.

Since

1.0

6.526.2 Constructor & Destructor Documentation

6.526.2.1 decaf::util::StringTokenizer::StringTokenizer (const std::string & *str,* const std::string & *delim =* " \t\n\r\f", bool *returnDelims =* false)

Constructs a string tokenizer for the specified string.

All characters in the delim argument are the delimiters for separating tokens.

If the returnDelims flag is true, then the delimiter characters are also returned as tokens. Each delimiter is returned as a string of length one. If the flag is false, the delimiter characters are skipped and only serve as separators between tokens.

Note that if delim is "", this constructor does not throw an exception. However, trying to invoke other methods on the resulting **StringTokenizer** (p. 2036) may result in an Exception.

Parameters

str	- The string to tokenize
delim	- String containing the delimiters
returnDelims	- boolean indicating if the delimiters are returned as tokens

6.526.2.2 virtual decaf::util::StringTokenizer::~StringTokenizer ( ) [virtual]

6.526.3 Member Function Documentation

6.526.3.1 virtual int decaf::util::StringTokenizer::countTokens ( ) const [virtual]

Calculates the number of times that this tokenizer's nextToken method can be called before it generates an exception.

The current position is not advanced.

Returns

Count of remaining tokens

6.526.3.2 virtual bool decaf::util::StringTokenizer::hasMoreTokens ( ) const [virtual]

Tests if there are more tokens available from this tokenizer's string.

Returns

true if there are more tokens remaining

6.526.3.3 virtual std::string decaf::util::StringTokenizer::nextToken ( ) [virtual]

Returns the next token from this string tokenizer.

Returns

string value of next token

Exceptions

NoSuchElementException *(p. 1537)*	if there are no more tokens in this string.

6.526.3.4 virtual std::string decaf::util::StringTokenizer::nextToken (const std::string & *delim*) [virtual]

Returns the next token in this string tokenizer's string.

First, the set of characters considered to be delimiters by this **StringTokenizer** (p. 2036) object is changed to be the characters in the string delim. Then the next token in the string after the current position is returned. The current position is advanced beyond the recognized token. The new delimiter set remains the default after this call.

Parameters

delim	The string containing the new set of delimiters.

Returns

next string in the token list

Exceptions

NoSuchElementException *(p. 1537)*	if there are no more tokens in this string.

6.526.3.5 virtual void decaf::util::StringTokenizer::reset (const std::string & *str* = " ", const std::string & *delim* = " ", bool *returnDelims* = false) [virtual]

Resets the Tokenizer's position in the String to the Beginning calls to countToken and nextToken now start back at the beginning.

This allows this object to be reused, the caller need not create a new instance every time a String needs tokenizing.

- If set the string param will reset the string that this Tokenizer is working on. If set to "" no change is made.
  - If set the delim param will reset the string that this Tokenizer is using to tokenizer the string. If set to "", no change is made
  - If set the return Delims will set if this Tokenizer will return delimiters as tokens. Defaults to false.

Parameters

str	New String to tokenize or "", defaults to ""
delim	New Delimiter String to use or "", defaults to ""
returnDelims	Should the Tokenizer return delimiters as Tokens, default false

6.526.3.6 virtual unsigned int decaf::util::StringTokenizer::toArray (std::vector< std::string > & *array*) [virtual]

Grab all remaining tokens in the String and return them in the vector that is passed in by reference.

Parameters

array	- vector to place token strings in

Returns

number of string placed into the vector

6.527.2 Member Function Documentation

6.527.2.1 virtual SubscriptionInfo* activemq::commands::SubscriptionInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.527.2.2 virtual void activemq::commands::SubscriptionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.527.2.3 virtual bool activemq::commands::SubscriptionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.527.2.4 virtual const std::string& activemq::commands::SubscriptionInfo::getClientId ( ) const [virtual]

6.527.2.5 virtual std::string& activemq::commands::SubscriptionInfo::getClientId ( ) [virtual]

6.527.2.6 virtual unsigned char activemq::commands::SubscriptionInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.527.2.7 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination ( ) const [virtual]

6.527.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getDestination ( ) [virtual]

6.527.2.9 virtual const std::string& activemq::commands::SubscriptionInfo::getSelector ( ) const [virtual]

6.527.2.10 virtual std::string& activemq::commands::SubscriptionInfo::getSelector ( ) [virtual]

6.527.2.11 virtual const std::string& activemq::commands::SubscriptionInfo::getSubcriptionName ( ) const [virtual]

6.527.2.12 virtual std::string& activemq::commands::SubscriptionInfo::getSubcriptionName ( ) [virtual]

6.527.2.13 virtual const Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination ( ) const [virtual]

6.527.2.14 virtual Pointer<ActiveMQDestination>& activemq::commands::SubscriptionInfo::getSubscribedDestination ( ) [virtual]

6.527.2.15 virtual void activemq::commands::SubscriptionInfo::setClientId (const std::string & *clientId*) [virtual]

6.527.2.16 virtual void activemq::commands::SubscriptionInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.527.2.17 virtual void activemq::commands::SubscriptionInfo::setSelector (const std::string & *selector*) [virtual]

6.527.2.18 virtual void activemq::commands::SubscriptionInfo::setSubcriptionName (const std::string & *subcriptionName*) [virtual]

6.527.2.19 virtual void activemq::commands::SubscriptionInfo::setSubscribedDestination (const Pointer< ActiveMQDestination > & *subscribedDestination*) [virtual]

6.527.2.20 virtual std::string activemq::commands::SubscriptionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.527.3 Field Documentation

6.527.3.1 std::string activemq::commands::SubscriptionInfo::clientId [protected]

6.527.3.2 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::destination [protected]

6.527.3.3 const unsigned char activemq::commands::SubscriptionInfo::ID_SUBSCRIPTIONINFO = 55 [static]

6.527.3.4 std::string activemq::commands::SubscriptionInfo::selector [protected]

6.527.3.5 std::string activemq::commands::SubscriptionInfo::subcriptionName [protected]

6.527.3.6 Pointer<ActiveMQDestination> activemq::commands::SubscriptionInfo::subscribedDestination [protected]

6.528 activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2042).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/SubscriptionInfoMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller:

Public Member Functions

- **SubscriptionInfoMarshaller** ()
- virtual ~**SubscriptionInfoMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.528.1 Detailed Description

Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2042).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.528.2 Constructor & Destructor Documentation

6.528.2.1 activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::SubscriptionInfoMarshaller ( ) [inline]

6.528.2.2 virtual activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::~SubscriptionInfoMarshaller ( ) [inline, virtual]

6.528.3 Member Function Documentation

6.528.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.528.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.528.3.3 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.528.3.4 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.528.3.5 virtual int activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.528.3.6 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.528.3.7 virtual void activemq::wireformat::openwire::marshal::generated::SubscriptionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**SubscriptionInfoMarshaller.h**

6.529 decaf::util::concurrent::Synchronizable Class Reference

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

`#include <src/main/decaf/util/concurrent/Synchronizable.h>`

Inheritance diagram for decaf::util::concurrent::Synchronizable:

Public Member Functions

- virtual ~**Synchronizable** ()
- virtual void **lock** ()=0

  Locks the object.
- virtual bool **tryLock** ()=0

  *Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.*
- virtual void **unlock** ()=0

  Unlocks the object.
- virtual void **wait** ()=0

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)=0

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)=0

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()=0

  Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()=0

  Signals the waiters on this object that it can now wake up and continue.

6.529.1 Detailed Description

The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

Since

1.0

6.529.2 Constructor & Destructor Documentation

6.529.2.1 virtual decaf::util::concurrent::Synchronizable::~Synchronizable ( ) [inline, virtual]

6.529.3 Member Function Documentation

6.529.3.1 virtual void decaf::util::concurrent::Synchronizable::lock ( ) [pure virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 808), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 808), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 708), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 708), **decaf::util::AbstractCollection< E >** (p. 91), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 91), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 91), **decaf::util::AbstractCollection< Resource * >** (p. 91), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 91), **decaf::util::AbstractCollection< CompositeTask * >** (p. 91), **decaf::util::AbstractCollection< URI >** (p. 91), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 91), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 91), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 91), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 91), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 91), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 91), **decaf::util::AbstractCollection< cms::Destination * >** (p. 91), **decaf::util::AbstractCollection< cms::Session * >** (p. 91), **decaf::util::AbstractCollection< cms::Connection * >** (p. 91), **decaf::io::InputStream** (p. 1137), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1984), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1984), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1984), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1984), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1984), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1984), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1984), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1984), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1984), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1984), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1984), **decaf::util::StlQueue< T >** (p. 1991), **decaf::io::OutputStream** (p. 1603), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1896), **activemq::core::FifoMessageDispatchChannel** (p. 1026), **decaf::util::concurrent::Mutex** (p. 1520), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2054).

6.529.3.2 virtual void decaf::util::concurrent::Synchronizable::notify ( ) [pure virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 808), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 808), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 709), **decaf::util::AbstractCollection< E >** (p. 91), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 91), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 91), **decaf::util::AbstractCollection< Resource * >** (p. 91), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 91), **decaf::util::AbstractCollection< CompositeTask * >** (p. 91), **decaf::util::AbstractCollection< URI >** (p. 91), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 91), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 91), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 91), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 91), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 91), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 91), **decaf::util::AbstractCollection< cms::Destination * >** (p. 91), **decaf::util::AbstractCollection< cms::Session * >** (p. 91), **decaf::util::AbstractCollection< cms::Connection * >** (p. 91), **decaf::io::InputStream** (p. 1137), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1984), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1984), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1984), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1984), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1984), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1984), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1984), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1984), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1984), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1984), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1984), **decaf::util::StlQueue< T >** (p. 1991), **decaf::io::OutputStream** (p. 1603), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1897), **activemq::core::FifoMessageDispatchChannel** (p. 1026), **decaf::util::concurrent::Mutex** (p. 1520), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2054).

6.529.3.3 virtual void decaf::util::concurrent::Synchronizable::notifyAll ( ) [pure virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 808), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 808), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 709), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 709), **decaf::util::AbstractCollection< E >** (p. 91), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 91), **decaf::util::AbstractCollection< Pointer< Synchronization**

> > (p. 91), **decaf::util::AbstractCollection< Resource * >** (p. 91), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 91), **decaf::util::AbstractCollection< CompositeTask * >** (p. 91), **decaf::util::AbstractCollection< URI >** (p. 91), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 91), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 91), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 91), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 91), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 91), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 91), **decaf::util::AbstractCollection< cms::Destination * >** (p. 91), **decaf::util::AbstractCollection< cms::Session * >** (p. 91), **decaf::util::AbstractCollection< cms::Connection * >** (p. 91), **decaf::io::InputStream** (p. 1138), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1984), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1984), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1984), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1984), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1984), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1984), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1984), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1984), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1984), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1984), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1984), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1984), **decaf::util::StlQueue< T >** (p. 1992), **decaf::io::OutputStream** (p. 1603), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1897), **activemq::core::FifoMessageDispatchChannel** (p. 1026), **decaf::util::concurrent::Mutex** (p. 1520), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2054).

6.529.3.4 virtual bool decaf::util::concurrent::Synchronizable::tryLock ( ) [pure virtual]

Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 811), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 811), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 713), **decaf::util::AbstractCollection< E >** (p. 94), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 94), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 94), **decaf::util::AbstractCollection< Resource * >** (p. 94), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 94), **decaf::util::AbstractCollection< CompositeTask * >** (p. 94), **decaf::util::AbstractCollection< URI >** (p. 94), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 94), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 94), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 94), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 94), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 94), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 94), **decaf::util::AbstractCollection< cms::Destination * >** (p. 94), **decaf::util::AbstractCollection< cms::Session * >** (p. 94), **decaf::util::AbstractCollection< cms::Connection * >** (p. 94), **decaf::io::InputStream** (p. 1141), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1986), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1986), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1986), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask ***

> (p. 1986), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1986), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1986), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1986), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1986), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1986), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1986), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1986), **decaf::util::StlQueue< T >** (p. 1993), **decaf::io::OutputStream** (p. 1604), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1898), **activemq::core::FifoMessageDispatchChannel** (p. 1027), **decaf::util::concurrent::Mutex** (p. 1521), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2054).

6.529.3.5 virtual void decaf::util::concurrent::Synchronizable::unlock ( ) [pure virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 812), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 812), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 713), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 713), **decaf::util::AbstractCollection< E >** (p. 94), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 94), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 94), **decaf::util::AbstractCollection< Resource * >** (p. 94), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 94), **decaf::util::AbstractCollection< CompositeTask * >** (p. 94), **decaf::util::AbstractCollection< URI >** (p. 94), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 94), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 94), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 94), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 94), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 94), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 94), **decaf::util::AbstractCollection< cms::Destination * >** (p. 94), **decaf::util::AbstractCollection< cms::Session * >** (p. 94), **decaf::util::AbstractCollection< cms::Connection * >** (p. 94), **decaf::io::InputStream** (p. 1141), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1986), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1986), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1986), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1986), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1986), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1986), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1986), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1986), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1986), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1986), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1986), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1986), **decaf::util::StlQueue< T >** (p. 1993), **decaf::io::OutputStream** (p. 1604), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1898), **activemq::core::FifoMessageDispatchChannel** (p. 1028), **decaf::util::concurrent::Mutex** (p. 1521), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2055).

6.529.3.6 virtual void decaf::util::concurrent::Synchronizable::wait ( ) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 812), **decaf::util::concurrent::-CopyOnWriteArrayList< ServiceListener * >** (p. 812), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 714), **decaf::util-::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::-COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 714), **decaf::util::AbstractCollection< E >** (p. 95), **decaf::util::Abstract-Collection< Pointer< Transport > >** (p. 95), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 95), **decaf::util::AbstractCollection< Resource * >** (p. 95), **decaf::util::AbstractCollection< cms-::MessageConsumer * >** (p. 95), **decaf::util::AbstractCollection< CompositeTask * >** (p. 95), **decaf-::util::AbstractCollection< URI >** (p. 95), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 95), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 95), **decaf::util::Abstract-Collection< PrimitiveValueNode >** (p. 95), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 95), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 95), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 95), **decaf::util::AbstractCollection< cms::Destination * >** (p. 95), **decaf-::util::AbstractCollection< cms::Session * >** (p. 95), **decaf::util::AbstractCollection< cms::Connection * >** (p. 95), **decaf::io::InputStream** (p. 1141), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1987), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1987), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1987), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1987), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1987), **decaf::util::StlMap< std-::string, cms::Queue * >** (p. 1987), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1987), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::Consumer-Id::COMPARATOR >** (p. 1987), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1987), **decaf::util-::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1987), **decaf::util::StlMap< std::string, Cached-Producer * >** (p. 1987), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1987), **decaf::util::StlQueue< T >** (p. 1993), **decaf::io::OutputStream** (p. 1604), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1898), **activemq::core::FifoMessageDispatchChannel** (p. 1028), **decaf::util::concurrent::Mutex** (p. 1521), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2055).

6.529.3.7 virtual void decaf::util::concurrent::Synchronizable::wait (long long *millisecs*) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 812), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 812), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 714), **decaf::util::AbstractCollection< E >** (p. 95), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 95), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 95), **decaf::util::AbstractCollection< Resource * >** (p. 95), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 95), **decaf::util::AbstractCollection< CompositeTask * >** (p. 95), **decaf::util::AbstractCollection< URI >** (p. 95), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 95), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 95), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 95), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 95), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 95), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 95), **decaf::util::AbstractCollection< cms::Destination * >** (p. 95), **decaf::util::AbstractCollection< cms::Session * >** (p. 95), **decaf::util::AbstractCollection< cms::Connection * >** (p. 95), **decaf::io::InputStream** (p. 1142), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1987), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1987), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1987), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1987), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1987), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1987), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1987), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1987), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1987), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1987), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1987), **decaf::util::StlQueue< T >** (p. 1994), **decaf::io::OutputStream** (p. 1604), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1899), **activemq::core::FifoMessageDispatchChannel** (p. 1028), **decaf::util::concurrent::Mutex** (p. 1522), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2055).

6.529.3.8 virtual void decaf::util::concurrent::Synchronizable::wait (long long *millisecs*, int *nanos*) [pure virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorStateException	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 813), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 813), **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 714), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 714), **decaf::util::AbstractCollection< E >** (p. 95), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 95), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 95), **decaf::util::AbstractCollection< Resource * >** (p. 95), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 95), **decaf::util::AbstractCollection< CompositeTask * >** (p. 95), **decaf::util::AbstractCollection< URI >** (p. 95), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 95), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 95), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 95), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 95), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 95), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 95), **decaf::util::AbstractCollection< cms::Destination * >** (p. 95), **decaf::util::AbstractCollection< cms::Session * >** (p. 95), **decaf::util::AbstractCollection< cms::Connection * >** (p. 95), **decaf::io::InputStream** (p. 1142), **decaf::util::StlMap< K, V, COMPARATOR >** (p. 1987), **decaf::util::StlMap< cms::Session *, SessionResolver * >** (p. 1987), **decaf::util::StlMap< std::string, WireFormatFactory * >** (p. 1987), **decaf::util::StlMap< decaf::lang::Runnable *, decaf::util::TimerTask * >** (p. 1987), **decaf::util::StlMap< std::string, PrimitiveValueNode >** (p. 1987), **decaf::util::StlMap< std::string, cms::Queue * >** (p. 1987), **decaf::util::StlMap< std::string, CachedConsumer * >** (p. 1987), **decaf::util::StlMap< Pointer< commands::ConsumerId >, ActiveMQConsumer *, commands::ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< std::string, TransportFactory * >** (p. 1987), **decaf::util::StlMap< Pointer< ConsumerId >, Pointer< ConsumerInfo >, ConsumerId::COMPARATOR >** (p. 1987), **decaf::util::StlMap< int, Pointer< Command > >** (p. 1987), **decaf::util::StlMap< std::string, CachedProducer * >** (p. 1987), **decaf::util::StlMap< std::string, cms::Topic * >** (p. 1987), **decaf::util::StlQueue< T >** (p. 1994), **decaf::io::OutputStream** (p. 1605), **activemq::core::SimplePriorityMessageDispatchChannel** (p. 1899), **activemq::core::FifoMessageDispatchChannel** (p. 1028), **decaf::util::concurrent::Mutex** (p. 1522), and **decaf::internal::util::concurrent::SynchronizableImpl** (p. 2055).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Synchronizable.h**

6.530 decaf::internal::util::concurrent::SynchronizableImpl Class Reference

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

`#include <src/main/decaf/internal/util/concurrent/SynchronizableImpl.h>`

Inheritance diagram for decaf::internal::util::concurrent::SynchronizableImpl:

Public Member Functions

- **SynchronizableImpl** ()
- virtual ~**SynchronizableImpl** ()
- virtual void **lock** ()

  Locks the object.
- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.
- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.
- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.
- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.530.1 Detailed Description

A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.

Since

1.0

6.530.2 Constructor & Destructor Documentation

6.530.2.1 decaf::internal::util::concurrent::SynchronizableImpl::SynchronizableImpl ( )

6.530.2.2 virtual decaf::internal::util::concurrent::SynchronizableImpl::~SynchronizableImpl ( ) [virtual]

6.530.3 Member Function Documentation

6.530.3.1 virtual void decaf::internal::util::concurrent::SynchronizableImpl::lock ( ) [virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.530.3.2 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notify ( ) [virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.530.3.3 virtual void decaf::internal::util::concurrent::SynchronizableImpl::notifyAll ( ) [virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.530.3.4 virtual bool decaf::internal::util::concurrent::SynchronizableImpl::tryLock ( ) [virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.530.3.5 virtual void decaf::internal::util::concurrent::SynchronizableImpl::unlock ( ) [virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.530.3.6 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait ( ) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.530.3.7 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.530.3.8 virtual void decaf::internal::util::concurrent::SynchronizableImpl::wait (long long *millisecs,* int *nanos*) [virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/concurrent/**SynchronizableImpl.h**

Data Structures

- class **EmptyIterator**

Public Member Functions

- **SynchronousQueue** ()
- virtual ~**SynchronousQueue** ()
- virtual void **put** (**const** E &value)

  Adds the specified element to this queue, waiting if necessary for another thread to receive it.
- virtual bool **offer** (**const** E &e, long long timeout, **const TimeUnit** &unit)

  Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.
- virtual bool **offer** (**const** E &value)

Inserts the specified element into this queue, if another thread is waiting to receive it.

- virtual E **take** ()

  Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

- virtual bool **poll** (E &result, long long timeout, **const TimeUnit** &unit)

  Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

- virtual bool **poll** (E &result)

  Retrieves and removes the head of this queue, if another thread is currently making an element available.

- virtual bool **equals** (**const Collection**< E > &value) **const**

  *Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.*

- virtual **decaf::util::Iterator** < E > * **iterator** ()
- virtual **decaf::util::Iterator** < E > * **iterator** () **const**
- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.

- virtual int **size** () **const**

  Returns the number of elements in this collection.

- virtual int **remainingCapacity** () **const**

  Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
  The collection will be empty after this method returns.
  *This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

  Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

This implementation repeatedly invokes poll until it returns false.

- virtual bool **contains** (**const** E &value **DECAF_UNUSED**) **const**
- virtual bool **containsAll** (**const Collection**< E > &collection) **const**

  Returns true if this collection contains all of the elements in the specified collection.

  Parameters

collection	*The **Collection** (p. 660) to compare to this one.*

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

- virtual bool **remove** (**const** E &value **DECAF_UNUSED**)
- virtual bool **removeAll** (**const Collection**< E > &collection **DECAF_UNUSED**)
- virtual bool **retainAll** (**const Collection**< E > &collection **DECAF_UNUSED**)
- virtual bool **peek** (E &result **DECAF_UNUSED**) **const**
- virtual std::vector< E > **toArray** () **const**

  *Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).*

- virtual int **drainTo** (**Collection**< E > &c)

  Removes all available elements from this queue and adds them to the given collection.

- virtual int **drainTo** (**Collection**< E > &c, int maxElements)

Removes at most the given number of available elements from this queue and adds them to the given collection.

6.532.1 Detailed Description

template<typename E>class decaf::util::concurrent::SynchronousQueue< E >

A **blocking queue** (p. 417) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.

A synchronous queue does not have any internal capacity, not even a capacity of one. You cannot `peek` at a synchronous queue because an element is only present when you try to remove it; you cannot insert an element (using any method) unless another thread is trying to remove it; you cannot iterate as there is nothing to iterate. The *head* of the queue is the element that the first queued inserting thread is trying to add to the queue; if there is no such queued thread then no element is available for removal and **`poll()`** (p. 2062) will return `null`. For purposes of other **`Collection`** (p. 660) methods (for example `contains`), a **`SynchronousQueue`** (p. 2057) acts as an empty collection. This queue does not permit `null` elements.

Synchronous queues are similar to rendezvous channels used in CSP and Ada. They are well suited for handoff designs, in which an object running in one thread must sync up with an object running in another thread in order to hand it some information, event, or task.

This class supports an optional fairness policy for ordering waiting producer and consumer threads. By default, this ordering is not guaranteed. However, a queue constructed with fairness set to `true` grants threads access in FIFO order.

This class and its iterator implement all of the *optional* methods of the **Collection** (p. 660) and **Iterator** (p. 1209) interfaces.

Since

1.0

6.532.2 Constructor & Destructor Documentation

6.532.2.1 template<typename E > decaf::util::concurrent::SynchronousQueue< E >::SynchronousQueue ( ) [inline]

6.532.2.2 template<typename E > virtual decaf::util::concurrent::SynchronousQueue< E >::~SynchronousQueue ( ) [inline, virtual]

6.532.3 Member Function Documentation

6.532.3.1 template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false.

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractQueue< E >** (p. 110).

6.532.3.2 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::contains (const E &value *DECAF_UNUSED*) const [inline, virtual]

6.532.3.3 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The **Collection** (p. 660) to compare to this one.

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

References decaf::util::Collection< E >::isEmpty().

6.532.3.4 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::drainTo (Collection< E > & *c*) [inline, virtual]

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into

Returns

the number of elements transferred

Exceptions

UnsupportedOperation-Exception	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 419).

References decaf::util::Collection< E >::add(), decaf::util::AbstractQueue< E >::element(), and decaf::util::concurrent::SynchronousQueue< E >::poll().

6.532.3.5 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::drainTo (Collection< E > & *c,* int *maxElements*) [inline, virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into
maxElements	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

UnsupportedOperationException	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 420).

References decaf::util::Collection< E >::add(), decaf::util::AbstractQueue< E >::element(), and decaf::util::concurrent::SynchronousQueue< E >::poll().

6.532.3.6 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.

Parameters

collection	- The **Collection** (p. 660) to be compared to this one.

Returns

true if this **Collection** (p. 660) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.532.3.7 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 2064) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.532.3.8 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

6.532.3.9 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::SynchronousQueue< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

6.532.3.10 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *e,* long long *timeout,* const TimeUnit & *unit*) [inline, virtual]

Inserts the specified element into this queue, waiting if necessary up to the specified wait time for another thread to receive it.

Returns

`true` if successful, or `false` if the specified waiting time elapses before a consumer appears.

Exceptions

InterruptedException	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
NullPointerException	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.
IllegalArgumentException	Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 420).

6.532.3.11 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::offer (const E & *value*) [inline, virtual]

Inserts the specified element into this queue, if another thread is waiting to receive it.

Parameters

value	the element to add to the **Queue** (p. 1723)

Returns

`true` if the element was added to this queue, else `false`

Exceptions

NullPointerException	if the **Queue** (p. 1723) implementation does not allow Null values to be inserted into the **Queue** (p. 1723).
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implements **decaf::util::Queue< E >** (p. 1724).

6.532.3.12 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::peek (E &result *DECAF_UNUSED*) const [inline, virtual]

6.532.3.13 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*, long long *timeout*, const TimeUnit & *unit*) [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary up to the specified wait time, for another thread to insert it.

Parameters

result	a reference to the value where the head of the **Queue** (p. 1723) should be copied to.
timeout	the time that the method should block if there is no element available to return.
unit	the Time Units that the timeout value represents.

Returns

true if the head of the **Queue** (p. 1723) was copied to the result param or false if no value could be returned.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.532.3.14 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::poll (E & *result*) [inline, virtual]

Retrieves and removes the head of this queue, if another thread is currently making an element available.

Parameters

result	a reference to the value where the head of the **Queue** (p. 1723) should be copied to.

Returns

true if the head of the **Queue** (p. 1723) was copied to the result param or false if no value could be returned.

Implements **decaf::util::Queue< E >** (p. 1725).

6.532.3.15 template<typename E > virtual void decaf::util::concurrent::SynchronousQueue< E >::put (const E & *value*) [inline, virtual]

Adds the specified element to this queue, waiting if necessary for another thread to receive it.

Parameters

value	the element to add to the **Queue** (p. 1723).

Exceptions

InterruptedException	Inserts the specified element into this queue, waiting if necessary for space to become available.
NullPointerException	Inserts the specified element into this queue, waiting if necessary for space to become available.
IllegalArgumentException	Inserts the specified element into this queue, waiting if necessary for space to become available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

6.532.3.16 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::remainingCapacity ( ) const [inline, virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 421).

6.532.3.17 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::remove (const E &value *DECAF_UNUSED*) [inline, virtual]

6.532.3.18 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::removeAll (const Collection< E > &collection *DECAF_UNUSED*) [inline, virtual]

6.532.3.19 template<typename E > virtual bool decaf::util::concurrent::SynchronousQueue< E >::retainAll (const Collection< E > &collection *DECAF_UNUSED*) [inline, virtual]

6.532.3.20 template<typename E > virtual int decaf::util::concurrent::SynchronousQueue< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

6.532.3.21 template<typename E > virtual E decaf::util::concurrent::SynchronousQueue< E >::take ( ) [inline, virtual]

Retrieves and removes the head of this queue, waiting if necessary for another thread to insert it.

Returns

the head of this queue

Exceptions

InterruptedException	Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Implements **decaf::util::concurrent::BlockingQueue< E >** (p. 422).

6.532.3.22 template<typename E > virtual std::vector<E> decaf::util::concurrent::SynchronousQueue< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 94).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**SynchronousQueue.h**

6.533 decaf::lang::System Class Reference

The **System** (p. 2065) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.

6.533.3.1 static void decaf::lang::System::arraycopy (const char * *src*, std::size_t *srcPos*, char * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::clone(), decaf::util::ArrayList< E >::ensureCapacity(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::ArrayList< E >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set(), and decaf::util::ArrayList< E >::trimToSize().

6.533.3.2 static void decaf::lang::System::arraycopy (const unsigned char * *src*, std::size_t *srcPos*, unsigned char * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.3 static void decaf::lang::System::arraycopy (const short * *src*, std::size_t *srcPos*, short * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.4 static void decaf::lang::System::arraycopy (const int * *src*, std::size_t *srcPos*, int * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.5 static void decaf::lang::System::arraycopy (const long long * *src*, std::size_t *srcPos*, long long * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.6 static void decaf::lang::System::arraycopy (const float * *src*, std::size_t *srcPos*, float * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.7 static void decaf::lang::System::arraycopy (const double * *src*, std::size_t *srcPos*, double * *dest*, std::size_t *destPos*, std::size_t *length*) [static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.8 template<typename E > static void decaf::lang::System::arraycopy (const E * *src*, std::size_t *srcPos*, E * *dest*, std::size_t *destPos*, std::size_t *length*) [inline, static]

Copies the number of elements specified by length from the source array starting at the given source offset specified by srcPos to the dest array starting at the given destination offset given by destPos.

Parameters

src	The source array to copy from.
srcPos	The position in the array to start copying from.
dest	The destination array to copy to.
destPos	The position in the destination array to start writing at.
length	The number of elements to copy from src to dest.

Exceptions

NullPointerException	if src or dest are NULL.

6.533.3.9 static int decaf::lang::System::availableProcessors ( ) [static]

Returns the number of processors available for execution of Decaf Threads.

This value may change during a particular execution of a Decaf based application. Applications that are sensitive to the number of available processors should therefore occasionally poll this property and adjust their resource usage appropriately.

Returns

the number of available processors.

6.533.3.10 static std::string decaf::lang::System::clearProperty (const std::string & *key*) [static]

Clear any value associated with the system property specified.

Parameters

key	The key name of the system property to clear.

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

IllegalArgumentException	if key is an empty string.

6.533.3.11 static long long decaf::lang::System::currentTimeMillis ( ) [static]

Returns the current time in milliseconds.

Note that while the unit of time of the return value is a millisecond, the granularity of the value depends on the underlying operating system and may be larger. For example, many operating systems measure time in units of tens of milliseconds.

See the description of the class Date for a discussion of slight discrepancies that may arise between "computer time" and coordinated universal time (UTC).

Returns

the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

6.533.3.12 static const util::Map<std::string, std::string>& decaf::lang::System::getenv ( ) [static]

Enumerates the system environment and returns a map of env variable names to the string values they hold.

Returns

A Map of all environment variables.

Exceptions

Exception *(p. 990)*	if an error occurs while getting the Environment Map.

6.533.3.13 static std::string decaf::lang::System::getenv (const std::string & *name*) [static]

Reads an environment value from the system and returns it as a string object.

Parameters

name	The environment variable to read.

Returns

a string with the value from the variables or ""

Exceptions

an	**Exception** (p. 990) if an error occurs while reading the Env.

6.533.3.14 static decaf::util::Properties& decaf::lang::System::getProperties ( ) [static]

Gets the Properties object that holds the Properties accessed from calls to getProperty and setProperty.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Returns

a reference to the static system Properties object.

6.533.3.15 static std::string decaf::lang::System::getProperty (const std::string & *key*) [static]

Gets the specified **System** (p. 2065) property if set, otherwise returns an empty string.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

key	The key name of the desired system property to retrieve.

Returns

an empty string if the named property is not set, otherwise returns the value.

Exceptions

IllegalArgumentException	if key is an empty string.

6.533.3.16 static std::string decaf::lang::System::getProperty (const std::string & *key,* const std::string & *defaultValue*) [static]

Gets the specified **System** (p. 2065) property if set, otherwise returns the specified default value.

If the Properties has not yet been created or are not yet initialized then they will be on the first call to a Properties accessor.

Parameters

key	The key name of the desired system property to retrieve.
defaultValue	The default value to return if the key is not set in the **System** (p. 2065) properties.

Returns

the value of the named system property or the defaultValue if the property isn't set..

Exceptions

IllegalArgumentException	if key is an empty string.

6.533.3.17 static long long decaf::lang::System::nanoTime ( ) [static]

Returns the current value of the most precise available system timer, in nanoseconds.

This method can only be used to measure elapsed time and is not related to any other notion of system or wall-clock time. The value returned represents nanoseconds since some fixed but arbitrary time (perhaps in the future, so values may be negative). This method provides nanosecond precision, but not necessarily nanosecond accuracy. No guarantees are made about how frequently values change. Differences in successive calls that span greater than approximately 292 years (263 nanoseconds) will not accurately compute elapsed time due to numerical overflow.

For example, to measure how long some code takes to execute:

long long startTime = **System::nanoTime()** (p. 2071); // ... the code being measured ... long long estimatedTime = **System::nanoTime()** (p. 2071) - startTime;

Returns

The current value of the system timer, in nanoseconds.

6.533.3.18 static void decaf::lang::System::setenv (const std::string & *name,* const std::string & *value*) [static]

Sets the specified system property to the value given.

Parameters

name	The name of the environment variables to set.
value	The value to assign to name.

Exceptions

an	**Exception** (p. 990) if an error occurs when setting the environment variable.

6.533.3.19 static std::string decaf::lang::System::setProperty (const std::string & *key,* const std::string & *value*) [static]

Sets the **System** (p. 2065) Property to the specified value.

Parameters

key	The key name of the system property to set to the given value.
value	The value to assign to the key.

Returns

the previous value of the property named by key if there was one, otherwise returns an empty string.

Exceptions

IllegalArgumentException	if key is an empty string.

6.533.3.20 static void decaf::lang::System::unsetenv (const std::string & *name*) [static]

Clears a set environment value if one is set.

Parameters

name	The environment variables to clear.

Exceptions

an	**Exception** (p. 990) if an error occurs while reading the environment.

6.533.4 Friends And Related Function Documentation

6.533.4.1 friend class decaf::lang::Runtime [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**System.h**

6.534 activemq::threads::Task Class Reference

Represents a unit of work that requires one or more iterations to complete.

`#include <src/main/activemq/threads/Task.h>`

Inheritance diagram for activemq::threads::Task:

Public Member Functions

- virtual ~**Task** ()
- virtual bool **iterate** ()=0

  Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.534.1 Detailed Description

Represents a unit of work that requires one or more iterations to complete.

Since

3.0

6.534.2 Constructor & Destructor Documentation

6.534.2.1 virtual activemq::threads::Task::~Task ( ) [inline, virtual]

6.534.3 Member Function Documentation

6.534.3.1 virtual bool activemq::threads::Task::iterate ( ) [pure virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1015), **activemq::core::ActiveMQSessionExecutor** (p. 278), **activemq::threads::CompositeTaskRunner** (p. 694), **activemq::transport::failover::BackupTransportPool** (p. 380), and **activemq::transport::failover::CloseTransportsTask** (p. 635).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**Task.h**

6.535 activemq::threads::TaskRunner Class Reference

`#include <src/main/activemq/threads/TaskRunner.h>`

Inheritance diagram for activemq::threads::TaskRunner:

Public Member Functions

- virtual ~**TaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)=0

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()=0

  *Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.*
- virtual void **wakeup** ()=0

  *Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.*

6.535.1 Constructor & Destructor Documentation

6.535.1.1 virtual activemq::threads::TaskRunner::~TaskRunner ( ) [inline, virtual]

6.535.2 Member Function Documentation

6.535.2.1 virtual void activemq::threads::TaskRunner::shutdown (unsigned int *timeout*) [pure virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout	- Time in Milliseconds to wait for the task to stop.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 694), and **activemq::threads::DedicatedTaskRunner** (p. 887).

6.535.2.2 virtual void activemq::threads::TaskRunner::shutdown ( ) [pure virtual]

Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 694), and **activemq::threads::DedicatedTaskRunner** (p. 887).

6.535.2.3 virtual void activemq::threads::TaskRunner::wakeup ( ) [pure virtual]

Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.

Implemented in **activemq::threads::CompositeTaskRunner** (p. 694), and **activemq::threads::DedicatedTaskRunner** (p. 887).

6.536 decaf::internal::net::tcp::TcpSocket Class Reference

Platform-independent implementation of the socket interface.

