5.2 activemq::cmsutil Namespace Reference

Data Structures

- class **CachedConsumer**

  A cached message consumer contained within a pooled session.
- class **CachedProducer**

A cached message producer contained within a pooled session.

- class **CmsAccessor**

  *Base class for **activemq.cmsutil.CmsTemplate** (p. 649) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 741) to operate on.*

- class **CmsDestinationAccessor**

  *Extends the **CmsAccessor** (p. 635) to add support for resolving destination names.*

- class **CmsTemplate**

  ***CmsTemplate** (p. 649) simplifies performing synchronous CMS operations.*

- class **DestinationResolver**

  Resolves a CMS destination name to a `Destination`.

- class **DynamicDestinationResolver**

  Resolves a CMS destination name to a `Destination`.

- class **MessageCreator**

  *Creates the user-defined message to be sent by the **CmsTemplate** (p. 649).*

- class **PooledSession**

  A pooled session object that wraps around a delegate session.

- class **ProducerCallback**

  Callback for sending a message to a CMS destination.

- class **ResourceLifecycleManager**

  Manages the lifecycle of a set of CMS resources.

- class **SessionCallback**

  Callback for executing any number of operations on a provided CMS Session.

- class **SessionPool**

  A pool of CMS sessions from the same connection and with the same acknowledge mode.

5.3 activemq::commands Namespace Reference

Data Structures

- class **ActiveMQBlobMessage**
- class **ActiveMQBytesMessage**
- class **ActiveMQDestination**
- class **ActiveMQMapMessage**
- class **ActiveMQMessage**
- class **ActiveMQMessageTemplate**
- class **ActiveMQObjectMessage**
- class **ActiveMQQueue**
- class **ActiveMQStreamMessage**
- class **ActiveMQTempDestination**
- class **ActiveMQTempQueue**
- class **ActiveMQTempTopic**
- class **ActiveMQTextMessage**
- class **ActiveMQTopic**
- class **BaseCommand**
- class **BaseDataStructure**
- class **BooleanExpression**
- class **BrokerError**

  This class represents an Exception sent from the Broker.

- class **BrokerId**
- class **BrokerInfo**
- class **Command**

- class **ConnectionControl**
- class **ConnectionError**
- class **ConnectionId**
- class **ConnectionInfo**
- class **ConsumerControl**
- class **ConsumerId**
- class **ConsumerInfo**
- class **ControlCommand**
- class **DataArrayResponse**
- class **DataResponse**
- class **DataStructure**
- class **DestinationInfo**
- class **DiscoveryEvent**
- class **ExceptionResponse**
- class **FlushCommand**
- class **IntegerResponse**
- class **JournalQueueAck**
- class **JournalTopicAck**
- class **JournalTrace**
- class **JournalTransaction**
- class **KeepAliveInfo**
- class **LastPartialCommand**
- class **LocalTransactionId**
- class **Message**
- class **MessageAck**
- class **MessageDispatch**
- class **MessageDispatchNotification**
- class **MessageId**
- class **MessagePull**
- class **NetworkBridgeFilter**
- class **PartialCommand**
- class **ProducerAck**
- class **ProducerId**
- class **ProducerInfo**
- class **RemoveInfo**
- class **RemoveSubscriptionInfo**
- class **ReplayCommand**
- class **Response**
- class **SessionId**
- class **SessionInfo**
- class **ShutdownInfo**
- class **SubscriptionInfo**
- class **TransactionId**
- class **TransactionInfo**
- class **WireFormatInfo**
- class **XATransactionId**

5.4 activemq::core Namespace Reference

Namespaces

- namespace **policies**

Data Structures

- class **ActiveMQAckHandler**

  Interface class that is used to give CMS Messages an interface to Ack themselves with.
- class **ActiveMQConnection**

  Concrete connection used for all connectors to the ActiveMQ broker.
- class **ActiveMQConnectionFactory**
- class **ActiveMQConnectionMetaData**

  *This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 145) class.*
- class **ActiveMQConstants**

  Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values.
- class **ActiveMQConsumer**
- class **ActiveMQProducer**
- class **ActiveMQQueueBrowser**
- class **ActiveMQSession**
- class **ActiveMQSessionExecutor**

  Delegate dispatcher for a single session.
- class **ActiveMQTransactionContext**

  Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.
- class **ActiveMQXAConnection**
- class **ActiveMQXAConnectionFactory**
- class **ActiveMQXASession**
- class **DispatchData**

  Simple POCO that contains the information necessary to route a message to a specified consumer.
- class **Dispatcher**

  Interface for an object responsible for dispatching messages to consumers.
- class **FifoMessageDispatchChannel**
- class **MessageDispatchChannel**
- class **PrefetchPolicy**

  Interface for a Policy object that controls message Prefetching on various destination types in ActiveMQ-CPP.
- class **RedeliveryPolicy**

  *Interface for a **RedeliveryPolicy** (p. 1744) object that controls how message Redelivery is handled in ActiveMQ-CPP when a transaction is rolled back.*
- class **SimplePriorityMessageDispatchChannel**
- class **Synchronization**

  *Transacted Object **Synchronization** (p. 2056), used to sync the events of a Transaction with the items in the Transaction.*

5.5 activemq::core::policies Namespace Reference

Data Structures

- class **DefaultPrefetchPolicy**
- class **DefaultRedeliveryPolicy**

5.6 activemq::exceptions Namespace Reference

Data Structures

- class **ActiveMQException**
- class **BrokerException**
- class **ConnectionFailedException**

5.7 activemq::io Namespace Reference

Data Structures

- class **LoggingInputStream**
- class **LoggingOutputStream**

  OutputStream filter that just logs the data being written.

5.8 activemq::library Namespace Reference

Data Structures

- class **ActiveMQCPP**

5.9 activemq::state Namespace Reference

Data Structures

- class **CommandVisitor**

  Interface for an Object that can visit the various Command Objects that are sent from and to this client.
- class **CommandVisitorAdapter**

  *Default Implementation of a **CommandVisitor** (p. 675) that returns NULL for all calls.*
- class **ConnectionState**
- class **ConnectionStateTracker**
- class **ConsumerState**
- class **ProducerState**
- class **SessionState**
- class **Tracked**
- class **TransactionState**

5.10 activemq::threads Namespace Reference

Data Structures

- class **CompositeTask**

  *Represents a single task that can be part of a set of Tasks that are contained in a **CompositeTaskRunner** (p. 693).*
- class **CompositeTaskRunner**

  *A **Task** (p. 2073) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.*
- class **DedicatedTaskRunner**

- class **Scheduler**

  Scheduler *(p. 1796) class for use in executing Runnable Tasks either periodically or one time only with optional delay.*
- class **SchedulerTimerTask**

  Extension of the Decaf TimerTask that adds a Runnable instance which is the target of this task.
- class **Task**

  Represents a unit of work that requires one or more iterations to complete.
- class **TaskRunner**

5.11 activemq::transport Namespace Reference

Namespaces

- namespace **correlator**
- namespace **failover**
- namespace **inactivity**
- namespace **logging**
- namespace **mock**
- namespace **tcp**

Data Structures

- class **AbstractTransportFactory**

  Abstract implementation of the ***TransportFactory*** *(p. 2167) interface, providing the base functionality that's common to most of the* ***TransportFactory*** *(p. 2167) instances.*
- class **CompositeTransport**

  A Composite ***Transport*** *(p. 2161) is a* ***Transport*** *(p. 2161) implementation that is composed of several Transports.*
- class **DefaultTransportListener**

  A Utility class that create empty implementations for the ***TransportListener*** *(p. 2176) interface so that a subclass only needs to override the one's its interested.*
- class **IOTransport**

  Implementation of the ***Transport*** *(p. 2161) interface that performs marshaling of commands to IO streams.*
- class **Transport**

  Interface for a transport layer for command objects.
- class **TransportFactory**

  Defines the interface for Factories that create Transports or TransportFilters.
- class **TransportFilter**

  A filter on the transport layer.
- class **TransportListener**

  A listener of asynchronous exceptions from a command transport object.
- class **TransportRegistry**

  Registry of all ***Transport*** *(p. 2161) Factories that are available to the client at runtime.*

5.12 activemq::transport::correlator Namespace Reference

Data Structures

- class **FutureResponse**

  A container that holds a response object.
- class **ResponseCorrelator**

  This type of transport filter is responsible for correlating asynchronous responses with requests.

5.13 activemq::transport::failover Namespace Reference

Data Structures

- class **BackupTransport**
- class **BackupTransportPool**
- class **CloseTransportsTask**
- class **FailoverTransport**
- class **FailoverTransportFactory**

  *Creates an instance of a **FailoverTransport** (p. 1010).*
- class **FailoverTransportListener**

  *Utility class used by the **Transport** (p. 2161) to perform the work of responding to events from the active **Transport** (p. 2161).*
- class **URIPool**

5.14 activemq::transport::inactivity Namespace Reference

Data Structures

- class **InactivityMonitor**
- class **ReadChecker**

  Runnable class that is used by the {.
- class **WriteChecker**

  Runnable class used by the {.

5.15 activemq::transport::logging Namespace Reference

Data Structures

- class **LoggingTransport**

  A transport filter that logs commands as they are sent/received.

5.16 activemq::transport::mock Namespace Reference

Data Structures

- class **InternalCommandListener**

  *Listens for Commands sent from the **MockTransport** (p. 1509).*
- class **MockTransport**

  *The **MockTransport** (p. 1509) defines a base level **Transport** (p. 2161) class that is intended to be used in place of an a regular protocol **Transport** (p. 2161) suck as TCP.*
- class **MockTransportFactory**

  Manufactures MockTransports, which are objects that read from input streams and write to output streams.
- class **ResponseBuilder**

  Interface for all Protocols to implement that defines the behavior of the Broker in response to messages of that protocol.

5.17 activemq::transport::tcp Namespace Reference

Data Structures

- class **SslTransport**

  Transport *(p. 2161) for connecting to a Broker using an SSL Socket.*
- class **SslTransportFactory**
- class **TcpTransport**

  Implements a TCP/IP based transport filter, this transport is meant to wrap an instance of an ***IOTransport*** *(p. 1200).*
- class **TcpTransportFactory**

  Factory Responsible for creating the ***TcpTransport*** *(p. 2086).*

5.18 activemq::util Namespace Reference

Data Structures

- class **ActiveMQProperties**

  Implementation of the CMSProperties interface that delegates to a ***decaf::util::Properties*** *(p. 1705) object.*
- class **CMSExceptionSupport**
- class **CompositeData**

  Represents a Composite URI.
- class **IdGenerator**
- class **LongSequenceGenerator**

  This class is used to generate a sequence of long long values that are incremented each time a new value is requested.
- class **MarshallingSupport**
- class **MemoryUsage**
- class **PrimitiveList**

  List of primitives.
- class **PrimitiveMap**

  Map of named primitives.
- class **PrimitiveValueConverter**

  Class controls the conversion of data contained in a ***PrimitiveValueNode*** *(p. 1662) from one type to another.*
- class **PrimitiveValueNode**

  Class that wraps around a single value of one of the many types.
- class **Service**

  Base interface for all classes that run as a ***Service*** *(p. 1826) inside the application.*
- class **ServiceListener**

  Listener interface for observers of ***Service*** *(p. 1826) related events.*
- class **ServiceStopper**
- class **ServiceSupport**

  Provides a base class for ***Service*** *(p. 1826) implementations.*
- class **URISupport**
- class **Usage**

5.19 activemq::wireformat Namespace Reference

Namespaces

- namespace **openwire**
- namespace **stomp**

Data Structures

- class **MarshalAware**
- class **WireFormat**

  Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.
- class **WireFormatFactory**

  *The **WireFormatFactory** (p. 2239) is the interface that all **WireFormatFactory** (p. 2239) classes must extend.*
- class **WireFormatNegotiator**

  *Defines a **WireFormatNegotiator** (p. 2251) which allows a **WireFormat** (p. 2236) to.*
- class **WireFormatRegistry**

  *Registry of all **WireFormat** (p. 2236) Factories that are available to the client at runtime.*

5.20 activemq::wireformat::openwire Namespace Reference

Namespaces

- namespace **marshal**
- namespace **utils**

Data Structures

- class **OpenWireFormat**
- class **OpenWireFormatFactory**
- class **OpenWireFormatNegotiator**
- class **OpenWireResponseBuilder**

  Used to allow a MockTransport to generate response commands to OpenWire Commands.

5.21 activemq::wireformat::openwire::marshal Namespace Reference

Namespaces

- namespace **generated**

Data Structures

- class **BaseDataStreamMarshaller**

  Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.
- class **DataStreamMarshaller**

  Base class for all classes that marshal commands for Openwire.
- class **PrimitiveTypesMarshaller**

  This class wraps the functionality needed to marshal a primitive map to the Openwire Format's expectation of what the map looks like on the wire.

5.22 activemq::wireformat::openwire::marshal::generated Namespace Reference

Data Structures

- class **ActiveMQBlobMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 126).*
- class **ActiveMQBytesMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 142).*
- class **ActiveMQDestinationMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQDestinationMarshaller** (p. 200).*
- class **ActiveMQMapMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 220).*
- class **ActiveMQMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQMessageMarshaller** (p. 225).*
- class **ActiveMQObjectMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 235).*
- class **ActiveMQQueueMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 255).*
- class **ActiveMQStreamMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 290).*
- class **ActiveMQTempDestinationMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 296).*
- class **ActiveMQTempQueueMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 303).*
- class **ActiveMQTempTopicMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 310).*
- class **ActiveMQTextMessageMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQTextMessageMarshaller** (p. 318).*
- class **ActiveMQTopicMarshaller**

  *Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 324).*
- class **BaseCommandMarshaller**

  *Marshaling code for Open Wire Format for **BaseCommandMarshaller** (p. 386).*
- class **BrokerIdMarshaller**

  *Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 440).*
- class **BrokerInfoMarshaller**

  *Marshaling code for Open Wire Format for **BrokerInfoMarshaller** (p. 448).*
- class **ConnectionControlMarshaller**

  *Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 732).*
- class **ConnectionErrorMarshaller**

  *Marshaling code for Open Wire Format for **ConnectionErrorMarshaller** (p. 738).*
- class **ConnectionIdMarshaller**

  *Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 748).*
- class **ConnectionInfoMarshaller**

  *Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 756).*
- class **ConsumerControlMarshaller**

  *Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 773).*
- class **ConsumerIdMarshaller**

  *Marshaling code for Open Wire Format for **ConsumerIdMarshaller** (p. 779).*
- class **ConsumerInfoMarshaller**

  *Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 789).*
- class **ControlCommandMarshaller**

*Marshaling code for Open Wire Format for **ControlCommandMarshaller** (p. 795).*

- class **DataArrayResponseMarshaller**

  *Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 831).*
- class **DataResponseMarshaller**

  *Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 865).*
- class **DestinationInfoMarshaller**

  *Marshaling code for Open Wire Format for **DestinationInfoMarshaller** (p. 943).*
- class **DiscoveryEventMarshaller**

  *Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 952).*
- class **ExceptionResponseMarshaller**

  *Marshaling code for Open Wire Format for **ExceptionResponseMarshaller** (p. 999).*
- class **FlushCommandMarshaller**

  *Marshaling code for Open Wire Format for **FlushCommandMarshaller** (p. 1070).*
- class **IntegerResponseMarshaller**

  *Marshaling code for Open Wire Format for **IntegerResponseMarshaller** (p. 1177).*
- class **JournalQueueAckMarshaller**

  *Marshaling code for Open Wire Format for **JournalQueueAckMarshaller** (p. 1213).*
- class **JournalTopicAckMarshaller**

  *Marshaling code for Open Wire Format for **JournalTopicAckMarshaller** (p. 1219).*
- class **JournalTraceMarshaller**

  *Marshaling code for Open Wire Format for **JournalTraceMarshaller** (p. 1224).*
- class **JournalTransactionMarshaller**

  *Marshaling code for Open Wire Format for **JournalTransactionMarshaller** (p. 1230).*
- class **KeepAliveInfoMarshaller**

  *Marshaling code for Open Wire Format for **KeepAliveInfoMarshaller** (p. 1236).*
- class **LastPartialCommandMarshaller**

  *Marshaling code for Open Wire Format for **LastPartialCommandMarshaller** (p. 1247).*
- class **LocalTransactionIdMarshaller**

  *Marshaling code for Open Wire Format for **LocalTransactionIdMarshaller** (p. 1301).*
- class **MarshallerFactory**

  Used to create marshallers for a specific version of the wire protocol.
- class **MessageAckMarshaller**