`#include <src/main/decaf/internal/net/tcp/TcpSocket.h>`

Inheritance diagram for decaf::internal::net::tcp::TcpSocket:

Public Member Functions

- **TcpSocket** ()

  Construct a non-connected socket.
- virtual ~**TcpSocket** ()

  Releases the socket handle but not gracefully shut down the connection.
- SocketHandle **getSocketHandle** ()

  Gets the handle for the socket.
- bool **isConnected** () **const**
- bool **isClosed** () **const**
- virtual std::string **getLocalAddress** () **const**

  *Gets the value of the local Inet address the **Socket** (p. 1900) is bound to if bound, otherwise return the **InetAddress** (p. 1113) ANY value "0.0.0.0".*

  Returns

  the local address bound to, or ANY.
- virtual void **create** ()

  *Creates the underlying platform **Socket** (p. 1900) data structures which allows for **Socket** (p. 1900) options to be applied.*
  The created socket is in an unconnected state.

Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual void **accept** (SocketImpl ∗socket)

- virtual void **bind** (**const** std::string &ipaddress, int **port**)

  *Binds this **Socket*** (p. *1900*) *instance to the local ip address and port number given.*

  Parameters

ipaddress	*The address of local ip to bind to.*
port	*The port number on the host to bind to.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual void **connect** (**const** std::string &hostname, int **port**, int timeout)

  Connects this socket to the given host and port.

  Parameters

hostname	*The name of the host to connect to, or IP address.*
port	*The port number on the host to connect to.*
timeout	*Time in milliseconds to wait for a connection, 0 indicates forever.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*
SocketTimeoutException (p. 1932)	*if the connect call times out due to timeout being set.*
IllegalArguementException	*if a parameter has an illegal value.*

- virtual void **listen** (int backlog)

  Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument. If a connection indication arrives when the queue is full, the connection is refused.

  Parameters

backlog	*The maximum length of the connection queue.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual **decaf::io::InputStream** ∗ **getInputStream** ()

  *Gets the InputStream linked to this **Socket*** (p. *1900*).

  Returns

  *an InputStream pointer owned by the **Socket*** (p. *1900*) *object.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual **decaf::io::OutputStream** ∗ **getOutputStream** ()

  *Gets the OutputStream linked to this **Socket*** (p. *1900*).

  Returns

  *an OutputStream pointer owned by the **Socket*** (p. *1900*) *object.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual int **available** ()

  *Gets the number of bytes that can be read from the **Socket*** (p. *1900*) *without blocking.*

  Returns

  *the number of bytes that can be read from the **Socket*** (p. *1900*) *without blocking.*

Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual void **close** ()

  Closes the socket, terminating any blocked reads or writes.

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual void **shutdownInput** ()

  Places the input stream for this socket at "end of stream".
  *Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 1926) on the socket, the stream will return EOF.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual void **shutdownOutput** ()

  Disables the output stream for this socket.
  For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence.
  *If you write to a socket output stream after invoking **shutdownOutput()** (p. 1927) on the socket, the stream will throw an IOException.*

  Exceptions

IOException	*if an I/O error occurs while attempting this operation.*

- virtual int **getOption** (int option) **const**

  *Gets the specified **Socket** (p. 1900) option.*

  Parameters

option	*The **Socket** (p. 1900) options whose value is to be retrieved.*

  Returns

  the value of the given socket option.

  Exceptions

IOException	*if an I/O error occurs while performing this operation.*

- virtual void **setOption** (int option, int value)

  *Sets the specified option on the **Socket** (p. 1900) if supported.*

  Parameters

option	*The **Socket** (p. 1900) option to set.*
value	*The value of the socket option to apply to the socket.*

  Exceptions

IOException	*if an I/O error occurs while performing this operation.*

- int **read** (unsigned char *buffer, int size, int offset, int length)

  Reads the requested data from the Socket and write it into the passed in buffer.
- void **write** (**const** unsigned char *buffer, int size, int offset, int length)

  Writes the specified data in the passed in buffer to the Socket.

Protected Member Functions

- void **checkResult** (apr_status_t value) **const**

6.536.1 Detailed Description

Platform-independent implementation of the socket interface.

6.536.2 Constructor & Destructor Documentation

6.536.2.1 decaf::internal::net::tcp::TcpSocket::TcpSocket ( )

Construct a non-connected socket.

Exceptions

SocketException	thrown if an error occurs while creating the Socket.

6.536.2.2 virtual decaf::internal::net::tcp::TcpSocket::~TcpSocket ( ) [virtual]

Releases the socket handle but not gracefully shut down the connection.

6.536.3 Member Function Documentation

6.536.3.1 virtual void decaf::internal::net::tcp::TcpSocket::accept (SocketImpl * *socket*) [virtual]

6.536.3.2 virtual int decaf::internal::net::tcp::TcpSocket::available ( ) [virtual]

Gets the number of bytes that can be read from the **Socket** (p. 1900) without blocking.

Returns

the number of bytes that can be read from the **Socket** (p. 1900) without blocking.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1923).

6.536.3.3 virtual void decaf::internal::net::tcp::TcpSocket::bind (const std::string & *ipaddress*, int *port*) [virtual]

Binds this **Socket** (p. 1900) instance to the local ip address and port number given.

Parameters

ipaddress	The address of local ip to bind to.
port	The port number on the host to bind to.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1923).

6.536.3.4 void decaf::internal::net::tcp::TcpSocket::checkResult (apr_status_t *value*) const [protected]

6.536.3.5 virtual void decaf::internal::net::tcp::TcpSocket::close ( ) [virtual]

Closes the socket, terminating any blocked reads or writes.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1923).

6.536.3.6 virtual void decaf::internal::net::tcp::TcpSocket::connect (const std::string & *hostname,* int *port,* int *timeout*) [virtual]

Connects this socket to the given host and port.

Parameters

hostname	The name of the host to connect to, or IP address.
port	The port number on the host to connect to.
timeout	Time in milliseconds to wait for a connection, 0 indicates forever.

Exceptions

IOException	if an I/O error occurs while attempting this operation.
SocketTimeoutException *(p. 1932)*	if the connect call times out due to timeout being set.
IllegalArguementException	if a parameter has an illegal value.

Implements **decaf::net::SocketImpl** (p. 1923).

6.536.3.7 virtual void decaf::internal::net::tcp::TcpSocket::create ( ) [virtual]

Creates the underlying platform **Socket** (p. 1900) data structures which allows for **Socket** (p. 1900) options to be applied.

The created socket is in an unconnected state.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1924).

6.536.3.8 virtual decaf::io::InputStream* decaf::internal::net::tcp::TcpSocket::getInputStream ( ) [virtual]

Gets the InputStream linked to this **Socket** (p. 1900).

Returns

an InputStream pointer owned by the **Socket** (p. 1900) object.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1924).

6.536.3.9 virtual std::string decaf::internal::net::tcp::TcpSocket::getLocalAddress ( ) const [virtual]

Gets the value of the local Inet address the **Socket** (p. 1900) is bound to if bound, otherwise return the **InetAddress** (p. 1113) ANY value "0.0.0.0".

Returns

the local address bound to, or ANY.

Implements **decaf::net::SocketImpl** (p. 1925).

6.536.3.10 virtual int decaf::internal::net::tcp::TcpSocket::getOption (int *option*) const [virtual]

Gets the specified **Socket** (p. 1900) option.

Parameters

option	The **Socket** (p. 1900) options whose value is to be retrieved.

Returns

the value of the given socket option.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p. 1925).

6.536.3.11 virtual decaf::io::OutputStream* decaf::internal::net::tcp::TcpSocket::getOutputStream ( ) [virtual]

Gets the OutputStream linked to this **Socket** (p. 1900).

Returns

an OutputStream pointer owned by the **Socket** (p. 1900) object.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1925).

6.536.3.12 SocketHandle decaf::internal::net::tcp::TcpSocket::getSocketHandle ( ) [inline]

Gets the handle for the socket.

Returns

SocketHabler for this Socket, can be NULL

6.536.3.13 bool decaf::internal::net::tcp::TcpSocket::isClosed ( ) const [inline]

Returns

true if the close method has been called on this Socket.

6.536.3.14 bool decaf::internal::net::tcp::TcpSocket::isConnected ( ) const [inline]

Returns

true if the socketHandle is not in a disconnected state.

6.536.3.15 virtual void decaf::internal::net::tcp::TcpSocket::listen (int *backlog*) [virtual]

Sets the maximum queue length for incoming connection indications (a request to connect) to the count argument.

If a connection indication arrives when the queue is full, the connection is refused.

Parameters

backlog	The maximum length of the connection queue.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1926).

6.536.3.16 int decaf::internal::net::tcp::TcpSocket::read (unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Reads the requested data from the Socket and write it into the passed in buffer.

Parameters

buffer	The buffer to read into
size	The size of the specified buffer
offset	The offset into the buffer where reading should start filling.
length	The number of bytes past offset to fill with data.

Returns

the actual number of bytes read or -1 if at EOF.

Exceptions

IOException	if an I/O error occurs during the read.
NullPointerException	if buffer is Null.
IndexOutOfBounds-Exception	if offset + length is greater than buffer size.

6.536.3.17 virtual void decaf::internal::net::tcp::TcpSocket::setOption (int *option*, int *value*) [virtual]

Sets the specified option on the **Socket** (p. 1900) if supported.

Parameters

option	The **Socket** (p. 1900) option to set.
value	The value of the socket option to apply to the socket.

Exceptions

IOException	if an I/O error occurs while performing this operation.

Implements **decaf::net::SocketImpl** (p. 1926).

6.536.3.18 virtual void decaf::internal::net::tcp::TcpSocket::shutdownInput ( ) [virtual]

Places the input stream for this socket at "end of stream".

Any data sent to this socket is acknowledged and then silently discarded. If you read from a socket input stream after invoking **shutdownInput()** (p. 1926) on the socket, the stream will return EOF.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1926).

6.536.3.19 virtual void decaf::internal::net::tcp::TcpSocket::shutdownOutput ( ) [virtual]

Disables the output stream for this socket.

For a TCP socket, any previously written data will be sent followed by TCP's normal connection termination sequence. If you write to a socket output stream after invoking **shutdownOutput()** (p. 1927) on the socket, the stream will throw an IOException.

Exceptions

IOException	if an I/O error occurs while attempting this operation.

Implements **decaf::net::SocketImpl** (p. 1927).

6.536.3.20 void decaf::internal::net::tcp::TcpSocket::write (const unsigned char * *buffer*, int *size*, int *offset*, int *length*)

Writes the specified data in the passed in buffer to the Socket.

Parameters

buffer	The buffer to write to the socket.
size	The size of the specified buffer.
offset	The offset into the buffer where the data to write starts at.
length	The number of bytes past offset to write.

Exceptions

IOException	if an I/O error occurs during the write.
NullPointerException	if buffer is Null.
IndexOutOfBounds-Exception	if offset + length is greater than buffer size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocket.h**

6.537 decaf::internal::net::tcp::TcpSocketInputStream Class Reference

Input stream for performing reads on a socket.

`#include <src/main/decaf/internal/net/tcp/TcpSocketInputStream.h>`

Inheritance diagram for decaf::internal::net::tcp::TcpSocketInputStream:

Public Member Functions

- **TcpSocketInputStream** (**TcpSocket** ∗socket)

  Create a new InputStream to use for reading from the TCP/IP socket.
- virtual ∼**TcpSocketInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  Close - does nothing.
- virtual long long **skip** (long long num)

  Not supported.

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char ∗buffer, int size, int offset, int length)

6.537.1 Detailed Description

Input stream for performing reads on a socket.

This class will only work properly for blocking sockets.

Since

1.0

6.537.2 Constructor & Destructor Documentation

6.537.2.1 decaf::internal::net::tcp::TcpSocketInputStream::TcpSocketInputStream (TcpSocket * *socket*)

Create a new InputStream to use for reading from the TCP/IP socket.

Parameters

socket	The parent SocketImpl for this stream.

6.537.2.2 virtual decaf::internal::net::tcp::TcpSocketInputStream::~TcpSocketInputStream ( ) [virtual]

6.537.3 Member Function Documentation

6.537.3.1 virtual int decaf::internal::net::tcp::TcpSocketInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.537.3.2 virtual void decaf::internal::net::tcp::TcpSocketInputStream::close ( ) [virtual]

Close - does nothing.

It is the responsibility of the owner of the socket object to close it.

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.537.3.3 virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadArrayBounded (unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.537.3.4 virtual int decaf::internal::net::tcp::TcpSocketInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

6.537.3.5 virtual long long decaf::internal::net::tcp::TcpSocketInputStream::skip (long long *num*) [virtual]

Not supported.

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1140).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocketInputStream.h**

6.538 decaf::internal::net::tcp::TcpSocketOutputStream Class Reference

Output stream for performing write operations on a socket.

`#include <src/main/decaf/internal/net/tcp/TcpSocketOutputStream.h>`

Inheritance diagram for decaf::internal::net::tcp::TcpSocketOutputStream:

Public Member Functions

- **TcpSocketOutputStream** (**TcpSocket** ∗socket)

  Create a new instance of a Socket OutputStream class.
- virtual ∼**TcpSocketOutputStream** ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
  The object is generally no longer usable after calling close.

Exceptions

IOException (p. 1198)	*if an error occurs while closing.*

The default implementation of this method does nothing.

Protected Member Functions

- virtual void **doWriteByte** (unsigned char c)
- virtual void **doWriteArrayBounded** (**const** unsigned char ∗buffer, int size, int offset, int length)

6.538.1 Detailed Description

Output stream for performing write operations on a socket.

Since

1.0

6.538.2 Constructor & Destructor Documentation

6.538.2.1 decaf::internal::net::tcp::TcpSocketOutputStream::TcpSocketOutputStream (TcpSocket ∗ *socket*)

Create a new instance of a Socket OutputStream class.

Parameters

socket	The socket to use to write out the data.

6.538.2.2 virtual decaf::internal::net::tcp::TcpSocketOutputStream::∼TcpSocketOutputStream ( ) [virtual]

6.538.3 Member Function Documentation

6.538.3.1 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(*p. *1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

The default implementation of this method does nothing.

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.538.3.2 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteArrayBounded (const unsigned char ∗ *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.538.3.3 virtual void decaf::internal::net::tcp::TcpSocketOutputStream::doWriteByte (unsigned char *c*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 1602).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/tcp/**TcpSocketOutputStream.h**

6.539 activemq::transport::tcp::TcpTransport Class Reference

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1200).

`#include <src/main/activemq/transport/tcp/TcpTransport.h>`

Inheritance diagram for activemq::transport::tcp::TcpTransport:

Public Member Functions

- **TcpTransport** (**const Pointer**< **Transport** > &**next**)

  *Creates a new instance of a **TcpTransport** (p. 2086), the transport is left unconnected and is in a unusable state until the connect method is called.*
- virtual ~**TcpTransport** ()
- void **connect** (**const decaf::net::URI** &uri, **const decaf::util::Properties** &properties)

  Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual bool **isFaultTolerant** () **const**

  *Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.*
- virtual bool **isConnected** () **const**

  *Is the **Transport** (p. 2161) Connected to its Broker.*
- virtual bool **isClosed** () **const**

  *Has the **Transport** (p. 2161) been shutdown and no longer usable.*

Protected Member Functions

- virtual **decaf::net::Socket** * **createSocket** ()

  Create an unconnected Socket instance to be used by the transport to communicate with the broker.
- virtual void **configureSocket** (**decaf::net::Socket** *socket, **const decaf::util::Properties** &properties)

  Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

6.539.1 Detailed Description

Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an **IOTransport** (p. 1200).

The lower level transport should take care of managing stream reads and writes.

6.539.2 Constructor & Destructor Documentation

6.539.2.1 activemq::transport::tcp::TcpTransport::TcpTransport (const Pointer< Transport > & *next*)

Creates a new instance of a **TcpTransport** (p. 2086), the transport is left unconnected and is in a unusable state until the connect method is called.

Parameters

next	The next transport in the chain

6.539.2.2 virtual activemq::transport::tcp::TcpTransport::~TcpTransport ( ) [virtual]

6.539.3 Member Function Documentation

6.539.3.1 virtual void activemq::transport::tcp::TcpTransport::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Reimplemented from **activemq::transport::TransportFilter** (p. 2170).

6.539.3.2 virtual void activemq::transport::tcp::TcpTransport::configureSocket (decaf::net::Socket * *socket*, const decaf::util::Properties & *properties*) [protected, virtual]

Using options from configuration URI, configure the socket options before the Socket instance is connected to the Server.

Subclasses can override this option to set more configuration options, they should called the base class version to allow the default set of Socket options to also be configured.

Parameters

socket	The Socket instance to configure using options from the given Properties.

Exceptions

NullPointerException	if the Socket instance is null.
IllegalArgumentException	if the socket instance is not handled by the class.
SocketException	if there is an error while setting one of the Socket options.

6.539.3.3 void activemq::transport::tcp::TcpTransport::connect (const decaf::net::URI & *uri*, const decaf::util::Properties & *properties*)

Creates a Socket and configures it before attempting to connect to the location specified by the URI passed in.

The Socket is configured using parameters in the properties that are passed to this method.

Parameters

uri	The URI that the **Transport** (p. 2161) is to connect to once initialized.
properties	The Properties that have been parsed from the URI or from configuration files.

6.539.3.4 virtual decaf::net::Socket* activemq::transport::tcp::TcpTransport::createSocket ( ) [protected, virtual]

Create an unconnected Socket instance to be used by the transport to communicate with the broker.

Returns

a newly created unconnected Socket instance.

Exceptions

IOException	if there is an error while creating the unconnected Socket.

Reimplemented in **activemq::transport::tcp::SslTransport** (p. 1957).

6.539.3.5 virtual bool activemq::transport::tcp::TcpTransport::isClosed ( ) const [inline, virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Reimplemented from **activemq::transport::TransportFilter** (p. 2172).

6.539.3.6 virtual bool activemq::transport::tcp::TcpTransport::isConnected ( ) const [inline, virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Reimplemented from **activemq::transport::TransportFilter** (p. 2172).

6.539.3.7 virtual bool activemq::transport::tcp::TcpTransport::isFaultTolerant ( ) const [inline, virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Reimplemented from **activemq::transport::TransportFilter** (p. 2172).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/tcp/**TcpTransport.h**

6.540 activemq::transport::tcp::TcpTransportFactory Class Reference

Factory Responsible for creating the **TcpTransport** (p. 2086).

`#include <src/main/activemq/transport/tcp/TcpTransportFactory.h>`

Inheritance diagram for activemq::transport::tcp::TcpTransportFactory:

Public Member Functions

- virtual ~**TcpTransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (**const decaf::net::URI** &location)

  *Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.*
- virtual **Pointer**< **Transport** > **createComposite** (**const decaf::net::URI** &location)

  *Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.*

6.540.1 Detailed Description

Factory Responsible for creating the **TcpTransport** (p. 2086).

6.540.2 Constructor & Destructor Documentation

6.540.2.1 virtual activemq::transport::tcp::TcpTransportFactory::~TcpTransportFactory ( ) [inline, virtual]

6.540.3 Member Function Documentation

6.540.3.1 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::create (const decaf::net::URI & *location*) [virtual]

Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.540.3.2 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::createComposite (const decaf::net::URI & *location*) [virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implements **activemq::transport::TransportFactory** (p. 2168).

6.540.3.3 virtual Pointer<Transport> activemq::transport::tcp::TcpTransportFactory::doCreateComposite (const decaf::net::URI & *location,* const Pointer< wireformat::WireFormat > & *wireFormat,* const decaf::util::Properties & *properties*) [protected, virtual]

Reimplemented in **activemq::transport::tcp::SslTransportFactory** (p. 1958).

The documentation for this class was generated from the following file:

6.541 cms::TemporaryQueue Class Reference

Defines a Temporary **Queue** (p. 1722) based **Destination** (p. 936).

`#include <src/main/cms/TemporaryQueue.h>`

Inheritance diagram for cms::TemporaryQueue:

Public Member Functions

- virtual ~**TemporaryQueue** () throw ()
- virtual std::string **getQueueName** () **const** =0

  Gets the name of this queue.
- virtual void **destroy** ()=0

  *Destroy's the Temporary **Destination** (p. 936) at the Provider.*

6.541.1 Detailed Description

Defines a Temporary **Queue** (p. 1722) based **Destination** (p. 936).

A **TemporaryQueue** (p. 2090) is a special type of **Queue** (p. 1722) **Destination** (p. 936) that can only be consumed from the **Connection** (p. 725) which created it. TemporaryQueues are most commonly used as the reply to address for **Message** (p. 1426)'s that implement the request response pattern.

A **TemporaryQueue** (p. 2090) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 725) that created it.

Since

1.0

6.542 cms::TemporaryTopic Class Reference

Defines a Temporary **Topic** (p. 2141) based **Destination** (p. 936).

`#include <src/main/cms/TemporaryTopic.h>`

Inheritance diagram for cms::TemporaryTopic:

Public Member Functions

- virtual ~**TemporaryTopic** () throw ()
- virtual std::string **getTopicName** () **const** =0

  Gets the name of this topic.
- virtual void **destroy** ()=0

  Destroy's the Temporary ***Destination*** *(p. 936) at the Provider.*

6.542.1 Detailed Description

Defines a Temporary **Topic** (p. 2141) based **Destination** (p. 936).

A **TemporaryTopic** (p. 2091) is a special type of **Topic** (p. 2141) **Destination** (p. 936) that can only be consumed from the **Connection** (p. 725) which created it. TemporaryTopics are most commonly used as the reply to address for **Message** (p. 1426)'s that implement the request response pattern.

A **TemporaryTopic** (p. 2091) is guaranteed to exist at the Provider only for the lifetime of the **Connection** (p. 725) that created it.

Since

1.0

6.542.2 Constructor & Destructor Documentation

6.542.2.1 virtual cms::TemporaryTopic::~TemporaryTopic ( ) throw () [virtual]

6.542.3 Member Function Documentation

6.542.3.1 virtual void cms::TemporaryTopic::destroy ( ) [pure virtual]

Destroy's the Temporary **Destination** (p. 936) at the Provider.

Exceptions

CMSException *(p. 640)*	

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 308).

6.542.3.2 virtual std::string cms::TemporaryTopic::getTopicName ( ) const [pure virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTempTopic** (p. 310).

The documentation for this class was generated from the following file:

6.543 cms::TextMessage Class Reference

Interface for a text message.

`#include <src/main/cms/TextMessage.h>`

Inheritance diagram for cms::TextMessage:

Public Member Functions

- virtual ~**TextMessage** () throw ()
- virtual std::string **getText** () **const** =0

  Gets the message character buffer.
- virtual void **setText** (**const** char *msg)=0

  Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void **setText** (**const** std::string &msg)=0

  Sets the message contents.

6.543.1 Detailed Description

Interface for a text message.

A **TextMessage** (p. 2093) can contain any Text based pay load such as an XML Document or other Text based document.

Like all Messages, a **TextMessage** (p. 2093) is received in Read-Only mode, any attempt to write to the **Message** (p. 1426) will result in a MessageNotWritableException being thrown until the `clearBody` method is called which will erase the contents and place the message back in a read / write mode.

Since

1.0

6.543.2 Constructor & Destructor Documentation

6.543.2.1 virtual cms::TextMessage::~TextMessage ( ) throw () [virtual]

6.543.3 Member Function Documentation

6.543.3.1 virtual std::string cms::TextMessage::getText ( ) const [pure virtual]

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 316).

6.543.3.2 virtual void cms::TextMessage::setText (const char * *msg*) [pure virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

msg	The message buffer.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 317).

6.543.3.3 virtual void cms::TextMessage::setText (const std::string & *msg*) [pure virtual]

Sets the message contents.

Parameters

msg	The message buffer.

Exceptions

CMSException *(*p. *640)*	- if an internal error occurs.
MessageNotWriteable-Exception *(*p. *1490)*	- if the message is in read-only mode..

Implemented in **activemq::commands::ActiveMQTextMessage** (p. 317).

The documentation for this class was generated from the following file:

- src/main/cms/**TextMessage.h**

6.544 decaf::lang::Thread Class Reference

A **Thread** (p. 2094) is a concurrent unit of execution.

`#include <src/main/decaf/lang/Thread.h>`

Inheritance diagram for decaf::lang::Thread:

Data Structures

- class **UncaughtExceptionHandler**

  Interface for handlers invoked when a ***Thread*** *(*p. *2094) abruptly terminates due to an uncaught exception.*

Public Types

- enum **State** {
  NEW = 0, **RUNNABLE** = 1, **BLOCKED** = 2, **WAITING** = 3,
  TIMED_WAITING = 4, **SLEEPING** = 5, **TERMINATED** = 6 }

  Represents the various states that the ***Thread*** *(*p. *2094) can be in during its lifetime.*

Public Member Functions

- **Thread** ()

  Constructs a new ***Thread*** *(*p. *2094).*
- **Thread** (**Runnable** ∗task)

  Constructs a new ***Thread*** *(*p. *2094) with the given target* ***Runnable*** *(*p. *1792) task.*
- **Thread** (**const** std::string &name)

  Constructs a new ***Thread*** *(*p. *2094) with the given name.*
- **Thread** (**Runnable** ∗task, **const** std::string &name)

  Constructs a new ***Thread*** *(*p. *2094) with the given target* ***Runnable*** *(*p. *1792) task and name.*
- virtual ∼**Thread** ()
- virtual void **start** ()

  Creates a system thread and starts it in a joinable mode.
- virtual void **join** ()

*Forces the Current **Thread** (p. 2094) to wait until the thread exits.*

- virtual void **join** (long long millisecs)

  *Forces the Current **Thread** (p. 2094) to wait until the thread exits.*
- virtual void **join** (long long millisecs, unsigned int nanos)

  *Forces the Current **Thread** (p. 2094) to wait until the thread exits.*
- virtual void **run** ()

  Default implementation of the run method - does nothing.
- std::string **getName** () **const**

  *Returns the **Thread** (p. 2094)'s assigned name.*
- void **setName** (**const** std::string &name)

  *Sets the name of the **Thread** (p. 2094) to the new Name given by the argument name*
- int **getPriority** () **const**

  *Gets the currently set priority for this **Thread** (p. 2094).*
- void **setPriority** (int value)

  *Sets the current **Thread** (p. 2094)'s priority to the newly specified value.*
- void **setDaemon** (bool value)

  *Sets if the given **Thread** (p. 2094) is a Daemon **Thread** (p. 2094) or not.*
- bool **isDaemon** () **const**

  Returns whether this thread is a daemon thread or not, if true this thread cannot be joined.
- **const UncaughtExceptionHandler** * **getUncaughtExceptionHandler** () **const**

  Set the handler invoked when this thread abruptly terminates due to an uncaught exception.
- void **setUncaughtExceptionHandler** (**UncaughtExceptionHandler** *handler)

  Set the handler invoked when this thread abruptly terminates due to an uncaught exception.
- std::string **toString** () **const**

  *Returns a string that describes the **Thread** (p. 2094).*
- bool **isAlive** () **const**

  *Returns true if the **Thread** (p. 2094) is alive, meaning it has been started and has not yet died.*
- **Thread::State getState** () **const**

  *Returns the currently set State of this **Thread** (p. 2094).*

Static Public Member Functions

- static void **sleep** (long long millisecs)

  Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.
- static void **sleep** (long long millisecs, unsigned int nanos)

  Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.
- static void **yield** ()

  Causes the currently executing thread object to temporarily pause and allow other threads to execute.
- static long long **getId** ()

  *Obtains the **Thread** (p. 2094) Id of the current thread.*
- static **Thread** * **currentThread** ()

  Returns a pointer to the currently executing thread object.

Static Public Attributes

- static **const** int **MIN_PRIORITY** = 1

  The minimum priority that a thread can have.
- static **const** int **NORM_PRIORITY** = 5

  The default priority that a thread is given at create time.
- static **const** int **MAX_PRIORITY** = 10

  The maximum priority that a thread can have.

Friends

- class **decaf::util::concurrent::locks::LockSupport**
- class **decaf::lang::Runtime**

6.544.1 Detailed Description

A **Thread** (p. 2094) is a concurrent unit of execution.

It has its own call stack for methods being invoked, their arguments and local variables. Each process has at least one main **Thread** (p. 2094) running when it is started; typically, there are several others for housekeeping. The application might decide to launch additional Threads for specific purposes.

Threads in the same process interact and synchronize by the use of shared objects and monitors associated with these objects.

There are basically two main ways of having a **Thread** (p. 2094) execute application code. One is providing a new class that extends **Thread** (p. 2094) and overriding its **run()** (p. 2100) method. The other is providing a new **Thread** (p. 2094) instance with a **Runnable** (p. 1792) object during its creation. In both cases, the **start()** (p. 2101) method must be called to actually execute the new **Thread** (p. 2094).

Each **Thread** (p. 2094) has an integer priority that basically determines the amount of CPU time the **Thread** (p. 2094) gets. It can be set using the **setPriority(int)** (p. 2100) method. A **Thread** (p. 2094) can also be made a daemon, which makes it run in the background. The latter also affects VM termination behavior: the VM does not terminate automatically as long as there are non-daemon threads running.

See also

decaf.lang.ThreadGroup (p. 2103)

Since

1.0

6.544.2 Member Enumeration Documentation

6.544.2.1 enum decaf::lang::Thread::State

Represents the various states that the **Thread** (p. 2094) can be in during its lifetime.

Enumerator:

NEW Before a **Thread** (p. 2094) is started it exists in this State.

RUNNABLE While a **Thread** (p. 2094) is running and is not blocked it is in this State.

BLOCKED A **Thread** (p. 2094) that is waiting to acquire a lock is in this state.

WAITING A **Thread** (p. 2094) that is waiting for another **Thread** (p. 2094) to perform an action is in this state.

TIMED_WAITING A **Thread** (p. 2094) that is waiting for another **Thread** (p. 2094) to perform an action up to a specified time interval is in this state.

SLEEPING A **Thread** (p. 2094) that is blocked in a Sleep call is in this state.

TERMINATED A **Thread** (p. 2094) whose run method has exited is in this state.

6.544.3 Constructor & Destructor Documentation

6.544.3.1 decaf::lang::Thread::Thread ( )

Constructs a new **Thread** (p. 2094).

This constructor has the same effect as Thread(NULL, NULL, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

6.544.3.2 decaf::lang::Thread::Thread (Runnable * *task*)

Constructs a new **Thread** (p. 2094) with the given target **Runnable** (p. 1792) task.

This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

task	the **Runnable** (p. 1792) that this thread manages, if the task is NULL the **Thread** (p. 2094)'s run method is used instead.

6.544.3.3 decaf::lang::Thread::Thread (const std::string & *name*)

Constructs a new **Thread** (p. 2094) with the given name.

This constructor has the same effect as Thread(NULL, NULL, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

name	the name to assign to this **Thread** (p. 2094).

6.544.3.4 decaf::lang::Thread::Thread (Runnable * *task,* const std::string & *name*)

Constructs a new **Thread** (p. 2094) with the given target **Runnable** (p. 1792) task and name.

This constructor has the same effect as Thread(NULL, task, GIVEN_NAME), where GIVEN_NAME is a newly generated name. When no name is given the name is automatically generated and are of the form "Thread-"+n, where n is an integer.

Parameters

task	the **Runnable** (p. 1792) that this thread manages, if the task is NULL the **Thread** (p. 2094)'s run method is used instead.
name	the name to assign to this **Thread** (p. 2094).

6.544.3.5 virtual decaf::lang::Thread::~Thread ( ) [virtual]

6.544.4 Member Function Documentation

6.544.4.1 static Thread* decaf::lang::Thread::currentThread ( ) [static]

Returns a pointer to the currently executing thread object.

Returns

Pointer (p. 1614) to the **Thread** (p. 2094) object representing the currently running **Thread** (p. 2094).

6.544.4.2 static long long decaf::lang::Thread::getId ( ) [static]

Obtains the **Thread** (p. 2094) Id of the current thread.

Returns

Thread (p. 2094) Id

6.544.4.3 std::string decaf::lang::Thread::getName ( ) const

Returns the **Thread** (p. 2094)'s assigned name.

Returns

the Name of the **Thread** (p. 2094).

6.544.4.4 int decaf::lang::Thread::getPriority ( ) const

Gets the currently set priority for this **Thread** (p. 2094).

Returns

an int value representing the **Thread** (p. 2094)'s current priority.

6.544.4.5 Thread::State decaf::lang::Thread::getState ( ) const

Returns the currently set State of this **Thread** (p. 2094).

Returns

the **Thread** (p. 2094)'s current state.

6.544.4.6 const UncaughtExceptionHandler* decaf::lang::Thread::getUncaughtExceptionHandler ( ) const

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Returns

a pointer to the set **UncaughtExceptionHandler** (p. 2180).

6.544.4.7 bool decaf::lang::Thread::isAlive ( ) const

Returns true if the **Thread** (p. 2094) is alive, meaning it has been started and has not yet died.

Returns

true if the thread is alive.

6.544.4.8 bool decaf::lang::Thread::isDaemon ( ) const

Returns whether this thread is a daemon thread or not, if true this thread cannot be joined.

Returns

true if the thread is a daemon thread.

6.544.4.9 virtual void decaf::lang::Thread::join ( ) [virtual]

Forces the Current **Thread** (p. 2094) to wait until the thread exits.

Exceptions

InterruptedException	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.544.4.10 virtual void decaf::lang::Thread::join (long long *millisecs*) [virtual]

Forces the Current **Thread** (p. 2094) to wait until the thread exits.

Parameters

millisecs	the time in Milliseconds before the thread resumes

Exceptions

IllegalArgumentException	if the milliseconds parameter is negative.
InterruptedException	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.544.4.11 virtual void decaf::lang::Thread::join (long long *millisecs,* unsigned int *nanos*) [virtual]

Forces the Current **Thread** (p. 2094) to wait until the thread exits.

Parameters

millisecs	the time in Milliseconds before the thread resumes
nanos	0-999999 extra nanoseconds to sleep.

Exceptions

IllegalArgumentException	if the nanoseconds parameter is out of range or the milliseconds paramter is negative.
InterruptedException	if any thread has interrupted the current thread. The interrupted status of the current thread is cleared when this exception is thrown.

6.544.4.12 virtual void decaf::lang::Thread::run ( ) [virtual]

Default implementation of the run method - does nothing.

Implements **decaf::lang::Runnable** (p. 1793).

Reimplemented in **activemq::transport::mock::InternalCommandListener** (p. 1184).

6.544.4.13 void decaf::lang::Thread::setDaemon (bool *value*)

Sets if the given **Thread** (p. 2094) is a Daemon **Thread** (p. 2094) or not.

Daemon threads cannot be joined and its resource are automatically reclaimed when it terminates.

Parameters

value	**Boolean** (p. 422) indicating if this thread should be a daemon thread or not.

Exceptions

IllegalThreadStateException	if the thread is already active.

6.544.4.14 void decaf::lang::Thread::setName (const std::string & *name*)

Sets the name of the **Thread** (p. 2094) to the new Name given by the argument *name*

name the new name of the **Thread** (p. 2094).

6.544.4.15 void decaf::lang::Thread::setPriority (int *value*)

Sets the current **Thread** (p. 2094)'s priority to the newly specified value.

The given value must be within the rane **Thread::MIN_PRIORITY** (p. 2102) and **Thread::MAX_PRIORITY** (p. 2102).

Parameters

value	the new priority value to assign to this **Thread** (p. 2094).

Exceptions

IllegalArgumentException	if the value is out of range.

6.544.4.16 void decaf::lang::Thread::setUncaughtExceptionHandler (UncaughtExceptionHandler * *handler*)

Set the handler invoked when this thread abruptly terminates due to an uncaught exception.

Parameters

handler	the UncaightExceptionHandler to invoke when the **Thread** (p. 2094) terminates due to an uncaught exception.

6.544.4.17 static void decaf::lang::Thread::sleep (long long *millisecs*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

millisecs	time in milliseconds to halt execution.

Exceptions

IllegalArgumentException	if the milliseconds parameter is negative.
InterruptedException	if the **Thread** (p. 2094) was interrupted while sleeping.

6.544.4.18 static void decaf::lang::Thread::sleep (long long *millisecs*, unsigned int *nanos*) [static]

Causes the currently executing thread to halt execution for the specified number of milliseconds plus any additionally specified nanoseconds given, subject to the precision and accuracy of system timers and schedulers.