  *Marshaling code for Open Wire Format for **MessageAckMarshaller** (p. 1452).*
- class **MessageDispatchMarshaller**

  *Marshaling code for Open Wire Format for **MessageDispatchMarshaller** (p. 1466).*
- class **MessageDispatchNotificationMarshaller**

  *Marshaling code for Open Wire Format for **MessageDispatchNotificationMarshaller** (p. 1472).*
- class **MessageIdMarshaller**

  *Marshaling code for Open Wire Format for **MessageIdMarshaller** (p. 1482).*
- class **MessageMarshaller**

  *Marshaling code for Open Wire Format for **MessageMarshaller** (p. 1486).*
- class **MessagePullMarshaller**

  *Marshaling code for Open Wire Format for **MessagePullMarshaller** (p. 1506).*
- class **NetworkBridgeFilterMarshaller**

  *Marshaling code for Open Wire Format for **NetworkBridgeFilterMarshaller** (p. 1530).*
- class **PartialCommandMarshaller**

  *Marshaling code for Open Wire Format for **PartialCommandMarshaller** (p. 1611).*
- class **ProducerAckMarshaller**

  *Marshaling code for Open Wire Format for **ProducerAckMarshaller** (p. 1686).*
- class **ProducerIdMarshaller**

  *Marshaling code for Open Wire Format for **ProducerIdMarshaller** (p. 1694).*

- class **ProducerInfoMarshaller**

  *Marshaling code for Open Wire Format for **ProducerInfoMarshaller** (p. 1701).*
- class **RemoveInfoMarshaller**

  *Marshaling code for Open Wire Format for **RemoveInfoMarshaller** (p. 1761).*
- class **RemoveSubscriptionInfoMarshaller**

  *Marshaling code for Open Wire Format for **RemoveSubscriptionInfoMarshaller** (p. 1767).*
- class **ReplayCommandMarshaller**

  *Marshaling code for Open Wire Format for **ReplayCommandMarshaller** (p. 1773).*
- class **ResponseMarshaller**

  *Marshaling code for Open Wire Format for **ResponseMarshaller** (p. 1788).*
- class **SessionIdMarshaller**

  *Marshaling code for Open Wire Format for **SessionIdMarshaller** (p. 1846).*
- class **SessionInfoMarshaller**

  *Marshaling code for Open Wire Format for **SessionInfoMarshaller** (p. 1851).*
- class **ShutdownInfoMarshaller**

  *Marshaling code for Open Wire Format for **ShutdownInfoMarshaller** (p. 1886).*
- class **SubscriptionInfoMarshaller**

  *Marshaling code for Open Wire Format for **SubscriptionInfoMarshaller** (p. 2042).*
- class **TransactionIdMarshaller**

  *Marshaling code for Open Wire Format for **TransactionIdMarshaller** (p. 2146).*
- class **TransactionInfoMarshaller**

  *Marshaling code for Open Wire Format for **TransactionInfoMarshaller** (p. 2152).*
- class **WireFormatInfoMarshaller**

  *Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 2248).*
- class **XATransactionIdMarshaller**

  *Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 2281).*

5.23 activemq::wireformat::openwire::utils Namespace Reference

Data Structures

- class **BooleanStream**

  Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.
- class **HexTable**

  *The **HexTable** (p. 1089) class maps hexidecimal strings to the value of an index into the table, i.e.*
- class **MessagePropertyInterceptor**

  Used the base ActiveMQMessage class to intercept calls to get and set properties in order to capture the calls that use the reserved JMS properties and get and set them in the OpenWire Message properties.

5.24 activemq::wireformat::stomp Namespace Reference

Data Structures

- class **StompCommandConstants**
- class **StompFrame**

  A Stomp-level message frame that encloses all messages to and from the broker.
- class **StompHelper**

  *Utility Methods used when marshaling to and from **StompFrame** (p. 2005)'s.*
- class **StompWireFormat**
- class **StompWireFormatFactory**

  Factory used to create the Stomp Wire Format instance.

5.25 cms Namespace Reference

Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.

Data Structures

- class **BytesMessage**

  *A **BytesMessage** (p. 557) object is used to send a message containing a stream of unsigned bytes.*
- class **Closeable**

  Interface for a class that implements the close method.
- class **CMSException**

  CMS API Exception that is the base for all exceptions thrown from CMS classes.
- class **CMSProperties**

  Interface for a Java-like properties object.
- class **CMSSecurityException**

  This exception must be thrown when a provider rejects a user name/password submitted by a client.
- class **Connection**

  The client's connection to its provider.
- class **ConnectionFactory**

  *Defines the interface for a factory that creates connection objects, the **Connection** (p. 725) objects returned implement the CMS **Connection** (p. 725) interface and hide the CMS Provider specific implementation details behind that interface.*
- class **ConnectionMetaData**

  *A **ConnectionMetaData** (p. 759) object provides information describing the **Connection** (p. 725) object.*
- class **DeliveryMode**

  This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.
- class **Destination**

  *A **Destination** (p. 936) object encapsulates a provider-specific address.*
- class **ExceptionListener**

  *If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 996) that is registered with the **Connection** (p. 725).*
- class **IllegalStateException**

  This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.
- class **InvalidClientIdException**

  This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.
- class **InvalidDestinationException**

  This exception must be thrown when a destination either is not understood by a provider or is no longer valid.
- class **InvalidSelectorException**

  This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.
- class **MapMessage**

  *A **MapMessage** (p. 1379) object is used to send a set of name-value pairs.*
- class **Message**

  Root of all messages.
- class **MessageConsumer**

  *A client uses a **MessageConsumer** (p. 1455) to received messages from a destination.*
- class **MessageEnumeration**

  Defines an object that enumerates a collection of Messages.
- class **MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 2020) or **BytesMessage** (p. 557) is being read.*

- class **MessageFormatException**

  This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.

- class **MessageListener**

  *A **MessageListener** (p. 1485) object is used to receive asynchronously delivered messages.*

- class **MessageNotReadableException**

  This exception must be thrown when a CMS client attempts to read a write-only message.

- class **MessageNotWriteableException**

  This exception must be thrown when a CMS client attempts to write to a read-only message.

- class **MessageProducer**

  *A client uses a **MessageProducer** (p. 1491) object to send messages to a **Destination** (p. 936).*

- class **ObjectMessage**

  Place holder for interaction with JMS systems that support Java, the C++ client is not responsible for deserializing the contained Object.

- class **Queue**

  An interface encapsulating a provider-specific queue name.

- class **QueueBrowser**

  *This class implements in interface for browsing the messages in a **Queue** (p. 1722) without removing them.*

- class **Session**

  *A **Session** (p. 1830) object is a single-threaded context for producing and consuming messages.*

- class **Startable**

  Interface for a class that implements the start method.

- class **Stoppable**

  Interface for a class that implements the stop method.

- class **StreamMessage**

  *Interface for a **StreamMessage** (p. 2020).*

- class **TemporaryQueue**

  *Defines a Temporary **Queue** (p. 1722) based **Destination** (p. 936).*

- class **TemporaryTopic**

  *Defines a Temporary **Topic** (p. 2141) based **Destination** (p. 936).*

- class **TextMessage**

  Interface for a text message.

- class **Topic**

  An interface encapsulating a provider-specific topic name.

- class **TransactionInProgressException**

  This exception is thrown when an operation is invalid because a transaction is in progress.

- class **TransactionRolledBackException**

  *This exception must be thrown when a call to **Session.commit** (p. 1834) results in a rollback of the current transaction.*

- class **UnsupportedOperationException**

  This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.

- class **XAConnection**

  *The **XAConnection** (p. 2262) interface defines an extended **Connection** (p. 725) type that is used to create **XASession** (p. 2275) objects.*

- class **XAConnectionFactory**

  *The **XAConnectionFactory** (p. 2263) interface is specialized interface that defines an **ConnectionFactory** (p. 741) that creates **Connection** (p. 725) instance that will participate in XA Transactions.*

- class **XAException**

  *The **XAException** (p. 2265) is thrown by the Resource Manager (RM) to inform the Transaction Manager of an error encountered by the involved transaction.*

- class **XAResource**

  *The **XAResource** (p. 2269) interface is a CMS mapping of the industry standard XA interface based on the X/Open CAE Specification (Distributed Transaction Processing: The XA Specification).*
- class **XASession**

  *The **XASession** (p. 2275) interface extends the capability of **Session** (p. 1830) by adding access to a CMS provider's support for the operating inside an XA Transaction (optional).*
- class **Xid**

  An interface which provides a mapping for the X/Open XID transaction identifier structure.

5.25.1 Detailed Description

5.26 decaf Namespace Reference

Namespaces

- namespace **internal**
- namespace **io**
- namespace **lang**
- namespace **net**
- namespace **nio**
- namespace **security**
- namespace **util**

5.26.1 Detailed Description

5.27 decaf::internal Namespace Reference

Namespaces

- namespace **io**

- namespace **net**
- namespace **nio**
- namespace **security**
- namespace **util**

Data Structures

- class **AprPool**

  Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.
- class **DecafRuntime**

  Handles APR initialization and termination.

5.28 decaf::internal::io Namespace Reference

Data Structures

- class **StandardErrorOutputStream**

  Wrapper Around the Standard error Output facility on the current platform.
- class **StandardInputStream**
- class **StandardOutputStream**

5.29 decaf::internal::net Namespace Reference

Namespaces

- namespace **ssl**
- namespace **tcp**

Data Structures

- class **DefaultServerSocketFactory**

  Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.
- class **DefaultSocketFactory**

  SocketFactory implementation that is used to create Sockets.
- class **Network**

  Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.
- class **SocketFileDescriptor**

  File Descriptor type used internally by Decaf Socket objects.
- class **URIEncoderDecoder**
- class **URIHelper**

  Helper class used by the URI classes in encoding and decoding of URI's.
- class **URIType**

  Basic type object that holds data that composes a given URI.

5.30 decaf::internal::net::ssl Namespace Reference

Namespaces

- namespace **openssl**

Data Structures

- class **DefaultSSLContext**

  Default SSLContext manager for the Decaf library.
- class **DefaultSSLServerSocketFactory**

  Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.
- class **DefaultSSLSocketFactory**

  Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

5.31 decaf::internal::net::ssl::openssl Namespace Reference

Data Structures

- class **OpenSSLContextSpi**

  Provides an SSLContext that wraps the OpenSSL API.
- class **OpenSSLParameters**

  Container class for parameters that are Common to OpenSSL socket classes.
- class **OpenSSLServerSocket**

  SSLServerSocket based on OpenSSL library code.
- class **OpenSSLServerSocketFactory**

  SSLServerSocketFactory that creates Server Sockets that use OpenSSL.
- class **OpenSSLSocket**

  Wraps a a Normal Socket object and extends or overrides functions in that class to make use of the OpenSSL Socket API.
- class **OpenSSLSocketException**

  Subclass of the standard SocketException that knows how to produce an error message from the OpenSSL error stack.
- class **OpenSSLSocketFactory**

  Client Socket Factory that creates SSL based client sockets using the OpenSSL library.
- class **OpenSSLSocketInputStream**

  An output stream for reading data from an OpenSSL Socket instance.
- class **OpenSSLSocketOutputStream**

  *OutputStream implementation used to write data to an **OpenSSLSocket** (p. 1560) instance.*

5.32 decaf::internal::net::tcp Namespace Reference

Data Structures

- class **TcpSocket**

  Platform-independent implementation of the socket interface.
- class **TcpSocketInputStream**

  Input stream for performing reads on a socket.
- class **TcpSocketOutputStream**

  Output stream for performing write operations on a socket.

5.33 decaf::internal::nio Namespace Reference

Data Structures

- class **BufferFactory**

  *Factory class used by static methods in the **decaf::nio** (p. 74) package to create the various default version of the NIO interfaces.*

- class **ByteArrayBuffer**

  This class defines six categories of operations upon byte buffers:

- class **CharArrayBuffer**
- class **DoubleArrayBuffer**
- class **FloatArrayBuffer**
- class **IntArrayBuffer**
- class **LongArrayBuffer**
- class **ShortArrayBuffer**

5.34 decaf::internal::security Namespace Reference

Data Structures

- class **SecureRandomImpl**

  Secure Random Number Generator for Unix based platforms that attempts to obtain secure bytes with high entropy from known sources.

5.35 decaf::internal::util Namespace Reference

Namespaces

- namespace **concurrent**

Data Structures

- class **ByteArrayAdapter**

  This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

- class **GenericResource**

  *A Generic **Resource** (p. 1777) wraps some type and will delete it when the **Resource** (p. 1777) itself is deleted.*

- class **HexStringParser**
- class **Resource**

  Interface for all Managed Resources in Decaf, these objects are added to the Runtime System and are destroyed at shutdown.

- class **ResourceLifecycleManager**
- class **TimerTaskHeap**

  A Binary Heap implemented specifically for the Timer class in Decaf Util.

5.36 decaf::internal::util::concurrent Namespace Reference

Data Structures

- class **ConditionImpl**
- class **MutexImpl**
- class **SynchronizableImpl**

  A convenience class used by some Decaf classes to implement the Synchronizable interface when there is no issues related to multiple inheritance.
- class **Transferer**

  Shared internal API for dual stacks and queues.
- class **TransferQueue**

  This extends Scherer-Scott dual queue algorithm, differing, among other ways, by using modes within nodes rather than marked pointers.
- class **TransferStack**

5.37 decaf::io Namespace Reference

Data Structures

- class **BlockingByteArrayInputStream**

  This is a blocking version of a byte buffer stream.
- class **BufferedInputStream**

  A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.
- class **BufferedOutputStream**

  Wrapper around another output stream that buffers output before writing to the target output stream.
- class **ByteArrayInputStream**

  *A **ByteArrayInputStream** (p. 527) contains an internal buffer that contains bytes that may be read from the stream.*
- class **ByteArrayOutputStream**
- class **Closeable**

  Interface for a class that implements the close method.
- class **DataInput**

  *The **DataInput** (p. 842) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*
- class **DataInputStream**

  A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.
- class **DataOutput**

  *The **DataOutput** (p. 856) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.*
- class **DataOutputStream**

  A data output stream lets an application write primitive Java data types to an output stream in a portable way.
- class **EOFException**
- class **FileDescriptor**

  This class servers as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.
- class **FilterInputStream**

  *A **FilterInputStream** (p. 1032) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*
- class **FilterOutputStream**

  This class is the superclass of all classes that filter output streams.

- class **Flushable**

  *A **Flushable** (p. 1067) is a destination of data that can be flushed.*
- class **InputStream**

  A base class that must be implemented by all classes wishing to provide a class that reads in a stream of bytes.
- class **InputStreamReader**

  *An **InputStreamReader** (p. 1142) is a bridge from byte streams to character streams.*
- class **InterruptedIOException**
- class **IOException**
- class **OutputStream**

  Base interface for any class that wants to represent an output stream of bytes.
- class **OutputStreamWriter**

  A class for turning a character stream into a byte stream.
- class **PushbackInputStream**

  *A **PushbackInputStream** (p. 1716) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*
- class **Reader**
- class **UnsupportedEncodingException**

  Thrown when the the Character Encoding is not supported.
- class **UTFDataFormatException**

  Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.
- class **Writer**

5.38 decaf::lang Namespace Reference

Namespaces

- namespace **exceptions**

Data Structures

- class **Appendable**

  An object to which char sequences and values can be appended.
- class **ArrayPointer**

  *Decaf's implementation of a Smart **Pointer** (p. 1614) that is a template on a Type and is **Thread** (p. 2094) Safe if the default Reference Counter is used.*
- class **ArrayPointerComparator**

  *This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 358).*
- class **Boolean**
- class **Byte**
- class **Character**
- class **CharSequence**

  *A **CharSequence** (p. 623) is a readable sequence of char values.*
- class **Comparable**

  This interface imposes a total ordering on the objects of each class that implements it.
- class **Double**
- class **Exception**
- class **Float**
- class **Integer**
- class **Iterable**

  *Implementing this interface allows an object to be cast to an **Iterable** (p. 1207) type for generic collections API calls.*

- class **Long**
- class **Math**

  *The class **Math** (p. 1396) contains methods for performing basic numeric operations such as the elementary exponential, logarithm, square root, and trigonometric functions.*
- class **Number**

  *The abstract class **Number** (p. 1543) is the superclass of classes **Byte** (p. 476), **Double** (p. 956), **Float** (p. 1040), **Integer** (p. 1161), **Long** (p. 1338), and **Short** (p. 1858).*
- struct **STATIC_CAST_TOKEN**
- struct **DYNAMIC_CAST_TOKEN**
- class **Pointer**

  *Decaf's implementation of a Smart **Pointer** (p. 1614) that is a template on a Type and is **Thread** (p. 2094) Safe if the default Reference Counter is used.*
- class **PointerComparator**

  *This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the Object being Pointed to and not the value of the contained pointer in the **Pointer** (p. 1614) instance.*
- class **Readable**

  *A **Readable** (p. 1732) is a source of characters.*
- class **Runnable**

  Interface for a runnable object - defines a task that can be run by a thread.
- class **Runtime**
- class **Short**
- class **String**

  *The **String** (p. 2031) class represents an immutable sequence of chars.*
- class **System**

  *The **System** (p. 2065) class provides static methods for accessing system level resources and performing some system dependent tasks such as looking up environment values and copying memory and arrays.*
- class **Thread**

  *A **Thread** (p. 2094) is a concurrent unit of execution.*
- class **ThreadGroup**
- class **Throwable**

  This class represents an error that has occurred.

Functions

- template<typename T , typename R , typename U >

5.39 decaf::lang::exceptions Namespace Reference

Data Structures

- class **ClassCastException**
- class **IllegalArgumentException**
- class **IllegalMonitorStateException**
- class **IllegalStateException**
- class **IllegalThreadStateException**

- class **IndexOutOfBoundsException**
- class **InterruptedException**
- class **InvalidStateException**
- class **NullPointerException**
- class **NumberFormatException**
- class **RuntimeException**
- class **UnsupportedOperationException**

5.40 decaf::net Namespace Reference

Namespaces

- namespace **ssl**

Data Structures

- class **BindException**
- class **ConnectException**
- class **DatagramPacket**

  Class that represents a single datagram packet.
- class **HttpRetryException**
- class **Inet4Address**
- class **Inet6Address**
- class **InetAddress**

  Represents an IP address.
- class **InetSocketAddress**
- class **MalformedURLException**
- class **NoRouteToHostException**
- class **PortUnreachableException**
- class **ProtocolException**
- class **ServerSocket**

  This class implements server sockets.
- class **ServerSocketFactory**

  Class used to create Server Sockets, subclasses can be created that create certain types of server sockets according to specific policies.
- class **Socket**
- class **SocketAddress**

  *Base class for protocol specific **Socket*** (p. *1900*) *addresses.*
- class **SocketError**

  Static utility class to simplify handling of error codes for socket operations.
- class **SocketException**

  Exception for errors when manipulating sockets.
- class **SocketFactory**

  *The **SocketFactory*** (p. *1916*) *is used to create **Socket*** (p. *1900*) *objects and can be sub-classed to provide other types of Sockets or Sockets with varying configurations.*
- class **SocketImpl**

  *Acts as a base class for all physical **Socket*** (p. *1900*) *implementations.*
- class **SocketImplFactory**

  Factory class interface for a Factory that creates ScoketImpl objects.
- class **SocketOptions**
- class **SocketTimeoutException**

- class **UnknownHostException**
- class **UnknownServiceException**
- class **URI**

  *This class represents an instance of a **URI** (p. 2191) as defined by RFC 2396.*
- class **URISyntaxException**
- class **URL**

  *Class **URL** (p. 2223) represents a Uniform Resource Locator, a pointer to a "resource" on the World Wide Web.*
- class **URLDecoder**
- class **URLEncoder**

5.41 decaf::net::ssl Namespace Reference

Data Structures

- class **SSLContext**

  *Represents on implementation of the Secure **Socket** (p. 1900) Layer for streaming based sockets.*
- class **SSLContextSpi**

  *Defines the interface that should be provided by an **SSLContext** (p. 1934) provider.*
- class **SSLParameters**
- class **SSLServerSocket**

  Represents a server socket that is used to accept connections from clients using the Secure Sockets protocol or the Top Level Security protocol.
- class **SSLServerSocketFactory**

  Factory class interface that provides methods to create SSL Server Sockets.
- class **SSLSocket**
- class **SSLSocketFactory**

  *Factory class interface for a **SocketFactory** (p. 1916) that can create **SSLSocket** (p. 1947) objects.*

5.42 decaf::nio Namespace Reference

Data Structures

- class **Buffer**

  A container for data of a specific primitive type.
- class **BufferOverflowException**
- class **BufferUnderflowException**
- class **ByteBuffer**

  This class defines six categories of operations upon byte buffers:
- class **CharBuffer**

  This class defines four categories of operations upon character buffers:
- class **DoubleBuffer**

  This class defines four categories of operations upon double buffers:
- class **FloatBuffer**

  This class defines four categories of operations upon float buffers:
- class **IntBuffer**

  This class defines four categories of operations upon int buffers:
- class **InvalidMarkException**
- class **LongBuffer**

  This class defines four categories of operations upon long long buffers:
- class **ReadOnlyBufferException**
- class **ShortBuffer**

  This class defines four categories of operations upon short buffers:

5.43 decaf::security Namespace Reference

Namespaces

- namespace **auth**

Data Structures

- class **GeneralSecurityException**
- class **InvalidKeyException**
- class **Key**

  *The **Key** (p. 1239) interface is the top-level interface for all keys.*
- class **KeyException**
- class **KeyManagementException**
- class **NoSuchAlgorithmException**
- class **NoSuchProviderException**
- class **Principal**

  Base interface for a principal, which can represent an individual or organization.
- class **PublicKey**

  A public key.
- class **SecureRandom**
- class **SecureRandomSpi**

  Interface class used by Security Service Providers to implement a source of secure random bytes.
- class **SignatureException**

5.44 decaf::security::auth Namespace Reference

5.45 decaf::security::auth::x500 Namespace Reference

Data Structures

- class **X500Principal**

5.46 decaf::security::cert Namespace Reference

Data Structures

- class **Certificate**

  Base interface for all identity certificates.
- class **CertificateEncodingException**
- class **CertificateException**
- class **CertificateExpiredException**
- class **CertificateNotYetValidException**
- class **CertificateParsingException**
- class **X509Certificate**

  Base interface for all identity certificates.

5.47 decaf::util Namespace Reference

Namespaces

- namespace **comparators**
- namespace **concurrent**
- namespace **logging**
- namespace **zip**

Data Structures

- class **AbstractCollection**

  *This class provides a skeletal implementation of the **Collection** (p. 660) interface, to minimize the effort required to implement this interface.*
- class **AbstractList**

  *This class provides a skeletal implementation of the **List** (p. 1286) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).*
- class **AbstractMap**

  *This class provides a skeletal implementation of the **Map** (p. 1371) interface, to minimize the effort required to implement this interface.*
- class **AbstractQueue**

  *This class provides skeletal implementations of some **Queue** (p. 1723) operations.*
- class **AbstractSequentialList**

  *This class provides a skeletal implementation of the **List** (p. 1286) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).*
- class **AbstractSet**

  *This class provides a skeletal implementation of the **Set** (p. 1857) interface to minimize the effort required to implement this interface.*
- class **ArrayList**
- class **Arrays**
- class **Collection**

  The root interface in the collection hierarchy.
- class **Comparator**

  A comparison function, which imposes a total ordering on some collection of objects.
- class **ConcurrentModificationException**
- class **Date**

  Wrapper class around a time value in milliseconds.
- class **Deque**

  *Defines a 'Double ended **Queue** (p. 1723)' interface that allows for insertion and removal of elements from both ends.*
- class **Iterator**

  Defines an object that can be used to iterate over the elements of a collection.
- class **LinkedList**

  *A complete implementation of the **List** (p. 1286) interface using a doubly linked list data structure.*
- class **List**

  An ordered collection (also known as a sequence).
- class **ListIterator**

  An iterator for lists that allows the programmer to traverse the list in either direction, modify the list during iteration, and obtain the iterator's current position in the list.
- class **Map**

  ***Map** (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.*
- class **NoSuchElementException**
- class **PriorityQueue**

An unbounded priority queue based on a binary heap algorithm.

- class **Properties**

  Java-like properties class for mapping string names to string values.

- class **Queue**

  A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.

- class **Random**

  Random (p. *1728) Value Generator which is used to generate a stream of pseudorandom numbers.*

- class **Set**

  A collection that contains no duplicate elements.

- class **StlList**

  List (p. *1286) class that wraps the STL list object to provide a simpler interface and additional methods not provided by the STL type.*

- class **StlMap**

  Map (p. *1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.*

- class **StlQueue**

  *The **Queue*** (p. *1723) class accepts messages with an psuh(m) command where m is the message to be queued.*

- class **StlSet**

  Set (p. *1857) template that wraps around a std::set to provide a more user-friendly interface and to provide common functions that do not exist in std::set.*

- class **StringTokenizer**

  Class that allows for parsing of string based on Tokens.

- class **Timer**

  A facility for threads to schedule tasks for future execution in a background thread.

- class **TimerTask**

  *A Base class for a task object that can be scheduled for one-time or repeated execution by a **Timer*** (p. *2122).*

- class **UUID**

  *A class that represents an immutable universally unique identifier (**UUID*** (p. *2230)).*

5.48 decaf::util::comparators Namespace Reference

Data Structures

- class **Less**

  *Simple **Less*** (p. *1250) **Comparator*** (p. *689) that compares to elements to determine if the first is less than the second.*

5.49 decaf::util::concurrent Namespace Reference

Namespaces

- namespace **atomic**
- namespace **locks**

Data Structures

- class **ConditionHandle**
- class **MutexHandle**
- class **AbstractExecutorService**

  *Provides a default implementation for the methods of the **ExecutorService** (p. 1008) interface.*
- class **BlockingQueue**

  *A **decaf::util::Queue** (p. 1723) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.*
- class **BrokenBarrierException**
- class **Callable**

  A task that returns a result and may throw an exception.
- class **CancellationException**
- class **ConcurrentMap**

  *Interface for a **Map** (p. 1371) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1371) interface.*
- class **ConcurrentStlMap**

  ***Map** (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.*
- class **CopyOnWriteArrayList**
- class **CopyOnWriteArraySet**

  *Since the **CopyOnWriteArraySet** (p. 813) and the **CopyOnWriteArrayList** (p. 798) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 798) for all its underlying operations.*
- class **CountDownLatch**
- class **Delayed**

  A mix-in style interface for marking objects that should be acted upon after a given delay.
- class **ExecutionException**
- class **Executor**

  *An object that executes submitted **decaf.lang.Runnable** (p. 1792) tasks.*
- class **Executors**

  *Implements a set of utilities for use with **Executors** (p. 1005), **ExecutorService** (p. 1008), **ThreadFactory** (p. 2102), and **Callable** (p. 578) types, as well as providing factory methods for instance of these types configured for the most common use cases.*
- class **ExecutorService**

  *An **Executor** (p. 1004) that provides methods to manage termination and methods that can produce a **Future** (p. 1075) for tracking progress of one or more asynchronous tasks.*
- class **Future**

  *A **Future** (p. 1075) represents the result of an asynchronous computation.*
- class **LinkedBlockingQueue**

  *A **BlockingQueue** (p. 417) derivative that allows for a bound to be placed on the number of elements that can be enqueued at any one time.*
- class **Lock**

  A wrapper class around a given synchronization mechanism that provides automatic release upon destruction.
- class **Mutex**

  ***Mutex** (p. 1519) object that offers recursive support on all platforms as well as providing the ability to use the standard wait / notify pattern used in languages like Java.*
- class **RejectedExecutionException**
- class **RejectedExecutionHandler**

  *A handler for tasks that cannot be executed by a **ThreadPoolExecutor** (p. 2104).*
- class **Semaphore**

  A counting semaphore.
- class **Synchronizable**

  The interface for all synchronizable objects (that is, objects that can be locked and unlocked).

- class **SynchronousQueue**

  *A **blocking queue** (p. 417) in which each insert operation must wait for a corresponding remove operation by another thread, and vice versa.*

- class **ThreadFactory**

  *public interface **ThreadFactory** (p. 2102)*

- class **ThreadPoolExecutor**

  Defines a Thread Pool object that implements the functionality of pooling threads to perform user tasks.

- class **TimeoutException**

- class **TimeUnit**

  *A **TimeUnit** (p. 2134) represents time durations at a given unit of granularity and provides utility methods to convert across units, and to perform timing and delay operations in these units.*

5.50 decaf::util::concurrent::atomic Namespace Reference

Data Structures

- class **AtomicBoolean**

  A boolean value that may be updated atomically.

- class **AtomicInteger**

  An int value that may be updated atomically.

- class **AtomicRefCounter**

- class **AtomicReference**

  An Pointer reference that may be updated atomically.

5.51 decaf::util::concurrent::locks Namespace Reference

Data Structures

- class **AbstractOwnableSynchronizer**

  Base class for locks that provide the notion of Ownership, the types of locks that are implemented using this base class would be owned by one specific Thread at any given time.

- class **Condition**

  ***Condition** (p. 715) factors out the **Mutex** (p. 1519) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1305) implementations.*

- class **Lock**

  ***Lock** (p. 1305) implementations provide more extensive locking operations than can be obtained using synchronized statements.*

- class **LockSupport**

  Basic thread blocking primitives for creating locks and other synchronization classes.

- class **ReadWriteLock**

  *A **ReadWriteLock** (p. 1741) maintains a pair of associated locks, one for read-only operations and one for writing.*

- class **ReentrantLock**

  *A reentrant mutual exclusion **Lock** (p. 1305) with extended capabilities.*

5.52 decaf::util::logging Namespace Reference

Data Structures

- class **ConsoleHandler**

  *This **Handler** (p. 1085) publishes log records to System.err.*

- class **ErrorManager**

  ***ErrorManager** (p. 988) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1085) during Logging.*

- class **Filter**

  *A **Filter** (p. 1031) can be used to provide fine grain control over what is logged, beyond the control provided by log levels.*

- class **Formatter**

  *A **Formatter** (p. 1074) provides support for formatting LogRecords.*

- class **Handler**

  *A **Handler** (p. 1085) object takes log messages from a **Logger** (p. 1312) and exports them.*

- class **Level**

  *The **Level** (p. 1253) class defines a set of standard logging levels that can be used to control logging output.*

- class **Logger**

  *A **Logger** (p. 1312) object is used to log messages for a specific system or application component.*

- class **LoggerHierarchy**

- class **LogManager**

  *There is a single global **LogManager** (p. 1327) object that is used to maintain a set of shared state about Loggers and log services.*

- class **LogRecord**

  ***LogRecord** (p. 1333) objects are used to pass logging requests between the logging framework and individual log Handlers.*

- class **LogWriter**

- class **MarkBlockLogger**

  Defines a class that can be used to mark the entry and exit from scoped blocks.

- class **PropertiesChangeListener**

  *Defines the interface that classes can use to listen for change events on **Properties** (p. 1705).*

- class **SimpleFormatter**

  *Print a brief summary of the **LogRecord** (p. 1333) in a human readable format.*

- class **SimpleLogger**

- class **StreamHandler**

  *Stream based logging **Handler** (p. 1085).*

- class **XMLFormatter**

  *Format a **LogRecord** (p. 1333) into a standard XML format.*

Enumerations

- enum **Levels** {
  Off, **Null**, **Markblock**, **Debug**,
  Info, **Warn**, **Error**, **Fatal**,
  Throwing }

  Defines an enumeration for logging levels.

Data Structures

- class **Adler32**

  Clas that can be used to compute an Adler-32 ***Checksum*** *(*p. *628) for a data stream.*

- class **CheckedInputStream**

  An implementation of a FilterInputStream that will maintain a ***Checksum*** *(*p. *628) of the bytes read, the* ***Checksum*** *(*p. *628) can then be used to verify the integrity of the input stream.*

- class **CheckedOutputStream**

  An implementation of a FilterOutputStream that will maintain a ***Checksum*** *(*p. *628) of the bytes written, the* ***Checksum*** *(*p. *628) can then be used to verify the integrity of the output stream.*

- class **Checksum**

  An interface used to represent ***Checksum*** *(*p. *628) values in the Zip package.*

- class **CRC32**

  Class that can be used to compute a CRC-32 checksum for a data stream.

- class **DataFormatException**

- class **Deflater**

  This class compresses data using the DEFLATE algorithm (see `specification`*).*

- class **DeflaterOutputStream**

  Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

- class **Inflater**

  This class uncompresses data that was compressed using the DEFLATE algorithm (see `specification`*).*

- class **InflaterInputStream**

  A FilterInputStream that decompresses data read from the wrapped InputStream instance.

- class **ZipException**

5.54 std Namespace Reference

Data Structures

- struct **less**< **decaf::lang::ArrayPointer**< **T** > >

  An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.
- struct **less**< **decaf::lang::Pointer**< **T** > >

  An override of the less function object so that the Pointer objects can be stored in STL Maps, etc.