Note that this method is a static method that applies to the calling thread and not to the thread object.

Parameters

millisecs	time in milliseconds to halt execution.
nanos	0-999999 extra nanoseconds to sleep.

Exceptions

IllegalArgumentException	if the nanoseconds parameter is out of range or the milliseconds paramter is negative.
InterruptedException	if the **Thread** (p. 2094) was interrupted while sleeping.

6.544.4.19 virtual void decaf::lang::Thread::start ( ) [virtual]

Creates a system thread and starts it in a joinable mode.

Upon creation, the **run()** (p. 2100) method of either this object or the provided **Runnable** (p. 1792) object will be invoked in the context of this thread.

Exceptions

IllegalThreadStateException	if the thread has already been started.
RuntimeException	if the **Thread** (p. 2094) cannot be created for some reason.

6.544.4.20 std::string decaf::lang::Thread::toString ( ) const

Returns a string that describes the **Thread** (p. 2094).

Returns

string describing the **Thread** (p. 2094).

6.544.4.21 static void decaf::lang::Thread::yield ( ) [static]

Causes the currently executing thread object to temporarily pause and allow other threads to execute.

6.544.5 Friends And Related Function Documentation

6.545 decaf::util::concurrent::ThreadFactory Class Reference

public interface **ThreadFactory** (p. 2102)

`#include <src/main/decaf/util/concurrent/ThreadFactory.h>`

Public Member Functions

- virtual ∼**ThreadFactory** ()
- virtual **decaf::lang::Thread** ∗ **newThread** (**decaf::lang::Runnable** ∗r)=0

  Constructs a new Thread.

6.545.1 Detailed Description

public interface **ThreadFactory** (p. 2102)

An object that creates new threads on demand. Using thread factories removes hardwiring of calls to new Thread, enabling applications to use special thread subclasses, priorities, etc.

The simplest implementation of this interface is just:

class SimpleThreadFactory : public **ThreadFactory** (p. 2102) { public: Thread∗ newThread(Runnable∗ r) { return new Thread(r); } }

The Executors.defaultThreadFactory() method provides a more useful simple implementation, that sets the created thread context to known values before returning it.

1.0

6.545.2 Constructor & Destructor Documentation

6.545.2.1 virtual decaf::util::concurrent::ThreadFactory::∼ThreadFactory ( ) [inline, virtual]

6.545.3 Member Function Documentation

6.545.3.1 virtual decaf::lang::Thread∗ decaf::util::concurrent::ThreadFactory::newThread (decaf::lang::Runnable ∗ *r*) [pure virtual]

Constructs a new Thread.

Implementations may also initialize priority, name, daemon status, ThreadGroup, etc. The pointer passed is still owned by the caller and is not deleted by the Thread object. The caller owns the returned Thread object and must delete it when finished.

Parameters

r	A pointer to a Runnable instance to be executed by new Thread instance returned.

Returns

constructed thread, or NULL if the request to create a thread is rejected the caller owns the returned pointer.

6.547 decaf::util::concurrent::ThreadPoolExecutor Class Reference

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

`#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>`

Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor:

Data Structures

- class **AbortPolicy**

  *Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2110) this class always throws a **RejectedExecutionException** (p. 1755).*
- class **CallerRunsPolicy**

*Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2110) this class will attempt to run the task in the Thread that called the execute method unless the executor is shutdown in which case the task is not run and is destroyed.*

Public Member Functions

- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, **const TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue)

  *Creates a new instance of a **ThreadPoolExecutor** (p. 2104).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, **const TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **RejectedExecutionHandler** *handler)

  *Creates a new instance of a **ThreadPoolExecutor** (p. 2104).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, **const TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory)

  *Creates a new instance of a **ThreadPoolExecutor** (p. 2104).*
- **ThreadPoolExecutor** (int corePoolSize, int maxPoolSize, long long keepAliveTime, **const TimeUnit** &unit, **BlockingQueue**< **decaf::lang::Runnable** * > *workQueue, **ThreadFactory** *threadFactory, **RejectedExecutionHandler** *handler)

  *Creates a new instance of a **ThreadPoolExecutor** (p. 2104).*
- virtual ~**ThreadPoolExecutor** ()
- virtual void **execute** (**decaf::lang::Runnable** *task)

  Executes the given command at some time in the future.
- virtual void **shutdown** ()

  *Performs an orderly shutdown of this **Executor** (p. 1004).*
- virtual **ArrayList**
  < **decaf::lang::Runnable** * > **shutdownNow** ()

  *Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 345) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.*
- virtual bool **awaitTermination** (long long timeout, **const decaf::util::concurrent::TimeUnit** &unit)

  The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion.
- virtual bool **isShutdown** () **const**

  Returns whether this executor has been shutdown or not.
- virtual bool **isTerminated** () **const**

  Returns whether all tasks have completed after this executor was shut down.
- virtual int **getPoolSize** () **const**

  *Returns the number of threads that currently exists for this **Executor** (p. 1004).*
- virtual int **getCorePoolSize** () **const**

  *Returns the configured number of core threads for this **Executor** (p. 1004).*
- virtual void **setCorePoolSize** (int poolSize)

  ***Set** (p. 1857) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor.*
- virtual int **getMaximumPoolSize** () **const**

  *Returns the configured maximum number of threads for this **Executor** (p. 1004).*
- virtual void **setMaximumPoolSize** (int maxSize)

  *Sets the maximum number of workers this **Executor** (p. 1004) is allowed to have at any given time above the core pool size.*
- virtual long long **getTaskCount** () **const**

  Returns the current number of pending tasks in the work queue.
- virtual int **getActiveCount** () **const**

  Returns an approximation of the number of threads that are currently running tasks for this executor.
- virtual long long **getCompletedTaskCount** () **const**

*Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1004), this value never decreases.*

- virtual int **getLargestPoolSize** () **const**

  *Returns the most Threads that have ever been active at one time within this **Executors** (p. 1005) Thread pool.*

- virtual **BlockingQueue**
  < **decaf::lang::Runnable** * > * **getQueue** ()

  *Provides access to the Task **Queue** (p. 1723) used by this **Executor** (p. 1004).*

- virtual bool **isTerminating** () **const**

  Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads.

- virtual void **allowCoreThreadTimeout** (bool value)

  When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time.

- virtual bool **allowsCoreThreadTimeout** () **const**

  Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time.

- virtual long long **getKeepAliveTime** (**const TimeUnit** &unit) **const**

  Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

- virtual void **setKeepAliveTime** (long long timeout, **const TimeUnit** &unit)

  Configures the amount of time a non core Thread will remain alive after it has completed its assigned task.

- virtual void **setThreadFactory** (**ThreadFactory** *factory)

  *Sets the **ThreadFactory** (p. 2102) instance used to create new Threads for this **Executor** (p. 1004).*

- virtual **ThreadFactory** * **getThreadFactory** () **const**

  *Gets the currently configured **ThreadFactory** (p. 2102).*

- virtual **RejectedExecutionHandler** * **getRejectedExecutionHandler** () **const**

  *Gets the currently configured **RejectedExecutionHandler** (p. 1757) for this **Executor** (p. 1004).*

- virtual void **setRejectedExecutionHandler** (**RejectedExecutionHandler** *handler)

  *Sets the new **RejectedExecutionHandler** (p. 1757) that this executor should use to process any rejected Runnable tasks.*

- virtual bool **prestartCoreThread** ()

  By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued.

- virtual int **prestartAllCoreThreads** ()

  This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit.

- bool **remove** (**decaf::lang::Runnable** *task)

  Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.

- virtual void **purge** ()

  *Attempts to remove any **Future** (p. 1075) derived tasks from the pending work queue if they have been canceled.*

Protected Member Functions

- virtual void **beforeExecute** (**decaf::lang::Thread** *thread, **decaf::lang::Runnable** *task)

  Method called before a task is executed by the given thread.

- virtual void **afterExecute** (**decaf::lang::Runnable** *task, **decaf::lang::Throwable** *error)

  Called upon completion of execution of a given task.

- virtual void **terminated** ()

  *Method invoked when the **Executor** (p. 1004) has terminated, by default this method does nothing.*

Friends

- class **ExecutorKernel**

6.547.1 Detailed Description

Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

The Thread Poll has max size that it will grow to. The thread pool allocates threads in blocks. When there are no waiting worker threads and a task is queued then a new batch is allocated. The user can specify the size of the blocks, otherwise a default value is used.

When the user queues a task they must also queue a listener to be notified when the task has completed, this provides the user with a mechanism to know when a task object can be freed.

To have the Thread Pool perform a task, the user enqueue's an object that implements the `Runnable` interface and one of the worker threads will executing it in its thread context.

6.547.2 Constructor & Destructor Documentation

6.547.2.1 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize,* int *maxPoolSize,* long long *keepAliveTime,* const TimeUnit & *unit,* BlockingQueue< decaf::lang::Runnable * > * *workQueue*)

Creates a new instance of a **ThreadPoolExecutor** (p. 2104).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

corePoolSize	The number of threads to pool regardless of their idle state.
maxPoolSize	The maximum number of threads that will ever exist at one time in the pool.
keepAliveTime	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
unit	The units that the keepAliveTime is specified in.
workQueue	A **BlockingQueue** (p. 417) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1004) takes ownership of the **BlockingQueue** (p. 417) instance passed once this method returns.

Exceptions

IllegalArguementException	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
NullPointerException	if the workQueue pointer is NULL.

6.547.2.2 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize,* int *maxPoolSize,* long long *keepAliveTime,* const TimeUnit & *unit,* BlockingQueue< decaf::lang::Runnable * > * *workQueue,* RejectedExecutionHandler * *handler*)

Creates a new instance of a **ThreadPoolExecutor** (p. 2104).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

corePoolSize	The number of threads to pool regardless of their idle state.
maxPoolSize	The maximum number of threads that will ever exist at one time in the pool.

keepAliveTime	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
unit	The units that the keepAliveTime is specified in.
workQueue	A **BlockingQueue** (p. 417) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1004) takes ownership of the **BlockingQueue** (p. 417) instance passed once this method returns.
handler	A **RejectedExecutionHandler** (p. 1757) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The **Executor** (p. 1004) takes ownership of the **RejectedExecutionHandler** (p. 1757) instance passed once this method returns.

Exceptions

IllegalArguementException	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
NullPointerException	if the workQueue pointer is NULL.

6.547.2.3 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize,* int *maxPoolSize,* long long *keepAliveTime,* const TimeUnit & *unit,* BlockingQueue< decaf::lang::Runnable * > * *workQueue,* ThreadFactory * *threadFactory*)

Creates a new instance of a **ThreadPoolExecutor** (p. 2104).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

corePoolSize	The number of threads to pool regardless of their idle state.
maxPoolSize	The maximum number of threads that will ever exist at one time in the pool.
keepAliveTime	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
unit	The units that the keepAliveTime is specified in.
workQueue	A **BlockingQueue** (p. 417) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1004) takes ownership of the **BlockingQueue** (p. 417) instance passed once this method returns.
threadFactory	A **ThreadFactory** (p. 2102) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The **Executor** (p. 1004) takes ownership of the **ThreadFactory** (p. 2102) instance passed once this method returns.

Exceptions

IllegalArguementException	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
NullPointerException	if the workQueue pointer is NULL.

6.547.2.4 decaf::util::concurrent::ThreadPoolExecutor::ThreadPoolExecutor (int *corePoolSize,* int *maxPoolSize,* long long *keepAliveTime,* const TimeUnit & *unit,* BlockingQueue< decaf::lang::Runnable * > * *workQueue,* ThreadFactory * *threadFactory,* RejectedExecutionHandler * *handler*)

Creates a new instance of a **ThreadPoolExecutor** (p. 2104).

The executor instance is configured with the passed in parameters and a default thread Factory is used along with a default rejected execution handler.

Parameters

corePoolSize	The number of threads to pool regardless of their idle state.
maxPoolSize	The maximum number of threads that will ever exist at one time in the pool.
keepAliveTime	The maximum time to keep a thread in the pool for if the number of current threads exceeds to core pool size.
unit	The units that the keepAliveTime is specified in.
workQueue	A **BlockingQueue** (p. 417) implementation that will be used to hold Runnable tasks that are awaiting execution within this executor. The **Executor** (p. 1004) takes ownership of the **BlockingQueue** (p. 417) instance passed once this method returns.
threadFactory	A **ThreadFactory** (p. 2102) implementation that will be used to create worker threads that are used by this executor to run the submitted tasks. The **Executor** (p. 1004) takes ownership of the **ThreadFactory** (p. 2102) instance passed once this method returns.
handler	A **RejectedExecutionHandler** (p. 1757) implementation that will be used to handle any rejected tasks when they are submitted to this executor. The **Executor** (p. 1004) takes ownership of the **BlockingQueue** (p. 417) instance passed once this method returns.

Exceptions

IllegalArguementException	if the corePoolSize or keepAliveTime are negative or the or if maximumPoolSize is less than or equal to zero, or if corePoolSize is greater than maximumPoolSize.
NullPointerException	if the workQueue pointer is NULL.

6.547.2.5 virtual decaf::util::concurrent::ThreadPoolExecutor::~ThreadPoolExecutor ( ) [virtual]

6.547.3 Member Function Documentation

6.547.3.1 virtual void decaf::util::concurrent::ThreadPoolExecutor::afterExecute (decaf::lang::Runnable * *task*, decaf::lang::Throwable * *error*) [protected, virtual]

Called upon completion of execution of a given task.

This method is called from the Thread that executed the given Runnable. If the Throwable pointer is not NULL then its value is the Exception that caused the task to terminate.

The base class implementation does nothing, a derived class should call this method on its base class to ensure that all subclasses have a chance to process the afterExecute event.

Parameters

task	The Runnable instance that was executed by the calling Thread.
error	The exception that was thrown from the given Runnable.

6.547.3.2 virtual void decaf::util::concurrent::ThreadPoolExecutor::allowCoreThreadTimeout (bool *value*) [virtual]

When true this setting allows the threads in the core pool to terminate if they sit idle longer than the set keep alive time.

Core threads that terminate are replaced as needed by new ones on demand. This settings requires that the set keep alive time be greater than zero and will throw an IllegalArguementException if that is not the case.

Parameters

value	Boolean value indicating if core threads are allowed to time out when idle.

Exceptions

IllegalArgumentException	if the keep alive time is set to zero.

6.547.3.3 virtual bool decaf::util::concurrent::ThreadPoolExecutor::allowsCoreThreadTimeout ( ) const [virtual]

Returns whether this executor has been configured to allow core threads to terminate if they sit idle longer than the configured keep alive time.

Threads that are not core threads continue to time out using the set keep alive value regardless of whether this option is enabled.

Returns

true if core threads can timeout when idle.

6.547.3.4 virtual bool decaf::util::concurrent::ThreadPoolExecutor::awaitTermination (long long *timeout,* const decaf::util::concurrent::TimeUnit & *unit*) [virtual]

The caller will block until the executor has completed termination meaning all tasks that where scheduled before shutdown have now completed and the executor is ready for deletion.

If the timeout period elapses before the executor reaches the terminated state then this method return false to indicate it has not terminated.

Parameters

timeout	The amount of time to wait before abandoning the wait for termination.
unit	The unit of time that the timeout value represents.

Returns

true if the executor terminated or false if the timeout expired.

Exceptions

InterruptedException	if this call is interrupted while awaiting termination.

Implements **decaf::util::concurrent::ExecutorService** (p. 1009).

6.547.3.5 virtual void decaf::util::concurrent::ThreadPoolExecutor::beforeExecute (decaf::lang::Thread * *thread,* decaf::lang::Runnable * *task*) [protected, virtual]

Method called before a task is executed by the given thread.

The default implementation of this method does nothing, however a subclass can override this method to add some new functionality.

It is recommended that a subclass call this method on its base class to ensure that all base classes have a chance to process this event.

Parameters

thread	The thread that will be executing the given task.
task	The task that will be executed by the given thread.

6.547.3.6 virtual void decaf::util::concurrent::ThreadPoolExecutor::execute (decaf::lang::Runnable * *command*) [virtual]

Executes the given command at some time in the future.

The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the **Executor** (p. 1004) implementation.

Parameters

command	the runnable task

Exceptions

RejectedExecution-Exception *(p. 1755)*	if this task cannot be accepted for execution.
NullPointerException	if command is null

Implements **decaf::util::concurrent::Executor** (p. 1005).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejected-Execution().

6.547.3.7 virtual int decaf::util::concurrent::ThreadPoolExecutor::getActiveCount ( ) const [virtual]

Returns an approximation of the number of threads that are currently running tasks for this executor.

This value can change rapidly.

Returns

the number of currently active threads.

6.547.3.8 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getCompletedTaskCount ( ) const [virtual]

Returns the approximate number of Tasks that have been completed by this **Executor** (p. 1004), this value never decreases.

Returns

the number of completed tasks since creation of the **Executor** (p. 1004).

6.547.3.9 virtual int decaf::util::concurrent::ThreadPoolExecutor::getCorePoolSize ( ) const [virtual]

Returns the configured number of core threads for this **Executor** (p. 1004).

Returns

the configured number of core Threads.

6.547.3.10 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getKeepAliveTime (const TimeUnit & *unit*) const [virtual]

Returns the currently set value for the maximum amount of time a worker Thread that is not part of the core threads is allowed to sit idle before it terminates.

Parameters

unit	The unit of time to return the results in.

Returns

the configure keep alive time in the requested time units.

6.547.3.11 virtual int decaf::util::concurrent::ThreadPoolExecutor::getLargestPoolSize ( ) const [virtual]

Returns the most Threads that have ever been active at one time within this **Executors** (p. 1005) Thread pool.

Returns

the largest number of threads ever to coexist in this executor.

6.547.3.12 virtual int decaf::util::concurrent::ThreadPoolExecutor::getMaximumPoolSize ( ) const [virtual]

Returns the configured maximum number of threads for this **Executor** (p. 1004).

Returns

the configured maximum number of Threads.

6.547.3.13 virtual int decaf::util::concurrent::ThreadPoolExecutor::getPoolSize ( ) const [virtual]

Returns the number of threads that currently exists for this **Executor** (p. 1004).

Returns

the configured number of Threads in the Pool.

6.547.3.14 virtual BlockingQueue<decaf::lang::Runnable*>* decaf::util::concurrent::ThreadPoolExecutor::getQueue ( ) [virtual]

Provides access to the Task **Queue** (p. 1723) used by this **Executor** (p. 1004).

This method is meant mainly for debugging and monitoring, care should be taken when using this method. The executor continues to execute tasks from the **Queue** (p. 1723).

Returns

a pointer to the blocking queue that this executor stores future tasks in.

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejectedExecution().

6.547.3.15 virtual RejectedExecutionHandler* decaf::util::concurrent::ThreadPoolExecutor::getRejectedExecutionHandler ( ) const [virtual]

Gets the currently configured **RejectedExecutionHandler** (p. 1757) for this **Executor** (p. 1004).

Returns

a pointer to the current **RejectedExecutionHandler** (p. 1757).

6.547.3.16 virtual long long decaf::util::concurrent::ThreadPoolExecutor::getTaskCount ( ) const [virtual]

Returns the current number of pending tasks in the work queue.

This is an approximation as the number of pending tasks can quickly changes as tasks complete and new tasks are started.

Returns

number of outstanding tasks, approximate.

6.547.3.17 virtual ThreadFactory* decaf::util::concurrent::ThreadPoolExecutor::getThreadFactory ( ) const [virtual]

Gets the currently configured **ThreadFactory** (p. 2102).

It is considered a programming error to delete the pointer returned by this method.

Returns

the currently configured **ThreadFactory** (p. 2102) instance used by this object.

6.547.3.18 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isShutdown ( ) const [virtual]

Returns whether this executor has been shutdown or not.

Returns

true if this executor has been shutdown.

Implements **decaf::util::concurrent::ExecutorService** (p. 1009).

Referenced by decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejectedExecution().

6.547.3.19 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminated ( ) const [virtual]

Returns whether all tasks have completed after this executor was shut down.

Returns

true if all tasks have completed after a request to shut down was made.

Implements **decaf::util::concurrent::ExecutorService** (p. 1009).

6.547.3.20 virtual bool decaf::util::concurrent::ThreadPoolExecutor::isTerminating ( ) const [virtual]

Returns true if the executor has begin the process of terminating but has not yet completed the process of shutting down all worker threads.

If the **Executor** (p. 1004) does not transition from this state to terminated after some time its generally an indication that one of the submitted tasks will not complete and the executor is locked in a terminating state.

Returns

true if all tasks have completed after a request to shut down was made.

6.547.3.21 virtual int decaf::util::concurrent::ThreadPoolExecutor::prestartAllCoreThreads ( ) [virtual]

This method will create and start new core threads running in an idle state waiting for new tasks up to the set core thread limit.

When the limit is reached this method returns zero to indicate no more core threads can be created.

Returns

the number of core threads created, or zero if the limit has already been met.

6.547.3.22 virtual bool decaf::util::concurrent::ThreadPoolExecutor::prestartCoreThread ( ) [virtual]

By default a Core thread is only created once the first task is queued, this method forces the creation of core thread that waits in an idle mode for new work to be enqueued.

If the limit on core threads has already been reached then this method returns false.

Returns

true if a new core thread was added, false otherwise.

6.547.3.23 virtual void decaf::util::concurrent::ThreadPoolExecutor::purge ( ) [virtual]

Attempts to remove any **Future** (p. 1075) derived tasks from the pending work queue if they have been canceled.

This method can be used to more quickly remove and reclaim space as canceled tasks are not run but must await a worker thread to be removed normally. Since there are multiple threads in operation its possible for this method to not remove all canceled tasks from the work queue.

6.547.3.24 bool decaf::util::concurrent::ThreadPoolExecutor::remove (decaf::lang::Runnable * *task*)

Attempts to remove the Runnable from the work queue, if successful then the caller now owns the Runnable and is responsible for deleting it.

Parameters

task	The task that is to be removed from the work queue.

Returns

true if the task was removed from the **Queue** (p. 1723).

6.547.3.25 virtual void decaf::util::concurrent::ThreadPoolExecutor::setCorePoolSize (int *poolSize*) [virtual]

Set (p. 1857) the number of threads that this executor treats as its core threads, this value will override the value set in the constructor.

If the value given is less than the current value then the core threads will shrink to the new value over time. If the value is larger than the current value then new threads may be started to process currently pending tasks, otherwise they will be started as needed when new tasks arrive.

Parameters

poolSize	The new core pool size for this executor.

Exceptions

IllegalArgumentException	if the pool size value is less than zero.

6.547.3.26 virtual void decaf::util::concurrent::ThreadPoolExecutor::setKeepAliveTime (long long *timeout*, const TimeUnit & *unit*) [virtual]

Configures the amount of time a non core Thread will remain alive after it has completed its assigned task.

This value can also be applied to core threads if the allowCoreThreadsTimeout option is enabled.

Parameters

timeout	The amount of time an idle worker will live before terminating.
unit	The units that the timeout is given in.

Exceptions

IllegalArgumentException	if allowCoreThreadsTimeout is enabled and the the timeout value given is zero, or the timeout given is negative.

6.547.3.27 virtual void decaf::util::concurrent::ThreadPoolExecutor::setMaximumPoolSize (int *maxSize*) [virtual]

Sets the maximum number of workers this **Executor** (p. 1004) is allowed to have at any given time above the core pool size.

This new value overrides any set in the constructor and if smaller than the current value worker threads will terminate as they complete their current tasks and become idle.

Parameters

maxSize	The new maximum allowed worker pool size.

Exceptions

IllegalArgumentException	if maxSize is negative or less than core pool size.

6.547.3.28 virtual void decaf::util::concurrent::ThreadPoolExecutor::setRejectedExecutionHandler (RejectedExecutionHandler * *handler*) [virtual]

Sets the new **RejectedExecutionHandler** (p. 1757) that this executor should use to process any rejected Runnable tasks.

This executor takes ownership of the supplied pointer and will desotroy it upon termination, any previous handler is destroyed by this call.

Parameters

handler	The new **RejectedExecutionHandler** (p. 1757) instance to use.

Exceptions

NullPointerException	if the handler is NULL.

6.547.3.29 virtual void decaf::util::concurrent::ThreadPoolExecutor::setThreadFactory (ThreadFactory * *factory*) [virtual]

Sets the **ThreadFactory** (p. 2102) instance used to create new Threads for this **Executor** (p. 1004).

This class takes ownership of the given **ThreadFactory** (p. 2102) and will destroy it upon termination or when a new **ThreadFactory** (p. 2102) is set using this method.

Parameters

factory	A **ThreadFactory** (p. 2102) instance used by this **Executor** (p. 1004) to create new Threads.

Exceptions

NullPointerException	if the given factory pointer is NULL.

6.547.3.30 virtual void decaf::util::concurrent::ThreadPoolExecutor::shutdown ( ) [virtual]

Performs an orderly shutdown of this **Executor** (p. 1004).

Previously queued tasks are allowed to complete but no new tasks are accepted for execution. Calling this method more than once has no affect on this executor.

Implements **decaf::util::concurrent::ExecutorService** (p. 1009).

6.547.3.31 virtual ArrayList<decaf::lang::Runnable*> decaf::util::concurrent::ThreadPoolExecutor::shutdownNow ( ) [virtual]

Attempts to stop all currently executing tasks and returns an **ArrayList** (p. 345) containing the Runnables that did not get executed, these object become the property of the caller and are not deleted by this class, they are removed from the work queue and forgotten about.

There is no guarantee that this method will halt execution of currently executing tasks.

Returns

an **ArrayList** (p. 345) containing all Runnable instance that were still waiting to be executed by this class, call now owns those pointers.

Implements **decaf::util::concurrent::ExecutorService** (p. 1010).

6.547.3.32 virtual void decaf::util::concurrent::ThreadPoolExecutor::terminated ( ) [protected, virtual]

Method invoked when the **Executor** (p. 1004) has terminated, by default this method does nothing.

When overridden the subclass should call superclass::terminated to ensure that all subclasses have their terminated method invoked.

6.547.4 Friends And Related Function Documentation

6.547.4.1 friend class ExecutorKernel [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.548 decaf::lang::Throwable Class Reference

This class represents an error that has occurred.

`#include <src/main/decaf/lang/Throwable.h>`

Inheritance diagram for decaf::lang::Throwable:

Public Member Functions

- **Throwable** () throw ()
- virtual ~**Throwable** () throw ()
- virtual std::string **getMessage** () **const** =0

  Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.
- virtual **const** std::exception * **getCause** () **const** =0

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (**const** std::exception *cause)=0

  Initializes the contained cause exception with the one given.
- virtual void **setMark** (**const** char *file, **const** int lineNumber)=0

  Adds a file/line number to the stack trace.
- virtual **Throwable** * **clone** () **const** =0

  Clones this exception.
- virtual std::vector< std::pair < std::string, int > > **getStackTrace** () **const** =0

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () **const** =0

  Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) **const** =0

  Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () **const** =0

  Gets the stack trace as one contiguous string.

6.548.1 Detailed Description

This class represents an error that has occurred.

All Exceptions in the Decaf library should extend from this or from the **Exception** (p. 990) class in order to ensure that all Decaf Exceptions are interchangeable with the std::exception class.

Throwable (p. 2116) can wrap another **Throwable** (p. 2116) as the cause if the error being thrown. The user can inspect the cause by calling `getCause`, the pointer returned is the property of the **Throwable** (p. 2116) instance and will be deleted when it is deleted or goes out of scope.

6.548.2.1 decaf::lang::Throwable::Throwable ( ) throw () [inline]

6.548.2.2 virtual decaf::lang::Throwable::~Throwable ( ) throw () [inline, virtual]

6.548.3 Member Function Documentation

6.548.3.1 virtual Throwable* decaf::lang::Throwable::clone ( ) const [pure virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p. 990) object

Implemented in **decaf::net::URISyntaxException** (p. 2216), **decaf::lang::Exception** (p. 992), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 1574), **decaf::lang::exceptions::InvalidStateException** (p. 1198), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1098), **decaf::lang::exceptions::InterruptedException** (p. 1187), **decaf::security::GeneralSecurityException** (p. 1081), **decaf::security::NoSuchProviderException** (p. 1541), **decaf::security::NoSuchAlgorithmException** (p. 1537), **decaf::security::SignatureException** (p. 1891), **decaf::lang::exceptions::IllegalStateException** (p. 1101), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1103), **decaf::lang::exceptions::NullPointerException** (p. 1543), **decaf::security::InvalidKeyException** (p. 1193), **decaf::lang::exceptions::IllegalArgumentException** (p. 1096), **decaf::util::concurrent::BrokenBarrierException** (p. 432), **decaf::lang::exceptions::RuntimeException** (p. 1796), **decaf::security::KeyException** (p. 1242), **decaf::security::KeyManagementException** (p. 1245), **decaf::util::concurrent::ExecutionException** (p. 1003), **decaf::util::concurrent::TimeoutException** (p. 2122), **decaf::util::NoSuchElementException** (p. 1539), **decaf::lang::exceptions::ClassCastException** (p. 632), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1108), **decaf::lang::exceptions::NumberFormatException** (p. 1547), **decaf::util::concurrent::CancellationException** (p. 582), **decaf::util::concurrent::RejectedExecutionException** (p. 1757), **decaf::net::BindException** (p. 413), **decaf::lang::exceptions::UnsupportedOperationException** (p. 2189), **decaf::net::ConnectException** (p. 724), **decaf::nio::InvalidMarkException** (p. 1195), **decaf::io::UTFDataFormatException** (p. 2230), **decaf::io::UnsupportedEncodingException** (p. 2187), **decaf::net::HttpRetryException** (p. 1092), **decaf::net::MalformedURLException** (p. 1371), **decaf::net::NoRouteToHostException** (p. 1534), **decaf::net::PortUnreachableException** (p. 1634), **decaf::net::ProtocolException** (p. 1715), **decaf::net::SocketTimeoutException** (p. 1934), **decaf::net::UnknownHostException** (p. 2183), **decaf::net::UnknownServiceException** (p. 2185), **decaf::util::zip::ZipException** (p. 2292), **decaf::io::EOFException** (p. 988), **decaf::io::InterruptedIOException** (p. 1189), **decaf::nio::ReadOnlyBufferException** (p. 1741), **decaf::util::ConcurrentModificationException** (p. 701), **decaf::util::zip::DataFormatException** (p. 835), **decaf::io::IOException** (p. 1200), **decaf::nio::BufferOverflowException** (p. 474), **decaf::nio::BufferUnderflowException** (p. 476), **decaf::net::SocketException** (p. 1916), **decaf::security::cert::CertificateExpiredException** (p. 590), **decaf::security::cert::CertificateNotYetValidException** (p. 591), **decaf::security::cert::CertificateParsingException** (p. 593), **decaf::security::cert::CertificateEncodingException** (p. 587), **decaf::security::cert::CertificateException** (p. 588), **activemq::exceptions::ActiveMQException** (p. 204), **activemq::exceptions::BrokerException** (p. 437), and **activemq::exceptions::ConnectionFailedException** (p. 745).

6.548.3.2 virtual const std::exception* decaf::lang::Throwable::getCause ( ) const [pure virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implemented in **decaf::lang::Exception** (p. 993).

6.548.3.3 virtual std::string decaf::lang::Throwable::getMessage ( ) const [pure virtual]

Gets the cause of the error, if no message was provided to the instance of this interface but a cause was then the value cause.getMessage is then returned.

Returns

string errors message

Implemented in **decaf::lang::Exception** (p. 993).

6.548.3.4 virtual std::vector< std::pair< std::string, int> > decaf::lang::Throwable::getStackTrace ( ) const [pure virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

Implemented in **decaf::lang::Exception** (p. 994).

6.548.3.5 virtual std::string decaf::lang::Throwable::getStackTraceString ( ) const [pure virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implemented in **decaf::lang::Exception** (p. 994).

6.548.3.6 virtual void decaf::lang::Throwable::initCause (const std::exception * *cause*) [pure virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

cause	The exception that was the cause of this one.

Implemented in **decaf::lang::Exception** (p. 994).

6.548.3.7 virtual void decaf::lang::Throwable::printStackTrace ( ) const [pure virtual]

Prints the stack trace to std::err.

Implemented in **decaf::lang::Exception** (p. 994).

6.548.3.8 virtual void decaf::lang::Throwable::printStackTrace (std::ostream & *stream*) const [pure virtual]

Prints the stack trace to the given output stream.

Parameters

stream	the target output stream.

Implemented in **decaf::lang::Exception** (p. 994).

6.548.3.9 virtual void decaf::lang::Throwable::setMark (const char * *file*, const int *lineNumber*) [pure virtual]

Adds a file/line number to the stack trace.

Parameters

file	The name of the file calling this method (use **FILE**).
lineNumber	The line number in the calling file (use **LINE**).

Implemented in **decaf::lang::Exception** (p. 995).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Throwable.h**

6.549 decaf::util::concurrent::TimeoutException Class Reference

`#include <src/main/decaf/util/concurrent/TimeoutException.h>`

Inheritance diagram for decaf::util::concurrent::TimeoutException:

Public Member Functions

- **TimeoutException** () throw ()

  Default Constructor.
- **TimeoutException** (**const decaf::lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **TimeoutException** (**const TimeoutException** &ex) throw ()

  Copy Constructor.
- **TimeoutException** (**const** std::exception *__cause__) throw ()

  Constructor.
- **TimeoutException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **TimeoutException** (**const** char *file, **const** int lineNumber, **const** std::exception *__cause__, **const** char *msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **TimeoutException** * **clone** () **const**

  Clones this exception.
- virtual ~**TimeoutException** () throw ()

6.549.1 Constructor & Destructor Documentation

6.549.1.1 decaf::util::concurrent::TimeoutException::TimeoutException ( ) throw () [inline]

Default Constructor.

6.549.1.2 decaf::util::concurrent::TimeoutException::TimeoutException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.549.1.3 decaf::util::concurrent::TimeoutException::TimeoutException (const TimeoutException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The exception to copy from.

6.549.1.4 decaf::util::concurrent::TimeoutException::TimeoutException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.549.1.5 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The string message to report
...	list of primitives that are formatted into the message

6.549.1.6 decaf::util::concurrent::TimeoutException::TimeoutException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The string message to report
...	list of primitives that are formatted into the message

6.549.1.7 virtual decaf::util::concurrent::TimeoutException::~TimeoutException ( ) throw () [inline, virtual]

6.549.2 Member Function Documentation

6.549.2.1 virtual TimeoutException* decaf::util::concurrent::TimeoutException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new **TimeoutException** (p. 2120) that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**TimeoutException.h**

6.550 decaf::util::Timer Class Reference

A facility for threads to schedule tasks for future execution in a background thread.

`#include <src/main/decaf/util/Timer.h>`

Public Member Functions

- **Timer** ()
- **Timer** (**const** std::string &name)

  *Create a new **Timer** (p. 2122) whose associated thread is assigned the name given.*
- virtual ~**Timer** ()
- void **cancel** ()

  Terminates this timer, discarding any currently scheduled tasks.
- int **purge** ()

  Removes all canceled tasks from this timer's task queue.
- void **schedule** (**TimerTask** *task, long long delay)

  Schedules the specified task for execution after the specified delay.
- void **schedule** (**const decaf::lang::Pointer**< **TimerTask** > &task, long long delay)

  Schedules the specified task for execution after the specified delay.
- void **schedule** (**TimerTask** *task, **const Date** &time)

  Schedules the specified task for execution at the specified time.
- void **schedule** (**const decaf::lang::Pointer**< **TimerTask** > &task, **const Date** &time)

Schedules the specified task for execution at the specified time.

- void **schedule** (**TimerTask** ∗task, long long delay, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (**const decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.
- void **schedule** (**TimerTask** ∗task, **const Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **schedule** (**const decaf::lang::Pointer**< **TimerTask** > &task, **const Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.
- void **scheduleAtFixedRate** (**TimerTask** ∗task, long long delay, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.
- void **scheduleAtFixedRate** (**const decaf::lang::Pointer**< **TimerTask** > &task, long long delay, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.
- void **scheduleAtFixedRate** (**TimerTask** ∗task, **const Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.
- void **scheduleAtFixedRate** (**const decaf::lang::Pointer**< **TimerTask** > &task, **const Date** &firstTime, long long period)

  Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

6.550.1 Detailed Description

A facility for threads to schedule tasks for future execution in a background thread.

Tasks may be scheduled for one-time execution, or for repeated execution at regular intervals.