6.2 decaf::util::AbstractCollection< E > Class Template Reference

This class provides a skeletal implementation of the **Collection** (p. 660) interface, to minimize the effort required to implement this interface.

`#include <src/main/decaf/util/AbstractCollection.h>`

Inheritance diagram for decaf::util::AbstractCollection< E >:

Public Member Functions

- **AbstractCollection** ()
- virtual ~**AbstractCollection** ()
- **AbstractCollection**< E > & **operator=** (**const AbstractCollection**< E > &collection)

  Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters

value	*The value to check for presence in the collection.*

  Returns

  true if there is at least one of the elements in the collection

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

- virtual bool **containsAll** (**const Collection**< E > &collection) **const**

  Returns true if this collection contains all of the elements in the specified collection.

  Parameters

collection	*The **Collection** (p. 660) to compare to this one.*

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

- virtual bool **equals** (**const Collection**< E > &collection) **const**

  *Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.*
- virtual void **copy** (**const Collection**< E > &collection)

  *Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).*

- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.

- virtual bool **add** (**const** E &value **DECAF_UNUSED**)

- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
  The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

  Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

  Returns

  true if this collection changed as a result of the call

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters

value	*The reference to the element to remove from this **Collection** (p. 660).*

  Returns

  true if the collection was changed, false otherwise.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

- virtual bool **removeAll** (**const Collection**< E > &collection)

  Removes all this collection's elements that are also contained in the specified collection (optional operation).
  After this call returns, this collection will contain no elements in common with the specified collection.

  Parameters

collection	*The **Collection** (p. 660) whose elements are to be removed from this one.*

  Returns

  true if the collection changed as a result of this call.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

- virtual bool **retainAll** (**const Collection**< E > &collection)

  Retains only the elements in this collection that are contained in the specified collection (optional operation).
  In other words, removes from this collection all of its elements that are not contained in the specified collection.

  Parameters

collection	*The **Collection** (p. 660) whose elements are to be retained.*

  Returns

  true if the collection changed as a result of this call.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

- virtual std::vector< E > **toArray** () **const**

  *Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).*

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

Protected Attributes

- **util::concurrent::Mutex mutex**

6.2.1 Detailed Description

template<typename E>class decaf::util::AbstractCollection< E >

This class provides a skeletal implementation of the **Collection** (p. 660) interface, to minimize the effort required to implement this interface.

To implement an unmodifiable collection, the programmer needs only to extend this class and provide implementations for the iterator and size methods. (The iterator returned by the iterator method must implement hasNext and next.)

To implement a modifiable collection, the programmer must additionally override this class's add method (which otherwise throws an UnsupportedOperationException), and the iterator returned by the iterator method must additionally implement its remove method.

The programmer should generally provide a void (no argument) and **Collection** (p. 660) constructor, as per the recommendation in the **Collection** (p. 660) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since

1.0

6.2.2 Constructor & Destructor Documentation

6.2.2.1 template<typename E> decaf::util::AbstractCollection< E >::AbstractCollection ( ) [inline]

6.2.2.2 template<typename E> virtual decaf::util::AbstractCollection< E >::~AbstractCollection ( ) [inline, virtual]

6.2.3 Member Function Documentation

6.2.3.1 template<typename E> virtual bool decaf::util::AbstractCollection< E >::add (const E &value *DECAF_UNUSED*) [inline, virtual]

This implementation always throws an UnsupportedOperationException.

Referenced by decaf::util::AbstractCollection< cms::Connection * >::addAll(), decaf::util::AbstractCollection< cms::Connection * >::copy(), and decaf::util::AbstractCollection< cms::Connection * >::operator=().

6.2.3.2 template<typename E> virtual bool decaf::util::AbstractCollection< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Implements **decaf::util::Collection< E >** (p. 663).

Reimplemented in **decaf::util::StlList< E >** (p. 1971), **decaf::util::ArrayList< E >** (p. 349), **decaf::util::LinkedList< E >** (p. 1272), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1272), **decaf::util::LinkedList< CompositeTask * >** (p. 1272), **decaf::util::LinkedList< URI >** (p. 1272), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1272), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1272), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1272), **decaf::util::LinkedList< Pointer< Command > >** (p. 1272), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1272), **decaf::util::LinkedList< cms::Destination * >** (p. 1272), **decaf::util::LinkedList< cms::Session * >** (p. 1272), **decaf::util::LinkedList< cms::Connection * >** (p. 1272), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 817),

and **decaf::util::AbstractQueue**< **E** > (p. 110).

6.2.3.3 template<typename E> virtual void decaf::util::AbstractCollection< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Implements **decaf::util::Collection**< **E** > (p. 663).

Reimplemented in **decaf::util::AbstractList**< **E** > (p. 100), **decaf::util::AbstractList**< **Pointer**< **Transport** > > (p. 100), **decaf::util::AbstractList**< **cms::MessageConsumer** * > (p. 100), **decaf::util::AbstractList**< **CompositeTask** * > (p. 100), **decaf::util::AbstractList**< **URI** > (p. 100), **decaf::util::AbstractList**< **Pointer**< **MessageDispatch** > > (p. 100), **decaf::util::AbstractList**< **Pointer**< **DestinationInfo** > > (p. 100), **decaf::util::AbstractList**< **PrimitiveValueNode** > (p. 100), **decaf::util::AbstractList**< **Pointer**< **Command** > > (p. 100), **decaf::util::AbstractList**< **Pointer**< **BackupTransport** > > (p. 100), **decaf::util::AbstractList**< **cms::MessageProducer** * > (p. 100), **decaf::util::AbstractList**< **cms::Destination** * > (p. 100), **decaf::util::AbstractList**< **cms::Session** * > (p. 100), **decaf::util::AbstractList**< **cms::Connection** * > (p. 100), **decaf::util::StlList**< **E** > (p. 1972), **decaf::util::PriorityQueue**< **E** > (p. 1679), **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2059), **decaf::util::concurrent::LinkedBlockingQueue**< **E** > (p. 1260), **decaf::util::LinkedList**< **E** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1274), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1274), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1274), **decaf::util::LinkedList**< **URI** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1274), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1274), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1274), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1274), **decaf::util::LinkedList**< **cms::Session** * > (p. 1274), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1274), **decaf::util::StlSet**< **E** > (p. 1998), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 1998), **decaf::util::StlSet**< **Resource** * > (p. 1998), **decaf::util::ArrayList**< **E** > (p. 350), **decaf::util::AbstractQueue**< **E** > (p. 110), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 818).

Referenced by decaf::util::AbstractCollection< cms::Connection * >::copy(), and decaf::util::AbstractCollection< cms::Connection * >::operator=().

6.2.3.4 template<typename E> virtual bool decaf::util::AbstractCollection< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Implements **decaf::util::Collection< E >** (p. 664).

Reimplemented in **decaf::util::StlList< E >** (p. 1972), **decaf::util::ArrayList< E >** (p. 350), **decaf::util::LinkedList< E >** (p. 1275), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1275), **decaf::util::LinkedList< CompositeTask * >** (p. 1275), **decaf::util::LinkedList< URI >** (p. 1275), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1275), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1275), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1275), **decaf::util::LinkedList< Pointer< Command > >** (p. 1275), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1275), **decaf::util::LinkedList< cms::Destination * >** (p. 1275), **decaf::util::LinkedList< cms::Session * >** (p. 1275), **decaf::util::LinkedList< cms::Connection * >** (p. 1275), **decaf::util::StlSet< E >** (p. 1998), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1998), **decaf::util::StlSet< Resource * >** (p. 1998), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 818).

Referenced by decaf::util::AbstractCollection< cms::Connection * >::containsAll().

6.2.3.5 template<typename E> virtual bool decaf::util::AbstractCollection< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The **Collection** (p. 660) to compare to this one.

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Implements **decaf::util::Collection< E >** (p. 665).

Reimplemented in **decaf::util::concurrent::SynchronousQueue< E >** (p. 2059), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 818).

Referenced by decaf::util::AbstractCollection< cms::Connection * >::equals().

6.2.3.6 template<typename E> virtual void decaf::util::AbstractCollection< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection**< **E** > (p. 666).

Reimplemented in **decaf::util::StlList**< **E** > (p. 1973), **decaf::util::LinkedList**< **E** > (p. 1275), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1275), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1275), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1275), **decaf::util::LinkedList**< **URI** > (p. 1275), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1275), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1275), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1275), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1275), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1275), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1275), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1275), **decaf::util::LinkedList**< **cms::Session** * > (p. 1275), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1275), **decaf::util::StlSet**< **E** > (p. 1999), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 1999), **decaf::util::StlSet**< **Resource** * > (p. 1999), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 819).

6.2.3.7 template<typename E> virtual bool decaf::util::AbstractCollection< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.

Parameters

collection	- The **Collection** (p. 660) to be compared to this one.

Returns

true if this **Collection** (p. 660) is equal to the one given.

Implements **decaf::util::Collection**< **E** > (p. 666).

Reimplemented in **decaf::util::StlList**< **E** > (p. 1973), **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2061), **decaf::util::StlSet**< **E** > (p. 1999), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 1999), **decaf::util::StlSet**< **Resource** * > (p. 1999), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 819).

6.2.3.8 template<typename E> virtual bool decaf::util::AbstractCollection< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 669) == 0.

Returns

true if the size method return 0.

Implements **decaf::util::Collection**< **E** > (p. 667).

Reimplemented in **decaf::util::StlList**< **E** > (p. 1974), **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2061), **decaf::util::LinkedList**< **E** > (p. 1278), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1278),

decaf::util::LinkedList< cms::MessageConsumer * > (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), **decaf::util::LinkedList< cms::Connection * >** (p. 1278), **decaf::util::StlSet< E >** (p. 1999), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1999), **decaf::util::StlSet< Resource * >** (p. 1999), **decaf::util::ArrayList< E >** (p. 352), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 820).

Referenced by decaf::util::AbstractQueue< E >::clear(), decaf::util::PriorityQueue< E >::peek(), decaf::util::PriorityQueue< E >::poll(), and decaf::util::PriorityQueue< E >::remove().

6.2.3.9 template<typename E> virtual void decaf::util::AbstractCollection< E >::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::clear(), decaf::util::concurrent::LinkedBlockingQueue< E >::remove(), and decaf::util::concurrent::LinkedBlockingQueue< E >::toArray().

6.2.3.10 template<typename E> virtual void decaf::util::AbstractCollection< E >::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.2.3.11 template<typename E> virtual void decaf::util::AbstractCollection< E >::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorStateException	- if the current thread is not the owner of the the Synchronizable Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.2.3.12 template<typename E> AbstractCollection<E>& decaf::util::AbstractCollection< E >::operator= (const AbstractCollection< E > & *collection*) [inline]

Assignment Operator, copy element from the source collection to this collection after clearing any element stored in this collection.

Parameters

collection	- the collection to copy

Returns

a reference to this collection

6.2.3.13 template<typename E> virtual bool decaf::util::AbstractCollection< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Implements **decaf::util::Collection< E >** (p. 667).

Reimplemented in **decaf::util::StlList< E >** (p. 1976), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1265), **decaf::util::PriorityQueue< E >** (p. 1682), **decaf::util::ArrayList< E >** (p. 353), **decaf::util::StlSet< E >** (p. 2000), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2000), **decaf::util::StlSet< Resource * >** (p. 2000), **decaf::util::LinkedList< E >** (p. 1283), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1283), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1283), **decaf::util::LinkedList< CompositeTask * >** (p. 1283), **decaf::util::LinkedList< URI >** (p. 1283), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1283), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1283), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1283), **decaf::util::LinkedList< Pointer< Command > >** (p. 1283), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1283), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1283), **decaf::util::LinkedList< cms::Destination * >** (p. 1283), **decaf::util::LinkedList< cms::Session * >** (p. 1283), **decaf::util::LinkedList< cms::Connection * >** (p. 1283), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 820).

6.2.3.14 template<typename E> virtual bool decaf::util::AbstractCollection< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be removed from this one.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

Implements **decaf::util::Collection**< **E** > (p. 668).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 821), **decaf::util::AbstractSet**< **E** > (p. 119), **decaf::util::AbstractSet**< **Pointer**< **Synchronization** > > (p. 119), and **decaf::util::AbstractSet**< **Resource** * > (p. 119).

6.2.3.15 template<typename E> virtual bool decaf::util::AbstractCollection< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be retained.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Implements **decaf::util::Collection< E >** (p. 669).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 821).

6.2.3.16 template<typename E> virtual std::vector<E> decaf::util::AbstractCollection< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Implements **decaf::util::Collection< E >** (p. 670).

Reimplemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1266), **decaf::util::ArrayList< E >** (p. 355), **decaf::util::LinkedList< E >** (p. 1286), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1286), **decaf::util::LinkedList< CompositeTask * >** (p. 1286), **decaf::util::LinkedList< URI >** (p. 1286), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1286), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1286), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1286), **decaf::util::LinkedList< Pointer< Command > >** (p. 1286), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1286), **decaf::util::LinkedList< cms::Destination * >** (p. 1286), **decaf::util::LinkedList< cms::Session * >** (p. 1286), **decaf::util::LinkedList< cms::Connection * >** (p. 1286), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2064), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 822).

6.2.3.17 template<typename E> virtual bool decaf::util::AbstractCollection< E >::tryLock ( ) [inline, virtual]

Attempts to Lock the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.2.3.18 template<typename E> virtual void decaf::util::AbstractCollection< E >::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.2.3.19 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.2.3.20 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.2.3.21 template<typename E> virtual void decaf::util::AbstractCollection< E >::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the Synchronizable Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

6.4.1 Detailed Description

template<typename E>class decaf::util::AbstractList< E >

This class provides a skeletal implementation of the **List** (p. 1286) interface to minimize the effort required to implement this interface backed by a "random access" data store (such as an array).

For sequential access data (such as a linked list), **AbstractSequentialList** (p. 111) should be used in preference to this class.

To implement an unmodifiable list, the programmer needs only to extend this class and provide implementations for the get(int) and **size()** (p. 669) methods.

To implement a modifiable list, the programmer must additionally override the set(int, E) method (which otherwise throws an UnsupportedOperationException). If the list is variable-size the programmer must additionally override the add(int, E) and remove(int) methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 660) interface specification.

Unlike the other abstract collection implementations, the programmer does not have to provide an iterator implementation; the iterator and list iterator are implemented by this class, on top of the "random access" methods: get(int), set(int, E), add(int, E) and remove(int).

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the collection being implemented admits a more efficient implementation.

Since

1.0

6.4.2 Constructor & Destructor Documentation

6.4.2.1 template<typename E> decaf::util::AbstractList< E >::AbstractList ( ) [inline]

6.4.2.2 template<typename E> virtual decaf::util::AbstractList< E >::~AbstractList ( ) [inline, virtual]

6.4.3 Member Function Documentation

6.4.3.1 template<typename E> virtual bool decaf::util::AbstractList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 662).

Reimplemented in **decaf::util::StlList< E >** (p. 1970), **decaf::util::ArrayList< E >** (p. 348), **decaf::util::LinkedList< E >** (p. 1271), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1271), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1271), **decaf::util::LinkedList< CompositeTask * >** (p. 1271), **decaf::util::LinkedList< URI >** (p. 1271), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1271), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1271), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1271), **decaf::util::LinkedList< Pointer< Command > >** (p. 1271), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1271), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1271), **decaf::util::LinkedList< cms::Destination * >** (p. 1271), **decaf::util::LinkedList< cms::Session * >** (p. 1271), and **decaf::util::LinkedList< cms::Connection * >** (p. 1271).

Referenced by decaf::util::AbstractList< cms::Connection * >::add(), and decaf::util::AbstractList< cms::Connection * >::addAll().

6.4.3.2 template<typename E> virtual void decaf::util::AbstractList< E >::add (int index *DECAF_UNUSED*, const E &element *DECAF_UNUSED*) [inline, virtual]

6.4.3.3 template<typename E> virtual bool decaf::util::AbstractList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List**< **E** > (p. 1288).

Reimplemented in **decaf::util::StlList**< **E** > (p. 1971), **decaf::util::ArrayList**< **E** > (p. 349), **decaf::util::LinkedList**< **E** > (p. 1273), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1273), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1273), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1273), **decaf::util::LinkedList**< **URI** > (p. 1273), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1273), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1273), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1273), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1273), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1273), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1273), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1273), **decaf::util::LinkedList**< **cms::Session** * > (p. 1273), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1273), **decaf::util::AbstractSequentialList**< **E** > (p. 114), **decaf::util::AbstractSequentialList**< **Pointer**< **Transport** > > (p. 114), **decaf::util::AbstractSequentialList**< **cms::MessageConsumer** * > (p. 114), **decaf::util::AbstractSequentialList**< **CompositeTask** * > (p. 114), **decaf::util::AbstractSequentialList**< **URI** > (p. 114), **decaf::util::AbstractSequentialList**< **Pointer**< **MessageDispatch** > > (p. 114), **decaf::util::AbstractSequentialList**< **Pointer**< **DestinationInfo** > > (p. 114), **decaf::util::AbstractSequentialList**< **PrimitiveValueNode** > (p. 114), **decaf::util::AbstractSequentialList**< **Pointer**< **Command** > > (p. 114), **decaf::util::AbstractSequentialList**< **Pointer**< **BackupTransport** > > (p. 114), **decaf::util::AbstractSequentialList**< **cms::MessageProducer** * > (p. 114), **decaf::util::AbstractSequentialList**< **cms::Destination** * > (p. 114), **decaf::util::AbstractSequentialList**< **cms::Session** * > (p. 114), and **decaf::util::AbstractSequentialList**< **cms::Connection** * > (p. 114).

6.4.3.4 template<typename E> virtual void decaf::util::AbstractList< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperationException	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 88).

Reimplemented in **decaf::util::StlList**< **E** > (p. 1972), **decaf::util::LinkedList**< **E** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1274), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1274), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1274), **decaf::util::LinkedList**< **URI** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1274), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1274), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1274), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1274), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1274), **decaf::util::LinkedList**< **cms::Session** * > (p. 1274), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1274), and **decaf::util::ArrayList**< **E** > (p. 350).

6.4.3.5 template<typename E> virtual int decaf::util::AbstractList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1290).

Reimplemented in **decaf::util::StlList< E >** (p. 1974), **decaf::util::ArrayList< E >** (p. 352), **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.4.3.6 template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

Reimplemented in **decaf::util::StlList< E >** (p. 1974), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 116), **decaf::util::AbstractSequentialList< URI >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 116), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 116), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 116).

Referenced by decaf::util::ArrayList< E >::ArrayList().

6.4.3.7 template<typename E> virtual Iterator<E>* decaf::util::AbstractList< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

Reimplemented in **decaf::util::StlList< E >** (p. 1974), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 116), **decaf::util::AbstractSequentialList< URI >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 116), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >**

(p. 116), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 116), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 116).

6.4.3.8 template<typename E> virtual int decaf::util::AbstractList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1290).

Reimplemented in **decaf::util::StlList< E >** (p. 1975), **decaf::util::ArrayList< E >** (p. 352), **decaf::util::LinkedList< E >** (p. 1278), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), and **decaf::util::LinkedList< cms::Connection * >** (p. 1278).

6.4.3.9 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator ( ) [inline, virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1291).

Reimplemented in **decaf::util::StlList< E >** (p. 1975), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 116), **decaf::util::AbstractSequentialList< URI >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 116), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 116), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 116).

Referenced by decaf::util::AbstractList< cms::Connection * >::indexOf(), decaf::util::AbstractList< cms::Connection * >::lastIndexOf(), and decaf::util::AbstractList< cms::Connection * >::removeRange().

6.4.3.10 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator ( ) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1291).

Reimplemented in **decaf::util::StlList< E >** (p. 1975), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 116), **decaf::util::AbstractSequentialList< URI >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 116), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 116), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 116).

6.4.3.11 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator (int *index*) [inline, virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 669))

Implements **decaf::util::List< E >** (p. 1292).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1278), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), **decaf::util::LinkedList< cms::Connection * >** (p. 1278), **decaf::util::StlList< E >** (p. 1975), **decaf::util::AbstractSequentialList< E >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 116), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 116), **decaf::util::AbstractSequentialList< URI >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 116), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 116), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 116), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 116), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 116), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 116).

6.4.3.12 template<typename E> virtual ListIterator<E>* decaf::util::AbstractList< E >::listIterator (int index) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1293).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1279), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1279), **decaf::util::LinkedList< CompositeTask * >** (p. 1279), **decaf::util::LinkedList< URI >** (p. 1279), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1279), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1279), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1279), **decaf::util::LinkedList< Pointer< Command > >** (p. 1279), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1279), **decaf::util::LinkedList< cms::Destination * >** (p. 1279), **decaf::util::LinkedList< cms::Session * >** (p. 1279), **decaf::util::LinkedList< cms::Connection * >** (p. 1279), **decaf::util::StlList< E >** (p. 1976), **decaf::util::AbstractSequentialList< E >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 117), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 117), **decaf::util::AbstractSequentialList< URI >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 117), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 117), and **decaf::util::AbstractSequentialList< cms::Connection * >** (p. 117).

6.4.3.13 template<typename E> virtual E decaf::util::AbstractList< E >::removeAt (int index *index*) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Implements **decaf::util::List< E >** (p. 1293).

Reimplemented in **decaf::util::StlList< E >** (p. 1976), **decaf::util::ArrayList< E >** (p. 353), **decaf::util::AbstractSequentialList< E >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Transport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageConsumer * >** (p. 117), **decaf::util::AbstractSequentialList< CompositeTask * >** (p. 117), **decaf::util::AbstractSequentialList< URI >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< MessageDispatch > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< DestinationInfo > >** (p. 117), **decaf::util::AbstractSequentialList< PrimitiveValueNode >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< Command > >** (p. 117), **decaf::util::AbstractSequentialList< Pointer< BackupTransport > >** (p. 117), **decaf::util::AbstractSequentialList< cms::MessageProducer * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Destination * >** (p. 117), **decaf::util::AbstractSequentialList< cms::Session * >** (p. 117), and **decaf::util::AbstractSequentialList<**

6.5.1 Detailed Description

template<typename K, typename V, typename COMPARATOR>class decaf::util::AbstractMap< K, V, COMPARATOR >

This class provides a skeletal implementation of the **Map** (p. 1371) interface, to minimize the effort required to implement this interface.

To implement an unmodifiable map, the programmer needs only to extend this class and provide an implementation for the entrySet method, which returns a set-view of the map's mappings. Typically, the returned set will, in turn, be implemented atop **AbstractSet** (p. 118). This set should not support the add or remove methods, and its iterator should not support the remove method.

To implement a modifiable map, the programmer must additionally override this class's put method (which otherwise throws an UnsupportedOperationException), and the iterator returned by entrySet().iterator() must additionally implement its remove method.

The programmer should generally provide a void (no argument) and map constructor, as per the recommendation in the **Map** (p. 1371) interface specification.

The documentation for each non-abstract method in this class describes its implementation in detail. Each of these methods may be overridden if the map being implemented admits a more efficient implementation.

6.7 decaf::util::AbstractQueue< E > Class Template Reference

This class provides skeletal implementations of some **Queue** (p. 1723) operations.

`#include <src/main/decaf/util/AbstractQueue.h>`

Inheritance diagram for decaf::util::AbstractQueue< E >:

Public Member Functions

- **AbstractQueue** ()
- virtual ~**AbstractQueue** ()
- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.
  (Returns false if this collection does not permit duplicates and already contains the specified element.)
  Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. ***Collection*** *(p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.*
  If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.
  For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

  Parameters

value	*The reference to the element to add to this* ***Collection*** *(p. 660).*

Returns

*true if the element was added to this **Collection** (p. 660).*

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of the element prevents it from being added to this collection*
IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

- virtual bool **addAll** (**const Collection**< E > &collection)

Adds all of the elements in the specified collection to this collection.
The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

- virtual E **remove** ()

Gets and removes the element in the head of the queue.
*Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1537)	*if there is no element in the queue.*

- virtual E **element** () **const**

Gets but not removes the element in the head of the queue.
*Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.*

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException (p. 1537)	*if there is no element in the queue.*

- virtual void **clear** ()

Removes all of the elements from this collection (optional operation).
The collection will be empty after this method returns.
*This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.*
Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	*if the clear operation is not supported by this collection*

6.7.1 Detailed Description

template<typename E>class decaf::util::AbstractQueue< E >

This class provides skeletal implementations of some **Queue** (p. 1723) operations.

Methods add, remove, and element are based on offer, poll, and peek, respectively.

A **Queue** (p. 1723) implementation that extends this class must minimally define a method **Queue** (p. 1723). offer(E) which does not permit insertion of null elements, along with methods **Queue** (p. 1723). **peek()** (p. 1725), **Queue.-poll()** (p. 1725), **Collection.size()** (p. 669), and a **Collection.iterator()** (p. 1207) supporting **Iterator.remove()** (p. 1210). Typically, additional methods will be overridden as well. If these requirements cannot be met, consider instead subclassing **AbstractCollection** (p. 84).

Since

6.7.2 Constructor & Destructor Documentation

6.7.2.1 template<typename E > decaf::util::AbstractQueue< E >::AbstractQueue ( ) [inline]

6.7.2.2 template<typename E > virtual decaf::util::AbstractQueue< E >::~AbstractQueue ( ) [inline, virtual]

6.7.3 Member Function Documentation

6.7.3.1 template<typename E > virtual bool decaf::util::AbstractQueue< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation returns true if offer succeeds, else throws an IllegalStateException.

Implements **decaf::util::Collection**< **E** > (p. 662).

Reimplemented in **decaf::util::PriorityQueue**< **E** > (p. 1678).

References decaf::util::Queue< E >::offer().

6.7.3.2 template<typename E > virtual bool decaf::util::AbstractQueue< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation checks to see if the **Queue** (p. 1723) is being added to itself and throws an IllegalArgument-Exception if so, otherwise it delegates the add to the **AbstractCollection** (p. 84)'s addAll implementation.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 87).

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::operator=().

6.7.3.3 template<typename E > virtual void decaf::util::AbstractQueue< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

This implementation repeatedly invokes poll until it returns false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 1679), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2059), and **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1260).

References decaf::util::AbstractCollection< E >::isEmpty(), and decaf::util::Queue< E >::poll().

6.7.3.4 template<typename E > virtual E decaf::util::AbstractQueue< E >::element ( ) const [inline, virtual]

Gets but not removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

This implementation returns the result of peek unless the queue is empty otherwise it throws a **NoSuchElementException** (p. 1537).

Implements **decaf::util::Queue< E >** (p. 1724).

References decaf::util::Queue< E >::peek().

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo().

6.7.3.5 template<typename E > virtual E decaf::util::AbstractQueue< E >::remove ( ) [inline, virtual]

Gets and removes the element in the head of the queue.

Throws a **NoSuchElementException** (p. 1537) if there is no element in the queue.

Returns

the element in the head of the queue.

Exceptions

NoSuchElementException *(p. 1537)*	if there is no element in the queue.

This implementation returns the result of poll unless the queue is empty.

Implements **decaf::util::Queue< E >** (p. 1725).

Reimplemented in **decaf::util::PriorityQueue< E >** (p. 1681).

References decaf::util::Queue< E >::poll().

IllegalStateException	*if the element cannot be added at this time due to insertion restrictions.*

- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list. Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

  Parameters

index	*- the index of the element to be removed.*

  Returns

  the element previously at the specified position.

  Exceptions

IndexOutOfBoundsException	*if the index given is less than zero or greater than the **List** (p. 1286) size.*
UnsupportedOperationExceptio	*if this is an unmodifiable collection.*

6.8.1 Detailed Description

template<typename E>class decaf::util::AbstractSequentialList< E >

This class provides a skeletal implementation of the **List** (p. 1286) interface to minimize the effort required to implement this interface backed by a "sequential access" data store (such as a linked list).

For random access data (such as an array), **AbstractList** (p. 97) should be used in preference to this class.

This class is the opposite of the **AbstractList** (p. 97) class in the sense that it implements the "random access" methods (get(int index), set(int index, E element), add(int index, E element) and remove(int index)) on top of the list's list iterator, instead of the other way around.

To implement a list the programmer needs only to extend this class and provide implementations for the listIterator and size methods. For an unmodifiable list, the programmer need only implement the list iterator's hasNext, next, hasPrevious, previous and index methods.

For a modifiable list the programmer should additionally implement the list iterator's set method. For a variable-size list the programmer should additionally implement the list iterator's remove and add methods.

The programmer should generally provide a void (no argument) and collection constructor, as per the recommendation in the **Collection** (p. 660) interface specification.

Since

1.0

6.8.2 Constructor & Destructor Documentation

6.8.2.1 template<typename E> virtual decaf::util::AbstractSequentialList< E >::~AbstractSequentialList ( ) [inline, virtual]

6.8.3 Member Function Documentation

6.8.3.1 template<typename E> virtual void decaf::util::AbstractSequentialList< E >::add (int index , const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it inserts the specified element with **ListIterator.add** (p. 1296).

Implements **decaf::util::List< E >** (p. 1287).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1272), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1272), **decaf::util::LinkedList< CompositeTask * >** (p. 1272), **decaf::util::LinkedList< URI >** (p. 1272), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1272), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1272), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1272), **decaf::util::LinkedList< Pointer< Command > >** (p. 1272), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1272), **decaf::util::LinkedList< cms::Destination * >** (p. 1272), **decaf::util::LinkedList< cms::Session * >** (p. 1272), and **decaf::util::LinkedList< cms::Connection * >** (p. 1272).

6.8.3.2 template<typename E> virtual bool decaf::util::AbstractSequentialList< E >::addAll (int *index,* const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's

iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation gets an iterator over the specified collection and a list iterator over this list pointing to the indexed element (with listIterator(index)). Then, it iterates over the specified collection, inserting the elements obtained from the iterator into this list, one at a time, using **ListIterator.add** (p. 1296) (to skip over the added element).

Reimplemented from **decaf::util::AbstractList< E >** (p. 99).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1273), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1273), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1273), **decaf::util::LinkedList< CompositeTask * >** (p. 1273), **decaf::util::LinkedList< URI >** (p. 1273), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1273), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1273), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1273), **decaf::util::LinkedList< Pointer< Command > >** (p. 1273), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1273), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1273), **decaf::util::LinkedList< cms::Destination * >** (p. 1273), **decaf::util::LinkedList< cms::Session * >** (p. 1273), and **decaf::util::LinkedList< cms::Connection * >** (p. 1273).

6.8.3.3 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the element using **ListIterator.next** (p. 1209) and returns it.

Implements **decaf::util::List< E >** (p. 1289).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1276), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1276), **decaf::util::LinkedList< CompositeTask * >** (p. 1276), **decaf::util::LinkedList< URI >** (p. 1276), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1276), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1276), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1276), **decaf::util::LinkedList< Pointer< Command > >** (p. 1276), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1276), **decaf::util::LinkedList< cms::Destination * >** (p. 1276), **decaf::util::LinkedList< cms::Session * >** (p. 1276), and **decaf::util::LinkedList< cms::Connection * >** (p. 1276).

6.8.3.4 template<typename E> virtual Iterator<E>* decaf::util::AbstractSequentialList< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Reimplemented from **decaf::util::AbstractList< E >** (p. 101).

Referenced by decaf::util::LinkedList< cms::Connection * >::removeFirstOccurrence().

6.8.3.5 template<typename E> virtual Iterator<E>* decaf::util::AbstractSequentialList< E >::iterator ( ) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 101).

6.8.3.6 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator ( ) [inline, virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Reimplemented from **decaf::util::AbstractList< E >** (p. 102).

Referenced by decaf::util::AbstractSequentialList< cms::Connection * >::add(), decaf::util::AbstractSequentialList< cms::Connection * >::addAll(), decaf::util::AbstractSequentialList< cms::Connection * >::get(), decaf::util::AbstractSequentialList< cms::Connection * >::iterator(), decaf::util::AbstractSequentialList< cms::Connection * >::listIterator(), decaf::util::AbstractSequentialList< cms::Connection * >::removeAt(), and decaf::util::AbstractSequentialList< cms::Connection * >::set().

6.8.3.7 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator ( ) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

6.8.3.8 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator (int index *index*) [inline, virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 669))

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1278), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), and **decaf::util::LinkedList< cms::Connection * >** (p. 1278).

6.8.3.9 template<typename E> virtual ListIterator<E>* decaf::util::AbstractSequentialList< E >::listIterator (int index *DECAF_UNUSED*) const [inline, virtual]

Reimplemented from **decaf::util::AbstractList< E >** (p. 103).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1279), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1279), **decaf::util::LinkedList< CompositeTask * >** (p. 1279), **decaf::util::LinkedList< URI >** (p. 1279), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1279), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1279), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1279), **decaf::util::LinkedList< Pointer< Command > >** (p. 1279), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1279), **decaf::util::LinkedList< cms::Destination * >** (p. 1279), **decaf::util::LinkedList< cms::Session * >** (p. 1279), and **decaf::util::LinkedList< cms::Connection * >** (p. 1279).