Corresponding to each **Timer** (p. 2122) object is a single background thread that is used to execute all of the timer's tasks, sequentially. **Timer** (p. 2122) tasks should complete quickly. If a timer task takes excessive time to complete, it "hogs" the timer's task execution thread. This can, in turn, delay the execution of subsequent tasks, which may "bunch up" and execute in rapid succession when (and if) the offending task finally completes.

This class is thread-safe: multiple threads can share a single **Timer** (p. 2122) object without the need for external synchronization.

This class does not offer real-time guarantees: it schedules tasks using the wait(long) method.

Since

1.0

6.550.2 Constructor & Destructor Documentation

6.550.2.1 decaf::util::Timer::Timer ( )

6.550.2.2 decaf::util::Timer::Timer (const std::string & *name*)

Create a new **Timer** (p. 2122) whose associated thread is assigned the name given.

Parameters

name	The name to assign to this **Timer** (p. 2122)'s Thread.

6.550.2.3 virtual decaf::util::Timer::∼Timer ( ) [virtual]

6.550.3 Member Function Documentation

6.550.3.1 void decaf::util::Timer::cancel ( )

Terminates this timer, discarding any currently scheduled tasks.

Does not interfere with a currently executing task (if it exists). Once a timer has been terminated, its execution thread terminates gracefully, and no more tasks may be scheduled on it.

Note that calling this method from within the run method of a timer task that was invoked by this timer absolutely guarantees that the ongoing task execution is the last task execution that will ever be performed by this timer.

This method may be called repeatedly; the second and subsequent calls have no effect.

6.550.3.2 int decaf::util::Timer::purge ( )

Removes all canceled tasks from this timer's task queue.

Calling this method has no effect on the behavior of the timer, but eliminates the canceled tasks from the queue causing the **Timer** (p. 2122) to destroy the **TimerTask** (p. 2130) pointer it was originally given, the caller should ensure that they no longer have any references to TimerTasks that were previously scheduled.

Most programs will have no need to call this method. It is designed for use by the rare application that cancels a large number of tasks. Calling this method trades time for space: the runtime of the method may be proportional to n + c log n, where n is the number of tasks in the queue and c is the number of canceled tasks.

This method can be called on a **Timer** (p. 2122) object that has no scheduled tasks without error.

Returns

the number of tasks removed from the queue.

6.550.3.3 void decaf::util::Timer::schedule (TimerTask * *task,* long long *delay*)

Schedules the specified task for execution after the specified delay.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, or timer was canceled.

6.550.3.4 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task,* long long *delay*)

Schedules the specified task for execution after the specified delay.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, or timer was canceled.

6.550.3.5 void decaf::util::Timer::schedule (TimerTask * *task,* const Date & *time*)

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

Parameters

task	- task to be scheduled.
time	- time at which task is to be executed.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.6 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task,* const Date & *time*)

Schedules the specified task for execution at the specified time.

If the time is in the past, the task is scheduled for immediate execution.

Parameters

task	- task to be scheduled.
time	- time at which task is to be executed.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.7 void decaf::util::Timer::schedule (TimerTask * *task,* long long *delay,* long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.8 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task,* long long *delay,* long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.9 void decaf::util::Timer::schedule (TimerTask * *task,* const Date & *firstTime,* long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task	- task to be scheduled.
firstTime	- First time at which task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.10 void decaf::util::Timer::schedule (const decaf::lang::Pointer< TimerTask > & *task,* const Date & *firstTime,* long long *period*)

Schedules the specified task for repeated fixed-delay execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals separated by the specified period.

In fixed-delay execution, each execution is scheduled relative to the actual execution time of the previous execution. If an execution is delayed for any reason (such as other background activity), subsequent executions will be delayed as well. In the long run, the frequency of execution will generally be slightly lower than the reciprocal of the specified period (assuming the system clock underlying Object.wait(long long) is accurate).

Fixed-delay execution is appropriate for recurring activities that require "smoothness." In other words, it is appropriate for activities where it is more important to keep the frequency accurate in the short run than in the long run. This includes most animation tasks, such as blinking a cursor at regular intervals. It also includes tasks wherein regular

activity is performed in response to human input, such as automatically repeating a character as long as a key is held down.

Parameters

task	- task to be scheduled.
firstTime	- First time at which task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.11 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task,* long long *delay,* long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a count down timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.12 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task,* long long *delay,* long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning after the specified delay.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task	- task to be scheduled.
delay	- delay in milliseconds before task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if delay is negative, or delay + **System.currentTimeMillis()** (p. 2070) is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.13 void decaf::util::Timer::scheduleAtFixedRate (TimerTask * *task,* const Date & *firstTime,* long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

The **TimerTask** (p. 2130) pointer is considered to be owned by the **Timer** (p. 2122) class once it has been scheduled, the **Timer** (p. 2122) will destroy its **TimerTask** (p. 2130)'s once they have been canceled or the **Timer** (p. 2122) itself is canceled. A **TimerTask** (p. 2130) is considered scheduled only when this method return without throwing an exception, until that time ownership is not considered to have been transferred to the **Timer** (p. 2122) and the caller should ensure that the **TimerTask** (p. 2130) gets deleted if an exception is thrown and no further attempts to schedule that **TimerTask** (p. 2130) instance are planned.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task	- task to be scheduled.
firstTime	- First time at which task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.

IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.550.3.14 void decaf::util::Timer::scheduleAtFixedRate (const decaf::lang::Pointer< TimerTask > & *task,* const Date & *firstTime,* long long *period*)

Schedules the specified task for repeated fixed-rate execution, beginning at the specified time.

Subsequent executions take place at approximately regular intervals, separated by the specified period.

In fixed-rate execution, each execution is scheduled relative to the scheduled execution time of the initial execution. If an execution is delayed for any reason (such as garbage collection or other background activity), two or more executions will occur in rapid succession to "catch up." In the long run, the frequency of execution will be exactly the reciprocal of the specified period (assuming the system clock underlying Object.wait(long) is accurate).

Fixed-rate execution is appropriate for recurring activities that are sensitive to absolute time, such as ringing a chime every hour on the hour, or running scheduled maintenance every day at a particular time. It is also appropriate for recurring activities where the total time to perform a fixed number of executions is important, such as a countdown timer that ticks once every second for ten seconds. Finally, fixed-rate execution is appropriate for scheduling multiple repeating timer tasks that must remain synchronized with respect to one another.

Parameters

task	- task to be scheduled.
firstTime	- First time at which task is to be executed.
period	- time in milliseconds between successive task executions.

Exceptions

NullPointerException	- if the **TimerTask** (p. 2130) value is Null.
IllegalArgumentException	- if time.getTime() is negative.
IllegalStateException	- if task was already scheduled or canceled, timer was canceled, or timer thread terminated.

6.551.1 Detailed Description

A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer** (p. 2122).

Since

1.0

6.551.2 Constructor & Destructor Documentation

6.551.2.1 decaf::util::TimerTask::TimerTask ( )

6.551.2.2 virtual decaf::util::TimerTask::~TimerTask ( ) [inline, virtual]

6.551.3 Member Function Documentation

6.551.3.1 bool decaf::util::TimerTask::cancel ( )

Cancels this timer task.

If the task has been scheduled for one-time execution and has not yet run, or has not yet been scheduled, it will never run. If the task has been scheduled for repeated execution, it will never run again. (If the task is running when this call occurs, the task will run to completion, but will never run again.)

Note that calling this method from within the run method of a repeating timer task absolutely guarantees that the timer task will not run again.

This method may be called repeatedly; the second and subsequent calls have no effect.

Returns

true if this task is scheduled for one-time execution and has not yet run, or this task is scheduled for repeated execution. Returns false if the task was scheduled for one-time execution and has already run, or if the task was never scheduled, or if the task was already canceled. (Loosely speaking, this method returns true if it prevents one or more scheduled executions from taking place.)

6.551.3.2 long long decaf::util::TimerTask::getWhen ( ) const [protected]

6.551.3.3 bool decaf::util::TimerTask::isScheduled ( ) const [protected]

6.551.3.4 long long decaf::util::TimerTask::scheduledExecutionTime ( ) const

Returns the scheduled execution time of the most recent actual execution of this task.

(If this method is invoked while task execution is in progress, the return value is the scheduled execution time of the ongoing task execution.)

This method is typically invoked from within a task's run method, to determine whether the current execution of the task is sufficiently timely to warrant performing the scheduled activity:

```
void run() {
    if( System::currentTimeMillis() - scheduledExecutionTime() >=
        MAX_TARDINESS)
            return;  // Too late; skip this execution.
    // Perform the task
}
```

This method is typically not used in conjunction with fixed-delay execution repeating tasks, as their scheduled execution times are allowed to drift over time, and so are not terribly significant.

Returns

the time at which the most recent execution of this task was scheduled to occur, in the format returned by **Date.getTime()** (p. 884). The return value is undefined if the task has yet to commence its first execution.

6.552 decaf::internal::util::TimerTaskHeap Class Reference

A Binary Heap implemented specifically for the Timer class in Decaf Util.

`#include <src/main/decaf/internal/util/TimerTaskHeap.h>`

Public Member Functions

- **TimerTaskHeap** ()
- virtual ~**TimerTaskHeap** ()
- **Pointer**< **TimerTask** > **peek** ()

  Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.
- bool **isEmpty** () **const**

- std::size_t **size** () **const**
- void **insert** (**const Pointer**< **TimerTask** > &task)

  Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.
- void **remove** (std::size_t pos)

  Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.
- void **reset** ()

  Clear all contents from the heap.
- void **adjustMinimum** ()

  Resorts the heap starting at the top.
- std::size_t **deleteIfCancelled** ()

  Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.
- std::size_t **find** (**const Pointer**< **TimerTask** > &task) **const**

  Searches the heap for the specified TimerTask element and returns its position in the heap.

6.552.1 Detailed Description

A Binary Heap implemented specifically for the Timer class in Decaf Util.

Since

1.0

6.552.2 Constructor & Destructor Documentation

6.552.2.1 decaf::internal::util::TimerTaskHeap::TimerTaskHeap ( )

6.552.2.2 virtual decaf::internal::util::TimerTaskHeap::~TimerTaskHeap ( ) [virtual]

6.552.3 Member Function Documentation

6.552.3.1 void decaf::internal::util::TimerTaskHeap::adjustMinimum ( )

Resorts the heap starting at the top.

6.552.3.2 std::size_t decaf::internal::util::TimerTaskHeap::deleteIfCancelled ( )

Runs through the heap removing all cancelled Tasks from it, this is not normally used but in case a a cancellation of a large number of tasks the user can perform this purge.

Returns

the number of task that were removed from the heap becuase they were cancelled.

6.552.3.3 std::size_t decaf::internal::util::TimerTaskHeap::find (const Pointer< TimerTask > & *task*) const

Searches the heap for the specified TimerTask element and returns its position in the heap.

Returns the unsigned equivalent of -1 if the element is not found.

Returns

the position in the Heap where the Task is stored, or npos.

6.552.3.4 void decaf::internal::util::TimerTaskHeap::insert (const Pointer< TimerTask > & *task*)

Inserts the specified Task into the heap, heap is reordered to reflect the addition of a new element.

Parameters

task	The TimerTask to insert into the heap.

6.552.3.5 bool decaf::internal::util::TimerTaskHeap::isEmpty ( ) const

Returns

true if the heap is empty.

6.552.3.6 Pointer<TimerTask> decaf::internal::util::TimerTaskHeap::peek ( )

Peaks at the Head of the Heap, returns the task with the nearest scheduled run time.

Returns

The TimerTask that is scheduled to be executed next if the Heap is empty a Null Pointer value is returned.

6.552.3.7 void decaf::internal::util::TimerTaskHeap::remove (std::size_t *pos*)

Removes the Task at the specified position from the heap, resorts the heap from the position down to the bottom.

Parameters

pos	The position at which to remove the TimerTask and begin a resort of the heap.

6.552.3.8 void decaf::internal::util::TimerTaskHeap::reset ( )

Clear all contents from the heap.

6.552.3.9 std::size_t decaf::internal::util::TimerTaskHeap::size ( ) const

Returns

the size of the heap.

  Hidden Constructor, this class can not be instantiated directly.

6.553.1 Detailed Description

A **TimeUnit** (p. 2134) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.

A **TimeUnit** (p. 2134) does not maintain time information, but only helps organize and use time representations that may be maintained separately across various contexts. A nanosecond is defined as one thousandth of a microsecond, a microsecond as one thousandth of a millisecond, a millisecond as one thousandth of a second, a minute as sixty seconds, an hour as sixty minutes, and a day as twenty four hours.

A **TimeUnit** (p. 2134) is mainly used to inform time-based methods how a given timing parameter should be interpreted. For example, the following code will timeout in 50 milliseconds if the lock is not available:

Lock (p. 1304) lock = ...; if (lock.tryLock(50, **TimeUnit.MILLISECONDS** (p. 2141))) ...

while this code will timeout in 50 seconds:

Lock (p. 1304) lock = ...; if (lock.tryLock(50, **TimeUnit.SECONDS** (p. 2141))) ...

Note however, that there is no guarantee that a particular timeout implementation will be able to notice the passage of time at the same granularity as the given **TimeUnit** (p. 2134).

6.553.2 Constructor & Destructor Documentation

6.553.2.1 decaf::util::concurrent::TimeUnit::TimeUnit (int *index,* const std::string & *name*) [protected]

Hidden Constructor, this class can not be instantiated directly.

Parameters

index	- Index into the Time Unit set.
name	- Name of the unit type being represented.

6.553.2.2 virtual decaf::util::concurrent::TimeUnit::~TimeUnit ( ) [inline, virtual]

6.553.3 Member Function Documentation

6.553.3.1 virtual int decaf::util::concurrent::TimeUnit::compareTo (const TimeUnit & *value*) const [virtual]

6.553.3.2 long long decaf::util::concurrent::TimeUnit::convert (long long *sourceDuration,* const TimeUnit & *sourceUnit*) const

Convert the given time duration in the given unit to this unit.

Conversions from finer to coarser granularities truncate, so lose precision. For example converting 999 milliseconds to seconds results in 0. Conversions from coarser to finer granularities with arguments that would numerically overflow saturate to Long.MIN_VALUE if negative or Long.MAX_VALUE if positive.

For example, to convert 10 minutes to milliseconds, use: TimeUnit.MILLISECONDS.convert(10L, **TimeUnit.MINUTES** (p. 2141))

Parameters

sourceDuration	- Duration value to convert.
sourceUnit	- Unit type of the source duration.

Returns

the converted duration in this unit, or Long.MIN_VALUE if conversion would negatively overflow, or Long.MAX-_VALUE if it would positively overflow.

6.553.3.3 virtual bool decaf::util::concurrent::TimeUnit::equals (const TimeUnit & *value*) const [virtual]

6.553.3.4 virtual bool decaf::util::concurrent::TimeUnit::operator< (const TimeUnit & *value*) const [virtual]

6.553.3.5 virtual bool decaf::util::concurrent::TimeUnit::operator== (const TimeUnit & *value*) const [virtual]

6.553.3.6 void decaf::util::concurrent::TimeUnit::sleep (long long *timeout*) const

Perform a `Thread.sleep` using this unit.

This is a convenience method that converts time arguments into the form required by the `Thread.sleep` method.

Parameters

timeout	the minimum time to sleep

See also

Thread::sleep

6.553.3.7 void decaf::util::concurrent::TimeUnit::timedJoin (decaf::lang::Thread * *thread,* long long *timeout*)

Perform a timed `Thread.join` using this time unit.

This is a convenience method that converts time arguments into the form required by the `Thread.join` method.

Parameters

thread	the thread to wait for
timeout	the maximum time to wait

Exceptions

InterruptedException	if interrupted while waiting.
NullPointerException	if the thread object is null.

See also

Thread::join(long long, long long)

6.553.3.8 void decaf::util::concurrent::TimeUnit::timedWait (Synchronizable * *obj,* long long *timeout*) const

Perform a timed `Object.wait` using this time unit.

This is a convenience method that converts timeout arguments into the form required by the `Object.wait` method.

For example, you could implement a blocking `poll` method (see **BlockingQueue.poll** (p. 421)) using:

```
 Object poll( long long timeout, const TimeUnit& unit )
   throw( InterruptedException ) {

  while( empty ) {
     unit.timedWait(this, timeout);
     ...
   }
}
```

Parameters

obj	the object to wait on
timeout	the maximum time to wait.

Exceptions

InterruptedException	if interrupted while waiting.
NullPointerException	if the **Synchronizable** (p. 2045) object is null.

See also

Synchronizable::wait(long long, long long)

6.553.3.9 long long decaf::util::concurrent::TimeUnit::toDays (long long *duration*) const [inline]

Equivalent to `DAYS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration.

See also

convert (p. 2136)

6.553.3.10 long long decaf::util::concurrent::TimeUnit::toHours (long long *duration*) const [inline]

Equivalent to `HOURS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration.

See also

convert (p. 2136)

6.553.3.11 long long decaf::util::concurrent::TimeUnit::toMicros (long long *duration*) const [inline]

Equivalent to `MICROSECONDS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2136)

6.553.3.12 long long decaf::util::concurrent::TimeUnit::toMillis (long long *duration*) const [inline]

Equivalent to `MILLISECONDS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2136)

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::offer(), and decaf::util::concurrent::LinkedBlockingQueue< E >::poll().

6.553.3.13 long long decaf::util::concurrent::TimeUnit::toMinutes (long long *duration*) const [inline]

Equivalent to `MINUTES.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration.

See also

convert (p. 2136)

6.553.3.14 long long decaf::util::concurrent::TimeUnit::toNanos (long long *duration*) const [inline]

Equivalent to `NANOSECONDS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration, or `Long.MIN_VALUE` if conversion would negatively overflow, or `Long.MAX_VALUE` if it would positively overflow.

See also

convert (p. 2136)

6.553.3.15 long long decaf::util::concurrent::TimeUnit::toSeconds (long long *duration*) const [inline]

Equivalent to `SECONDS.convert(duration, this)`.

Parameters

duration	the duration

Returns

the converted duration.

See also

convert (p. 2136)

6.553.3.16 virtual std::string decaf::util::concurrent::TimeUnit::toString ( ) const [virtual]

Converts the **TimeUnit** (p. 2134) type to the Name of the **TimeUnit** (p. 2134).

Returns

String name of the **TimeUnit** (p. 2134)

6.553.3.17 static const TimeUnit& decaf::util::concurrent::TimeUnit::valueOf (const std::string & *name*) [static]

Returns the **TimeUnit** (p. 2134) constant of this type with the specified name.

The string must match exactly an identifier used to declare an **TimeUnit** (p. 2134) constant in this type. (Extraneous whitespace characters are not permitted.)

Parameters

name	The Name of the **TimeUnit** (p. 2134) constant to be returned.

Returns

A constant reference to the **TimeUnit** (p. 2134) Constant with the given name.

Exceptions

IllegalArgumentException	if this enum type has no constant with the specified name

6.554 cms::Topic Class Reference

An interface encapsulating a provider-specific topic name.

`#include <src/main/cms/Topic.h>`

Inheritance diagram for cms::Topic:

Public Member Functions

- virtual ~**Topic** () throw ()
- virtual std::string **getTopicName** () **const** =0

  Gets the name of this topic.

6.554.1 Detailed Description

An interface encapsulating a provider-specific topic name.

A **Topic** (p. 2141) is a Publish / Subscribe type **Destination** (p. 936). All Messages sent to a **Topic** (p. 2141) are broadcast to all Subscribers of that **Topic** (p. 2141) unless the Subscriber defines a **Message** (p. 1426) selector that filters out that **Message** (p. 1426).

Since

1.0

6.554.2 Constructor & Destructor Documentation

6.554.2.1 virtual cms::Topic::~Topic ( ) throw () [virtual]

6.554.3 Member Function Documentation

6.554.3.1 virtual std::string cms::Topic::getTopicName ( ) const [pure virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.

Implemented in **activemq::commands::ActiveMQTopic** (p. 324).

The documentation for this class was generated from the following file:

- src/main/cms/**Topic.h**

6.556.1 Member Typedef Documentation

6.556.1.1 typedef decaf::lang::PointerComparator<TransactionId> activemq::commands::TransactionId::COMPARATOR

Reimplemented in **activemq::commands::XATransactionId** (p. 2278), and **activemq::commands::LocalTransactionId** (p. 1298).

6.556.2 Constructor & Destructor Documentation

6.556.2.1 activemq::commands::TransactionId::TransactionId ( )

6.556.2.2 activemq::commands::TransactionId::TransactionId (const TransactionId & *other*)

6.556.2.3 virtual activemq::commands::TransactionId::~TransactionId ( ) [virtual]

6.556.3 Member Function Documentation

6.556.3.1 virtual TransactionId* activemq::commands::TransactionId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

Reimplemented in **activemq::commands::XATransactionId** (p. 2278), and **activemq::commands::LocalTransactionId** (p. 1299).

6.556.3.2 virtual int activemq::commands::TransactionId::compareTo (const TransactionId & *value*) const [virtual]

6.556.3.3 virtual void activemq::commands::TransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::XATransactionId** (p. 2279), and **activemq::commands::LocalTransactionId** (p. 1299).

6.556.3.4 virtual bool activemq::commands::TransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::XATransactionId** (p. 2279), and **activemq::commands::LocalTransactionId** (p. 1299).

6.556.3.5 virtual bool activemq::commands::TransactionId::equals (const TransactionId & *value*) const [virtual]

6.556.3.6 virtual unsigned char activemq::commands::TransactionId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

Reimplemented in **activemq::commands::XATransactionId** (p. 2280), and **activemq::commands::LocalTransactionId** (p. 1300).

6.556.3.7 virtual bool activemq::commands::TransactionId::isLocalTransactionId ( ) const [inline, virtual]

Reimplemented in **activemq::commands::LocalTransactionId** (p. 1300).

6.556.3.8 virtual bool activemq::commands::TransactionId::isXATransactionId ( ) const [inline, virtual]

Reimplemented in **activemq::commands::XATransactionId** (p. 2281).

6.556.3.9 virtual bool activemq::commands::TransactionId::operator< (const TransactionId & *value*) const [virtual]

6.556.3.10 TransactionId& activemq::commands::TransactionId::operator= (const TransactionId & *other*)

6.557.2 Constructor & Destructor Documentation

6.557.2.1 activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::TransactionIdMarshaller ( ) [inline]

6.557.2.2 virtual activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::~TransactionIdMarshaller ( ) [inline, virtual]

6.557.3 Member Function Documentation

6.557.3.1 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1302), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2283).

6.557.3.2 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1302), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2283).

6.557.3.3 virtual int activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1303), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2283).

6.557.3.4 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1303), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2284).

6.557.3.5 virtual void activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::LocalTransactionIdMarshaller** (p. 1303), and **activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller** (p. 2284).

6.558.1.1 activemq::commands::TransactionInfo::TransactionInfo ( )

6.558.1.2 virtual activemq::commands::TransactionInfo::~TransactionInfo ( ) [virtual]

6.558.2 Member Function Documentation

6.558.2.1 virtual TransactionInfo* activemq::commands::TransactionInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.558.2.2 virtual void activemq::commands::TransactionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.558.2.3 virtual bool activemq::commands::TransactionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.558.2.4 virtual const Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ( ) const [virtual]

6.558.2.5 virtual Pointer<ConnectionId>& activemq::commands::TransactionInfo::getConnectionId ( ) [virtual]

6.558.2.6 virtual unsigned char activemq::commands::TransactionInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.558.2.7 virtual const Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ( ) const [virtual]

6.558.2.8 virtual Pointer<TransactionId>& activemq::commands::TransactionInfo::getTransactionId ( ) [virtual]

6.558.2.9 virtual unsigned char activemq::commands::TransactionInfo::getType ( ) const [virtual]

Referenced by activemq::state::CommandVisitorAdapter::processTransactionInfo().

6.558.2.10 virtual bool activemq::commands::TransactionInfo::isTransactionInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isTransactionInfo()** (p. 2151) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 385).

6.558.2.11 virtual void activemq::commands::TransactionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.558.2.12 virtual void activemq::commands::TransactionInfo::setTransactionId (const Pointer< TransactionId > & *transactionId*) [virtual]

6.558.2.13 virtual void activemq::commands::TransactionInfo::setType (unsigned char *type*) [virtual]

6.558.2.14 virtual std::string activemq::commands::TransactionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.558.2.15 virtual Pointer<Command> activemq::commands::TransactionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.558.3 Field Documentation

6.558.3.1 Pointer<ConnectionId> activemq::commands::TransactionInfo::connectionId [protected]

6.558.3.2 const unsigned char activemq::commands::TransactionInfo::ID_TRANSACTIONINFO = 7 [static]

  Tight Marhsal to the given stream.

6.559.1 Detailed Description

Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2152).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.559.2 Constructor & Destructor Documentation

6.559.2.1 activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::TransactionInfoMarshaller ( ) [inline]

6.559.2.2 virtual activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::~TransactionInfoMarshaller ( ) [inline, virtual]

6.559.3 Member Function Documentation

6.559.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.559.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.559.3.3 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.559.3.4 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.559.3.5 virtual int activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.559.3.6 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.559.3.7 virtual void activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

- virtual E * **transfer** (bool timed, long long nanos)

  Performs a take.

6.564.1 Detailed Description

template<typename E>class decaf::internal::util::concurrent::TransferQueue< E >

This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.

The algorithm is a little simpler than that for stacks because fulfillers do not need explicit nodes, and matching is done by CAS'ing QNode.item field from non-null to null (for put) or vice versa (for take).

6.564.2 Constructor & Destructor Documentation

6.564.2.1 template<typename E > decaf::internal::util::concurrent::TransferQueue< E >::TransferQueue ( ) [inline]

Node class for **TransferQueue** (p. 2158).

Tries to cancel by CAS'ing ref to NULL if that succeeds then we mark as cancelled. Returns true if this node is known to be off the queue because its next pointer has been forgotten due to an advanceHead operation.

6.564.2.2 template<typename E > virtual decaf::internal::util::concurrent::TransferQueue< E >::~TransferQueue ( ) [inline, virtual]

6.564.3 Member Function Documentation

6.564.3.1 template<typename E > virtual void decaf::internal::util::concurrent::TransferQueue< E >::transfer (E * *e*, bool *timed*, long long *nanos*) [inline, virtual]

Performs a put.

Parameters

e	the item to be handed to a consumer;
timed	if this operation should timeout
nanos	the timeout, in nanoseconds

Exceptions

TimeoutException	if the operation timed out waiting for the consumer to accept the item offered.
InterruptedException	if the thread was interrupted while waiting for the consumer to accept the item offered.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 2158).

6.564.3.2 template<typename E > virtual E* decaf::internal::util::concurrent::TransferQueue< E >::transfer (bool *timed,* long long *nanos*) [inline, virtual]

Performs a take.

Parameters

timed	if this operation should timeout
nanos	the timeout, in nanoseconds

Returns

the item provided or received;

Exceptions

TimeoutException	if the operation timed out waiting for the producer to offer an item.
InterruptedException	if the thread was interrupted while waiting for the producer to offer an item.

Implements **decaf::internal::util::concurrent::Transferer< E >** (p. 2158).

The documentation for this class was generated from the following file:

- virtual bool **isUpdateURIsSupported** () **const** =0
- virtual std::string **getRemoteAddress** () **const** =0
- virtual void **reconnect** (**const decaf::net::URI** &uri)=0

  reconnect to another location
- virtual void **updateURIs** (bool rebalance, **const decaf::util::List**< **decaf::net::URI** > &uris)=0

  *Updates the set of URIs the **Transport** (p. 2161) can connect to.*

6.566.1 Detailed Description

Interface for a transport layer for command objects.

Callers can send oneway messages or make synchronous requests. Non-response messages will be delivered to the specified listener object upon receipt. A user of the **Transport** (p. 2161) can set an exception listener to be notified of errors that occurs in Threads that the **Transport** (p. 2161) layer runs. Transports should be given an instance of a WireFormat object when created so that they can turn the built in Commands to / from the required wire format encoding.

6.566.2 Constructor & Destructor Documentation

6.566.2.1 virtual activemq::transport::Transport::~Transport ( ) [inline, virtual]

6.566.3 Member Function Documentation

6.566.3.1 virtual std::string activemq::transport::Transport::getRemoteAddress ( ) const [pure virtual]

Returns

the remote address for this connection

Implemented in **activemq::transport::IOTransport** (p. 1202), **activemq::transport::mock::MockTransport** (p. 1512), **activemq::transport::failover::FailoverTransport** (p. 1013), and **activemq::transport::TransportFilter** (p. 2171).

6.566.3.2 virtual TransportListener* activemq::transport::Transport::getTransportListener ( ) const [pure virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implemented in **activemq::transport::IOTransport** (p. 1202), **activemq::transport::mock::MockTransport** (p. 1512), **activemq::transport::failover::FailoverTransport** (p. 1013), and **activemq::transport::TransportFilter** (p. 2171).

6.566.3.3 virtual Pointer<wireformat::WireFormat> activemq::transport::Transport::getWireFormat ( ) const [pure virtual]

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a WireFormat info instance.

Returns

The WireFormat the object used to encode / decode commands.

Implemented in **activemq::transport::IOTransport** (p. 1203), **activemq::transport::mock::MockTransport** (p. 1513), **activemq::transport::failover::FailoverTransport** (p. 1013), and **activemq::transport::TransportFilter** (p. 2171).

6.566.3.4 virtual bool activemq::transport::Transport::isClosed ( ) const [pure virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Implemented in **activemq::transport::IOTransport** (p. 1203), **activemq::transport::mock::MockTransport** (p. 1513), **activemq::transport::TransportFilter** (p. 2172), **activemq::transport::failover::FailoverTransport** (p. 1014), and **activemq::transport::tcp::TcpTransport** (p. 2088).

6.566.3.5 virtual bool activemq::transport::Transport::isConnected ( ) const [pure virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Implemented in **activemq::transport::IOTransport** (p. 1203), **activemq::transport::mock::MockTransport** (p. 1513), **activemq::transport::failover::FailoverTransport** (p. 1014), **activemq::transport::TransportFilter** (p. 2172), and **activemq::transport::tcp::TcpTransport** (p. 2088).

6.566.3.6 virtual bool activemq::transport::Transport::isFaultTolerant ( ) const [pure virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Implemented in **activemq::transport::IOTransport** (p. 1203), **activemq::transport::mock::MockTransport** (p. 1513), **activemq::transport::failover::FailoverTransport** (p. 1015), **activemq::transport::TransportFilter** (p. 2172), and **activemq::transport::tcp::TcpTransport** (p. 2089).

6.566.3.7 virtual bool activemq::transport::Transport::isReconnectSupported ( ) const [pure virtual]

Returns

true if reconnect is supported.

Implemented in **activemq::transport::mock::MockTransport** (p. 1514), **activemq::transport::failover::FailoverTransport** (p. 1015), **activemq::transport::IOTransport** (p. 1203), and **activemq::transport::TransportFilter** (p. 2172).

6.566.3.8 virtual bool activemq::transport::Transport::isUpdateURIsSupported ( ) const [pure virtual]

Returns

true if updating uris is supported.

Implemented in **activemq::transport::mock::MockTransport** (p. 1514), **activemq::transport::failover::FailoverTransport** (p. 1015), **activemq::transport::IOTransport** (p. 1204), and **activemq::transport::TransportFilter** (p. 2172).

6.566.3.9 virtual Transport* activemq::transport::Transport::narrow (const std::type_info & *typeId*) [pure virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId	- The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implemented in **activemq::transport::IOTransport** (p. 1204), **activemq::transport::mock::MockTransport** (p. 1514), **activemq::transport::failover::FailoverTransport** (p. 1016), and **activemq::transport::TransportFilter** (p. 2172).

6.566.3.10 virtual void activemq::transport::Transport::oneway (const Pointer< Command > & *command*) [pure virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 1514), **activemq::transport::IOTransport** (p. 1204), **activemq::transport::failover::FailoverTransport** (p. 1016), **activemq::transport::TransportFilter** (p. 2173), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), **activemq::transport::inactivity::InactivityMonitor** (p. 1105), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.566.3.11 virtual void activemq::transport::Transport::reconnect (const decaf::net::URI & *uri*) [pure virtual]

reconnect to another location

Parameters

uri	The new URI to connect this **Transport** (p. 2161) to.

Exceptions

IOException	on failure or if reconnect is not supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1016), and **activemq::transport::TransportFilter** (p. 2174).

6.566.3.12 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & *command*) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implemented in **activemq::transport::mock::MockTransport** (p. 1515), **activemq::transport::IOTransport** (p. 1204), **activemq::transport::failover::FailoverTransport** (p. 1017), **activemq::transport::TransportFilter** (p. 2174), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1598), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.566.3.13 virtual Pointer<Response> activemq::transport::Transport::request (const Pointer< Command > & *command,* unsigned int *timeout*) [pure virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implemented in **activemq::transport::IOTransport** (p. 1205), **activemq::transport::mock::MockTransport** (p. 1515), **activemq::transport::failover::FailoverTransport** (p. 1017), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1598), **activemq::transport::TransportFilter** (p. 2174), **activemq::transport::correlator::ResponseCorrelator** (p. 1788), and **activemq::transport::logging::LoggingTransport** (p. 1327).

6.566.3.14 virtual void activemq::transport::Transport::setTransportListener (TransportListener * *listener*) [pure virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener	the listener of transport events.

Implemented in **activemq::transport::IOTransport** (p. 1206), **activemq::transport::mock::MockTransport** (p. 1516), **activemq::transport::failover::FailoverTransport** (p. 1018), and **activemq::transport::TransportFilter** (p. 2175).

6.566.3.15 virtual void activemq::transport::Transport::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [pure virtual]

Sets the WireFormat instance to use.

Parameters

wireFormat	The WireFormat the object used to encode / decode commands.

Implemented in **activemq::transport::IOTransport** (p. 1206), and **activemq::transport::TransportFilter** (p. 2175).

6.566.3.16 virtual void activemq::transport::Transport::start ( ) [pure virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Implemented in **activemq::transport::IOTransport** (p. 1206), **activemq::transport::mock::MockTransport** (p. 1517), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1599), **activemq::transport::TransportFilter** (p. 2175), **activemq::transport::failover::FailoverTransport** (p. 1019), and **activemq::transport::correlator::ResponseCorrelator** (p. 1788).

6.566.3.17 virtual void activemq::transport::Transport::stop ( ) [pure virtual]

Stops the **Transport** (p. 2161).

Exceptions

IOException	if an error occurs while stopping the transport.

Implemented in **activemq::transport::IOTransport** (p. 1206), **activemq::transport::mock::MockTransport** (p. 1517), **activemq::transport::TransportFilter** (p. 2175), and **activemq::transport::failover::FailoverTransport** (p. 1019).

6.566.3.18 virtual void activemq::transport::Transport::updateURIs (bool *rebalance*, const decaf::util::List< decaf::net::URI > & *uris*) [pure virtual]

Updates the set of URIs the **Transport** (p. 2161) can connect to.

If the **Transport** (p. 2161) doesn't support updating its URIs then an IOException is thrown.

Parameters

rebalance	Indicates if a forced reconnection should be performed as a result of the update.
uris	The new list of URIs that can be used for connection.

Exceptions

IOException	if an error occurs or updates aren't supported.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1019), and **activemq::transport::TransportFilter** (p. 2176).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**Transport.h**

6.567 activemq::transport::TransportFactory Class Reference

Defines the interface for Factories that create Transports or TransportFilters.

`#include <src/main/activemq/transport/TransportFactory.h>`

Inheritance diagram for activemq::transport::TransportFactory:

Public Member Functions

- virtual ~**TransportFactory** ()
- virtual **Pointer**< **Transport** > **create** (**const decaf::net::URI** &location)=0

  *Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.*
- virtual **Pointer**< **Transport** > **createComposite** (**const decaf::net::URI** &location)=0

  *Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.*

6.567.1 Detailed Description

Defines the interface for Factories that create Transports or TransportFilters.

The factory should be able to create either a completely configured **Transport** (p. 2161) meaning that it has all the appropriate filters wrapping it, or it should be able to create a slimed down version that is used in composite transports like Failover or Fanout.