6.8.3.10 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::removeAt (int index) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it removes the element with **ListIterator.remove** (p. 1210).

Reimplemented from **decaf::util::AbstractList< E >** (p. 104).

6.8.3.11 template<typename E> virtual E decaf::util::AbstractSequentialList< E >::set (int index , const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

This implementation first gets a list iterator pointing to the indexed element (with listIterator(index)). Then, it gets the current element using **ListIterator.next** (p. 1209) and replaces it with **ListIterator.set** (p. 1297).

Implements **decaf::util::List< E >** (p. 1294).

Reimplemented in **decaf::util::LinkedList< E >** (p. 1285), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1285), **decaf::util::LinkedList< CompositeTask * >** (p. 1285), **decaf::util::LinkedList< URI >** (p. 1285), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1285), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1285), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1285), **decaf::util::LinkedList< Pointer< Command > >** (p. 1285), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1285), **decaf::util::LinkedList< cms::Destination * >** (p. 1285), **decaf::util::LinkedList< cms::Session * >** (p. 1285), and **decaf::util::LinkedList< cms::Connection * >** (p. 1285).

6.9 decaf::util::AbstractSet< E > Class Template Reference

This class provides a skeletal implementation of the **Set** (p. 1857) interface to minimize the effort required to implement this interface.

`#include <src/main/decaf/util/AbstractSet.h>`

Inheritance diagram for decaf::util::AbstractSet< E >:

Public Member Functions

- virtual ~**AbstractSet** ()
- virtual bool **removeAll** (**const Collection**< E > &collection)

Removes all this collection's elements that are also contained in the specified collection (optional operation). After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	*The **Collection** (p. 660) whose elements are to be removed from this one.*

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.
Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

6.9.1 Detailed Description

template<typename E>class decaf::util::AbstractSet< E >

This class provides a skeletal implementation of the **Set** (p. 1857) interface to minimize the effort required to implement this interface.

The process of implementing a set by extending this class is identical to that of implementing a **Collection** (p. 660) by extending **AbstractCollection** (p. 84), except that all of the methods and constructors in subclasses of this class must obey the additional constraints imposed by the **Set** (p. 1857) interface (for instance, the add method must not permit addition of multiple instances of an object to a set).

Since

1.0

6.9.2 Constructor & Destructor Documentation

6.9.2.1 template<typename E> virtual decaf::util::AbstractSet< E >::~AbstractSet ( ) [inline, virtual]

6.9.3 Member Function Documentation

6.9.3.1 template<typename E> virtual bool decaf::util::AbstractSet< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be removed from this one.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 93).

Reimplemented in **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 821).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**AbstractSet.h**

6.10 activemq::transport::AbstractTransportFactory Class Reference

Abstract implementation of the **TransportFactory** (p. 2167) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2167) instances.

`#include <src/main/activemq/transport/AbstractTransportFactory.h>`

Inheritance diagram for activemq::transport::AbstractTransportFactory:

Public Member Functions

- virtual ~**AbstractTransportFactory** ()

Protected Member Functions

- virtual **Pointer**
  < **wireformat::WireFormat** > **createWireFormat** (**const decaf::util::Properties** &properties)

  *Creates the WireFormat that is configured for this **Transport** (p. 2161) and returns it.*

6.10.1 Detailed Description

Abstract implementation of the **TransportFactory** (p. 2167) interface, providing the base functionality that's common to most of the **TransportFactory** (p. 2167) instances.

Since

3.0

6.10.2 Constructor & Destructor Documentation

6.10.2.1 virtual activemq::transport::AbstractTransportFactory::~AbstractTransportFactory ( ) [inline, virtual]

6.10.3 Member Function Documentation

6.10.3.1 virtual Pointer<wireformat::WireFormat> activemq::transport::AbstractTransportFactory::createWireFormat (const decaf::util::Properties & *properties*) [protected, virtual]

Creates the WireFormat that is configured for this **Transport** (p. 2161) and returns it.

The default WireFormat is Openwire.

Parameters

properties	The properties that were configured on the URI.

Returns

a pointer to a WireFormat instance that the caller then owns.

Exceptions

NoSuchElementException	if the configured WireFormat is not found.

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**AbstractTransportFactory.h**

6.11 activemq::core::ActiveMQAckHandler Class Reference

Interface class that is used to give CMS Messages an interface to Ack themselves with.

`#include <src/main/activemq/core/ActiveMQAckHandler.h>`

Public Member Functions

- virtual ~**ActiveMQAckHandler** ()
- virtual void **acknowledgeMessage** (**const commands::Message** *message)=0

  Method called to acknowledge the message once it has been received by a MessageConsumer.

6.11.1 Detailed Description

Interface class that is used to give CMS Messages an interface to Ack themselves with.

Since

2.0

6.11.2 Constructor & Destructor Documentation

6.11.2.1 virtual activemq::core::ActiveMQAckHandler::~ActiveMQAckHandler ( ) [inline, virtual]

6.11.3 Member Function Documentation

6.11.3.1 virtual void activemq::core::ActiveMQAckHandler::acknowledgeMessage (const commands::Message * *message*) [pure virtual]

Method called to acknowledge the message once it has been received by a MessageConsumer.

Parameters

message	The Message to Acknowledge.

Exceptions

CMSException	if an error occurs while acknowledging the given Message.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQAckHandler.h**

6.12 activemq::commands::ActiveMQBlobMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQBlobMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQBlobMessage:

Public Member Functions

- **ActiveMQBlobMessage** ()
- virtual ~**ActiveMQBlobMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure*** (p. *877*) *Type as defined in CommandTypes.h.*
- virtual **ActiveMQBlobMessage** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure*** (p. *877*) *such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure*** (p. *877*) *passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.
- std::string **getRemoteBlobUrl** () **const**

  Get the Remote URL of the Blob.

- void **setRemoteBlobUrl** (**const** std::string &remoteURL)

  Set the Remote URL of the Blob.
- std::string **getMimeType** () **const**

  Get the Mime Type of the Blob.
- void **setMimeType** (**const** std::string &mimeType)

  Set the Mime Type of the Blob.
- std::string **getName** () **const**

  Gets the Name of the Blob.
- void **setName** (**const** std::string &name)

  Sets the Name of the Blob.
- bool **isDeletedByBroker** () **const**

  Gets if this Blob is deleted by the Broker.
- void **setDeletedByBroker** (bool value)

  Sets the Deleted By Broker flag.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQBLOBMESSAGE** = 29
- static **const** std::string **BINARY_MIME_TYPE**

6.12.1 Constructor & Destructor Documentation

6.12.1.1 activemq::commands::ActiveMQBlobMessage::ActiveMQBlobMessage ( )

6.12.1.2 virtual activemq::commands::ActiveMQBlobMessage::~ActiveMQBlobMessage ( ) throw () [inline, virtual]

6.12.2 Member Function Documentation

6.12.2.1 virtual cms::Message* activemq::commands::ActiveMQBlobMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.12.2.2 virtual ActiveMQBlobMessage* activemq::commands::ActiveMQBlobMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.12.2.3 virtual void activemq::commands::ActiveMQBlobMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.12.2.4 virtual bool activemq::commands::ActiveMQBlobMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230).

6.12.2.5 virtual unsigned char activemq::commands::ActiveMQBlobMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.12.2.6 std::string activemq::commands::ActiveMQBlobMessage::getMimeType ( ) const [inline]

Get the Mime Type of the Blob.

Returns

string holding the MIME Type.

6.12.2.7 std::string activemq::commands::ActiveMQBlobMessage::getName ( ) const [inline]

Gets the Name of the Blob.

Returns

string name of the Blob.

6.12.2.8 std::string activemq::commands::ActiveMQBlobMessage::getRemoteBlobUrl ( ) const [inline]

Get the Remote URL of the Blob.

Returns

string from of the Remote Blob URL.

6.12.2.9 bool activemq::commands::ActiveMQBlobMessage::isDeletedByBroker ( ) const [inline]

Gets if this Blob is deleted by the Broker.

Returns

true if the Blob is deleted by the Broker.

6.12.2.10 void activemq::commands::ActiveMQBlobMessage::setDeletedByBroker (bool *value*) [inline]

Sets the Deleted By Broker flag.

Parameters

value	- set the Delete by broker flag to value.

6.12.2.11 void activemq::commands::ActiveMQBlobMessage::setMimeType (const std::string & *mimeType*) [inline]

Set the Mime Type of the Blob.

Parameters

mimeType	- String holding the MIME Type.

6.12.2.12 void activemq::commands::ActiveMQBlobMessage::setName (const std::string & *name*) [inline]

Sets the Name of the Blob.

Parameters

name	- Name of the Blob.

6.12.2.13 void activemq::commands::ActiveMQBlobMessage::setRemoteBlobUrl (const std::string & *remoteURL*) [inline]

Set the Remote URL of the Blob.

Parameters

remoteURL	- String form of the Remote URL.

6.12.2.14 virtual std::string activemq::commands::ActiveMQBlobMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.12.3 Field Documentation

6.12.3.1 const std::string activemq::commands::ActiveMQBlobMessage::BINARY_MIME_TYPE [static]

6.12.3.2 const unsigned char activemq::commands::ActiveMQBlobMessage::ID_ACTIVEMQBLOBMESSAGE = 29 [static]

The documentation for this class was generated from the following file:

6.13 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessage-Marshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 126).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQ-BlobMessageMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller:

Public Member Functions

- **ActiveMQBlobMessageMarshaller** ()
- virtual ~**ActiveMQBlobMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.13.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBlobMessageMarshaller** (p. 126).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.13.2 Constructor & Destructor Documentation

6.13.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::ActiveMQBlobMessageMarshaller ( ) [inline]

6.13.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::~ActiveMQBlobMessageMarshaller ( ) [inline, virtual]

6.13.3 Member Function Documentation

6.13.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.13.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.13.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.13.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.13.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.13.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.13.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQBlobMessageMarshaller.h**

6.14 activemq::commands::ActiveMQBytesMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQBytesMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQBytesMessage:

Public Member Functions

- **ActiveMQBytesMessage** ()
- virtual ∼**ActiveMQBytesMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQBytesMessage** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual **cms::BytesMessage** ∗ **clone** () **const**

  Clones this message.
- virtual void **clearBody** ()

  Clears out the body of the message.
- virtual void **onSend** ()

  *Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.*
- virtual void **setBodyBytes** (**const** unsigned char ∗buffer, int numBytes)

  sets the bytes given to the message body.
- virtual unsigned char ∗ **getBodyBytes** () **const**

  Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual int **getBodyLength** () **const**

  Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

- virtual bool **readBoolean** () **const**

  Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)

  Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () **const**

  Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)

  Writes a byte to the bytes message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) **const**

  Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (**const** std::vector< unsigned char > &value)

  Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) **const**

  Reads a portion of the bytes message stream.
- virtual void **writeBytes** (**const** unsigned char *value, int offset, int length)

  Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () **const**

  Reads a Char from the Bytes message stream.
- virtual void **writeChar** (char value)

  Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () **const**

  Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)

  Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () **const**

  Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)

  Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () **const**

  Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)

  Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () **const**

  Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value)

  Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () **const**

  Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)

  Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () **const**

  Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)

  Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () **const**

  Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (**const** std::string &value)

  Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () **const**

  Reads an UTF String from the BytesMessage stream.
- virtual void **writeUTF** (**const** std::string &value)

  Writes an UTF String to the BytesMessage stream.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQBYTESMESSAGE** = 24

6.14.1 Constructor & Destructor Documentation

6.14.1.1 activemq::commands::ActiveMQBytesMessage::ActiveMQBytesMessage ( )

6.14.1.2 virtual activemq::commands::ActiveMQBytesMessage::~ActiveMQBytesMessage ( ) throw () [virtual]

6.14.2 Member Function Documentation

6.14.2.1 virtual void activemq::commands::ActiveMQBytesMessage::clearBody ( ) [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSException	- if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230).

6.14.2.2 virtual cms::BytesMessage* activemq::commands::ActiveMQBytesMessage::clone ( ) const [inline, virtual]

Clones this message.

Returns

a deep copy of this message.

Exceptions

CMSException	- if an internal error occurs while cloning the **Message** (p. 1412).

Implements **cms::BytesMessage** (p. 559).

6.14.2.3 virtual ActiveMQBytesMessage* activemq::commands::ActiveMQBytesMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.14.2.4 virtual void activemq::commands::ActiveMQBytesMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.14.2.5 virtual bool activemq::commands::ActiveMQBytesMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230).

6.14.2.6 virtual unsigned char* activemq::commands::ActiveMQBytesMessage::getBodyBytes ( ) const [virtual]

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

CMSException	- If an internal error occurs.
MessageNotReadable-Exception	- If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 559).

6.14.2.7 virtual int activemq::commands::ActiveMQBytesMessage::getBodyLength ( ) const [virtual]

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

CMSException	- If an internal error occurs.
MessageNotReadable-Exception	- If the message is in Write Only Mode.

Implements **cms::BytesMessage** (p. 559).

6.14.2.8 virtual unsigned char activemq::commands::ActiveMQBytesMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.14.2.9 virtual void activemq::commands::ActiveMQBytesMessage::onSend ( ) [virtual]

Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 232).

6.14.2.10 virtual bool activemq::commands::ActiveMQBytesMessage::readBoolean ( ) const [virtual]

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 560).

6.14.2.11 virtual unsigned char activemq::commands::ActiveMQBytesMessage::readByte ( ) const [virtual]

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 560).

6.14.2.12 virtual int activemq::commands::ActiveMQBytesMessage::readBytes (std::vector< unsigned char > & *value*) const [virtual]

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value	buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 560).

6.14.2.13 virtual int activemq::commands::ActiveMQBytesMessage::readBytes (unsigned char * *buffer,* int *length*) const [virtual]

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an IndexOutOfBoundsException is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer	the buffer into which the data is read
length	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 561).

6.14.2.14 virtual char activemq::commands::ActiveMQBytesMessage::readChar ( ) const [virtual]

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 562).

6.14.2.15 virtual double activemq::commands::ActiveMQBytesMessage::readDouble ( ) const [virtual]

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 562).

6.14.2.16 virtual float activemq::commands::ActiveMQBytesMessage::readFloat ( ) const [virtual]

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 562).

6.14.2.17 virtual int activemq::commands::ActiveMQBytesMessage::readInt ( ) const [virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 563).

6.14.2.18 virtual long long activemq::commands::ActiveMQBytesMessage::readLong ( ) const [virtual]

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 563).

6.14.2.19 virtual short activemq::commands::ActiveMQBytesMessage::readShort ( ) const [virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 563).

6.14.2.20 virtual std::string activemq::commands::ActiveMQBytesMessage::readString ( ) const [virtual]

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 564).

6.14.2.21 virtual unsigned short activemq::commands::ActiveMQBytesMessage::readUnsignedShort ( ) const [virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 564).

6.14.2.22 virtual std::string activemq::commands::ActiveMQBytesMessage::readUTF ( ) const [virtual]

Reads an UTF String from the BytesMessage stream.

Returns

String from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::BytesMessage** (p. 564).

6.14.2.23 virtual void activemq::commands::ActiveMQBytesMessage::reset ( ) [virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

CMSException	- If the provider fails to perform the reset operation.
MessageFormatException	- If the **Message** (p. 1412) has an invalid format.

Implements **cms::BytesMessage** (p. 565).

6.14.2.24 virtual void activemq::commands::ActiveMQBytesMessage::setBodyBytes (const unsigned char * *buffer*, int *numBytes*) [virtual]

sets the bytes given to the message body.

Parameters

buffer	Byte Buffer to copy
numBytes	Number of bytes in Buffer to copy

Exceptions

CMSException	- If an internal error occurs.
MessageNotWriteable-Exception	- if in Read Only Mode.

Implements **cms::BytesMessage** (p. 565).

6.14.2.25 virtual std::string activemq::commands::ActiveMQBytesMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.14.2.26 virtual void activemq::commands::ActiveMQBytesMessage::writeBoolean (bool *value*) [virtual]

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value	boolean to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 565).

6.14.2.27 virtual void activemq::commands::ActiveMQBytesMessage::writeByte (unsigned char *value*) [virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

value	byte to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 565).

6.14.2.28 virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const std::vector< unsigned char > & *value*) [virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

value	bytes to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 566).