Since

3.0

6.567.2 Constructor & Destructor Documentation

6.567.2.1 virtual activemq::transport::TransportFactory::~TransportFactory ( ) [inline, virtual]

6.567.3 Member Function Documentation

6.567.3.1 virtual Pointer<Transport> activemq::transport::TransportFactory::create (const decaf::net::URI & *location*) [pure virtual]

Creates a fully configured **Transport** (p. 2161) instance which could be a chain of filters and transports.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implemented in **activemq::transport::failover::FailoverTransportFactory** (p. 1020), **activemq::transport::mock::MockTransportFactory** (p. 1518), and **activemq::transport::tcp::TcpTransportFactory** (p. 2089).

6.567.3.2 virtual Pointer<Transport> activemq::transport::TransportFactory::createComposite (const decaf::net::URI & *location*) [pure virtual]

Creates a slimed down **Transport** (p. 2161) instance which can be used in composite transport instances.

Parameters

location	- URI location to connect to plus any properties to assign.

Exceptions

ActiveMQexception	if an error occurs

Implemented in **activemq::transport::mock::MockTransportFactory** (p. 1518), **activemq::transport::failover::FailoverTransportFactory** (p. 1021), and **activemq::transport::tcp::TcpTransportFactory** (p. 2090).

  *Has the **Transport** (p. 2161) been shutdown and no longer usable.*
- virtual std::string **getRemoteAddress** () **const**
- virtual void **reconnect** (**const decaf::net::URI** &uri)

  reconnect to another location
- virtual void **updateURIs** (bool rebalance, **const decaf::util::List**< **decaf::net::URI** > &uris)

  *Updates the set of URIs the **Transport** (p. 2161) can connect to.*

Protected Member Functions

- void **fire** (**const decaf::lang::Exception** &ex)

  Notify the listener of the thrown Exception.
- void **fire** (**const Pointer**< **Command** > &command)

  Notify the listener of the new incoming Command.

Protected Attributes

- **Pointer**< **Transport** > **next**

  The transport that this filter wraps around.
- **TransportListener** * **listener**

  Listener of this transport.

6.568.1 Detailed Description

A filter on the transport layer.

Transport (p. 2161) filters implement the **Transport** (p. 2161) interface and optionally delegate calls to another **Transport** (p. 2161) object.

Since

1.0

6.568.2 Constructor & Destructor Documentation

6.568.2.1 activemq::transport::TransportFilter::TransportFilter (const Pointer< Transport > & *next*)

Constructor.

Parameters

next	- the next **Transport** (p. 2161) in the chain

6.568.2.2 virtual activemq::transport::TransportFilter::~TransportFilter ( ) [virtual]

6.568.3 Member Function Documentation

6.568.3.1 virtual void activemq::transport::TransportFilter::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException	if an error occurs while closing.

Implements **decaf::io::Closeable** (p. 633).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::tcp::TcpTransport** (p. 2087), **activemq::transport::correlator::ResponseCorrelator** (p. 1786), and **activemq::transport::inactivity::InactivityMonitor** (p. 1104).

6.568.3.2 void activemq::transport::TransportFilter::fire (const decaf::lang::Exception & *ex*) [protected]

Notify the listener of the thrown Exception.

Parameters

ex	- the exception to send to listeners

6.568.3.3 void activemq::transport::TransportFilter::fire (const Pointer< Command > & *command*) [protected]

Notify the listener of the new incoming Command.

Parameters

command	- the command to send to the listener

6.568.3.4 virtual std::string activemq::transport::TransportFilter::getRemoteAddress ( ) const [inline, virtual]

Returns

the remote address for this connection

Implements **activemq::transport::Transport** (p. 2162).

6.568.3.5 virtual TransportListener* activemq::transport::TransportFilter::getTransportListener ( ) const [inline, virtual]

Gets the observer of asynchronous events from this transport.

Returns

the listener of transport events.

Implements **activemq::transport::Transport** (p. 2163).

6.568.3.6 virtual Pointer<wireformat::WireFormat> activemq::transport::TransportFilter::getWireFormat ( ) const [inline, virtual]

Gets the WireFormat instance that is in use by this transport.

In the case of nested transport this method delegates down to the lowest level transport that actually maintains a WireFormat info instance.

Returns

The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2163).

6.568.3.7 virtual bool activemq::transport::TransportFilter::isClosed ( ) const [inline, virtual]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

Implements **activemq::transport::Transport** (p. 2163).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2088).

6.568.3.8 virtual bool activemq::transport::TransportFilter::isConnected ( ) const [inline, virtual]

Is the **Transport** (p. 2161) Connected to its Broker.

Returns

true if a connection has been made.

Implements **activemq::transport::Transport** (p. 2163).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2088).

6.568.3.9 virtual bool activemq::transport::TransportFilter::isFaultTolerant ( ) const [inline, virtual]

Is this **Transport** (p. 2161) fault tolerant, meaning that it will reconnect to a broker on disconnect.

Returns

true if the **Transport** (p. 2161) is fault tolerant.

Implements **activemq::transport::Transport** (p. 2163).

Reimplemented in **activemq::transport::tcp::TcpTransport** (p. 2089).

6.568.3.10 virtual bool activemq::transport::TransportFilter::isReconnectSupported ( ) const [inline, virtual]

Returns

true if reconnect is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.568.3.11 virtual bool activemq::transport::TransportFilter::isUpdateURIsSupported ( ) const [inline, virtual]

Returns

true if updating uris is supported.

Implements **activemq::transport::Transport** (p. 2164).

6.568.3.12 virtual Transport* activemq::transport::TransportFilter::narrow (const std::type_info & *typeId*) [virtual]

Narrows down a Chain of Transports to a specific **Transport** (p. 2161) to allow a higher level transport to skip intermediate Transports in certain circumstances.

Parameters

typeId	- The type_info of the Object we are searching for.

Returns

the requested Object. or NULL if its not in this chain.

Implements **activemq::transport::Transport** (p. 2164).

6.568.3.13 virtual void activemq::transport::TransportFilter::onCommand (const Pointer< Command > & *command*) [virtual]

Event handler for the receipt of a command.

Parameters

command	- the received command object.

Implements **activemq::transport::TransportListener** (p. 2177).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), **activemq::transport::inactivity::InactivityMonitor** (p. 1105), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.568.3.14 virtual void activemq::transport::TransportFilter::oneway (const Pointer< Command > & *command*) [inline, virtual]

Sends a one-way command.

Does not wait for any response from the broker.

Parameters

command	The command to be sent.

Exceptions

IOException	if an exception occurs during writing of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2164).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), **activemq::transport::inactivity::InactivityMonitor** (p. 1105), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.568.3.15 virtual void activemq::transport::TransportFilter::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

ex	The exception to handle.

Implements **activemq::transport::TransportListener** (p. 2177).

Reimplemented in **activemq::transport::inactivity::InactivityMonitor** (p. 1105).

6.568.3.16 virtual void activemq::transport::TransportFilter::reconnect (const decaf::net::URI & *uri*) [virtual]

reconnect to another location

Parameters

uri	The new URI to connect this **Transport** (p. 2161) to.

Exceptions

IOException	on failure or if reconnect is not supported.

Implements **activemq::transport::Transport** (p. 2165).

6.568.3.17 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & *command*) [inline, virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	the command to be sent.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1598), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.568.3.18 virtual Pointer<Response> activemq::transport::TransportFilter::request (const Pointer< Command > & *command,* unsigned int *timeout*) [inline, virtual]

Sends the given command to the broker and then waits for the response.

Parameters

command	The command to be sent.
timeout	The time to wait for this response.

Returns

the response from the broker.

Exceptions

IOException	if an exception occurs during the read of the command.
UnsupportedOperation-Exception	if this method is not implemented by this transport.

Implements **activemq::transport::Transport** (p. 2165).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1598), **activemq::transport::correlator::ResponseCorrelator** (p. 1788), and **activemq::transport::logging::LoggingTransport** (p. 1327).

6.568.3.19 virtual void activemq::transport::TransportFilter::setTransportListener (TransportListener * *listener*) [inline, virtual]

Sets the observer of asynchronous events from this transport.

Parameters

listener	the listener of transport events.

Implements **activemq::transport::Transport** (p. 2166).

6.568.3.20 virtual void activemq::transport::TransportFilter::setWireFormat (const Pointer< wireformat::WireFormat > & *wireFormat*) [inline, virtual]

Sets the WireFormat instance to use.

Parameters

wireFormat	The WireFormat the object used to encode / decode commands.

Implements **activemq::transport::Transport** (p. 2166).

6.568.3.21 virtual void activemq::transport::TransportFilter::start ( ) [virtual]

Starts the **Transport** (p. 2161), the send methods of a **Transport** (p. 2161) will throw an exception if used before the **Transport** (p. 2161) is started.

Exceptions

IOException	if and error occurs while starting the **Transport** (p. 2161).

Implements **activemq::transport::Transport** (p. 2166).

Reimplemented in **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1599), and **activemq::transport::correlator::ResponseCorrelator** (p. 1788).

6.568.3.22 virtual void activemq::transport::TransportFilter::stop ( ) [virtual]

Stops the **Transport** (p. 2161).

Exceptions

IOException	if an error occurs while stopping the transport.

Implements **activemq::transport::Transport** (p. 2167).

6.568.3.23 virtual void activemq::transport::TransportFilter::transportInterrupted ( ) [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2178).

6.568.3.24 virtual void activemq::transport::TransportFilter::transportResumed ( ) [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2178).

6.568.3.25 virtual void activemq::transport::TransportFilter::updateURIs (bool *rebalance*, const decaf::util::List< decaf::net::URI > & *uris*) [inline, virtual]

Updates the set of URIs the **Transport** (p. 2161) can connect to.

If the **Transport** (p. 2161) doesn't support updating its URIs then an IOException is thrown.

Parameters

rebalance	Indicates if a forced reconnection should be performed as a result of the update.
uris	The new list of URIs that can be used for connection.

Exceptions

IOException	if an error occurs or updates aren't supported.

Implements **activemq::transport::Transport** (p. 2167).

6.568.4 Field Documentation

6.568.4.1 TransportListener* activemq::transport::TransportFilter::listener [protected]

Listener of this transport.

6.568.4.2 Pointer<Transport> activemq::transport::TransportFilter::next [protected]

The transport that this filter wraps around.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportFilter.h**

6.569 activemq::transport::TransportListener Class Reference

A listener of asynchronous exceptions from a command transport object.

`#include <src/main/activemq/transport/TransportListener.h>`

Inheritance diagram for activemq::transport::TransportListener:

Public Member Functions

- virtual ~**TransportListener** ()
- virtual void **onCommand** (**const Pointer**< **Command** > &command)=0

  Event handler for the receipt of a command.
- virtual void **onException** (**const decaf::lang::Exception** &ex)=0

  Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()=0

  The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()=0

  The transport has resumed after an interruption.

6.569.1 Detailed Description

A listener of asynchronous exceptions from a command transport object.

6.569.2 Constructor & Destructor Documentation

6.569.2.1 virtual activemq::transport::TransportListener::~TransportListener ( ) [inline, virtual]

6.569.3 Member Function Documentation

6.569.3.1 virtual void activemq::transport::TransportListener::onCommand (const Pointer< Command > & *command*) [pure virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2161) deletes the command upon receipt.

Parameters

command	The received command object.

Implemented in **activemq::core::ActiveMQConnection** (p. 159), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::correlator::ResponseCorrelator** (p. 1787), **activemq::transport::TransportFilter** (p. 2173), **activemq::transport::inactivity::InactivityMonitor** (p. 1105), **activemq::transport::mock::InternalCommandListener** (p. 1184), **activemq::transport::failover::FailoverTransportListener** (p. 1022), and **activemq::transport::logging::LoggingTransport** (p. 1326).

6.569.3.2 virtual void activemq::transport::TransportListener::onException (const decaf::lang::Exception & *ex*) [pure virtual]

Event handler for an exception from a command transport.

Parameters

ex	The exception being propagated to this listener to handle.

Implemented in **activemq::core::ActiveMQConnection** (p. 159), **activemq::transport::failover::BackupTransport** (p. 378), **activemq::transport::TransportFilter** (p. 2173), **activemq::transport::inactivity::InactivityMonitor** (p. 1105), and **activemq::transport::failover::FailoverTransportListener** (p. 1022).

6.569.3.3 virtual void activemq::transport::TransportListener::transportInterrupted ( ) [pure virtual]

The transport has suffered an interruption from which it hopes to recover.

Implemented in **activemq::core::ActiveMQConnection** (p. 165), **activemq::transport::TransportFilter** (p. 2176), **activemq::transport::failover::FailoverTransportListener** (p. 1023), and **activemq::transport::DefaultTransportListener** (p. 913).

6.569.3.4 virtual void activemq::transport::TransportListener::transportResumed ( ) [pure virtual]

The transport has resumed after an interruption.

Implemented in **activemq::core::ActiveMQConnection** (p. 165), **activemq::transport::TransportFilter** (p. 2176), **activemq::transport::failover::FailoverTransportListener** (p. 1023), and **activemq::transport::DefaultTransportListener** (p. 913).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportListener.h**

6.570 activemq::transport::TransportRegistry Class Reference

Registry of all **Transport** (p. 2161) Factories that are available to the client at runtime.

`#include <src/main/activemq/transport/TransportRegistry.h>`

Public Member Functions

- virtual ~**TransportRegistry** ()
- **TransportFactory** * **findFactory** (**const** std::string &name) **const**

  *Gets a Registered **TransportFactory** (p. 2167) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- void **registerFactory** (**const** std::string &name, **TransportFactory** *factory)

*Registers a new **TransportFactory** (p. 2167) with this Registry.*

- void **unregisterFactory** (**const** std::string &name)

  Unregisters the Factory with the given name and deletes that instance of the Factory.

- void **unregisterAllFactories** ()

  Removes all Factories and deletes the instances of the Factory objects.

- std::vector< std::string > **getTransportNames** () **const**

  *Retrieves a list of the names of all the Registered **Transport** (p. 2161)'s in this Registry.*

Static Public Member Functions

- static **TransportRegistry** & **getInstance** ()

  *Gets the single instance of the **TransportRegistry** (p. 2178).*

6.570.1 Detailed Description

Registry of all **Transport** (p. 2161) Factories that are available to the client at runtime.

New **Transport** (p. 2161)'s must have a factory registered here before a connection attempt is made.

Since

3.0

6.570.2 Constructor & Destructor Documentation

6.570.2.1 virtual activemq::transport::TransportRegistry::~TransportRegistry ( ) [virtual]

6.570.3 Member Function Documentation

6.570.3.1 TransportFactory* activemq::transport::TransportRegistry::findFactory (const std::string & *name*) const

Gets a Registered **TransportFactory** (p. 2167) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name	The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException	if no factory is registered with that name.

6.570.3.2 static TransportRegistry& activemq::transport::TransportRegistry::getInstance ( ) [static]

Gets the single instance of the **TransportRegistry** (p. 2178).

Returns

reference to the single instance of this Registry

6.570.3.3 std::vector<std::string> activemq::transport::TransportRegistry::getTransportNames ( ) const

Retrieves a list of the names of all the Registered **Transport** (p. 2161)'s in this Registry.

Returns

stl vector of strings with all the **Transport** (p. 2161) names registered.

6.570.3.4 void activemq::transport::TransportRegistry::registerFactory (const std::string & *name,* TransportFactory * *factory*)

Registers a new **TransportFactory** (p. 2167) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name	The name of the new Factory to register.
factory	The new Factory to add to the Registry.

Exceptions

IllegalArgumentException	is name is the empty string.
NullPointerException	if the Factory is Null.

6.570.3.5 void activemq::transport::TransportRegistry::unregisterAllFactories ( )

Removes all Factories and deletes the instances of the Factory objects.

6.570.3.6 void activemq::transport::TransportRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

name	Name of the Factory to unregister and destroy

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**TransportRegistry.h**

6.571 tree_desc_s Struct Reference

`#include <src/main/decaf/internal/util/zip/deflate.h>`

Data Fields

- **ct_data** * **dyn_tree**

- int **max_code**
- **static_tree_desc** * **stat_desc**

6.571.1 Field Documentation

6.571.1.1 ct_data* tree_desc_s::dyn_tree

6.571.1.2 int tree_desc_s::max_code

6.571.1.3 static_tree_desc* tree_desc_s::stat_desc

The documentation for this struct was generated from the following file:

6.572 decaf::lang::Thread::UncaughtExceptionHandler Class Reference

Interface for handlers invoked when a **Thread** (p. 2094) abruptly terminates due to an uncaught exception.

`#include <src/main/decaf/lang/Thread.h>`

Public Member Functions

- virtual ~**UncaughtExceptionHandler** ()
- virtual void **uncaughtException** (**const Thread** *thread, **const Throwable** &error)=0 throw ()

  Method invoked when the given thread terminates due to the given uncaught exception.

6.572.1 Detailed Description

Interface for handlers invoked when a **Thread** (p. 2094) abruptly terminates due to an uncaught exception.

6.572.2 Constructor & Destructor Documentation

6.572.2.1 virtual decaf::lang::Thread::UncaughtExceptionHandler::~UncaughtExceptionHandler ( ) [inline, virtual]

6.572.3 Member Function Documentation

6.572.3.1 virtual void decaf::lang::Thread::UncaughtExceptionHandler::uncaughtException (const Thread * *thread,* const Throwable & *error*) throw () [pure virtual]

Method invoked when the given thread terminates due to the given uncaught exception.

This method is defined to indicate that it will not throw an exception, throwing and exception from this method will on most systems result in a segmentation fault.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Thread.h**

6.573 decaf::net::UnknownHostException Class Reference

`#include <src/main/decaf/net/UnknownHostException.h>`

Inheritance diagram for decaf::net::UnknownHostException:

Public Member Functions

- **UnknownHostException** () throw ()

  Default Constructor.
- **UnknownHostException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **UnknownHostException** (**const UnknownHostException** &ex) throw ()

  Copy Constructor.
- **UnknownHostException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **UnknownHostException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **UnknownHostException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownHostException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**UnknownHostException** () throw ()

6.573.1 Constructor & Destructor Documentation

6.573.1.1 decaf::net::UnknownHostException::UnknownHostException ( ) throw () [inline]

Default Constructor.

6.573.1.2 decaf::net::UnknownHostException::UnknownHostException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.573.1.3 decaf::net::UnknownHostException::UnknownHostException (const UnknownHostException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.573.1.4 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.573.1.5 decaf::net::UnknownHostException::UnknownHostException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.573.1.6 decaf::net::UnknownHostException::UnknownHostException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.573.1.7 virtual decaf::net::UnknownHostException::~UnknownHostException ( ) throw () [inline, virtual]

6.573.2 Member Function Documentation

6.573.2.1 virtual UnknownHostException* decaf::net::UnknownHostException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**UnknownHostException.h**

  Copy Constructor.
- **UnknownServiceException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **UnknownServiceException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **UnknownServiceException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **UnknownServiceException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**UnknownServiceException** () throw ()

6.574.1 Constructor & Destructor Documentation

6.574.1.1 decaf::net::UnknownServiceException::UnknownServiceException ( ) throw () [inline]

Default Constructor.

6.574.1.2 decaf::net::UnknownServiceException::UnknownServiceException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.574.1.3 decaf::net::UnknownServiceException::UnknownServiceException (const UnknownServiceException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.574.1.4 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.574.1.5 decaf::net::UnknownServiceException::UnknownServiceException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.574.1.6 decaf::net::UnknownServiceException::UnknownServiceException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.574.1.7 virtual decaf::net::UnknownServiceException::~UnknownServiceException ( ) throw () [inline, virtual]

6.574.2 Member Function Documentation

6.574.2.1 virtual UnknownServiceException* decaf::net::UnknownServiceException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

6.575.1 Detailed Description

Thrown when the the Character Encoding is not supported.

Since

1.0

6.575.2 Constructor & Destructor Documentation

6.575.2.1 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException ( ) throw () [inline]

Default Constructor.

6.575.2.2 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.575.2.3 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const UnsupportedEncodingException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.575.2.4 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.575.2.5 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.575.2.6 decaf::io::UnsupportedEncodingException::UnsupportedEncodingException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.575.2.7 virtual decaf::io::UnsupportedEncodingException::~UnsupportedEncodingException ( ) throw () [inline, virtual]

6.575.3 Member Function Documentation

6.575.3.1 virtual UnsupportedEncodingException* decaf::io::UnsupportedEncodingException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

6.578.1 Detailed Description

This class represents an instance of a **URI** (p. 2191) as defined by RFC 2396.

6.578.2 Constructor & Destructor Documentation

6.578.2.1 decaf::net::URI::URI ( )

Default Constructor, same as calling a Constructor with all fields empty.

6.578.2.2 decaf::net::URI::URI (const URI & *uri*)

Constructs a **URI** (p. 2191) as a copy of another **URI** (p. 2191).

Parameters

uri	- uri to copy

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.3 decaf::net::URI::URI (const std::string & *uri*)

Constructs a **URI** (p. 2191) from the given string.

Parameters

uri	- string uri to parse.

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.4 decaf::net::URI::URI (const std::string & *scheme,* const std::string & *ssp,* const std::string & *fragment*)

Constructs a **URI** (p. 2191) from the given components.

Parameters

scheme	- the uri scheme
ssp	- Scheme specific part
fragment	- Fragment

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.5 decaf::net::URI::URI (const std::string & *scheme,* const std::string & *userInfo,* const std::string & *host,* int *port,* const std::string & *path,* const std::string & *query,* const std::string & *fragment*)

Constructs a **URI** (p. 2191) from the given components.

Parameters

scheme	- Scheme name
userInfo	- User name and authorization information
host	- Host name
port	- Port number
path	- Path
query	- Query
fragment	- Fragment

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.6 decaf::net::URI::URI (const std::string & *scheme,* const std::string & *host,* const std::string & *path,* const std::string & *fragment*)

Constructs a **URI** (p. 2191) from the given components.

Parameters

scheme	- Scheme name
host	- Host name
path	- Path
fragment	- Fragment

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.7 decaf::net::URI::URI (const std::string & *scheme,* const std::string & *authority,* const std::string & *path,* const std::string & *query,* const std::string & *fragment*)

Constructs a **URI** (p. 2191) from the given components.

Parameters

scheme	- Scheme name
authority	- Authority
path	- Path
query	- Query
fragment	- Fragment

Exceptions

URISyntaxException *(p. 2214)*	if the **URI** (p. 2191) passed is malformed.

6.578.2.8 virtual decaf::net::URI::~URI ( ) [inline, virtual]

6.578.3 Member Function Documentation

6.578.3.1 virtual int decaf::net::URI::compareTo (const URI & *value*) const [virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Parameters

value	- the value to compare to this one.

Returns

zero if equal minus one if less than and one if greater than.

6.578.3.2 static URI decaf::net::URI::create (const std::string *uri*) [static]

Creates a **URI** (p. 2191) by parsing the given string.

This convenience factory method works as if by invoking the URI(string) constructor; any **URISyntaxException** (p. 2214) thrown by the constructor is caught and wrapped in a new IllegalArgumentException object, which is then thrown.

Parameters

uri	- **URI** (p. 2191) string to parse

Exceptions

IllegalArgumentException	

6.578.3.3 virtual bool decaf::net::URI::equals (const URI & *value*) const [virtual]

Returns

true if this value is considered equal to the passed value.

6.578.3.4 std::string decaf::net::URI::getAuthority ( ) const

Returns

the decoded authority component of this **URI** (p. 2191).

6.578.3.5 std::string decaf::net::URI::getFragment ( ) const

Returns

the decoded fragment component of this **URI** (p. 2191).

6.578.3.6 std::string decaf::net::URI::getHost ( ) const

Returns

the host component of this **URI** (p. 2191).

6.578.3.7 std::string decaf::net::URI::getPath ( ) const

Returns

the path component of this **URI** (p. 2191).

6.578.3.8 int decaf::net::URI::getPort ( ) const

Returns

the port component of this **URI** (p. 2191).

6.578.3.9 std::string decaf::net::URI::getQuery ( ) const

Returns

the query component of this **URI** (p. 2191).

6.578.3.10 std::string decaf::net::URI::getRawAuthority ( ) const

Returns the raw authority component of this **URI** (p. 2191).

The authority component of a **URI** (p. 2191), if defined, only contains the commercial-at character ('@') and characters in the unreserved, punct, escaped, and other categories. If the authority is server-based then it is further constrained to have valid user-information, host, and port components.

Returns

the raw authority component of the **URI** (p. 2191)

6.578.3.11 std::string decaf::net::URI::getRawFragment ( ) const

Returns the raw fragment component of this **URI** (p. 2191).

The fragment component of a **URI** (p. 2191), if defined, only contains legal **URI** (p. 2191) characters.

Returns

the raw fragment component of this **URI** (p. 2191)

6.578.3.12 std::string decaf::net::URI::getRawPath ( ) const

Returns the raw path component of this **URI** (p. 2191).

The path component of a **URI** (p. 2191), if defined, only contains the slash character ('/'), the commercial-at character ('@'), and characters in the unreserved, punct, escaped, and other categories.

Returns

the raw path component of this **URI** (p. 2191)

6.578.3.13 std::string decaf::net::URI::getRawQuery ( ) const

Returns the raw query component of this **URI** (p. 2191).

The query component of a **URI** (p. 2191), if defined, only contains legal **URI** (p. 2191) characters.

Returns

the raw query component of the **URI** (p. 2191).

6.578.3.14 std::string decaf::net::URI::getRawSchemeSpecificPart ( ) const

Returns the raw scheme-specific part of this **URI** (p. 2191).

The scheme-specific part is never undefined, though it may be empty. The scheme-specific part of a **URI** (p. 2191) only contains legal **URI** (p. 2191) characters.

Returns

the raw scheme special part of the uri

6.578.3.15 std::string decaf::net::URI::getRawUserInfo ( ) const

Returns the raw user-information component of this **URI** (p. 2191).

The user-information component of a **URI** (p. 2191), if defined, only contains characters in the unreserved, punct, escaped, and other categories.

Returns

the raw user-information component of the **URI** (p. 2191)

6.578.3.16 std::string decaf::net::URI::getScheme ( ) const

Returns

the scheme component of this **URI** (p. 2191)

6.578.3.17 std::string decaf::net::URI::getSchemeSpecificPart ( ) const

Returns the decoded scheme-specific part of this **URI** (p. 2191).

The string returned by this method is equal to that returned by the getRawSchemeSpecificPart method except that all sequences of escaped octets are decoded.

Returns

the raw scheme specific part of the uri.

6.578.3.18 std::string decaf::net::URI::getUserInfo ( ) const

Returns

the user info component of this **URI** (p. 2191)

6.578.3.19 bool decaf::net::URI::isAbsolute ( ) const

Tells whether or not this **URI** (p. 2191) is absolute.

A **URI** (p. 2191) is absolute if, and only if, it has a scheme component.

Returns

true if, and only if, this **URI** (p. 2191) is absolute

6.578.3.20 bool decaf::net::URI::isOpaque ( ) const

Tells whether or not this **URI** (p. 2191) is opaque.

A **URI** (p. 2191) is opaque if, and only if, it is absolute and its scheme-specific part does not begin with a slash character ('/'). An opaque **URI** (p. 2191) has a scheme, a scheme-specific part, and possibly a fragment; all other components are undefined.

Returns

true if, and only if, this **URI** (p. 2191) is opaque

6.578.3.21 URI decaf::net::URI::normalize ( ) const

Normalizes this **URI** (p. 2191)'s path.

If this **URI** (p. 2191) is opaque, or if its path is already in normal form, then this **URI** (p. 2191) is returned. Otherwise a new **URI** (p. 2191) is constructed that is identical to this **URI** (p. 2191) except that its path is computed by normalizing this **URI** (p. 2191)'s path in a manner consistent with RFC 2396, section 5.2, step 6, sub-steps c through f; that is:

1. All "." segments are removed.
   (a) If a ".." segment is preceded by a non-".." segment then both of these segments are removed. This step is repeated until it is no longer applicable.
   (b) If the path is relative, and if its first segment contains a colon character (':'), then a "." segment is prepended. This prevents a relative **URI** (p. 2191) with a path such as "a:b/c/d" from later being re-parsed as an opaque **URI** (p. 2191) with a scheme of "a" and a scheme-specific part of "b/c/d". (Deviation from RFC 2396)

A normalized path will begin with one or more ".." segments if there were insufficient non-".." segments preceding them to allow their removal. A normalized path will begin with a "." segment if one was inserted by step 3 above. Otherwise, a normalized path will not contain any "." or ".." segments.

Returns

A **URI** (p. 2191) equivalent to this **URI** (p. 2191), but whose path is in normal form

6.578.3.22 virtual bool decaf::net::URI::operator< (const URI & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.578.3.23 virtual bool decaf::net::URI::operator== (const URI & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.578.3.24 URI decaf::net::URI::parseServerAuthority ( ) const

Attempts to parse this **URI** (p. 2191)'s authority component, if defined, into user-information, host, and port components.

If this **URI** (p. 2191)'s authority component has already been recognized as being server-based then it will already have been parsed into user-information, host, and port components. In this case, or if this **URI** (p. 2191) has no authority component, this method simply returns this **URI** (p. 2191).

Otherwise this method attempts once more to parse the authority component into user-information, host, and port components, and throws an exception describing why the authority component could not be parsed in that way.

Returns

A **URI** (p. 2191) whose authority field has been parsed as a server-based authority

Exceptions

URISyntaxException *(p. 2214)*	- If the authority component of this **URI** (p. 2191) is defined but cannot be parsed as a server-based authority.

6.578.3.25 URI decaf::net::URI::relativize (const URI & *uri*) const

Relativizes the given **URI** (p. 2191) against this **URI** (p. 2191).

The relativization of the given **URI** (p. 2191) against this **URI** (p. 2191) is computed as follows:

1. If either this **URI** (p. 2191) or the given **URI** (p. 2191) are opaque, or if the scheme and authority components of the two URIs are not identical, or if the path of this **URI** (p. 2191) is not a prefix of the path of the given **URI** (p. 2191), then the given **URI** (p. 2191) is returned.
   (a) Otherwise a new relative hierarchical **URI** (p. 2191) is constructed with query and fragment components taken from the given **URI** (p. 2191) and with a path component computed by removing this **URI** (p. 2191)'s path from the beginning of the given **URI** (p. 2191)'s path.

Parameters

uri	- The **URI** (p. 2191) to be relativized against this **URI** (p. 2191)

Returns

The resulting **URI** (p. 2191)

6.578.3.26 URI decaf::net::URI::resolve (const std::string & *str*) const

Constructs a new **URI** (p. 2191) by parsing the given string and then resolving it against this **URI** (p. 2191).

This convenience method works as if invoking it were equivalent to evaluating the expression resolve(URI::create(str)).

Parameters

str	- The string to be parsed into a **URI** (p. 2191)

Returns

The resulting **URI** (p. 2191)

Exceptions

IllegalArgumentException	- If the given string violates RFC 2396

6.578.3.27 URI decaf::net::URI::resolve (const URI & *uri*) const

Resolves the given **URI** (p. 2191) against this **URI** (p. 2191).

If the given **URI** (p. 2191) is already absolute, or if this **URI** (p. 2191) is opaque, then a copy of the given **URI** (p. 2191) is returned.

If the given **URI** (p. 2191)'s fragment component is defined, its path component is empty, and its scheme, authority, and query components are undefined, then a **URI** (p. 2191) with the given fragment but with all other components equal to those of this **URI** (p. 2191) is returned. This allows a **URI** (p. 2191) representing a standalone fragment reference, such as "#foo", to be usefully resolved against a base **URI** (p. 2191).

Otherwise this method constructs a new hierarchical **URI** (p. 2191) in a manner consistent with RFC 2396, section 5.2; that is:

1. A new **URI** (p. 2191) is constructed with this **URI** (p. 2191)'s scheme and the given **URI** (p. 2191)'s query and

fragment components.

(a) If the given **URI** (p. 2191) has an authority component then the new **URI** (p. 2191)'s authority and path are taken from the given **URI** (p. 2191).

(b) Otherwise the new **URI** (p. 2191)'s authority component is copied from this **URI** (p. 2191), and its path is computed as follows:

i. If the given **URI** (p. 2191)'s path is absolute then the new **URI** (p. 2191)'s path is taken from the given **URI** (p. 2191).

A. Otherwise the given **URI** (p. 2191)'s path is relative, and so the new **URI** (p. 2191)'s path is computed by resolving the path of the given **URI** (p. 2191) against the path of this **URI** (p. 2191). This is done by concatenating all but the last segment of this **URI** (p. 2191)'s path, if any, with the given **URI** (p. 2191)'s path and then normalizing the result as if by invoking the normalize method.

The result of this method is absolute if, and only if, either this **URI** (p. 2191) is absolute or the given **URI** (p. 2191) is absolute.

Parameters

uri	- The **URI** (p. 2191) to be resolved against this **URI** (p. 2191)

Returns

The resulting **URI** (p. 2191)

6.578.3.28 std::string decaf::net::URI::toString ( ) const

Returns the content of this **URI** (p. 2191) as a string.

If this **URI** (p. 2191) was created by invoking one of the constructors in this class then a string equivalent to the original input string, or to the string computed from the originally-given components, as appropriate, is returned. Otherwise this **URI** (p. 2191) was created by normalization, resolution, or relativization, and so a string is constructed from this **URI** (p. 2191)'s components according to the rules specified in RFC 2396, section 5.2, step 7.

Returns

the string form of this **URI** (p. 2191)

6.578.3.29 URL decaf::net::URI::toURL ( ) const

Constructs a **URL** (p. 2223) from this **URI** (p. 2191).

This convenience method works as if invoking it were equivalent to evaluating the expression new **URL** (p. 2223)(this.toString()) after first checking that this **URI** (p. 2191) is absolute.

Returns

A **URL** (p. 2223) constructed from this **URI** (p. 2191)

Exceptions

IllegalArgumentException	- If this **URL** (p. 2223) is not absolute
MalformedURLException *(p. 1369)*	- If a protocol handler for the **URL** (p. 2223) could not be found, or if some other error occurred while constructing the **URL** (p. 2223)

Public Member Functions

- **URIEncoderDecoder** ()
- virtual ~**URIEncoderDecoder** ()

Static Public Member Functions

- static void **validate** (**const** std::string &s, **const** std::string &legal)

  Validate a string by checking if it contains any characters other than:
- static void **validateSimple** (**const** std::string &s, **const** std::string &legal)

  Validate a string by checking if it contains any characters other than:
- static std::string **quotelllegal** (**const** std::string &s, **const** std::string &legal)

  All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and legal characters are converted into their hexidecimal value prepended by ".
- static std::string **encodeOthers** (**const** std::string &s)

  Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.
- static std::string **decode** (**const** std::string &s)

  Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme.

6.579.1 Constructor & Destructor Documentation

6.579.1.1 decaf::internal::net::URIEncoderDecoder::URIEncoderDecoder ( )

6.579.1.2 virtual decaf::internal::net::URIEncoderDecoder::~URIEncoderDecoder ( ) [inline, virtual]

6.579.2 Member Function Documentation

6.579.2.1 static std::string decaf::internal::net::URIEncoderDecoder::decode (const std::string & *s*) [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type using the UTF-8 encoding scheme.

" and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A%20B%20C %24%25" -> "A B C $%"

Parameters

s	- The encoded string.

Returns

The decoded version.

6.579.2.2 static std::string decaf::internal::net::URIEncoderDecoder::encodeOthers (const std::string & *s*) [static]

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars are not preserved.

They are converted into their hexidecimal value prepended by ”.

For example: Euro currency symbol -> "%E2%82%AC".

Parameters

s	- the string to be converted

Returns

the converted string

6.579.2.3 static std::string decaf::internal::net::URIEncoderDecoder::quoteIllegal (const std::string & *s,* const std::string & *legal*) [static]

All characters except letters (’a’..’z’, ’A’..’Z’) and numbers (’0’..’9’) and legal characters are converted into their hexidecimal value prepended by ”.

For example: ’#’ -> %23

Other characters, which are chars that are not US-ASCII, and are not ISO Control or are not ISO Space chars, are preserved.

Parameters

s	- the string to be converted
legal	- the characters allowed to be preserved in the string s

Returns

converted string

6.579.2.4 static void decaf::internal::net::URIEncoderDecoder::validate (const std::string & *s,* const std::string & *legal*) [static]

Validate a string by checking if it contains any characters other than:

1. letters (’a’..’z’, ’A’..’Z’)
2. numbers (’0’..’9’)
3. characters in the legalset parameter
4. characters that are not ISO Control or are not ISO Space characters)

Parameters

s	- the string to be validated
legal	- the characters allowed in the string s

Exceptions

URISyntaxException	if the uri string is not well formed.

6.579.2.5 static void decaf::internal::net::URIEncoderDecoder::validateSimple (const std::string & *s*, const std::string & *legal*) [static]

Validate a string by checking if it contains any characters other than:

1. letters ('a'..'z', 'A'..'Z')
2. numbers ('0'..'9')
3. characters in the legalset parameter

Parameters

s	- the string to be validated
legal	- the characters allowed in the string s

Exceptions

URISyntaxException	if the uri string is not well formed.

6.580 decaf::internal::net::URIHelper Class Reference

Helper class used by the URI classes in encoding and decoding of URI's.

`#include <src/main/decaf/internal/net/URIHelper.h>`

Public Member Functions

- **URIHelper** (**const** std::string &unreserved, **const** std::string &punct, **const** std::string &reserved, **const** std::string &someLegal, **const** std::string &allLegal)

  *Setup the **URIHelper** (p. 2204) with values assigned to the various fields that are used in the validation process.*
- **URIHelper** ()

  Sets up the filter strings with sane defaults.
- virtual ~**URIHelper** ()
- **URIType parseURI** (**const** std::string &uri, bool forceServer)

  Parse the passed in URI.
- void **validateScheme** (**const** std::string &uri, **const** std::string &scheme, int index)

  Validate the schema portin of the URI.
- void **validateSsp** (**const** std::string &uri, **const** std::string &ssp, std::size_t index)

  Validate that the URI Ssp Segment contains no invalid encodings.
- void **validateAuthority** (**const** std::string &uri, **const** std::string &authority, std::size_t index)

  Validate that the URI Authority Segment contains no invalid encodings.
- void **validatePath** (**const** std::string &uri, **const** std::string &path, std::size_t index)

  Validate that the URI Path Segment contains no invalid encodings.

- void **validateQuery** (**const** std::string &uri, **const** std::string &query, std::size_t index)

  Validate that the URI Query Segment contains no invalid encodings.
- void **validateFragment** (**const** std::string &uri, **const** std::string &fragment, std::size_t index)

  Validate that the URI fragment contains no invalid encodings.
- **URIType parseAuthority** (bool forceServer, **const** std::string &authority)

  determine the host, port and user-info if the authority parses successfully to a server based authority
- void **validateUserinfo** (**const** std::string &uri, **const** std::string &userinfo, std::size_t index)

  Check the supplied user info for validity.
- bool **isValidHost** (bool forceServer, **const** std::string &host)

  distinguish between IPv4, IPv6, domain name and validate it based on its type
- bool **isValidDomainName** (**const** std::string &host)

  Validates the string past to determine if it is a well formed domain name.
- bool **isValidIPv4Address** (**const** std::string &host)

  Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.
- bool **isValidIP6Address** (**const** std::string &ipAddress)

  Determines if the given address is valid according to the IPv6 spec.
- bool **isValidIP4Word** (**const** std::string &word)

  Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.
- bool **isValidHexChar** (char c)

  Determines if the given char is a valid Hex char.

6.580.1 Detailed Description

Helper class used by the URI classes in encoding and decoding of URI's.

6.580.2 Constructor & Destructor Documentation

6.580.2.1 decaf::internal::net::URIHelper::URIHelper (const std::string & *unreserved,* const std::string & *punct,* const std::string & *reserved,* const std::string & *someLegal,* const std::string & *allLegal*)

Setup the **URIHelper** (p. 2204) with values assigned to the various fields that are used in the validation process.

The defaults are overridden by these values.

Parameters

unreserved	- characters not reserved for use.
punct	- allowable punctuation symbols.
reserved	- characters not allowed for general use in the URI.
someLegal	- characters that are legal in certain cases.
allLegal	- characters that are always legal.

6.580.2.2 decaf::internal::net::URIHelper::URIHelper ( )

Sets up the filter strings with sane defaults.

6.580.2.3 virtual decaf::internal::net::URIHelper::~URIHelper ( ) [inline, virtual]

6.580.3 Member Function Documentation

6.580.3.1 bool decaf::internal::net::URIHelper::isValidDomainName (const std::string & *host*)

Validates the string past to determine if it is a well formed domain name.

Parameters

host	- domain name to validate.

Returns

true if host is well formed.

6.580.3.2 bool decaf::internal::net::URIHelper::isValidHexChar (char *c*)

Determines if the given char is a valid Hex char.

Valid chars are A-F (upper or lower case) and 0-9.

Parameters

c	- char to inspect

Returns

true if c is a valid hex char.

6.580.3.3 bool decaf::internal::net::URIHelper::isValidHost (bool *forceServer,* const std::string & *host*)

distinguish between IPv4, IPv6, domain name and validate it based on its type

Parameters

forceServer	- true if the forceServer mode should be active.
host	- Host string to validate.

Returns

true if the host value if a valid domain name.

Exceptions

URISyntaxException	if the host is invalid and forceServer is true.

6.580.3.4 bool decaf::internal::net::URIHelper::isValidIP4Word (const std::string & *word*)

Check is the string passed contains a Valid IPv4 word, which is an integer in the range of 0 to 255.

Parameters

word	- string value to check.

Returns

true if the word is a valid IPv4 word.

6.580.3.5 bool decaf::internal::net::URIHelper::isValidIP6Address (const std::string & *ipAddress*)

Determines if the given address is valid according to the IPv6 spec.

Parameters

ipAddress	- string ip address value to validate.

Returns

true if the address string is valid.

6.580.3.6 bool decaf::internal::net::URIHelper::isValidIPv4Address (const std::string & *host*)

Validate if the host value is a well formed IPv4 address, this is the form XXX.XXX.XXX.XXX were X is any number 0-9.

and XXX is not greater than 255.

Parameters

host	- IPv4 address string to parse.

Returns

true if host is a well formed IPv4 address.

6.580.3.7 URIType decaf::internal::net::URIHelper::parseAuthority (bool *forceServer,* const std::string & *authority*)

determine the host, port and user-info if the authority parses successfully to a server based authority

behavior in error cases: if forceServer is true, throw URISyntaxException with the proper diagnostic messages. if forceServer is false assume this is a registry based uri, and just return leaving the host, port and user-info fields undefined.

and there are some error cases where URISyntaxException is thrown regardless of the forceServer parameter e.g. mal-formed ipv6 address

Parameters

forceServer	
authority	

Returns

a **URIType** (p. 2217) instance containing the parsed data.

Exceptions

URISyntaxException	

6.580.3.8 URIType decaf::internal::net::URIHelper::parseURI (const std::string & *uri,* bool *forceServer*)

Parse the passed in URI.

Parameters

uri	- the URI to Parse
forceServer	- if true invalid URI data throws an Exception

Returns

a **URIType** (p. 2217) instance containing the parsed data.

Exceptions

URISyntaxException	if forceServer is true and the URI is invalid.

6.580.3.9 void decaf::internal::net::URIHelper::validateAuthority (const std::string & *uri,* const std::string & *authority,* std::size_t *index*)

Validate that the URI Authority Segment contains no invalid encodings.

Parameters

uri	- the full uri.
authority	- the Authority to check.
index	- position in the uri where Authority starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.10 void decaf::internal::net::URIHelper::validateFragment (const std::string & *uri,* const std::string & *fragment,* std::size_t *index*)

Validate that the URI fragment contains no invalid encodings.

Parameters

uri	- the full uri.
fragment	- the fragment to check.
index	- position in the uri where fragment starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.11 void decaf::internal::net::URIHelper::validatePath (const std::string & *uri,* const std::string & *path,* std::size_t *index*)

Validate that the URI Path Segment contains no invalid encodings.

Parameters

uri	- the full uri.
path	- the path to check.
index	- position in the uri where path starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.12 void decaf::internal::net::URIHelper::validateQuery (const std::string & *uri,* const std::string & *query,* std::size_t *index*)

Validate that the URI Query Segment contains no invalid encodings.

Parameters

uri	- the full uri.
query	- the query to check.
index	- position in the uri where fragment starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.13 void decaf::internal::net::URIHelper::validateScheme (const std::string & *uri,* const std::string & *scheme,* int *index*)

Validate the schema portin of the URI.

Parameters

uri	- the URI to check.
scheme	- the schema section of the URI.
index	- index in uri where schema starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.14 void decaf::internal::net::URIHelper::validateSsp (const std::string & *uri,* const std::string & *ssp,* std::size_t *index*)

Validate that the URI Ssp Segment contains no invalid encodings.

Parameters

uri	- the full uri.
ssp	- the SSP to check.
index	- position in the uri where Ssp starts.

Exceptions

URISyntaxException	if the fragment has errors.

6.580.3.15 void decaf::internal::net::URIHelper::validateUserinfo (const std::string & *uri,* const std::string & *userinfo,* std::size_t *index*)

Check the supplied user info for validity.

Parameters

uri	- the uri to parse.
userinfo	- supplied user info
index	- index into the URI string where the data is located.

Returns

true if valid

Exceptions

URISyntaxException	if an error occurs

The documentation for this class was generated from the following file:

6.581 activemq::transport::failover::URIPool Class Reference

`#include <src/main/activemq/transport/failover/URIPool.h>`

Public Member Functions

- **URIPool** ()

  Create an Empty URI Pool.
- **URIPool** (**const decaf::util::List**< **URI** > &uris)

  Creates a new URI Pool using the given list as the initial Free List.
- ~**URIPool** ()
- **URI getURI** ()

  Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.
- void **addURI** (**const URI** &uri)

  Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.
- void **addURIs** (**const LinkedList**< **URI** > &uris)

  Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.
- void **removeURI** (**const URI** &uri)

  Remove a given URI from the Free List.
- bool **isRandomize** () **const**

  Is the URI that is given randomly picked from the pool or is each one taken in sequence.
- void **setRandomize** (bool value)

  Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

6.581.1 Constructor & Destructor Documentation

6.581.1.1 activemq::transport::failover::URIPool::URIPool ( )

Create an Empty URI Pool.

6.581.1.2 activemq::transport::failover::URIPool::URIPool (const decaf::util::List< URI > & *uris*)

Creates a new URI Pool using the given list as the initial Free List.

Parameters

uris	- List of URI to place in the Pool.

6.581.1.3 activemq::transport::failover::URIPool::~URIPool ( )

6.581.2 Member Function Documentation

6.581.2.1 void activemq::transport::failover::URIPool::addURI (const URI & *uri*)

Adds a URI to the free list, callers that have previously taken one using the `getURI` method should always return the URI when they close the resource that was connected to that URI.

Parameters

uri	- a URI previously taken from the pool.

6.581.2.2 void activemq::transport::failover::URIPool::addURIs (const LinkedList< URI > & *uris*)

Adds a List of URIs to this Pool, the method checks for duplicates already in the pool and does not add those.

Parameters

uris	- List of URIs to add into the Pool.

6.581.2.3 URI activemq::transport::failover::URIPool::getURI ( )

Fetches the next available URI from the pool, if there are no more URIs free when this method is called it throws a NoSuchElementException.

Receiving the exception is not an indication that a URI won't be available in the future, the caller should react accordingly.

Returns

the next free URI in the Pool.

Exceptions

NoSuchElementException	if there are none free currently.

6.581.2.4 bool activemq::transport::failover::URIPool::isRandomize ( ) const [inline]

Is the URI that is given randomly picked from the pool or is each one taken in sequence.

Returns

true if URI gets are random.

6.581.2.5 void activemq::transport::failover::URIPool::removeURI (const URI & *uri*)

Remove a given URI from the Free List.

Parameters

uri	- the URI to find and remove from the free list

6.581.2.6 void activemq::transport::failover::URIPool::setRandomize (bool *value*) [inline]

Sets if the URI's that are taken from the pool are chosen Randomly or are taken in the order they are in the list.

Parameters

value	- true indicates URI gets are random.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**URIPool.h**

6.582 activemq::util::URISupport Class Reference

`#include <src/main/activemq/util/URISupport.h>`

Static Public Member Functions

- static void **parseURL** (**const** std::string &**URI**, **decaf::util::Properties** &properties)

  Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.
- static **CompositeData parseComposite** (**const URI** &uri)

  *Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme:///(uri1,uri2,...uri-N)?param1=value1, each of the composite URIs is stored in the **CompositeData** (p. 690)'s internal list.*
- static **decaf::util::Properties parseQuery** (std::string query)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static void **parseQuery** (std::string query, **decaf::util::Properties** ∗properties)

  Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.
- static std::string **createQueryString** (**const Properties** &options)

  Given a properties object create a string that can be appended to a URI as a valid Query string.

6.582.1 Member Function Documentation

6.582.1.1 static std::string activemq::util::URISupport::createQueryString (const Properties & *options*) [static]

Given a properties object create a string that can be appended to a URI as a valid Query string.

Parameters

options	Properties object containing key / value query values.

Returns

a valid URI query string.

Exceptions

URISyntaxException	if the string in the Properties object can't be encoded into a valid URI Query string.

6.582.1.2 static CompositeData activemq::util::URISupport::parseComposite (const URI & *uri*) [static]

Parses a Composite URI into a Composite Data instance, the Composite URI takes the for scheme://(uri1,uri2,...uri-N)?param1=value1, each of the composite URIs is stored in the **CompositeData** (p. 690)'s internal list.

Parameters

uri	- The Composite URI to parse.

Returns

a new **CompositeData** (p. 690) object with the parsed data

Exceptions

URISyntaxException	if the URI is not well formed.

6.582.1.3 static decaf::util::Properties activemq::util::URISupport::parseQuery (std::string *query*) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query	The query string to parse and extract the encoded properties.

Returns

Properties object with the parsed output.

Exceptions

IllegalArgumentException	if the Query string is not well formed.

6.582.1.4 static void activemq::util::URISupport::parseQuery (std::string *query,* decaf::util::Properties * *properties*) [static]

Parse the Query portion of a URI String and return a Simple Properties object containing the parameter names as keys, and the parameter values and values of the Properties.

Parameters

query	- the query string to parse.
properties	- object pointer to get the parsed output.

Exceptions

IllegalArgumentException	if the Query string is not well formed.

6.582.1.5 static void activemq::util::URISupport::parseURL (const std::string & *URI,* decaf::util::Properties & *properties*) [static]

Parses the properties out of the provided Broker URI and sets them in the passed Properties Object.

Parameters

URI	a Broker URI to parse
properties	a Properties object to set the parsed values in

Exceptions

IllegalArgumentException	if the passed URI is invalid

6.583 decaf::net::URISyntaxException Class Reference

`#include <src/main/decaf/net/URISyntaxException.h>`

Inheritance diagram for decaf::net::URISyntaxException:

Public Member Functions

- **URISyntaxException** () throw ()

  Default Constructor.
- **URISyntaxException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **URISyntaxException** (**const URISyntaxException** &ex) throw ()

  Copy Constructor.
- **URISyntaxException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **URISyntaxException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg **DECAF_UNUSED**) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (**const** char ∗file, **const** int lineNumber, **const** std::string &input, **const** std::string &reason) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **URISyntaxException** (**const** char ∗file, **const** int lineNumber, **const** std::string &input, **const** std::string &reason, int index) throw ()

  Constructor - Initializes the file name and line number where this message occurred.

- virtual **URISyntaxException** * **clone** () **const**

  Clones this exception.
- virtual ~**URISyntaxException** () throw ()
- std::string **getInput** () **const**
- std::string **getReason** () **const**
- int **getIndex** () **const**

6.583.1 Constructor & Destructor Documentation

6.583.1.1 decaf::net::URISyntaxException::URISyntaxException ( ) throw () [inline]

Default Constructor.

6.583.1.2 decaf::net::URISyntaxException::URISyntaxException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.583.1.3 decaf::net::URISyntaxException::URISyntaxException (const URISyntaxException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.583.1.4 decaf::net::URISyntaxException::URISyntaxException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.583.1.5 decaf::net::URISyntaxException::URISyntaxException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.583.1.6 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const char *msg *DECAF_UNUSED*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.583.1.7 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file	The file name where exception occurs.
lineNumber	The line number where the exception occurred.
input	The **URL** (p. 2223) that caused the exception.
reason	The reason for the failure.

6.583.1.8 decaf::net::URISyntaxException::URISyntaxException (const char * *file*, const int *lineNumber*, const std::string & *input*, const std::string & *reason*, int *index*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the input string that caused the error and the reason for the error.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
input	The input **URI** (p. 2191) that caused the exception
reason	The reason for the failure.
index	The index in the **URI** (p. 2191) string where the error occurred.

6.583.1.9 virtual decaf::net::URISyntaxException::~URISyntaxException ( ) throw () [inline, virtual]

6.583.2 Member Function Documentation

6.583.2.1 virtual URISyntaxException* decaf::net::URISyntaxException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::lang::Exception** (p. 992).

6.583.2.2 int decaf::net::URISyntaxException::getIndex ( ) const [inline]

Returns

the index in the input string where the error occured or -1

6.583.2.3 std::string decaf::net::URISyntaxException::getInput ( ) const [inline]

Returns

the Input string that cause this exception or ""

6.583.2.4 std::string decaf::net::URISyntaxException::getReason ( ) const [inline]

Returns

the Reason given for this failure, or ""

The documentation for this class was generated from the following file:

6.584 decaf::internal::net::URIType Class Reference

Basic type object that holds data that composes a given URI.

`#include <src/main/decaf/internal/net/URIType.h>`

Public Member Functions

- **URIType** (**const** std::string &source)
- **URIType** ()
- virtual ~**URIType** ()
- std::string **getSource** () **const**

  *Gets the source URI string that was parsed to obtain this **URIType*** (p. *2217) instance and the resulting data,.*
- void **setSource** (**const** std::string &source)

  *Sets the source URI string that was parsed to obtain this **URIType*** (p. *2217) instance and the resulting data,.*
- std::string **getScheme** () **const**

  Gets the Scheme of the URI, e.g.
- void **setScheme** (**const** std::string &scheme)

Sets the Scheme of the URI, e.g.

- std::string **getSchemeSpecificPart** () **const**

  Gets the Scheme Specific Part of the URI.

- void **setSchemeSpecificPart** (**const** std::string &schemeSpecificPart)

  Sets the Scheme Specific Part of the URI.

- std::string **getAuthority** () **const**

  Gets the Authority of the URI.

- void **setAuthority** (**const** std::string &authority)

  Sets the Authority of the URI.

- std::string **getUserInfo** () **const**

  Gets the user info part of the URI, e.g.

- void **setUserInfo** (**const** std::string &userinfo)

  Sets the user info part of the URI, e.g.

- std::string **getHost** () **const**

  Gets the Host name part of the URI.

- void **setHost** (**const** std::string &host)

  Sets the Host name part of the URI.

- int **getPort** () **const**

  Gets the port part of the URI.

- void **setPort** (int port)

  Sets the port part of the URI.

- std::string **getPath** () **const**

  Gets the Path part of the URI.

- void **setPath** (**const** std::string &path)

  Sets the Path part of the URI.

- std::string **getQuery** () **const**

  Gets the Query part of the URI.

- void **setQuery** (**const** std::string &query)

  Sets the Query part of the URI.

- std::string **getFragment** () **const**

  Gets the Fragment part of the URI.

- void **setFragment** (**const** std::string &fragment)

  Sets the Fragment part of the URI.

- bool **isOpaque** () **const**

  Gets if the URI is Opaque.

- void **setOpaque** (bool opaque)

  Sets if the URI is Opaque.

- bool **isAbsolute** () **const**

  Gets if the URI is Absolute.

- void **setAbsolute** (bool absolute)

  Sets if the URI is Absolute.

- bool **isServerAuthority** () **const**

  Gets if the URI is a Server Authority.

- void **setServerAuthority** (bool serverAuthority)

  Sets if the URI is a Server Authority.

- bool **isValid** () **const**

  Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

- void **setValid** (bool valid)

  Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

6.584.1 Detailed Description

Basic type object that holds data that composes a given URI.

6.584.2 Constructor & Destructor Documentation

6.584.2.1 decaf::internal::net::URIType::URIType (const std::string & *source*) [inline]

6.584.2.2 decaf::internal::net::URIType::URIType ( ) [inline]

6.584.2.3 virtual decaf::internal::net::URIType::~URIType ( ) [inline, virtual]

6.584.3 Member Function Documentation

6.584.3.1 std::string decaf::internal::net::URIType::getAuthority ( ) const [inline]

Gets the Authority of the URI.

Returns

Authority part string.

6.584.3.2 std::string decaf::internal::net::URIType::getFragment ( ) const [inline]

Gets the Fragment part of the URI.

Returns

Fragment part string.

6.584.3.3 std::string decaf::internal::net::URIType::getHost ( ) const [inline]

Gets the Host name part of the URI.

Returns

Host name part string.

6.584.3.4 std::string decaf::internal::net::URIType::getPath ( ) const [inline]

Gets the Path part of the URI.

Returns

Path part string.

6.584.3.5 int decaf::internal::net::URIType::getPort ( ) const [inline]

Gets the port part of the URI.

Returns

port part string, -1 if not set.

6.584.3.6 std::string decaf::internal::net::URIType::getQuery ( ) const [inline]

Gets the Query part of the URI.

Returns

Query part string.

6.584.3.7 std::string decaf::internal::net::URIType::getScheme ( ) const [inline]

Gets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Returns

scheme part string.

6.584.3.8 std::string decaf::internal::net::URIType::getSchemeSpecificPart ( ) const [inline]

Gets the Scheme Specific Part of the URI.

Returns

scheme specific part string.

6.584.3.9 std::string decaf::internal::net::URIType::getSource ( ) const [inline]

Gets the source URI string that was parsed to obtain this **URIType** (p. 2217) instance and the resulting data,.

Returns

the source URI string

6.584.3.10 std::string decaf::internal::net::URIType::getUserInfo ( ) const [inline]

Gets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Returns

user info part string.

6.584.3.11 bool decaf::internal::net::URIType::isAbsolute ( ) const [inline]

Gets if the URI is Absolute.

Returns

true if Absolute.

6.584.3.12 bool decaf::internal::net::URIType::isOpaque ( ) const [inline]

Gets if the URI is Opaque.

Returns

true if opaque.

6.584.3.13 bool decaf::internal::net::URIType::isServerAuthority ( ) const [inline]

Gets if the URI is a Server Authority.

Returns

true if Server Authority.

6.584.3.14 bool decaf::internal::net::URIType::isValid ( ) const [inline]

Gets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Returns

true if the **URIType** (p. 2217) contains valid data.

6.584.3.15 void decaf::internal::net::URIType::setAbsolute (bool *absolute*) [inline]

Sets if the URI is Absolute.

Parameters

absolute	- true if Absolute.

6.584.3.16 void decaf::internal::net::URIType::setAuthority (const std::string & *authority*) [inline]

Sets the Authority of the URI.

Parameters

authority	Authority part string.

6.584.3.17 void decaf::internal::net::URIType::setFragment (const std::string & *fragment*) [inline]

Sets the Fragment part of the URI.

Parameters

fragment	- Fragment part string.

6.584.3.18 void decaf::internal::net::URIType::setHost (const std::string & *host*) [inline]

Sets the Host name part of the URI.

Parameters

host	- Host name part string.

6.584.3.19 void decaf::internal::net::URIType::setOpaque (bool *opaque*) [inline]

Sets if the URI is Opaque.

Parameters

opaque	true if opaque.

6.584.3.20 void decaf::internal::net::URIType::setPath (const std::string & *path*) [inline]

Sets the Path part of the URI.

Parameters

path	- Path part string.

6.584.3.21 void decaf::internal::net::URIType::setPort (int *port*) [inline]

Sets the port part of the URI.

Parameters

port	- port part string, -1 if not set.

6.584.3.22 void decaf::internal::net::URIType::setQuery (const std::string & *query*) [inline]

Sets the Query part of the URI.

Parameters

query	- Query part string.

6.584.3.23 void decaf::internal::net::URIType::setScheme (const std::string & *scheme*) [inline]

Sets the Scheme of the URI, e.g.

scheme ("http"/"ftp"/...).

Parameters

scheme	- scheme part string.

6.584.3.24 void decaf::internal::net::URIType::setSchemeSpecificPart (const std::string & *schemeSpecificPart*) [inline]

Sets the Scheme Specific Part of the URI.

Parameters

schemeSpecific-Part	- scheme specific part string.

6.584.3.25 void decaf::internal::net::URIType::setServerAuthority (bool *serverAuthority*) [inline]

Sets if the URI is a Server Authority.

Parameters

serverAuthority	- true if Server Authority.

6.584.3.26 void decaf::internal::net::URIType::setSource (const std::string & *source*) [inline]

Sets the source URI string that was parsed to obtain this **URIType** (p. 2217) instance and the resulting data,.

Parameters

source	- the source URI string

6.584.3.27 void decaf::internal::net::URIType::setUserInfo (const std::string & *userinfo*) [inline]

Sets the user info part of the URI, e.g.

user name, as in `http://user:passwd@host:port/`

Parameters

userinfo	- user info part string.

6.584.3.28 void decaf::internal::net::URIType::setValid (bool *valid*) [inline]

Sets if the URI is valid, meaning that the source has been set and parsed and all relevant data fields have been set.

Parameters

valid	- true if the **URIType** (p. 2217) contains valid data.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/net/**URIType.h**

6.585 decaf::net::URL Class Reference

Class **URL** (p. 2223) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

`#include <src/main/decaf/net/URL.h>`

Public Member Functions

- **URL** ()
- **URL** (**const** std::string &url)

- virtual ~**URL** ()

6.585.1 Detailed Description

Class **URL** (p. 2223) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.

A resource can be something as simple as a file or a directory, or it can be a reference to a more complicated object, such as a query to a database or to a search engine. More information on the types of URLs and their formats can be found at:

`http://www.ksc.nasa.gov/facts/internet/url-primer.html`

In general, a **URL** (p. 2223) can be broken into several parts. The previous example of a **URL** (p. 2223) indicates that the protocol to use is http (HyperText Transfer Protocol) and that the information resides on a host machine named www.ksc.nasa.gov. The information on that host machine is named /facts/internet/url-primer.html. The exact meaning of this name on the host machine is both protocol dependent and host dependent. The information normally resides in a file, but it could be generated on the fly. This component of the **URL** (p. 2223) is called the path component.

A **URL** (p. 2223) can optionally specify a "port", which is the port number to which the TCP connection is made on the remote host machine. If the port is not specified, the default port for the protocol is used instead. For example, the default port for http is 80. An alternative port could be specified as:

`http://www.ksc.nasa.gov:80/facts/internet/url-primer.html`

The syntax of **URL** (p. 2223) is defined by RFC 2396: Uniform Resource Identifiers (**URI** (p. 2191)): Generic Syntax, amended by RFC 2732: Format for Literal IPv6 Addresses in URLs. The Literal IPv6 address format also supports scope_ids. The syntax and usage of scope_ids is described here.

A **URL** (p. 2223) may have appended to it a "fragment", also known as a "ref" or a "reference". The fragment is indicated by the sharp sign character "#" followed by more characters. For example,

`http://www.apache.org/cms/index.html#chapter1`

This fragment is not technically part of the **URL** (p. 2223). Rather, it indicates that after the specified resource is retrieved, the application is specifically interested in that part of the document that has the tag chapter1 attached to it. The meaning of a tag is resource specific.

An application can also specify a "relative URL", which contains only enough information to reach the resource relative to another **URL** (p. 2223). Relative URLs are frequently used within HTML pages. For example, if the contents of the **URL** (p. 2223):

`http://www.apache.org/cms/index.html`

contained within it the relative **URL** (p. 2223):

FAQ.html

it would be a shorthand for:

`http://www.apache.org/cms/FAQ.html`

The relative **URL** (p. 2223) need not specify all the components of a **URL** (p. 2223). If the protocol, host name, or port number is missing, the value is inherited from the fully specified **URL** (p. 2223). The file component must be specified. The optional fragment is not inherited.

The **URL** (p. 2223) class does not itself encode or decode any **URL** (p. 2223) components according to the escaping mechanism defined in RFC2396. It is the responsibility of the caller to encode any fields, which need to be escaped prior to calling **URL** (p. 2223), and also to decode any escaped fields, that are returned from **URL** (p. 2223). Furthermore, because **URL** (p. 2223) has no knowledge of **URL** (p. 2223) escaping, it does not recognise equivalence between the encoded or decoded form of the same **URL** (p. 2223). For example, the two URLs:

`http://foo.com/hello` world/ and `http://foo.com/hello%20world`

would be considered not equal to each other.

Note, the **URI** (p. 2191) class does perform escaping of its component fields in certain circumstances. The recommended way to manage the encoding and decoding of URLs is to use **URI** (p. 2191), and to convert between these

two classes using toURI() and **URI.toURL()** (p. 2201).

The **URLEncoder** (p. 2225) and **URLDecoder** (p. 2225) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

  Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

6.586.1 Constructor & Destructor Documentation

6.586.1.1 virtual decaf::net::URLDecoder::~URLDecoder ( ) [inline, virtual]

6.586.2 Member Function Documentation

6.586.2.1 static std::string decaf::net::URLDecoder::decode (const std::string & *value*) [static]

Decodes the string argument which is assumed to be encoded in the `x-www-form-urlencoded` MIME content type.

'+' will be converted to space, '' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C $%"

Parameters

value	- string The encoded string.

Returns

The decoded version as a string.

6.587.1.1 virtual decaf::net::URLEncoder::~URLEncoder ( ) [inline, virtual]

6.587.2 Member Function Documentation

6.587.2.1 static std::string decaf::net::URLEncoder::encode (const std::string & *value*) [static]

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencode` MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '*', '_' are converted into their hexidecimal value prepended by ''.

For example: '#' -> %23

In addition, spaces are substituted by '+'

Parameters

value	- the string to be converted

Returns

the converted string

- virtual void **waitForSpace** (unsigned int timeout)=0

  *Waits for more space to be returned to this **Usage** (p. 2226) Manager, times out when the given time span in milliseconds elapses.*
- virtual void **enqueueUsage** (unsigned long long value)=0

  Tries to increase the usage by value amount but blocks if this object is currently full.
- virtual void **increaseUsage** (unsigned long long value)=0

  Increases the usage by the value amount.
- virtual void **decreaseUsage** (unsigned long long value)=0

  Decreases the usage by the value amount.
- virtual bool **isFull** () **const** =0

  *Returns true if this **Usage** (p. 2226) instance is full, i.e.*

6.588.1 Constructor & Destructor Documentation

6.588.1.1 virtual activemq::util::Usage::~Usage ( ) [inline, virtual]

6.588.2 Member Function Documentation

6.588.2.1 virtual void activemq::util::Usage::decreaseUsage (unsigned long long *value*) [pure virtual]

Decreases the usage by the value amount.

Parameters

value	Amount of space to return to the pool

Implemented in **activemq::util::MemoryUsage** (p. 1411).

6.588.2.2 virtual void activemq::util::Usage::enqueueUsage (unsigned long long *value*) [pure virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

Parameters

value	Amount of usage in bytes to add.

Implemented in **activemq::util::MemoryUsage** (p. 1411).

6.588.2.3 virtual void activemq::util::Usage::increaseUsage (unsigned long long *value*) [pure virtual]

Increases the usage by the value amount.

Parameters

value	Amount of usage to add.

Implemented in **activemq::util::MemoryUsage** (p. 1411).

6.588.2.4 virtual bool activemq::util::Usage::isFull ( ) const [pure virtual]

Returns true if this **Usage** (p. 2226) instance is full, i.e.

Usage (p. 2226) >= 100%

Returns

true if **Usage** (p. 2226) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 1412).

6.588.2.5 virtual void activemq::util::Usage::waitForSpace ( ) [pure virtual]

Waits forever for more space to be returned to this **Usage** (p. 2226) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 1412).

6.588.2.6 virtual void activemq::util::Usage::waitForSpace (unsigned int *timeout*) [pure virtual]

Waits for more space to be returned to this **Usage** (p. 2226) Manager, times out when the given time span in milliseconds elapses.

Parameters

timeout	The time to wait for more space.

Implemented in **activemq::util::MemoryUsage** (p. 1412).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**Usage.h**

6.589 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

`#include <src/main/decaf/io/UTFDataFormatException.h>`

Inheritance diagram for decaf::io::UTFDataFormatException:

Public Member Functions

- **UTFDataFormatException** () throw ()

  Default Constructor.
- **UTFDataFormatException** (**const lang::Exception** &ex) throw ()

  Copy Constructor.
- **UTFDataFormatException** (**const UTFDataFormatException** &ex) throw ()

  Copy Constructor.
- **UTFDataFormatException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **UTFDataFormatException** (**const** std::exception ∗**cause**) throw ()

  Constructor.

- **UTFDataFormatException** (**const** char *file, **const** int lineNumber, **const** char *msg,...) throw ()

  Constructor.
- virtual **UTFDataFormatException** * **clone** () **const**

  Clones this exception.
- virtual ~**UTFDataFormatException** () throw ()

6.589.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

Since

1.0

6.589.2 Constructor & Destructor Documentation

6.589.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException ( ) throw () [inline]

Default Constructor.

6.589.2.2 decaf::io::UTFDataFormatException::UTFDataFormatException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.589.2.3 decaf::io::UTFDataFormatException::UTFDataFormatException (const UTFDataFormatException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.589.2.4 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.589.2.5 decaf::io::UTFDataFormatException::UTFDataFormatException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.589.2.6 decaf::io::UTFDataFormatException::UTFDataFormatException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.589.2.7 virtual decaf::io::UTFDataFormatException::~UTFDataFormatException ( ) throw () [inline, virtual]

6.589.3 Member Function Documentation

6.589.3.1 virtual UTFDataFormatException* decaf::io::UTFDataFormatException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UTFDataFormatException.h**

6.590 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 2230)).

`#include <src/main/decaf/util/UUID.h>`

Inheritance diagram for decaf::util::UUID:

Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)

  *Constructs a new **UUID** (p. 2230) using the specified data.*

  *Static factory to retrieve a type 3 (name based) **UUID** (p. 2230) based on the specified byte array.*
- static **UUID fromString** (**const** std::string &name)

  *Creates a **UUID** (p. 2230) from the string standard representation as described in the **toString()** (p. 2235) method.*

6.590.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 2230)).

A **UUID** (p. 2230) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach--Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 2230) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 2230) is as follows: The most significant long consists of the following unsigned fields:

0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000 version 0x0000000000000-FFF time_hi

The least significant long consists of the following unsigned fields:

0xC000000000000000 variant 0x3FFF000000000000 clock_seq 0x0000FFFFFFFFFFFF node

The variant field contains a value which identifies the layout of the **UUID** (p. 2230). The bit layout described above is valid only for a **UUID** (p. 2230) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 2230). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

6.590.2 Constructor & Destructor Documentation

6.590.2.1 decaf::util::UUID::UUID (long long *mostSigBits,* long long *leastSigBits*)

Constructs a new **UUID** (p. 2230) using the specified data.

mostSigBits is used for the most significant 64 bits of the **UUID** (p. 2230) and leastSigBits becomes the least significant 64 bits of the **UUID** (p. 2230).

Parameters

mostSigBits	
leastSigBits	

6.590.2.2 virtual decaf::util::UUID::~UUID ( ) [virtual]

6.590.3 Member Function Documentation

6.590.3.1 virtual int decaf::util::UUID::clockSequence ( ) [virtual]

The clock sequence value associated with this **UUID** (p. 2230).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 2230). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 2230).

The clockSequence value is only meaningful in a time-based **UUID** (p. 2230), which has version type 1. If this **UUID** (p. 2230) is not a time-based **UUID** (p. 2230) then this method throws UnsupportedOperationException.

Returns

the clockSequeunce associated with a V1 **UUID** (p. 2230)

Exceptions

UnsupportedOperation-Exception	if this **UUID** (p. 2230) version does not support this operation.

6.590.3.2 virtual int decaf::util::UUID::compareTo (const UUID & *value*) const [virtual]

Compare the given **UUID** (p. 2230) to this one.

Parameters

value	- the **UUID** (p. 2230) to compare to

6.590.3.3 virtual bool decaf::util::UUID::equals (const UUID & *value*) const [virtual]

Compares this **UUID** (p. 2230) to the one given, returns true if they are equal.

Parameters

value	The **UUID** (p. 2230) to compare to.

Returns

true if UUIDs are the same.

6.590.3.4 static UUID decaf::util::UUID::fromString (const std::string & *name*) [static]

Creates a **UUID** (p. 2230) from the string standard representation as described in the **toString()** (p. 2235) method.

Parameters

name	A string to be used to construct a **UUID** (p. 2230).

Returns

type 3 **UUID** (p. 2230)

Exceptions

IllegalArgumentException	if the **UUID** (p. 2230) string given is invalid.