6.14.2.29 virtual void activemq::commands::ActiveMQBytesMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [virtual]

Writes a portion of a byte array to the bytes message stream.

size as the number of bytes to write.

Parameters

value	bytes to write to the stream
offset	the initial offset within the byte array
length	the number of bytes to use

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 566).

6.14.2.30 virtual void activemq::commands::ActiveMQBytesMessage::writeChar (char *value*) [virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters

value	char to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 566).

6.14.2.31 virtual void activemq::commands::ActiveMQBytesMessage::writeDouble (double *value*) [virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters

value	double to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 567).

6.14.2.32 virtual void activemq::commands::ActiveMQBytesMessage::writeFloat (float *value*) [virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters

value	float to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 567).

6.14.2.33 virtual void activemq::commands::ActiveMQBytesMessage::writeInt (int *value*) [virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

value	signed int to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 567).

6.14.2.34 virtual void activemq::commands::ActiveMQBytesMessage::writeLong (long long *value*) [virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

value	signed long long to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 568).

6.14.2.35 virtual void activemq::commands::ActiveMQBytesMessage::writeShort (short *value*) [virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

value	signed short to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 568).

6.14.2.36 virtual void activemq::commands::ActiveMQBytesMessage::writeString (const std::string & *value*) [virtual]

Writes an ASCII String to the Bytes message stream.

Parameters

value	String to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 568).

6.14.2.37 virtual void activemq::commands::ActiveMQBytesMessage::writeUnsignedShort (unsigned short *value*) [virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

value	unsigned short to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 569).

6.14.2.38 virtual void activemq::commands::ActiveMQBytesMessage::writeUTF (const std::string & *value*) [virtual]

Writes an UTF String to the BytesMessage stream.

Parameters

value	String to write to the stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::BytesMessage** (p. 569).

6.14.3 Field Documentation

6.14.3.1 const unsigned char activemq::commands::ActiveMQBytesMessage::ID_ACTIVEMQBYTESMESSAGE = 24 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQBytesMessage.h**

6.15 activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 142).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQBytesMessageMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller:

Public Member Functions

- **ActiveMQBytesMessageMarshaller** ()
- virtual ~**ActiveMQBytesMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.15.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQBytesMessageMarshaller** (p. 142).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.15.2 Constructor & Destructor Documentation

6.15.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::ActiveMQBytesMessageMarshaller ( ) [inline]

6.15.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::~ActiveMQBytesMessageMarshaller ( ) [inline, virtual]

6.15.3 Member Function Documentation

6.15.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.15.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.15.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.15.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.15.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.15.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.15.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQBytesMessageMarshaller.h**

6.16 activemq::core::ActiveMQConnection Class Reference

Concrete connection used for all connectors to the ActiveMQ broker.

`#include <src/main/activemq/core/ActiveMQConnection.h>`

Inheritance diagram for activemq::core::ActiveMQConnection:

Public Member Functions

- **ActiveMQConnection** (**const Pointer**< **transport::Transport** > &transport, **const Pointer**< **decaf::util::-Properties** > &properties)

  Constructor.
- virtual ~**ActiveMQConnection** () throw ()
- virtual void **addSession** (**ActiveMQSession** *session)

  Adds the session resources for the given session instance.
- virtual void **removeSession** (**ActiveMQSession** *session)

  Removes the session resources for the given session instance.
- virtual void **addProducer** (**ActiveMQProducer** *producer)

  Adds an active Producer to the Set of known producers.
- virtual void **removeProducer** (**const Pointer**< **commands::ProducerId** > &producerId)

  Removes an active Producer to the Set of known producers.
- virtual void **addDispatcher** (**const Pointer**< **commands::ConsumerId** > &consumer, **Dispatcher** *dispatcher)

  Adds a dispatcher for a consumer.
- virtual void **removeDispatcher** (**const Pointer**< **commands::ConsumerId** > &consumer)

  Removes the dispatcher for a consumer.
- virtual void **sendPullRequest** (**const commands::ConsumerInfo** *consumer, long long timeout)

  If supported sends a message pull request to the service provider asking for the delivery of a new message.
- bool **isClosed** () **const**

  Checks if this connection has been closed.
- bool **isStarted** () **const**

  Check if this connection has been started.
- bool **isTransportFailed** () **const**

  Checks if the Connection's Transport has failed.
- virtual void **destroyDestination** (**const commands::ActiveMQDestination** *destination)

  Requests that the Broker removes the given Destination.
- virtual void **destroyDestination** (**const cms::Destination** *destination)

  Requests that the Broker removes the given Destination.
- virtual **const**
  cms::ConnectionMetaData * **getMetaData** () **const**

  Gets the metadata for this connection.

  Returns

  the connection MetaData pointer (caller does not own it).

  Exceptions

CMSException (p. 640)	*if the provider fails to get the connection metadata for this connection.*

See also

ConnectionMetaData *(*p. *759)*

Since

2.0

- virtual **cms::Session** ∗ **createSession** ()

  Creates an AUTO_ACKNOWLEDGE ***Session*** *(*p. *1830).*

  Exceptions

CMSException (p. 640)	

- virtual std::string **getClientID** () **const**

  Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

  Returns

  Client Id String for this ***Connection*** *(*p. *725).*

  Exceptions

CMSException (p. 640)	*if the provider fails to return the client id or an internal error occurs.*

- virtual void **setClientID** (**const** std::string &clientID)

  Sets the client identifier for this connection.
  The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific ***ConnectionFactory*** *(*p. *741) object and transparently assigned to the* ***Connection*** *(*p. *725) object it creates.*
  If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an ***IllegalStateException*** *(*p. *1098).*

  Parameters

clientID	*The unique client identifier to assign to the* ***Connection*** *(*p. *725).*

  Exceptions

CMSException (p. 640)	*if the provider fails to set the client id due to some internal error.*
InvalidClientIDException	*if the id given is somehow invalid or is a duplicate.*
IllegalStateException (p. 1098)	*if the client tries to set the id after a* ***Connection*** *(*p. *725) method has been called.*

- virtual **cms::Session** ∗ **createSession** (**cms::Session::AcknowledgeMode** ackMode)

  Creates a new ***Session*** *(*p. *1830) to work for this* ***Connection*** *(*p. *725) using the specified acknowledgment mode.*

  Parameters

ackMode	*the Acknowledgment Mode to use.*

  Exceptions

CMSException (p. 640)	

- virtual void **close** ()

  Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

  Exceptions

CMSException (p. 640)	

- virtual void **start** ()

  Starts the service.

  Exceptions

CMSException (p. 640)	*if an internal error occurs while starting.*

- virtual void **stop** ()

  Stops this service.

Exceptions

CMSException (p. 640)	*- if an internal error occurs while stopping the Service.*

- virtual **cms::ExceptionListener** ∗ **getExceptionListener** () **const**

  Gets the registered Exception Listener for this connection.

  Returns

  pointer to an exception listener or NULL

- virtual void **setExceptionListener** (**cms::ExceptionListener** ∗listener)

  Sets the registered Exception Listener for this connection.

  Parameters

listener	*pointer to and* ***ExceptionListener*** *(p. 996)*

- void **setUsername** (**const** std::string &username)

  Sets the username that should be used when creating a new connection.

- **const** std::string & **getUsername** () **const**

  Gets the username that this factory will use when creating a new connection instance.

- void **setPassword** (**const** std::string &password)

  Sets the password that should be used when creating a new connection.

- **const** std::string & **getPassword** () **const**

  Gets the password that this factory will use when creating a new connection instance.

- void **setDefaultClientId** (**const** std::string &clientId)

  Sets the Client Id.

- void **setBrokerURL** (**const** std::string &brokerURL)

  Sets the Broker URL that should be used when creating a new connection instance.

- **const** std::string & **getBrokerURL** () **const**

  Gets the Broker URL that this factory will use when creating a new connection instance.

- void **setPrefetchPolicy** (**PrefetchPolicy** ∗policy)

  Sets the ***PrefetchPolicy*** *(p. 1635) instance that this factory should use when it creates new Connection instances.*

- **PrefetchPolicy** ∗ **getPrefetchPolicy** () **const**

  Gets the pointer to the current ***PrefetchPolicy*** *(p. 1635) that is in use by this ConnectionFactory.*

- void **setRedeliveryPolicy** (**RedeliveryPolicy** ∗policy)

  Sets the ***RedeliveryPolicy*** *(p. 1744) instance that this factory should use when it creates new Connection instances.*

- **RedeliveryPolicy** ∗ **getRedeliveryPolicy** () **const**

  Gets the pointer to the current ***RedeliveryPolicy*** *(p. 1744) that is in use by this ConnectionFactory.*

- bool **isDispatchAsync** () **const**
- void **setDispatchAsync** (bool value)

  Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

- bool **isAlwaysSyncSend** () **const**

  Gets if the Connection should always send things Synchronously.

- void **setAlwaysSyncSend** (bool value)

  Sets if the Connection should always send things Synchronously.

- bool **isUseAsyncSend** () **const**

  Gets if the useAsyncSend option is set.

- void **setUseAsyncSend** (bool value)

  Sets the useAsyncSend option.

- bool **isUseCompression** () **const**

  Gets if the Connection is configured for Message body compression.

- void **setUseCompression** (bool value)

  Sets whether Message body compression is enabled.

- void **setCompressionLevel** (int value)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

- int **getCompressionLevel** () **const**

  Gets the currently configured Compression level for Message bodies.
- unsigned int **getSendTimeout** () **const**

  Gets the assigned send timeout for this Connector.
- void **setSendTimeout** (unsigned int timeout)

  Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.
- unsigned int **getCloseTimeout** () **const**

  Gets the assigned close timeout for this Connector.
- void **setCloseTimeout** (unsigned int timeout)

  Sets the close timeout to use when sending the disconnect request.
- unsigned int **getProducerWindowSize** () **const**

  Gets the configured producer window size for Producers that are created from this connector.
- void **setProducerWindowSize** (unsigned int windowSize)

  Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.
- bool **isMessagePrioritySupported** () **const**
- void **setMessagePrioritySupported** (bool value)

  Set whether or not this factory should create Connection objects with the Message priority support function enabled.
- long long **getNextTempDestinationId** ()

  Get the Next Temporary Destination Id.
- long long **getNextLocalTransactionId** ()

  Get the Next Temporary Destination Id.
- void **addTransportListener** (**transport::TransportListener** ∗transportListener)

  Adds a transport listener so that a client can be notified of events in the underlying transport, client's are always notified after the event has been processed by the Connection class.
- void **removeTransportListener** (**transport::TransportListener** ∗transportListener)

  Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events.
- virtual void **onCommand** (**const Pointer**< **commands::Command** > &command)

  Event handler for the receipt of a non-response command from the transport.
- virtual void **onException** (**const decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()

  The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()

  The transport has resumed after an interruption.
- **const commands::ConnectionInfo** & **getConnectionInfo** () **const**

  Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.
- **const commands::ConnectionId** & **getConnectionId** () **const**

  Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.
- **transport::Transport** & **getTransport** () **const**

  Gets a reference to this object's Transport instance.
- **Pointer**< **threads::Scheduler** > **getScheduler** () **const**

  Gets a reference to the Connection objects built in Scheduler instance.
- std::string **getResourceManagerId** () **const**

  Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.
- void **cleanup** ()

  *Clean up this connection object, reseting it back to a state that mirrors what a newly created **ActiveMQConnection** (p. 145) object has.*

- void **oneway** (**Pointer**< **commands::Command** > command)

  Sends a message without request that the broker send a response to indicate that it was received.
- **Pointer**< **commands::Response** > **syncRequest** (**Pointer**< **commands::Command** > command, unsigned int timeout=0)

  Sends a synchronous request and returns the response from the broker.
- virtual void **fire** (**const exceptions::ActiveMQException** &ex)

  Notify the exception listener.
- void **setTransportInterruptionProcessingComplete** ()

  Indicates that a Connection resource that is processing the transportInterrupted event has completed.
- **decaf::lang::Exception** ∗ **getFirstFailureError** () **const**

  Gets the pointer to the first exception that caused the Connection to become failed.
- void **onAsyncException** (**const decaf::lang::Exception** &ex)

  Event handler for dealing with async exceptions.
- void **checkClosed** () **const**

  Check for Closed State and Throw an exception if true.
- void **checkClosedOrFailed** () **const**

  Check for Closed State and Failed State and Throw an exception if either is true.
- void **ensureConnectionInfoSent** ()

  If its not been sent, then send the ConnectionInfo to the Broker.

Protected Member Functions

- virtual **Pointer**
  < **commands::SessionId** > **getNextSessionId** ()
- void **disconnect** (long long lastDeliveredSequenceId)
- void **waitForTransportInterruptionProcessingToComplete** ()
- void **signalInterruptionProcessingComplete** ()
- **const decaf::util::Properties** & **getProperties** () **const**

6.16.1 Detailed Description

Concrete connection used for all connectors to the ActiveMQ broker.

Since

2.0

6.16.2 Constructor & Destructor Documentation

6.16.2.1 activemq::core::ActiveMQConnection::ActiveMQConnection (const Pointer< transport::Transport > & *transport,* const Pointer< decaf::util::Properties > & *properties*)

Constructor.

Parameters

transport	The Transport requested for this connection to the Broker.
properties	The Properties that were defined for this connection

6.16.2.2 virtual activemq::core::ActiveMQConnection::~ActiveMQConnection ( ) throw () [virtual]

6.16.3 Member Function Documentation

6.16.3.1 virtual void activemq::core::ActiveMQConnection::addDispatcher (const Pointer< commands::ConsumerId > & *consumer,* Dispatcher * *dispatcher*) [virtual]

Adds a dispatcher for a consumer.

Parameters

consumer	- The consumer for which to register a dispatcher.
dispatcher	- The dispatcher to handle incoming messages for the consumer.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.2 virtual void activemq::core::ActiveMQConnection::addProducer (ActiveMQProducer * *producer*) [virtual]

Adds an active Producer to the Set of known producers.

Parameters

producer	The Producer to add from the the known set.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.3 virtual void activemq::core::ActiveMQConnection::addSession (ActiveMQSession * *session*) [virtual]

Adds the session resources for the given session instance.

Parameters

session	The session to be added to this connection.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.4 void activemq::core::ActiveMQConnection::addTransportListener (transport::TransportListener * *transportListener*)

Adds a transport listener so that a client can be notified of events in the underlying transport, client's are always notified after the event has been processed by the Connection class.

Client's should ensure that the registered listener does not block or take a long amount of time to execute in order to not degrade performance of this Connection.

Parameters

transportListener	The TransportListener instance to add to this Connection's set of listeners to notify of Transport events.

6.16.3.5 void activemq::core::ActiveMQConnection::checkClosed ( ) const

Check for Closed State and Throw an exception if true.

Exceptions

CMSException	if the Connection is closed.

6.16.3.6 void activemq::core::ActiveMQConnection::checkClosedOrFailed ( ) const

Check for Closed State and Failed State and Throw an exception if either is true.

Exceptions

CMSException	if the Connection is closed or failed.

6.16.3.7 void activemq::core::ActiveMQConnection::cleanup ( )

Clean up this connection object, reseting it back to a state that mirrors what a newly created **ActiveMQConnection** (p. 145) object has.

6.16.3.8 virtual void activemq::core::ActiveMQConnection::close ( ) [virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

CMSException *(p. 640)*	

Implements **cms::Connection** (p. 726).

6.16.3.9 virtual cms::Session* activemq::core::ActiveMQConnection::createSession ( ) [virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 1830).

Exceptions

CMSException *(p. 640)*	

Implements **cms::Connection** (p. 726).

6.16.3.10 virtual cms::Session* activemq::core::ActiveMQConnection::createSession (cms::Session::AcknowledgeMode *ackMode*) [virtual]

Creates a new **Session** (p. 1830) to work for this **Connection** (p. 725) using the specified acknowledgment mode.

Parameters

ackMode	the Acknowledgment Mode to use.

Exceptions

CMSException *(p. 640)*	

Implements **cms::Connection** (p. 726).

Reimplemented in **activemq::core::ActiveMQXAConnection** (p. 335).

6.16.3.11 virtual void activemq::core::ActiveMQConnection::destroyDestination (const commands::ActiveMQDestination * *destination*) [virtual]

Requests that the Broker removes the given Destination.

Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters

destination	The Destination the Broker will be requested to remove.

Exceptions

NullPointerException	If the passed Destination is Null
IllegalStateException	If the connection is closed.
UnsupportedOperation-Exception	If the wire format in use does not support this operation.
ActiveMQException	If any other error occurs during the attempt to destroy the destination.