6.590.3.5 virtual long long decaf::util::UUID::getLeastSignificantBits ( ) const [virtual]

Returns

the most significant 64 bits of this **UUID** (p. 2230)'s 128 bit value.

6.590.3.6 virtual long long decaf::util::UUID::getMostSignificantBits ( ) const [virtual]

Returns

the most significant 64 bits of this **UUID** (p. 2230)'s 128 bit value.

6.590.3.7 static UUID decaf::util::UUID::nameUUIDFromBytes (const std::vector< char > & *name*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 2230) based on the specified byte array.

Parameters

name	A byte array to be used to construct a **UUID** (p. 2230).

Returns

type 3 **UUID** (p. 2230)

6.590.3.8 static UUID decaf::util::UUID::nameUUIDFromBytes (const char * *name*, std::size_t *size*) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 2230) based on the specified byte array.

Parameters

name	A byte array to be used to construct a **UUID** (p. 2230).
size	The size of the byte array, or number of bytes to use.

Returns

type 3 **UUID** (p. 2230)

6.590.3.9 virtual long long decaf::util::UUID::node ( ) [virtual]

The node value associated with this **UUID** (p. 2230).

The 48 bit node value is constructed from the node field of this **UUID** (p. 2230). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 2230) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 2230), which has version type 1. If this **UUID** (p. 2230) is not a time-based **UUID** (p. 2230) then this method throws UnsupportedOperationException.

Returns

the node value of this **UUID** (p. 2230)

Exceptions

UnsupportedOperation-Exception	if this **UUID** (p. 2230) version does not support this operation.

6.590.3.10 virtual bool decaf::util::UUID::operator< (const UUID & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.590.3.11 virtual bool decaf::util::UUID::operator== (const UUID & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

6.590.3.12 static UUID decaf::util::UUID::randomUUID ( ) [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 2230).

The **UUID** (p. 2230) is generated using a cryptographically strong pseudo random number generator.

Returns

type 4 **UUID** (p. 2230)

6.590.3.13 virtual long long decaf::util::UUID::timestamp ( ) [virtual]

The timestamp value associated with this **UUID** (p. 2230).

The 60 bit timestamp value is constructed from the time_low, time_mid, and time_hi fields of this **UUID** (p. 2230). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 2230), which has version type 1. If this **UUID** (p. 2230) is not a time-based **UUID** (p. 2230) then this method throws UnsupportedOperationException.

Returns

the timestamp associated with a V1 **UUID** (p. 2230)

Exceptions

UnsupportedOperation-Exception	if this **UUID** (p. 2230) version does not support this operation.

6.590.3.14 virtual std::string decaf::util::UUID::toString ( ) const [virtual]

Returns a String object representing this **UUID** (p. 2230).

UUID (p. 2230)'s are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

Returns

formatted string for this **UUID** (p. 2230)

6.590.3.15 virtual int decaf::util::UUID::variant ( ) [virtual]

The variant number associated with this **UUID** (p. 2230).

The variant number describes the layout of the **UUID** (p. 2230). The variant number has the following meaning:

```
* 0 Reserved for NCS backward compatibility
* 2 The Leach-Salz variant (used by this class)
* 6 Reserved, Microsoft Corporation backward compatibility
* 7 Reserved for future definition
```

Returns

the variant associated with a V1 **UUID** (p. 2230)

Exceptions

UnsupportedOperation-Exception	if this **UUID** (p. 2230) version does not support this operation.

6.590.3.16 virtual int decaf::util::UUID::version ( ) [virtual]

The version number associated with this **UUID** (p. 2230).

The version number describes how this **UUID** (p. 2230) was generated. The version number has the following meaning:

```
* 1 Time-based UUID
* 2 DCE security UUID
* 3 Name-based UUID
* 4 Randomly generated UUID
```

Returns

the version associated with a V1 **UUID** (p. 2230)

Exceptions

UnsupportedOperation-Exception	if this **UUID** (p. 2230) version does not support this operation.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**UUID.h**

6.591 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

`#include <src/main/activemq/wireformat/WireFormat.h>`

Inheritance diagram for activemq::wireformat::WireFormat:

Public Member Functions

- virtual ~**WireFormat** ()
- virtual void **marshal** (**const Pointer**< **commands::Command** > &command, **const activemq::transport::Transport** *transport, **decaf::io::DataOutputStream** *out)=0

  Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.
- virtual **Pointer** < **commands::Command** > **unmarshal** (**const activemq::transport::Transport** *transport, **decaf::io::DataInputStream** *in)=0

  Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.
- virtual void **setVersion** (int version)=0

  Set the Version.
- virtual int **getVersion** () **const** =0

Get the Version.

- virtual bool **hasNegotiator** () **const** =0

  *Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.*

- virtual bool **inReceive** () **const** =0

  Indicates if the WireFromat object is in the process of receiving a message.

- virtual **Pointer**
  < **transport::Transport** > **createNegotiator** (**const Pointer**< **transport::Transport** > &transport)=0

  If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

6.591.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

Version

Revision:

1.1

6.591.2 Constructor & Destructor Documentation

6.591.2.1 virtual activemq::wireformat::WireFormat::~WireFormat ( ) [inline, virtual]

6.591.3 Member Function Documentation

6.591.3.1 virtual Pointer<transport::Transport> activemq::wireformat::WireFormat::createNegotiator (const Pointer< transport::Transport > & *transport*) [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

Parameters

transport	The Transport to Wrap the Negotiator around.

Returns

new instance of a **WireFormatNegotiator** (p. 2251) as a **Pointer**<**Transport**> (p. 1614).

Exceptions

UnsupportedOperation-Exception	if the **WireFormat** (p. 2236) doesn't have a Negotiator.

Implemented in **activemq::wireformat::stomp::StompWireFormat** (p. 2013), and **activemq::wireformat::openwire::OpenWireFormat** (p. 1587).

6.591.3.2 virtual int activemq::wireformat::WireFormat::getVersion ( ) const [pure virtual]

Get the Version.

Returns

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1588), and **activemq::wireformat::stomp::StompWireFormat** (p. 2014).

6.591.3.3 virtual bool activemq::wireformat::WireFormat::hasNegotiator ( ) const [pure virtual]

Returns true if this **WireFormat** (p. 2236) has a Negotiator that needs to wrap the Transport that uses it.

Returns

true if the **WireFormat** (p. 2236) provides a Negotiator.

Implemented in **activemq::wireformat::stomp::StompWireFormat** (p. 2014), and **activemq::wireformat::openwire::OpenWireFormat** (p. 1589).

6.591.3.4 virtual bool activemq::wireformat::WireFormat::inReceive ( ) const [pure virtual]

Indicates if the WireFromat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 2236) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 2236) instance to determine if its busy or not and not mark the connection as inactive if so.

Returns

true if the **WireFormat** (p. 2236) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1589), and **activemq::wireformat::stomp::StompWireFormat** (p. 2014).

6.591.3.5 virtual void activemq::wireformat::WireFormat::marshal (const Pointer< commands::Command > & *command,* const activemq::transport::Transport * *transport,* decaf::io::DataOutputStream * *out*) [pure virtual]

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

Parameters

command	The Command to Marshal
transport	The Transport that called this method.
out	The output stream to write the command to.

Exceptions

IOException	if an I/O error occurs.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1590), and **activemq::wireformat::stomp::StompWireFormat** (p. 2014).

6.591.3.6 virtual void activemq::wireformat::WireFormat::setVersion (int *version*) [pure virtual]

Set the Version.

Parameters

version	the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1593), and **activemq::wireformat::stomp::StompWireFormat** (p. 2015).

6.591.3.7 virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal (const activemq::transport::Transport * *transport,* decaf::io::DataInputStream * *in*) [pure virtual]

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

Parameters

transport	Pointer to the transport that is making this request.
in	The input stream to read the command from.

Returns

the newly marshaled Command, caller owns the pointer

Exceptions

IOException	if an I/O error occurs.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 1594), and **activemq::wireformat::stomp::StompWireFormat** (p. 2015).

The documentation for this class was generated from the following file:

6.592 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 2239) is the interface that all **WireFormatFactory** (p. 2239) classes must extend.

`#include <src/main/activemq/wireformat/WireFormatFactory.h>`

Inheritance diagram for activemq::wireformat::WireFormatFactory:

Public Member Functions

- virtual ~**WireFormatFactory** ()
- virtual **Pointer**< **WireFormat** > **createWireFormat** (**const decaf::util::Properties** &properties)=0

  *Creates a new **WireFormat** (p. 2236) Object passing it a set of properties from which it can obtain any optional settings.*

6.592.1 Detailed Description

The **WireFormatFactory** (p. 2239) is the interface that all **WireFormatFactory** (p. 2239) classes must extend.

The Factory creates a **WireFormat** (p. 2236) Object based on the properties that are set in the passed `Properties` object.

6.592.2 Constructor & Destructor Documentation

6.592.2.1 virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory ( ) [inline, virtual]

6.592.3 Member Function Documentation

6.592.3.1 virtual Pointer<WireFormat> activemq::wireformat::WireFormatFactory::createWireFormat (const decaf::util::Properties & *properties*) [pure virtual]

Creates a new **WireFormat** (p. 2236) Object passing it a set of properties from which it can obtain any optional settings.

Parameters

properties	The Properties for this **WireFormat** (p. 2236).

Returns

Pointer to a new instance of a **WireFormat** (p. 2236) object.

Exceptions

IllegalStateException	if the factory has not been initialized.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 1595), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 2016).

The documentation for this class was generated from the following file:

6.593 activemq::commands::WireFormatInfo Class Reference

`#include <src/main/activemq/commands/WireFormatInfo.h>`

Inheritance diagram for activemq::commands::WireFormatInfo:

Public Member Functions

- **WireFormatInfo** ()
- virtual ~**WireFormatInfo** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **DataStructure** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

*Returns a string containing the information for this **DataStructure*** (p. *877) such as its type and value of its elements.*

- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure*** (p. *877) passed in to this one, and returns if they are equivalent.*

- virtual bool **isMarshalAware** () **const**

  Determine if the class implementing this interface is really wanting to be told about marshaling.

- virtual **decaf::lang::Pointer** < **commands::Command** > **visit** (**activemq::state::CommandVisitor** ∗visitor) throw (exceptions::ActiveMQException)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

- int **getVersion** () **const**

  Get the current Wireformat Version.

- void **setVersion** (int version)

  Set the current Wireformat Version.

- long long **getMaxInactivityDuration** () **const**

  Returns the currently configured Max Inactivity duration.

- void **setMaxInactivityDuration** (long long maxInactivityDuration)

  Sets the Max inactivity duration value.

- long long **getMaxInactivityDurationInitalDelay** () **const**

  Returns the currently configured Max Inactivity Intial Delay duration.

- void **setMaxInactivityDurationInitalDelay** (long long maxInactivityDurationInitalDelay)

  Sets the Max inactivity initial delay duration value.

- bool **isStackTraceEnabled** () **const**

  Checks if the stackTraceEnabled flag is on.

- void **setStackTraceEnabled** (bool stackTraceEnabled)

  Sets if the stackTraceEnabled flag is on.

- bool **isTcpNoDelayEnabled** () **const**

  Checks if the tcpNoDelayEnabled flag is on.

- void **setTcpNoDelayEnabled** (bool tcpNoDelayEnabled)

  Sets if the tcpNoDelayEnabled flag is on.

- bool **isCacheEnabled** () **const**

  Checks if the cacheEnabled flag is on.

- void **setCacheEnabled** (bool cacheEnabled)

  Sets if the cacheEnabled flag is on.

- int **getCacheSize** () **const**

  Gets the Cache Size setting.

- void **setCacheSize** (int value)

  Sets the Cache Size setting.

- bool **isTightEncodingEnabled** () **const**

  Checks if the tightEncodingEnabled flag is on.

- void **setTightEncodingEnabled** (bool tightEncodingEnabled)

  Sets if the tightEncodingEnabled flag is on.

- bool **isSizePrefixDisabled** () **const**

  Checks if the sizePrefixDisabled flag is on.

- void **setSizePrefixDisabled** (bool sizePrefixDisabled)

  Sets if the sizePrefixDisabled flag is on.

- **const** std::vector< unsigned char > & **getMagic** () **const**

  Get the Magic field.

- void **setMagic** (**const** std::vector< unsigned char > &magic)

  Sets the value of the magic field.

- **const** std::vector< unsigned char > & **getMarshalledProperties** () **const**

  Get the marshalledProperties field.
- void **setMarshalledProperties** (**const** std::vector< unsigned char > &marshalledProperties)

  Sets the value of the marshalledProperties field.
- virtual **const util::PrimitiveMap** & **getProperties** () **const**

  *Gets the Properties for this **Command** (p. 671).*
- virtual **util::PrimitiveMap** & **getProperties** ()

  *Gets the Properties for this **Command** (p. 671).*
- virtual void **setProperties** (**const util::PrimitiveMap** &map)

  *Sets the Properties for this **Command** (p. 671).*

6.593.1 Constructor & Destructor Documentation

6.593.1.1 activemq::commands::WireFormatInfo::WireFormatInfo ( )

6.593.1.2 virtual activemq::commands::WireFormatInfo::~WireFormatInfo ( ) [virtual]

6.593.2 Member Function Documentation

6.593.2.1 virtual void activemq::commands::WireFormatInfo::afterUnmarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.593.2.2 virtual void activemq::commands::WireFormatInfo::beforeMarshal (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*) [virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.593.2.3 virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.593.2.4 virtual void activemq::commands::WireFormatInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.593.2.5 virtual bool activemq::commands::WireFormatInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.593.2.6 int activemq::commands::WireFormatInfo::getCacheSize ( ) const

Gets the Cache Size setting.

Returns

currently set cache size.

6.593.2.7 virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.593.2.8 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic ( ) const [inline]

Get the Magic field.

Returns

const reference to a std::vector<char>

6.593.2.9 const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshalledProperties ( ) const [inline]

Get the marshalledProperties field.

Returns

const reference to a std::vector<char>

6.593.2.10 long long activemq::commands::WireFormatInfo::getMaxInactivityDuration ( ) const

Returns the currently configured Max Inactivity duration.

Returns

the set inactivity duration value.

6.593.2.11 long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitalDelay ( ) const

Returns the currently configured Max Inactivity Intial Delay duration.

Returns

the set inactivity duration initial delay value.

6.593.2.12 virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) const [inline, virtual]

Gets the Properties for this **Command** (p. 671).

Returns

the Properties object for this **Command** (p. 671).

6.593.2.13 virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) [inline, virtual]

Gets the Properties for this **Command** (p. 671).

Returns

the Properties object for this **Command** (p. 671).

6.593.2.14 int activemq::commands::WireFormatInfo::getVersion ( ) const [inline]

Get the current Wireformat Version.

Returns

int that identifies the version

6.593.2.15 bool activemq::commands::WireFormatInfo::isCacheEnabled ( ) const

Checks if the cacheEnabled flag is on.

Returns

true if the flag is on.

6.593.2.16 virtual bool activemq::commands::WireFormatInfo::isMarshalAware ( ) const [inline, virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.593.2.17 bool activemq::commands::WireFormatInfo::isSizePrefixDisabled ( ) const

Checks if the sizePrefixDisabled flag is on.

Returns

true if the flag is on.

6.593.2.18 bool activemq::commands::WireFormatInfo::isStackTraceEnabled ( ) const

Checks if the stackTraceEnabled flag is on.

Returns

true if the flag is on.

6.593.2.19 bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled ( ) const

Checks if the tcpNoDelayEnabled flag is on.

Returns

true if the flag is on.

6.593.2.20 bool activemq::commands::WireFormatInfo::isTightEncodingEnabled ( ) const

Checks if the tightEncodingEnabled flag is on.

Returns

true if the flag is on.

6.593.2.21 bool activemq::commands::WireFormatInfo::isValid ( ) const

Determines if we think this is a Valid **WireFormatInfo** (p. 2240) command.

Returns

true if its valid.

6.593.2.22 virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo ( ) const [inline, virtual]

Returns

answers true to the isWireFormatInfo query

Reimplemented from **activemq::commands::BaseCommand** (p. 385).

6.593.2.23 void activemq::commands::WireFormatInfo::setCacheEnabled (bool *cacheEnabled*)

Sets if the cacheEnabled flag is on.

Parameters

cacheEnabled	- true to turn flag is on

6.593.2.24 void activemq::commands::WireFormatInfo::setCacheSize (int *value*)

Sets the Cache Size setting.

Parameters

value	- value to set to the cache size.

6.593.2.25 void activemq::commands::WireFormatInfo::setMagic (const std::vector< unsigned char > & *magic*) [inline]

Sets the value of the magic field.

Parameters

magic	- const std::vector<char>

6.593.2.26 void activemq::commands::WireFormatInfo::setMarshalledProperties (const std::vector< unsigned char > & *marshalledProperties*) [inline]

Sets the value of the marshalledProperties field.

Parameters

marshalled-Properties	The Byte Array vector that contains the marshaled form of the **Message** (p. 1412) properties, this is the data sent over the wire.

6.593.2.27 void activemq::commands::WireFormatInfo::setMaxInactivityDuration (long long *maxInactivityDuration*)

Sets the Max inactivity duration value.

Parameters

maxInactivity-Duration	- max time a client can be inactive.

6.593.2.28 void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitalDelay (long long *maxInactivityDurationInitalDelay*)

Sets the Max inactivity initial delay duration value.

Parameters

maxInactivity-DurationInital-Delay	- time before the inactivity delay is checked.

6.593.2.29 virtual void activemq::commands::WireFormatInfo::setProperties (const util::PrimitiveMap & *map*) [inline, virtual]

Sets the Properties for this **Command** (p. 671).

Parameters

map	- PrimtiveMap to copy

6.593.2.30 void activemq::commands::WireFormatInfo::setSizePrefixDisabled (bool *sizePrefixDisabled*)

Sets if the sizePrefixDisabled flag is on.

Parameters

sizePrefix-Disabled	- true to turn flag is on

6.593.2.31 void activemq::commands::WireFormatInfo::setStackTraceEnabled (bool *stackTraceEnabled*)

Sets if the stackTraceEnabled flag is on.

Parameters

stackTrace-Enabled	- ture to turn flag is on

6.593.2.32 void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled (bool *tcpNoDelayEnabled*)

Sets if the tcpNoDelayEnabled flag is on.

Parameters

tcpNoDelay-Enabled	- ture to turn flag is on

6.593.2.33 void activemq::commands::WireFormatInfo::setTightEncodingEnabled (bool *tightEncodingEnabled*)

Sets if the tightEncodingEnabled flag is on.

Parameters

tightEncoding-Enabled	- true to turn flag is on

6.593.2.34 void activemq::commands::WireFormatInfo::setVersion (int *version*) [inline]

Set the current Wireformat Version.

Parameters

version	- int that identifies the version

6.593.2.35 virtual std::string activemq::commands::WireFormatInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.593.2.36 virtual decaf::lang::Pointer<commands::Command> activemq::commands::WireFormatInfo::visit (activemq::state::CommandVisitor * *visitor*) throw (exceptions::ActiveMQException) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.593.3 Field Documentation

6.593.3.1 const unsigned char activemq::commands::WireFormatInfo::ID_WIREFORMATINFO = 1 [static]

  Tight Marhsal to the given stream.

6.594.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2248).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.594.2 Constructor & Destructor Documentation

6.594.2.1 activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]

6.594.2.2 virtual activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::∼WireFormatInfoMarshaller ( ) [inline, virtual]

6.594.3 Member Function Documentation

6.594.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.594.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.594.3.3 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.594.3.4 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.594.3.5 virtual int activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.594.3.6 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.594.3.7 virtual void activemq::wireformat::openwire::marshal::generated::WireFormatInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.596.1 Detailed Description

Registry of all **WireFormat** (p. 2236) Factories that are available to the client at runtime.

New **WireFormat** (p. 2236)'s must have a factory registered here before a connection attempt is made.

Since

3.0

6.596.2 Constructor & Destructor Documentation

6.596.2.1 virtual activemq::wireformat::WireFormatRegistry::~WireFormatRegistry ( ) [virtual]

6.596.3 Member Function Documentation

6.596.3.1 WireFormatFactory* activemq::wireformat::WireFormatRegistry::findFactory (const std::string & *name*) const

Gets a Registered **WireFormatFactory** (p. 2239) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

Parameters

name	The name of the Factory to find in the Registry.

Returns

the Factory registered under the given name.

Exceptions

NoSuchElementException	if no factory is registered with that name.

6.596.3.2 static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance ( ) [static]

Gets the single instance of the **WireFormatRegistry** (p. 2252).

Returns

reference to the single instance of this Registry

6.596.3.3 std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames ( ) const

Retrieves a list of the names of all the Registered **WireFormat** (p. 2236)'s in this Registry.

Returns

stl vector of strings with all the **WireFormat** (p. 2236) names registered.

6.596.3.4 void activemq::wireformat::WireFormatRegistry::registerFactory (const std::string & *name,* WireFormatFactory * *factory*)

Registers a new **WireFormatFactory** (p. 2239) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

Parameters

name	The name of the new Factory to register.
factory	The new Factory to add to the Registry.

Exceptions

IllegalArgumentException	is name is the empty string.
NullPointerException	if the Factory is Null.

6.596.3.5 void activemq::wireformat::WireFormatRegistry::unregisterAllFactories ( )

Removes all Factories and deletes the instances of the Factory objects.

6.596.3.6 void activemq::wireformat::WireFormatRegistry::unregisterFactory (const std::string & *name*)

Unregisters the Factory with the given name and deletes that instance of the Factory.

Parameters

name	Name of the Factory to unregister and destroy

6.598.1.1 decaf::io::Writer::Writer ( )

6.598.1.2 virtual decaf::io::Writer::∼Writer ( ) [virtual]

6.598.2 Member Function Documentation

6.598.2.1 virtual decaf::lang::Appendable& decaf::io::Writer::append (char *value*) [virtual]

Appends the specified character to this Appendable.

Parameters

value	The character to append.

Returns

a Reference to this Appendable

Exceptions

Exception	if an error occurs.

Implements **decaf::lang::Appendable** (p. 343).

6.598.2.2 virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * *csq*) [virtual]

Appends the specified character sequence to this Appendable.

Parameters

csq	The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

Returns

a Reference to this Appendable.

Exceptions

Exception	if an error occurs.

Implements **decaf::lang::Appendable** (p. 343).

6.598.2.3 virtual decaf::lang::Appendable& decaf::io::Writer::append (const decaf::lang::CharSequence * *csq,* int *start,* int *end*) [virtual]

Appends a subsequence of the specified character sequence to this Appendable.

Parameters

csq	- The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".
start	The index of the first character in the subsequence.
end	The index of the character following the last character in the subsequence.

Returns

a Reference to this Appendable

Exceptions

Exception	if an error occurs.
IndexOutOfBounds-Exception	start is greater than end, or end is greater than csq.length()

Implements **decaf::lang::Appendable** (p. 344).

6.598.2.4 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendChar (char *value*) [protected, virtual]

6.598.2.5 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequence (const decaf::lang::CharSequence * *csq*) [protected, virtual]

6.598.2.6 virtual decaf::lang::Appendable& decaf::io::Writer::doAppendCharSequenceStartEnd (const decaf::lang::CharSequence * *csq,* int *start,* int *end*) [protected, virtual]

6.598.2.7 virtual void decaf::io::Writer::doWriteArray (const char * *buffer,* int *size*) [protected, virtual]

6.598.2.8 virtual void decaf::io::Writer::doWriteArrayBounded (const char * *buffer,* int *size,* int *offset,* int *length*) [protected, pure virtual]

Override this method to customize the functionality of the method write(char* buffer, int size, int offset, int length).

All subclasses must override this method to provide the basic **Writer** (p. 2255) functionality.

Implemented in **decaf::io::OutputStreamWriter** (p. 1608).

6.598.2.9 virtual void decaf::io::Writer::doWriteChar (char *v*) [protected, virtual]

6.598.2.10 virtual void decaf::io::Writer::doWriteString (const std::string & *str*) [protected, virtual]

6.598.2.11 virtual void decaf::io::Writer::doWriteStringBounded (const std::string & *str,* int *offset,* int *length*) [protected, virtual]

6.598.2.12 virtual void decaf::io::Writer::doWriteVector (const std::vector< char > & *buffer*) [protected, virtual]

6.598.2.13 virtual void decaf::io::Writer::write (char *v*) [virtual]

Writes an single byte char value.

Parameters

v	The value to be written.

Exceptions

IOException *(p. 1198)*	thrown if an error occurs.

6.598.2.14 virtual void decaf::io::Writer::write (const std::vector< char > & *buffer*) [virtual]

Writes an array of Chars.

Parameters

buffer	The array to be written.

Exceptions

IOException *(p. 1198)*	thrown if an error occurs.

6.598.2.15 virtual void decaf::io::Writer::write (const char * *buffer,* int *size*) [virtual]

Writes a byte array to the output stream.

Parameters

buffer	The byte array to write (cannot be NULL).
size	The size in bytes of the buffer passed.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	if buffer is NULL.

6.598.2.16 virtual void decaf::io::Writer::write (const char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Writes a byte array to the output stream.

Parameters

buffer	The byte array to write (cannot be NULL).
size	The size in bytes of the buffer passed.
offset	The position in the array to start writing from.
length	The number of bytes in the array to write.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if offset + length $>$ size of the buffer.

6.598.2.17 virtual void decaf::io::Writer::write (const std::string & *str*) [virtual]

Writes a string.

Parameters

str	The string to be written.

Exceptions

IOException *(p. 1198)*	thrown if an error occurs.

6.598.2.18 virtual void decaf::io::Writer::write (const std::string & *str,* int *offset,* int *length*) [virtual]

Writes a string.

Parameters

str	The string to be written.
offset	The position in the array to start writing from.
length	The number of bytes in the array to write.

Exceptions

IOException *(p. 1198)*	thrown if an error occurs.
IndexOutOfBounds-Exception	if offset+length is greater than the string length.

6.601 cms::XAConnection Class Reference

The **XAConnection** (p. 2262) interface defines an extended **Connection** (p. 725) type that is used to create **XASession** (p. 2275) objects.

`#include <src/main/cms/XAConnection.h>`

Inheritance diagram for cms::XAConnection:

Public Member Functions

- virtual ~**XAConnection** () throw ()
- virtual **XASession** * **createXASession** ()=0

  *Creates an **XASession** (p. 2275) object.*

6.601.1 Detailed Description

The **XAConnection** (p. 2262) interface defines an extended **Connection** (p. 725) type that is used to create **XASession** (p. 2275) objects.

This is an optional interface and CMS providers are allowed to omit an implementation and instead throw an exception from an **XAConnectionFactory** (p. 2263) stub to indicate that XA is not supported.

Since

2.3

6.601.2 Constructor & Destructor Documentation

6.601.2.1 virtual cms::XAConnection::~XAConnection ( ) throw () [virtual]

6.601.3 Member Function Documentation

6.601.3.1 virtual XASession* cms::XAConnection::createXASession ( ) [pure virtual]

Creates an **XASession** (p. 2275) object.

Returns

a newly created **XASession** (p. 2275) instance, caller owns the pointer.

Exceptions

CMSException *(p. 640)*	If the **XAConnection** (p. 2262) object fails to create the **XASession** (p. 2275) instance due to an internal error.

Implemented in **activemq::core::ActiveMQXAConnection** (p. 336).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnection.h**

6.602 cms::XAConnectionFactory Class Reference

The **XAConnectionFactory** (p. 2263) interface is specialized interface that defines an **ConnectionFactory** (p. 741) that creates **Connection** (p. 725) instance that will participate in XA Transactions.

`#include <src/main/cms/XAConnectionFactory.h>`

Inheritance diagram for cms::XAConnectionFactory:

Public Member Functions

- virtual ~**XAConnectionFactory** ()
- virtual **XAConnection** * **createXAConnection** ()=0

  *Creates an **XAConnection** (p. 2262) with the default user name and password.*
- virtual **XAConnection** * **createXAConnection** (**const** std::string &userName, **const** std::string &password)=0

  Creates an XA connection with the specified user name and password.

Static Public Member Functions

- static **XAConnectionFactory** * **createCMSXAConnectionFactory** (**const** std::string &brokerURI)

Static method that is used to create a provider specific XA ***Connection*** *(p. 725) factory.*

6.602.1 Detailed Description

The **XAConnectionFactory** (p. 2263) interface is specialized interface that defines an **ConnectionFactory** (p. 741) that creates **Connection** (p. 725) instance that will participate in XA Transactions.

Some application provide support for grouping XA capable resource use into a distributed transaction (optional). To include CMS API transactions in a XA transaction, an application requires a XA aware library. A CMS provider exposes its XA support using an **XAConnectionFactory** (p. 2263) object, which an application uses to create **XAConnection** (p. 2262) objects.

The **XAConnectionFactory** (p. 2263) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since

2.3

6.602.2 Constructor & Destructor Documentation

6.602.2.1 virtual cms::XAConnectionFactory::~XAConnectionFactory ( ) [virtual]

6.602.3 Member Function Documentation

6.602.3.1 static XAConnectionFactory* cms::XAConnectionFactory::createCMSXAConnectionFactory (const std::string & *brokerURI*) [static]

Static method that is used to create a provider specific XA **Connection** (p. 725) factory.

The provider implements this method in their library and returns an instance of a **XAConnectionFactory** (p. 2263) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

The XA interfaces are optional in CMS however if a provider chooses to omit them it should still override this method and throw an **UnsupportedOperationException** (p. 2190) to indicate that it doesn't provide this functionality.

Parameters

brokerURI	The remote address to use to connect to the Provider.

Returns

A pointer to a provider specific implementation of the **XAConnectionFactory** (p. 2263) interface, the caller is responsible for deleting this resource.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **XAConnectionFactory** (p. 2263).
UnsupportedOperationException *(p. 2190)*	if the provider does not support the XA API.

6.602.3.2 virtual XAConnection* cms::XAConnectionFactory::createXAConnection ( ) [pure virtual]

Creates an **XAConnection** (p. 2262) with the default user name and password.

The connection is created in stopped mode just as the standard **Connection** (p. 725) object is created from the **ConnectionFactory** (p. 741). No messages will be delivered until the **Connection.start** (p. 1964) method is explicitly called.

Returns

a new **XAConnectionFactory** (p. 2263) instance, the caller owns the returned pointer.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **Connection** (p. 725).
CMSSecurityException *(p. 648)*	if the client authentication fails because the user name or password are invalid.

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 337).

6.602.3.3 virtual XAConnection* cms::XAConnectionFactory::createXAConnection (const std::string & *userName,* const std::string & *password*) [pure virtual]

Creates an XA connection with the specified user name and password.

The connection is created in stopped mode just as the standard **ConnectionFactory** (p. 741) creates a new **Connection** (p. 725). No messages will be delivered until the **Connection.start** (p. 1964) method is explicitly called.

Returns

a new **XAConnectionFactory** (p. 2263) instance, the caller owns the returned pointer.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **Connection** (p. 725).
CMSSecurityException *(p. 648)*	if the client authentication fails because the user name or password are invalid.

Implemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 338).

The documentation for this class was generated from the following file:

- src/main/cms/**XAConnectionFactory.h**

6.603 cms::XAException Class Reference

The **XAException** (p. 2265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

`#include <src/main/cms/XAException.h>`

Inheritance diagram for cms::XAException:

Public Member Functions

  *Gets the error code that was assigned to this **XAException** (p. 2265).*

Static Public Attributes

- static **const** int **XA_RBBASE**

  Code which contains the inclusive lower bound of the rollback error codes.
- static **const** int **XA_RBROLLBACK**

  Code which means that the rollback occurred for an unspecified reason.
- static **const** int **XA_RBCOMMFAIL**

  Code which means that rollback was caused by a communication failure.
- static **const** int **XA_RBDEADLOCK**

  Code which means that a failure occurred because a deadlock was detected.
- static **const** int **XA_RBINTEGRITY**

  Code which means that a condition was detected than implies a violation of the integrity of the resource.
- static **const** int **XA_RBOTHER**

  Code which means that the Resource Manager rolled back the transaction branch for a reason not separately listed.
- static **const** int **XA_RBPROTO**

  Code which means that a protocol error occurred in the Resource Manager.
- static **const** int **XA_RBTIMEOUT**

  Code which means that a transaction branch took too long.
- static **const** int **XA_RBTRANSIENT**

  Code which means that the caller may retry the transaction branch.
- static **const** int **XA_RBEND**

  Code which contains the inclusive upper bound of the rollback error codes.
- static **const** int **XA_NOMIGRATE**

  Code which means that resumption must occur where the suspension occurred.
- static **const** int **XA_HEURHAZ**

  Code which means that the transaction branch may have been heuristically completed.
- static **const** int **XA_HEURCOM**

  Code which means that the transaction branch has been heuristically committed.
- static **const** int **XA_HEURRB**

  Code which means that the transaction branch has been heuristically rolled back.
- static **const** int **XA_HEURMIX**

  Code which means that the transaction branch has been heuristically committed and rolled back.
- static **const** int **XA_RETRY**

  Code which means that the method returned with no effect and can be reissued.
- static **const** int **XA_RDONLY**

  Code which means that the transaction branch was read only and has been committed.
- static **const** int **XAER_ASYNC**

  Code which means that there is already an asynchronous operation outstanding.
- static **const** int **XAER_RMERR**

  Code which means that a Resource Manager error has occurred for the transaction branch.
- static **const** int **XAER_NOTA**

Code which means that the XID is not valid.

- static **const** int **XAER_INVAL**

  Code which means that invalid arguments were supplied.

- static **const** int **XAER_PROTO**

  Code which means that the method was invoked in an improper context.

- static **const** int **XAER_RMFAIL**

  Code which means that the Resource Manager is unavailable.

- static **const** int **XAER_DUPID**

  Code which means that the XID already exists.

- static **const** int **XAER_OUTSIDE**

  Work is being done by the Resource Manager outside the boundaries of a global transaction.

6.603.1 Detailed Description

The **XAException** (p. 2265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.

Code which means that a failure occurred because a deadlock was detected.

6.603.4.9 const int cms::XAException::XA_RBEND [static]

Code which contains the inclusive upper bound of the rollback error codes.

6.603.4.10 const int cms::XAException::XA_RBINTEGRITY [static]

Code which means that a condition was detected than implies a violation of the integrity of the resource.

6.603.4.11 const int cms::XAException::XA_RBOTHER [static]

Code which means that the Resource Manager rolled back the transaction branch for a reason not separately listed.

6.603.4.12 const int cms::XAException::XA_RBPROTO [static]

Code which means that a protocol error occurred in the Resource Manager.

6.603.4.13 const int cms::XAException::XA_RBROLLBACK [static]

Code which means that the rollback occurred for an unspecified reason.

6.603.4.14 const int cms::XAException::XA_RBTIMEOUT [static]

Code which means that a transaction branch took too long.

6.603.4.15 const int cms::XAException::XA_RBTRANSIENT [static]

Code which means that the caller may retry the transaction branch.

6.603.4.16 const int cms::XAException::XA_RDONLY [static]

Code which means that the transaction branch was read only and has been committed.

6.603.4.17 const int cms::XAException::XA_RETRY [static]

Code which means that the method returned with no effect and can be reissued.

6.603.4.18 const int cms::XAException::XAER_ASYNC [static]

Code which means that there is already an asynchronous operation outstanding.

6.603.4.19 const int cms::XAException::XAER_DUPID [static]

Code which means that the XID already exists.

6.603.4.20 const int cms::XAException::XAER_INVAL [static]

Code which means that invalid arguments were supplied.

6.603.4.21 const int cms::XAException::XAER_NOTA [static]

Code which means that the XID is not valid.

6.603.4.22 const int cms::XAException::XAER_OUTSIDE [static]

Work is being done by the Resource Manager outside the boundaries of a global transaction.

6.603.4.23 const int cms::XAException::XAER_PROTO [static]

Code which means that the method was invoked in an improper context.

6.603.4.24 const int cms::XAException::XAER_RMERR [static]

Code which means that a Resource Manager error has occurred for the transaction branch.

6.603.4.25 const int cms::XAException::XAER_RMFAIL [static]

Code which means that the Resource Manager is unavailable.

  Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.
- static **const** int **TMJOIN**

  Flag to indicate that the caller is joining sn existing transaction branch.

- static **const** int **TMNOFLAGS**

  Flag that indicates that no flags options are selected.
- static **const** int **TMONEPHASE**

  Flag that indicates the caller is using one-phase commit optimization.
- static **const** int **TMRESUME**

  Flag that indicates the caller is resuming association with a suspended transaction branch.
- static **const** int **TMSTARTRSCAN**

  Flag that indicates the start of a recovery scan.
- static **const** int **TMSUCCESS**

  Flag that indicates the caller is dissociating from a transaction branch.
- static **const** int **TMSUSPEND**

  Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.
- static **const** int **XA_RDONLY**

  Flag that indicates that transaction work has been read only and has been committed normally.
- static **const** int **XA_OK**

  Flag that indicates that transaction work has been Prepared normally.

6.604.1 Detailed Description

The **XAResource** (p. 2269) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).

The XA interface defines the contract between a Resource Manager and a Transaction Manager in a distributed transaction processing (DTP) environment. A CMS provider implements this interface to support the association between a global transaction and a message broker connection.

The **XAResource** (p. 2269) is exposed to CMS client so that they can proxy calls from the Transaction Manager API of their choosing to the CMS provider. The CMS provider should behave and a standard XA Resource Manager its up to the client however to transmit the Transaction Manager's calls to the CMS provider through this interface.

Since

2.3

6.604.2 Constructor & Destructor Documentation

6.604.2.1 virtual cms::XAResource::~XAResource ( ) [virtual]

6.604.3 Member Function Documentation

6.604.3.1 virtual void cms::XAResource::commit (const Xid * *xid*, bool *onePhase*) [pure virtual]

Commits a global transaction.

Parameters

xid	the XID which identifies the global transaction.
onePhase	true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions

XAException *(p. 2265)*	if an error occurred.

Possible errors are identified by the errorcode in the **XAException** (p. 2265) and include: XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. In addition, one of the XA_RB∗ errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 330).

6.604.3.2 virtual void cms::XAResource::end (const Xid ∗ *xid,* int *flags*) [pure virtual]

Ends the work done for a transaction branch.

The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters

xid	the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.
flags	a flags integer - one of: **XAResource::TMSUCCESS** (p. 2275), **XAResource::TMFAIL** (p. 2275), or **XAResource::TMSUSPEND** (p. 2275).

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. **??**) with the TMRESUME flag.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB∗.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 330).

6.604.3.3 virtual void cms::XAResource::forget (const Xid ∗ *xid*) [pure virtual]

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters

xid	the XID which identifies the global transaction.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 331).

6.604.3.4 virtual int cms::XAResource::getTransactionTimeout ( ) const [pure virtual]

Gets the transaction timeout value for this **XAResource** (p. 2269).

The default timeout value is the default timeout value set for the Resource Manager.

Returns

the transaction timeout value for this **XAResource** (p. 2269) in seconds.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 331).

6.604.3.5 virtual bool cms::XAResource::isSameRM (const XAResource * *theXAResource*) [pure virtual]

Returns true if the ResourceManager for this **XAResource** (p. 2269) is the same as the Resource Manager for a supplied **XAResource** (p. 2269).

Parameters

theXAResource	an **XAResource** (p. 2269) object

Returns

true if the Resource Manager for this **XAResource** (p. 2269) is the same as the Resource Manager for `theXAResource`.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 332).

6.604.3.6 virtual int cms::XAResource::prepare (const Xid * *xid*) [pure virtual]

Requests the Resource manager to prepare to commit a specified transaction.

Parameters

xid	the XID which identifies the global transaction.

Returns

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an **XAException** (p. 2265) is raised.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 332).

6.604.3.7 virtual int cms::XAResource::recover (int *flag,* Xid ** *recovered*) [pure virtual]

Get a list of prepared transaction branches.

Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters

flag	an integer. Must be one of: **XAResource::TMSTARTRSCAN** (p. 2275), **XAResource::TMENDRSCAN** (p. 2274), **XAResource::TMNOFLAGS** (p. 2275).

Returns

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_INVAL, and XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 333).

6.604.3.8 virtual void cms::XAResource::rollback (const Xid * *xid*) [pure virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters

xid	the XID which identifies the transaction branch.

Exceptions

XAException *(p. 2265)*	if an error occurs.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 333).

6.604.3.9 virtual bool cms::XAResource::setTransactionTimeout (int *seconds*) [pure virtual]

Sets the transaction timeout value for this **XAResource** (p. 2269).

If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters

seconds	the new Timeout value in seconds.

Returns

true if the transaction timeout value has been updated, false otherwise.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 334).

6.604.3.10 virtual void cms::XAResource::start (const Xid * *xid,* int *flags*) [pure virtual]

Starts work for a specified transaction branch.

Parameters

xid	the XID which identifies the transaction branch.
flags	an integer. Must be one of **XAResource::TMNOFLAGS** (p. 2275), **XAResource::TMJOIN** (p. 2275), or **XAResource::TMRESUME** (p. 2275).

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an **XAException** (p. 2265) is raised with the code XAER_DUPID.

Exceptions

XAException *(p. 2265)*	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implemented in **activemq::core::ActiveMQTransactionContext** (p. 334).

6.604.4 Field Documentation

6.604.4.1 const int cms::XAResource::TMENDRSCAN [static]

Flag to end a recovery scan.

6.604.4.2 const int cms::XAResource::TMFAIL [static]

Flag to indicate that the caller is dissociation from a transaction branch and that it should be marked rollback only.

6.604.4.3 const int cms::XAResource::TMJOIN [static]

Flag to indicate that the caller is joining sn existing transaction branch.

6.604.4.4 const int cms::XAResource::TMNOFLAGS [static]

Flag that indicates that no flags options are selected.

(ie a null flag)

6.604.4.5 const int cms::XAResource::TMONEPHASE [static]

Flag that indicates the caller is using one-phase commit optimization.

6.604.4.6 const int cms::XAResource::TMRESUME [static]

Flag that indicates the caller is resuming association with a suspended transaction branch.

6.604.4.7 const int cms::XAResource::TMSTARTRSCAN [static]

Flag that indicates the start of a recovery scan.

6.604.4.8 const int cms::XAResource::TMSUCCESS [static]

Flag that indicates the caller is dissociating from a transaction branch.

6.604.4.9 const int cms::XAResource::TMSUSPEND [static]

Flag that indicates that the caller is suspending (not terminating) its association with a transaction branch.

6.604.4.10 const int cms::XAResource::XA_OK [static]

Flag that indicates that transaction work has been Prepared normally.

6.604.4.11 const int cms::XAResource::XA_RDONLY [static]

Flag that indicates that transaction work has been read only and has been committed normally.

6.605 cms::XASession Class Reference

The **XASession** (p. 2275) interface extends the capability of **Session** (p. 1830) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

`#include <src/main/cms/XASession.h>`

Inheritance diagram for cms::XASession:

Public Member Functions

- virtual ~**XASession** () throw ()
- virtual **XAResource** * **getXAResource** () **const** =0

  *Returns the XA resource associated with this **Session** (p. 1830) to the caller.*

6.605.1 Detailed Description

The **XASession** (p. 2275) interface extends the capability of **Session** (p. 1830) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).

This support takes the form of a **cms::XAResource** (p. 2269) object. The functionality of this object closely resembles that defined by the standard X/Open XA Resource interface.

An application controls the transactional assignment of an **XASession** (p. 2275) by obtaining its **XAResource** (p. 2269). It uses the **XAResource** (p. 2269) to assign the session to a transaction, prepare and commit work on the transaction, and so on.

An **XAResource** (p. 2269) provides some fairly sophisticated facilities for interleaving work on multiple transactions, recovering a list of transactions in progress, and so on. A XA aware CMS provider must fully implement this functionality.

The **XASession** (p. 2275) instance will behave much like a normal **cms::Session** (p. 1830) however some methods will will not operate as normal, any call to **Session::commit** (p. 1834), or **Session::rollback** (p. 1841) will result in a **CMSException** (p. 640) being thrown. Also when not inside an XA transaction the **MessageConsumer** (p. 1455) will operate as if it were in the AutoAcknowlege mode.

The **XASession** (p. 2275) interface is optional. CMS providers are not required to support this interface. This interface is for use by CMS providers to support transactional environments. Client programs are strongly encouraged to use the transactional support available in their environment, rather than use these XA interfaces directly.

Since

2.3

6.605.2 Constructor & Destructor Documentation

6.605.2.1 virtual cms::XASession::~XASession ( ) throw () [virtual]

6.605.3 Member Function Documentation

6.605.3.1 virtual XAResource* cms::XASession::getXAResource ( ) const [pure virtual]

Returns the XA resource associated with this **Session** (p. 1830) to the caller.

The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns

an XAResouce instance to the caller, the caller does not own this pointer and should not delete it.

Implemented in **activemq::core::ActiveMQXASession** (p. 339).

The documentation for this class was generated from the following file:

6.606.1 Member Typedef Documentation

6.606.1.1 typedef decaf::lang::PointerComparator<XATransactionId> activemq::commands::XATransactionId::COMPARATOR

Reimplemented from **activemq::commands::TransactionId** (p. 2143).

6.606.2 Constructor & Destructor Documentation

6.606.2.1 activemq::commands::XATransactionId::XATransactionId ( )

6.606.2.2 activemq::commands::XATransactionId::XATransactionId (const XATransactionId & *other*)

6.606.2.3 activemq::commands::XATransactionId::XATransactionId (const cms::Xid * *xid*)

6.606.2.4 virtual activemq::commands::XATransactionId::~XATransactionId ( ) [virtual]

6.606.3 Member Function Documentation

6.606.3.1 virtual Xid* activemq::commands::XATransactionId::clone ( ) const [virtual]

Creates a Copy of this Xid instance that contains the same id values.

Returns

a new Xid instance that is equal to this one when compared.

Implements **cms::Xid** (p. 2285).

6.606.3.2 virtual XATransactionId* activemq::commands::XATransactionId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.606.3.3 virtual int activemq::commands::XATransactionId::compareTo (const XATransactionId & *value*) const [virtual]

6.606.3.4 virtual void activemq::commands::XATransactionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.606.3.5 virtual bool activemq::commands::XATransactionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 2144).

6.606.3.6 virtual bool activemq::commands::XATransactionId::equals (const Xid * *other*) const [virtual]

6.606.3.7 virtual bool activemq::commands::XATransactionId::equals (const XATransactionId & *value*) const [virtual]

6.606.3.8 virtual int activemq::commands::XATransactionId::getBranchQualifier (unsigned char * *buffer,* int *size*) const [virtual]

Gets the transaction branch qualifier component of the XID.

The value of this Xid's branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters

buffer	The location in memory to copy the qualifier bytes to.
size	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

XAException	if the size parameter is less than zero or buffer is NULL.

Implements **cms::Xid** (p. 2286).

6.606.3.9 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ( ) const [virtual]

6.606.3.10 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ( ) [virtual]

6.606.3.11 virtual unsigned char activemq::commands::XATransactionId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.606.3.12 virtual int activemq::commands::XATransactionId::getFormatId ( ) const [virtual]

Gets the format identifier component of the XID.

Returns

an integer containing the format identifier. 0 means the OSI CCR format.

Implements **cms::Xid** (p. 2286).

6.606.3.13 virtual int activemq::commands::XATransactionId::getGlobalTransactionId (unsigned char * *buffer*, int *size*) const [virtual]

Gets the global transaction id component of the XID.

The value of this Xid's transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters

buffer	The location in memory to copy the transaction id bytes to.
size	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

XAException	if the size parameter is less than zero or buffer is NULL.

Implements **cms::Xid** (p. 2286).

6.606.3.14 virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ( ) const [virtual]

6.606.3.15 virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ( ) [virtual]

6.606.3.16 virtual bool activemq::commands::XATransactionId::isXATransactionId ( ) const [inline, virtual]

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.606.3.17 virtual bool activemq::commands::XATransactionId::operator< (const XATransactionId & *value*) const [virtual]

6.606.3.18 XATransactionId& activemq::commands::XATransactionId::operator= (const XATransactionId & *other*)

6.606.3.19 virtual bool activemq::commands::XATransactionId::operator== (const XATransactionId & *value*) const [virtual]

6.606.3.20 virtual void activemq::commands::XATransactionId::setBranchQualifier (const std::vector< unsigned char > & *branchQualifier*) [virtual]

6.606.3.21 virtual void **activemq::commands::XATransactionId::setFormatId** (int *formatId*) [virtual]

6.606.3.22 virtual void **activemq::commands::XATransactionId::setGlobalTransactionId** (const std::vector< unsigned char > & *globalTransactionId*) [virtual]

6.606.3.23 virtual std::string **activemq::commands::XATransactionId::toString** ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 2145).

6.606.4 Field Documentation

6.606.4.1 std::vector<unsigned char> **activemq::commands::XATransactionId::branchQualifier** [protected]

6.607 activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller Class Reference

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2281).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/XATransaction-IdMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller:

Public Member Functions

- **XATransactionIdMarshaller** ()
- virtual ~**XATransactionIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight Un-marhsal to the given stream.

- virtual int **tightMarshal1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.

- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.

- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.

- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.607.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2281).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.607.2 Constructor & Destructor Documentation

6.607.2.1 activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::XATransactionIdMarshaller ( ) [inline]

6.607.2.2 virtual activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::∼XATransactionIdMarshaller ( ) [inline, virtual]

6.607.3 Member Function Documentation

6.607.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.607.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.607.3.3 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionId-Marshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2146).

6.607.3.4 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller-::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2147).

6.607.3.5 virtual int activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tight-Marshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2147).

6.607.3.6 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2148).

6.607.3.7 virtual void activemq::wireformat::openwire::marshal::generated::XATransactionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::TransactionIdMarshaller** (p. 2148).

The documentation for this class was generated from the following file:

6.608 cms::Xid Class Reference

An interface which provides a mapping for the X/Open XID transaction identifier structure.

`#include <src/main/cms/Xid.h>`

Inheritance diagram for cms::Xid:

Public Member Functions

- **Xid** ()
- virtual ∼**Xid** ()
- virtual **Xid** ∗ **clone** () **const** =0

  *Creates a Copy of this **Xid** (p. 2285) instance that contains the same id values.*
- virtual bool **equals** (**const Xid** ∗other) **const** =0

  *Compares this **Xid** (p. 2285) to another and returns true if they are the same.*
- virtual int **getBranchQualifier** (unsigned char ∗buffer, int size) **const** =0

  Gets the transaction branch qualifier component of the XID.
- virtual int **getFormatId** () **const** =0

  Gets the format identifier component of the XID.
- virtual int **getGlobalTransactionId** (unsigned char ∗buffer, int size) **const** =0

  Gets the global transaction id component of the XID.

Static Public Attributes

- static **const** int **MAXGTRIDSIZE**

  The maximum number of bytes which will be copied into the array passed to getGlobaltransactionId().
- static **const** int **MAXBQUALSIZE**

  *The maximum number of bytes which will be copied into the array that is passed to **getBranchQualifier()** (p. 2286).*

6.608.1 Detailed Description

An interface which provides a mapping for the X/Open XID transaction identifier structure.

The **Xid** (p. 2285) interface is used by the Transaction Manager and the Resource managers. It is not typically used by application programs directly but the application developer must define a mechanism to map the calls and structures used by the Transaction Manager API in use into the format used by the CMS XA interfaces.

Since

2.3

6.608.2 Constructor & Destructor Documentation

6.608.2.1 cms::Xid::Xid ( )

6.608.2.2 virtual cms::Xid::∼Xid ( ) [virtual]

6.608.3 Member Function Documentation

6.608.3.1 virtual Xid∗ cms::Xid::clone ( ) const [pure virtual]

Creates a Copy of this **Xid** (p. 2285) instance that contains the same id values.

Returns

a new **Xid** (p. 2285) instance that is equal to this one when compared.

Implemented in **activemq::commands::XATransactionId** (p. 2278).

6.608.3.2 virtual bool cms::Xid::equals (const Xid * *other*) const [pure virtual]

Compares this **Xid** (p. 2285) to another and returns true if they are the same.

Returns

true if both **Xid** (p. 2285)'s represent that same id value.

6.608.3.3 virtual int cms::Xid::getBranchQualifier (unsigned char * *buffer,* int *size*) const [pure virtual]

Gets the transaction branch qualifier component of the XID.

The value of this **Xid** (p. 2285)'s branch qualifier is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the branch qualifier then no copy is performed and the method returns -1.

Parameters

buffer	The location in memory to copy the qualifier bytes to.
size	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

XAException *(p. 2265)*	if the size parameter is less than zero or buffer is NULL.

Implemented in **activemq::commands::XATransactionId** (p. 2279).

6.608.3.4 virtual int cms::Xid::getFormatId ( ) const [pure virtual]

Gets the format identifier component of the XID.

Returns

an integer containing the format identifier. 0 means the OSI CCR format.

Implemented in **activemq::commands::XATransactionId** (p. 2280).

6.608.3.5 virtual int cms::Xid::getGlobalTransactionId (unsigned char * *buffer,* int *size*) const [pure virtual]

Gets the global transaction id component of the XID.

The value of this **Xid** (p. 2285)'s transaction id is copied into the buffer provided. If the size of the provided buffer is not large enough to accommodate the transaction id then no copy is performed and the method returns -1.

Parameters

buffer	The location in memory to copy the transaction id bytes to.
size	The size of the buffer provided.

Returns

the number of bytes copied into the buffer, or -1 if the buffer provided was not large enough.

Exceptions

XAException *(p. 2265)*	if the size parameter is less than zero or buffer is NULL.

Implemented in **activemq::commands::XATransactionId** (p. 2280).

6.608.4 Field Documentation

6.608.4.1 const int cms::Xid::MAXBQUALSIZE [static]

The maximum number of bytes which will be copied into the array that is passed to **getBranchQualifier()** (p. 2286).

6.608.4.2 const int cms::Xid::MAXGTRIDSIZE [static]

The maximum number of bytes which will be copied into the array passed to getGlobaltransactionId().

The documentation for this class was generated from the following file:

- src/main/cms/**Xid.h**

6.609 decaf::util::logging::XMLFormatter Class Reference

Format a **LogRecord** (p. 1333) into a standard XML format.

`#include <src/main/decaf/util/logging/XMLFormatter.h>`

Inheritance diagram for decaf::util::logging::XMLFormatter:

Public Member Functions

- **XMLFormatter** ()
- virtual ~**XMLFormatter** ()
- virtual std::string **format** (**const LogRecord** &record) **const**

  *Converts a **LogRecord** (p. 1333) into an XML string.*
- virtual std::string **getHead** (**const Handler** *handler)

  Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.
- virtual std::string **getTail** (**const Handler** *handler)

  Returns the tail string for a set of log records formatted as XML strings.

6.609.1 Detailed Description

Format a **LogRecord** (p. 1333) into a standard XML format.

TODO - Currently only outputs UTF-8 The **XMLFormatter** (p. 2287) can be used with arbitrary character encodings, but it is recommended that it normally be used with UTF-8. The character encoding can be set on the output **Handler** (p. 1085).

Since

6.609.2 Constructor & Destructor Documentation

6.609.2.1 decaf::util::logging::XMLFormatter::XMLFormatter ( )

6.609.2.2 virtual decaf::util::logging::XMLFormatter::~XMLFormatter ( ) [virtual]

6.609.3 Member Function Documentation

6.609.3.1 virtual std::string decaf::util::logging::XMLFormatter::format (const LogRecord & *record*) const [virtual]

Converts a **LogRecord** (p. 1333) into an XML string.

Parameters

record	The log record to be formatted.

Returns

the log record formatted as an XML string.

Implements **decaf::util::logging::Formatter** (p. 1074).

6.609.3.2 virtual std::string decaf::util::logging::XMLFormatter::getHead (const Handler * *handler*) [virtual]

Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

Parameters

handler	The output handler, may be NULL.

Returns

the header string for log records formatted as XML strings.

6.609.3.3 virtual std::string decaf::util::logging::XMLFormatter::getTail (const Handler * *handler*) [virtual]

Returns the tail string for a set of log records formatted as XML strings.

Parameters

handler	The output handler, may be NULL.

Returns

the tail string for log records formatted as XML strings.

6.611 decaf::util::zip::ZipException Class Reference

`#include <src/main/decaf/util/zip/ZipException.h>`

Inheritance diagram for decaf::util::zip::ZipException:

Public Member Functions

- **ZipException** () throw ()
  Default Constructor.
- **ZipException** (**const lang::Exception** &ex) throw ()
  Copy Constructor.
- **ZipException** (**const ZipException** &ex) throw ()
  Copy Constructor.
- **ZipException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **ZipException** (**const** std::exception ∗**cause**) throw ()
  Constructor.
- **ZipException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()
  Constructor.
- virtual **ZipException** ∗ **clone** () **const**
  Clones this exception.
- virtual ∼**ZipException** () throw ()

6.611.1 Constructor & Destructor Documentation

6.611.1.1 decaf::util::zip::ZipException::ZipException ( ) throw ()

Default Constructor.

6.611.1.2 decaf::util::zip::ZipException::ZipException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.611.1.3 decaf::util::zip::ZipException::ZipException (const ZipException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.611.1.4 decaf::util::zip::ZipException::ZipException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.611.1.5 decaf::util::zip::ZipException::ZipException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.611.1.6 decaf::util::zip::ZipException::ZipException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.611.1.7 virtual decaf::util::zip::ZipException::~ZipException ( ) throw () [virtual]

6.611.2 Member Function Documentation

6.611.2.1 virtual ZipException* decaf::util::zip::ZipException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

Defines

- #define **AMQ_CATCH_RETHROW**(type)

  Macro for catching and re-throwing an exception of a given type.
- #define **AMQ_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

  Macro for catching an exception of one type and then re-throwing as another type.
- #define **AMQ_CATCHALL_THROW**(type)

  A catch-all that throws a known exception.
- #define **AMQ_CATCHALL_NOTHROW**()

  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- #define **AMQ_CATCH_NOTHROW**(type)

  Macro for catching and re-throwing an exception of a given type.

7.110.1 Define Documentation

7.110.1.1 #define AMQ_CATCH_EXCEPTION_CONVERT(*sourceType, targetType*)

Value:

```
catch( sourceType& ex ){ \
        targetType target( ex ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then re-throwing as another type.

Parameters

sourceType	the type of the exception to be caught.
targetType	the type of the exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq-::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.110.1.2 #define AMQ_CATCH_NOTHROW(*type*)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type	The type of the exception to throw (e.g. ActiveMQException).

7.110.1.3 #define AMQ_CATCH_RETHROW(*type*)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw; \
    }
```

Macro for catching and re-throwing an exception of a given type.

Parameters

type	The type of the exception to throw (e.g. ActiveMQException).

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq-::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.110.1.4 #define AMQ_CATCHALL_NOTHROW( )

Value:

```
catch( ... ){ \
        activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

7.110.1.5 #define AMQ_CATCHALL_THROW(*type*)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters

type	the type of exception to be thrown.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray(), activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1(), and activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

7.111 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference

Defines

- #define **DECAF_CATCH_RETHROW**(type)

  Macro for catching and rethrowing an exception of a given type.
- #define **DECAF_CATCH_EXCEPTION_CONVERT**(sourceType, targetType)

  Macro for catching an exception of one type and then rethrowing as another type.
- #define **DECAF_CATCHALL_THROW**(type)

  A catch-all that throws a known exception.
- #define **DECAF_CATCHALL_NOTHROW**()

  A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.
- #define **DECAF_CATCH_NOTHROW**(type)

  Macro for catching and rethrowing an exception of a given type.

7.111.1 Define Documentation

7.111.1.1 #define DECAF_CATCH_EXCEPTION_CONVERT(*sourceType, targetType*)

Value:

```
catch( sourceType& ex ){ \
        targetType target( &ex ); \
        target.setMark( __FILE__, __LINE__ ); \
        throw target; \
    }
```

Macro for catching an exception of one type and then rethrowing as another type.

Parameters

sourceType	the type of the exception to be caught.
targetType	the type of the exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add().

7.111.1.2 #define DECAF_CATCH_NOTHROW(*type*)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type	The type of the exception to throw (e.g. Exception).

7.111.1.3 #define DECAF_CATCH_RETHROW(*type*)

Value:

```
catch( type& ex ){ \
        ex.setMark( __FILE__, __LINE__ ); \
        throw; \
    }
```

Macro for catching and rethrowing an exception of a given type.

Parameters

type	The type of the exception to throw (e.g. Exception).

Referenced by decaf::util::PriorityQueue< E >::add(), and decaf::util::concurrent::LinkedBlockingQueue< E >::-LinkedBlockingQueue().

7.111.1.4 #define DECAF_CATCHALL_NOTHROW( )

Value:

```
catch( ... ){ \
        lang::Exception ex( __FILE__, __LINE__, \
            "caught unknown exception, not rethrowing" ); \
    }
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

Referenced by decaf::util::ArrayList< E >::~ArrayList().

7.111.1.5 #define DECAF_CATCHALL_THROW(*type*)

Value:

```
catch( ... ){ \
        type ex( __FILE__, __LINE__, \
            "caught unknown exception" ); \
        throw ex; \
    }
```

A catch-all that throws a known exception.

Parameters

type	the type of exception to be thrown.

Referenced by decaf::util::PriorityQueue< E >::add(), and decaf::util::concurrent::LinkedBlockingQueue< E >::-

LinkedBlockingQueue().

#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **activemq::wireformat::WireFormatRegistry**

  *Registry of all **WireFormat** (p. 2236) Factories that are available to the client at runtime.*

Namespaces

- namespace **activemq**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **activemq::wireformat**

7.263 src/main/cms/BytesMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageEOFException.h>
#include <cms/MessageFormatException.h>
```

Data Structures

- class **cms::BytesMessage**

  *A **BytesMessage** (p. 557) object is used to send a message containing a stream of unsigned bytes.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.264 src/main/cms/Closeable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Closeable**

  Interface for a class that implements the close method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.265 src/main/decaf/io/Closeable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::io::Closeable**

  Interface for a class that implements the close method.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.266 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

Data Structures

- class **cms::CMSException**

  CMS API Exception that is the base for all exceptions thrown from CMS classes.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.267 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

Data Structures

- class **cms::CMSProperties**

  Interface for a Java-like properties object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.268 src/main/cms/CMSSecurityException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::CMSSecurityException**

  This exception must be thrown when a provider rejects a user name/password submitted by a client.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.269 src/main/cms/Connection.h File Reference

```
#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

Data Structures

- class **cms::Connection**

  The client's connection to its provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.270 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/Connection.h>
#include <cms/CMSException.h>
#include <string>
```

Data Structures

- class **cms::ConnectionFactory**

  *Defines the interface for a factory that creates connection objects, the **Connection** (p. 725) objects returned implement the CMS **Connection** (p. 725) interface and hide the CMS Provider specific implementation details behind that interface.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.271 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ConnectionMetaData**

  *A **ConnectionMetaData** (p. 759) object provides information describing the **Connection** (p. 725) object.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.272 src/main/cms/DeliveryMode.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::DeliveryMode**

  This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.273 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

Data Structures

- class **cms::Destination**

  *A **Destination** (p. 936) object encapsulates a provider-specific address.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.274 src/main/cms/ExceptionListener.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::ExceptionListener**

  *If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 996) that is registered with the **Connection** (p. 725).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.275 src/main/cms/IllegalStateException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::IllegalStateException**

  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.276 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::IllegalStateException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

7.277 src/main/cms/InvalidClientIdException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidClientIdException**

  This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.278 src/main/cms/InvalidDestinationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidDestinationException**

  This exception must be thrown when a destination either is not understood by a provider or is no longer valid.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.279 src/main/cms/InvalidSelectorException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::InvalidSelectorException**

  This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.280 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::MapMessage**

  *A **MapMessage** (p. 1379) object is used to send a set of name-value pairs.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.281 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
```

Data Structures

- class **cms::MessageConsumer**

  *A client uses a **MessageConsumer** (p. 1455) to received messages from a destination.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.282 src/main/cms/MessageEnumeration.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEnumeration**

  Defines an object that enumerates a collection of Messages.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.283 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageEOFException**

  *This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2020) or **BytesMessage** (p. 557) is being read.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.284 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageFormatException**

  This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.285 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

Data Structures

- class **cms::MessageListener**

  *A **MessageListener** (p. 1485) object is used to receive asynchronously delivered messages.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.286 src/main/cms/MessageNotReadableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotReadableException**

  This exception must be thrown when a CMS client attempts to read a write-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.287 src/main/cms/MessageNotWriteableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::MessageNotWriteableException**

  This exception must be thrown when a CMS client attempts to write to a read-only message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.288 src/main/cms/MessageProducer.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/Destination.h>
#include <cms/Closeable.h>
#include <cms/CMSException.h>
#include <cms/InvalidDestinationException.h>
#include <cms/MessageFormatException.h>
#include <cms/UnsupportedOperationException.h>
#include <cms/DeliveryMode.h>
```

Data Structures

- class **cms::MessageProducer**

  A client uses a ***MessageProducer*** *(p. 1491)* *object to send messages to a* ***Destination*** *(p. 936)**.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.289 src/main/cms/ObjectMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
```

Data Structures

- class **cms::ObjectMessage**

  Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.290 src/main/cms/Queue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Queue**

  An interface encapsulating a provider-specific queue name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.291 src/main/decaf/util/Queue.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/Iterator.h>
#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/util/NoSuchElementException.h>
```

Data Structures

- class **decaf::util::Queue**< **E** >

  A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**

7.292 src/main/cms/QueueBrowser.h File Reference

```
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageEnumeration.h>
```

Data Structures

- class **cms::QueueBrowser**

  *This class implements in interface for browsing the messages in a **Queue*** (p. 1722) *without removing them.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.293 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>

#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Session**

  *A **Session** (p. 1830) object is a single-threaded context for producing and consuming messages.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.294 src/main/cms/Startable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Startable**

  Interface for a class that implements the start method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.295 src/main/cms/Stoppable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Stoppable**

  Interface for a class that implements the stop method.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.296 src/main/cms/StreamMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWriteableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

Data Structures

- class **cms::StreamMessage**

  *Interface for a **StreamMessage*** (p. *2020*).

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.297 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryQueue**

  *Defines a Temporary **Queue*** (p. *1722*) *based **Destination*** (p. *936*).

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.298 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TemporaryTopic**

  *Defines a Temporary **Topic*** (p. *2141*) *based **Destination*** (p. *936*).

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.299 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

Data Structures

- class **cms::TextMessage**

  Interface for a text message.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.300 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Topic**

  An interface encapsulating a provider-specific topic name.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.301 src/main/cms/TransactionInProgressException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TransactionInProgressException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.302 src/main/cms/TransactionRolledBackException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::TransactionRolledBackException**

  This exception must be thrown when a call to ***Session.commit*** (p. *1834*) *results in a rollback of the current transaction.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.303 src/main/cms/UnsupportedOperationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::UnsupportedOperationException**

  This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.304 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

- namespace **decaf::lang::exceptions**

7.305 src/main/cms/XAConnection.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
#include <cms/Connection.h>
#include <cms/XASession.h>
```

Data Structures

- class **cms::XAConnection**

  *The **XAConnection** (p. 2262) interface defines an extended **Connection** (p. 725) type that is used to create **XASession** (p. 2275) objects.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.306 src/main/cms/XAConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/XAConnection.h>
#include <cms/XAException.h>
```

Data Structures

- class **cms::XAConnectionFactory**

  *The **XAConnectionFactory** (p. 2263) interface is specialized interface that defines an **ConnectionFactory** (p. 741) that creates **Connection** (p. 725) instance that will participate in XA Transactions.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.307 src/main/cms/XAException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::XAException**

  *The **XAException** (p. 2265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.308 src/main/cms/XAResource.h File Reference

```
#include <cms/Config.h>
#include <cms/Xid.h>
#include <cms/XAException.h>
```

Data Structures

- class **cms::XAResource**

  *The **XAResource** (p. 2269) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.309 src/main/cms/XASession.h File Reference

```
#include <cms/Config.h>
#include <cms/Session.h>
#include <cms/XAResource.h>
```

Data Structures

- class **cms::XASession**

  *The **XASession** (p. 2275) interface extends the capability of **Session** (p. 1830) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).*

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.310 src/main/cms/Xid.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

Data Structures

- class **cms::Xid**

  An interface which provides a mapping for the X/Open XID transaction identifier structure.

Namespaces

- namespace **cms**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

7.311 src/main/decaf/internal/AprPool.h File Reference

```
#include <decaf/util/Config.h>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::AprPool**

  Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.312 src/main/decaf/internal/DecafRuntime.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/Runtime.h>
#include <decaf/util/concurrent/Mutex.h>
#include <apr_pools.h>
```

Data Structures

- class **decaf::internal::DecafRuntime**

  Handles APR initialization and termination.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**

7.313 src/main/decaf/internal/io/StandardErrorOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
```

Data Structures

- class **decaf::internal::io::StandardErrorOutputStream**

  Wrapper Around the Standard error Output facility on the current platform.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::internal**
- namespace **decaf::internal::io**

7.314 src/main/decaf/internal/io/StandardInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/InputStream.h>
```

Data Structures

- class **decaf::internal::io::StandardInputStream**

Namespaces

7.374 src/main/decaf/io/BlockingByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <vector>
```

Data Structures

- class **decaf::io::BlockingByteArrayInputStream**
  This is a blocking version of a byte buffer stream.

Namespaces

- namespace **decaf**
  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.375 src/main/decaf/io/BufferedInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedInputStream**

  A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.376 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

Data Structures

- class **decaf::io::BufferedOutputStream**

  Wrapper around another output stream that buffers output before writing to the target output stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.377 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
```

Data Structures

- class **decaf::io::ByteArrayInputStream**

  *A **ByteArrayInputStream** (p. 527) contains an internal buffer that contains bytes that may be read from the stream.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.378 src/main/decaf/io/ByteArrayOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <utility>
```

Data Structures

- class **decaf::io::ByteArrayOutputStream**

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.379 src/main/decaf/io/DataInput.h File Reference

```
#include <decaf/util/Config.h>
#include <vector>
#include <string>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::DataInput**

  *The **DataInput** (p. 842) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.380 src/main/decaf/io/DataInputStream.h File Reference

```
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

Data Structures

- class **decaf::io::DataInputStream**

  A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::io**

7.381 src/main/decaf/io/DataOutput.h File Reference

```
#include <decaf/util/Config.h>
#include <vector>

Defines

- #define **WAIT_INFINITE** 0xFFFFFFFF

  The synchronized macro defines a mechanism for synchronizing a section of code.
- #define **synchronized**(W)

7.523.1 Define Documentation

7.523.1.1 #define synchronized(*W*)

Value:

```
if(false){}                                                    \
        else                                                        \
        for( decaf::util::concurrent::Lock lock_W(W);               \
             lock_W.isLocked(); lock_W.unlock() )
```

7.523.1.2 #define WAIT_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of code.

The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compiles restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

somefunction() { **synchronized(X)** (p. 2533) { // Do something that needs synchronizing. } }

7.524 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference

#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Checksum**

  *An interface used to represent **Checksum** (p. 628) values in the Zip package.*

7.597 src/main/decaf/util/zip/CRC32.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/zip/Checksum.h>
```

Data Structures

- class **decaf::util::zip::CRC32**

  Class that can be used to compute a CRC-32 checksum for a data stream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.598 src/main/decaf/util/zip/DataFormatException.h File Reference

```
#include <decaf/lang/Exception.h>
```

Data Structures

- class **decaf::util::zip::DataFormatException**

Namespaces

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.599 src/main/decaf/util/zip/Deflater.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Deflater**

  This class compresses data using the DEFLATE algorithm (see `specification`*).*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.600 src/main/decaf/util/zip/DeflaterOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Deflater.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::DeflaterOutputStream**

  Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.601 src/main/decaf/util/zip/Inflater.h File Reference

```
#include <decaf/util/Config.h>
```

```
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/util/zip/DataFormatException.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::Inflater**

  This class uncompresses data that was compressed using the DEFLATE algorithm (see `specification`*).*

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.602 src/main/decaf/util/zip/InflaterInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Inflater.h>
#include <vector>
```

Data Structures

- class **decaf::util::zip::InflaterInputStream**

  A FilterInputStream that decompresses data read from the wrapped InputStream instance.

Namespaces

- namespace **decaf**

  Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.
- namespace **decaf::util**
- namespace **decaf::util::zip**

7.603 src/main/decaf/util/zip/ZipException.h File Reference

```
#include <decaf/io/IOException.h>
```

Data Structures

- class **decaf::util::zip::ZipException**