6.16.3.12 virtual void activemq::core::ActiveMQConnection::destroyDestination (const cms::Destination * *destination*) [virtual]

Requests that the Broker removes the given Destination.

Calling this method implies that the client is finished with the Destination and that no other messages will be sent or received for the given Destination. The Broker frees all resources it has associated with this Destination.

Parameters

destination	The CMS Destination the Broker will be requested to remove.

Exceptions

NullPointerException	If the passed Destination is Null
IllegalStateException	If the connection is closed.
UnsupportedOperation-Exception	If the wire format in use does not support this operation.
ActiveMQException	If any other error occurs during the attempt to destroy the destination.

6.16.3.13 void activemq::core::ActiveMQConnection::disconnect (long long *lastDeliveredSequenceId*) [protected]

6.16.3.14 void activemq::core::ActiveMQConnection::ensureConnectionInfoSent ( )

If its not been sent, then send the ConnectionInfo to the Broker.

6.16.3.15 virtual void activemq::core::ActiveMQConnection::fire (const exceptions::ActiveMQException & *ex*) [virtual]

Notify the exception listener.

Parameters

ex	the exception to fire

6.16.3.16 const std::string& activemq::core::ActiveMQConnection::getBrokerURL ( ) const

Gets the Broker URL that this factory will use when creating a new connection instance.

Returns

brokerURL string

6.16.3.17 virtual std::string activemq::core::ActiveMQConnection::getClientID ( ) const [virtual]

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns

Client Id String for this **Connection** (p. 725).

Exceptions

CMSException *(p. 640)*	if the provider fails to return the client id or an internal error occurs.

Implements **cms::Connection** (p. 727).

6.16.3.18 unsigned int activemq::core::ActiveMQConnection::getCloseTimeout ( ) const

Gets the assigned close timeout for this Connector.

Returns

the close timeout configured in the connection uri

6.16.3.19 int activemq::core::ActiveMQConnection::getCompressionLevel ( ) const

Gets the currently configured Compression level for Message bodies.

Returns

the int value of the current compression level.

6.16.3.20 const commands::ConnectionId& activemq::core::ActiveMQConnection::getConnectionId ( ) const

Gets the ConnectionId for this Object, if the Connection is not open than this method throws an exception.

Exceptions

ActiveMQException	if an error occurs while performing this operation.

6.16.3.21 const commands::ConnectionInfo& activemq::core::ActiveMQConnection::getConnectionInfo ( ) const

Gets the ConnectionInfo for this Object, if the Connection is not open than this method throws an exception.

Exceptions

ActiveMQException	if an error occurs while performing this operation.

6.16.3.22 virtual cms::ExceptionListener* activemq::core::ActiveMQConnection::getExceptionListener ( ) const [virtual]

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

Implements **cms::Connection** (p. 727).

6.16.3.23 decaf::lang::Exception* activemq::core::ActiveMQConnection::getFirstFailureError ( ) const

Gets the pointer to the first exception that caused the Connection to become failed.

Returns

pointer to and Exception instance or NULL if none is set.

6.16.3.24 virtual const cms::ConnectionMetaData* activemq::core::ActiveMQConnection::getMetaData ( ) const [inline, virtual]

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

CMSException *(p. 640)*	if the provider fails to get the connection metadata for this connection.

See also

ConnectionMetaData (p. 759)

Since

2.0

Implements **cms::Connection** (p. 727).

6.16.3.25 long long activemq::core::ActiveMQConnection::getNextLocalTransactionId ( )

Get the Next Temporary Destination Id.

Returns

the next id in the sequence.

6.16.3.26 virtual Pointer<commands::SessionId> activemq::core::ActiveMQConnection::getNextSessionId ( ) [protected, virtual]

Returns

the next available Session Id.

6.16.3.27 long long activemq::core::ActiveMQConnection::getNextTempDestinationId ( )

Get the Next Temporary Destination Id.

Returns

the next id in the sequence.

6.16.3.28 const std::string& activemq::core::ActiveMQConnection::getPassword ( ) const

Gets the password that this factory will use when creating a new connection instance.

Returns

password string, "" for default credentials

6.16.3.29 PrefetchPolicy* activemq::core::ActiveMQConnection::getPrefetchPolicy ( ) const

Gets the pointer to the current **PrefetchPolicy** (p. 1635) that is in use by this ConnectionFactory.

Returns

a pointer to this objects **PrefetchPolicy** (p. 1635).

6.16.3.30 unsigned int activemq::core::ActiveMQConnection::getProducerWindowSize ( ) const

Gets the configured producer window size for Producers that are created from this connector.

This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.16.3.31 const decaf::util::Properties& activemq::core::ActiveMQConnection::getProperties ( ) const [protected]

6.16.3.32 RedeliveryPolicy* activemq::core::ActiveMQConnection::getRedeliveryPolicy ( ) const

Gets the pointer to the current **RedeliveryPolicy** (p. 1744) that is in use by this ConnectionFactory.

Returns

a pointer to this objects **RedeliveryPolicy** (p. 1744).

6.16.3.33 std::string activemq::core::ActiveMQConnection::getResourceManagerId ( ) const

Returns the Id of the Resource Manager that this client will use should it be entered into an XA Transaction.

Returns

a string containing the resource manager Id for XA Transactions.

6.16.3.34 Pointer<threads::Scheduler> activemq::core::ActiveMQConnection::getScheduler ( ) const

Gets a reference to the Connection objects built in Scheduler instance.

Returns

a reference to a Scheduler instance owned by this Connection.

6.16.3.35 unsigned int activemq::core::ActiveMQConnection::getSendTimeout ( ) const

Gets the assigned send timeout for this Connector.

Returns

the send timeout configured in the connection uri

6.16.3.36 transport::Transport& activemq::core::ActiveMQConnection::getTransport ( ) const

Gets a reference to this object's Transport instance.

Returns

a reference to the Transport that is in use by this Connection.

6.16.3.37 const std::string& activemq::core::ActiveMQConnection::getUsername ( ) const

Gets the username that this factory will use when creating a new connection instance.

Returns

username string, "" for default credentials

6.16.3.38 bool activemq::core::ActiveMQConnection::isAlwaysSyncSend ( ) const

Gets if the Connection should always send things Synchronously.

Returns

true if sends should always be Synchronous.

6.16.3.39 bool activemq::core::ActiveMQConnection::isClosed ( ) const [inline]

Checks if this connection has been closed.

Returns

true if the connection is closed

6.16.3.40 bool activemq::core::ActiveMQConnection::isDispatchAsync ( ) const

Returns

The value of the dispatch asynchronously option sent to the broker.

6.16.3.41 bool activemq::core::ActiveMQConnection::isMessagePrioritySupported ( ) const

Returns

true if the Connections that this factory creates should support the message based priority settings.

6.16.3.42 bool activemq::core::ActiveMQConnection::isStarted ( ) const [inline]

Check if this connection has been started.

Returns

true if the start method has been called.

6.16.3.43 bool activemq::core::ActiveMQConnection::isTransportFailed ( ) const [inline]

Checks if the Connection's Transport has failed.

Returns

true if the Connection's Transport has failed.

6.16.3.44 bool activemq::core::ActiveMQConnection::isUseAsyncSend ( ) const

Gets if the useAsyncSend option is set.

Returns

true if on false if not.

6.16.3.45 bool activemq::core::ActiveMQConnection::isUseCompression ( ) const

Gets if the Connection is configured for Message body compression.

Returns

if the Message body will be Compressed or not.

6.16.3.46 void activemq::core::ActiveMQConnection::onAsyncException (const decaf::lang::Exception & *ex*)

Event handler for dealing with async exceptions.

Parameters

ex	The exception that caused the error condition.

6.16.3.47 virtual void activemq::core::ActiveMQConnection::onCommand (const Pointer< commands::Command > & *command*) [virtual]

Event handler for the receipt of a non-response command from the transport.

Parameters

command	the received command object.

Implements **activemq::transport::TransportListener** (p. 2177).

6.16.3.48 void activemq::core::ActiveMQConnection::oneway (Pointer< commands::Command > *command*)

Sends a message without request that the broker send a response to indicate that it was received.

Parameters

command	The Command object to send to the Broker.

Exceptions

ActiveMQException	if not currently connected, or if the operation fails for any reason.

6.16.3.49 virtual void activemq::core::ActiveMQConnection::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

Parameters

ex	The exception.

Implements **activemq::transport::TransportListener** (p. 2177).

6.16.3.50 virtual void activemq::core::ActiveMQConnection::removeDispatcher (const Pointer< commands::ConsumerId > & *consumer*) [virtual]

Removes the dispatcher for a consumer.

Parameters

consumer	- The consumer for which to remove the dispatcher.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.51 virtual void activemq::core::ActiveMQConnection::removeProducer (const Pointer< commands::ProducerId > & *producerId*) [virtual]

Removes an active Producer to the Set of known producers.

Parameters

producerId	- The ProducerId to remove from the the known set.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.52 virtual void activemq::core::ActiveMQConnection::removeSession (ActiveMQSession * *session*) [virtual]

Removes the session resources for the given session instance.

Parameters

session	The session to be unregistered from this connection.

Exceptions

CMSException	if an error occurs while removing performing the operation.

6.16.3.53 void activemq::core::ActiveMQConnection::removeTransportListener (transport::TransportListener * *transportListener*)

Removes a registered TransportListener from the Connection's set of Transport listeners, this listener will no longer receive any Transport related events.

The caller is responsible for freeing the listener in all cases.

Parameters

transportListener	The pointer to the TransportListener to remove from the set of listeners.

6.16.3.54 virtual void activemq::core::ActiveMQConnection::sendPullRequest (const commands::ConsumerInfo * *consumer*, long long *timeout*) [virtual]

If supported sends a message pull request to the service provider asking for the delivery of a new message.

This is used in the case where the service provider has been configured with a zero prefetch or is only capable of delivering messages on a pull basis.

Parameters

consumer	- the ConsumerInfo for the requesting Consumer.
timeout	- the time that the client is willing to wait.

Exceptions

ActiveMQException	if an error occurs while removing performing the operation.

6.16.3.55 void activemq::core::ActiveMQConnection::setAlwaysSyncSend (bool *value*)

Sets if the Connection should always send things Synchronously.

Parameters

value	true if sends should always be Synchronous.

6.16.3.56 void activemq::core::ActiveMQConnection::setBrokerURL (const std::string & *brokerURL*)

Sets the Broker URL that should be used when creating a new connection instance.

Parameters

brokerURL	string

6.16.3.57 virtual void activemq::core::ActiveMQConnection::setClientID (const std::string & *clientID*) [virtual]

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 741) object and transparently assigned to the **Connection** (p. 725) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1098).

Parameters

clientID	The unique client identifier to assign to the **Connection** (p. 725).

Exceptions

CMSException *(p. 640)*	if the provider fails to set the client id due to some internal error.
InvalidClientIDException	if the id given is somehow invalid or is a duplicate.
IllegalStateException *(p. 1098)*	if the client tries to set the id after a **Connection** (p. 725) method has been called.

Implements **cms::Connection** (p. 727).

6.16.3.58 void activemq::core::ActiveMQConnection::setCloseTimeout (unsigned int *timeout*)

Sets the close timeout to use when sending the disconnect request.

Parameters

timeout	- The time to wait for a close message.

6.16.3.59 void activemq::core::ActiveMQConnection::setCompressionLevel (int *value*)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters

value	A signed int value that controls the compression level.

6.16.3.60 void activemq::core::ActiveMQConnection::setDefaultClientId (const std::string & *clientId*)

Sets the Client Id.

Parameters

clientId	- The new clientId value.

6.16.3.61 void activemq::core::ActiveMQConnection::setDispatchAsync (bool *value*)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters

value	The value of the dispatch asynchronously option sent to the broker.

6.16.3.62 virtual void activemq::core::ActiveMQConnection::setExceptionListener (cms::ExceptionListener * *listener*) [virtual]

Sets the registered Exception Listener for this connection.

Parameters

listener	pointer to and **ExceptionListener** (p. 996)

Implements **cms::Connection** (p. 728).

6.16.3.63 void activemq::core::ActiveMQConnection::setMessagePrioritySupported (bool *value*)

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters

value	Boolean indicating if Message priority should be enabled.

6.16.3.64 void activemq::core::ActiveMQConnection::setPassword (const std::string & *password*)

Sets the password that should be used when creating a new connection.

Parameters

password	string

6.16.3.65 void activemq::core::ActiveMQConnection::setPrefetchPolicy (PrefetchPolicy * *policy*)

Sets the **PrefetchPolicy** (p. 1635) instance that this factory should use when it creates new Connection instances.

The **PrefetchPolicy** (p. 1635) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

policy	The new **PrefetchPolicy** (p. 1635) that the ConnectionFactory should clone for Connections.

6.16.3.66 void activemq::core::ActiveMQConnection::setProducerWindowSize (unsigned int *windowSize*)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters

windowSize	- The size in bytes of the Producers memory window.

6.16.3.67 void activemq::core::ActiveMQConnection::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 1744) instance that this factory should use when it creates new Connection instances.

The **RedeliveryPolicy** (p. 1744) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

policy	The new **RedeliveryPolicy** (p. 1744) that the ConnectionFactory should clone for Connections.

6.16.3.68 void activemq::core::ActiveMQConnection::setSendTimeout (unsigned int *timeout*)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters

timeout	- The time to wait for a response.

6.16.3.69 void activemq::core::ActiveMQConnection::setTransportInterruptionProcessingComplete ( )

Indicates that a Connection resource that is processing the transportInterrupted event has completed.

6.16.3.70 void activemq::core::ActiveMQConnection::setUseAsyncSend (bool *value*)

Sets the useAsyncSend option.

Parameters

value	- true to activate, false to disable.

6.16.3.71 void activemq::core::ActiveMQConnection::setUseCompression (bool *value*)

Sets whether Message body compression is enabled.

Parameters

value	Boolean indicating if Message body compression is enabled.

6.16.3.72 void activemq::core::ActiveMQConnection::setUsername (const std::string & *username*)

Sets the username that should be used when creating a new connection.

Parameters

username	string

6.16.3.73 void activemq::core::ActiveMQConnection::signalInterruptionProcessingComplete ( ) [protected]

6.16.3.74 virtual void activemq::core::ActiveMQConnection::start ( ) [virtual]

Starts the service.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while starting.

Implements **cms::Startable** (p. 1964).

6.16.3.75 virtual void activemq::core::ActiveMQConnection::stop ( ) [virtual]

Stops this service.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2017).

6.16.3.76 Pointer<commands::Response> activemq::core::ActiveMQConnection::syncRequest (Pointer< commands::Command > *command,* unsigned int *timeout* = 0)

Sends a synchronous request and returns the response from the broker.

This method converts any error responses it receives into an exception.

Parameters

command	The Command object that is to be sent to the broker.
timeout	The time in milliseconds to wait for a response, default is zero or infinite.

Returns

a Pointer instance to the Response object sent from the Broker.

Exceptions

BrokerException	if the response from the broker is of type ExceptionResponse.
ActiveMQException	if any other error occurs while sending the Command.

6.16.3.77 virtual void activemq::core::ActiveMQConnection::transportInterrupted ( ) [virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2178).

6.16.3.78 virtual void activemq::core::ActiveMQConnection::transportResumed ( ) [virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2178).

6.16.3.79 void activemq::core::ActiveMQConnection::waitForTransportInterruptionProcessingToComplete ( ) [protected]

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConnection.h**

6.17 activemq::core::ActiveMQConnectionFactory Class Reference

`#include <src/main/activemq/core/ActiveMQConnectionFactory.h>`

Inheritance diagram for activemq::core::ActiveMQConnectionFactory:

Public Member Functions

- **ActiveMQConnectionFactory** ()
- **ActiveMQConnectionFactory** (**const** std::string &uri, **const** std::string &username="", **const** std::string &password="")

  Constructor.
- **ActiveMQConnectionFactory** (**const decaf::net::URI** &uri, **const** std::string &username="", **const** std::string &password="")

  Constructor.
- virtual ~**ActiveMQConnectionFactory** () throw ()
- virtual **cms::Connection** * **createConnection** ()

  Creates a connection with the default user identity.
- virtual **cms::Connection** * **createConnection** (**const** std::string &username, **const** std::string &password)

  Creates a connection with the specified user identity.
- virtual **cms::Connection** * **createConnection** (**const** std::string &username, **const** std::string &password, **const** std::string &clientId)

  Creates a connection with the specified user identity.
- void **setUsername** (**const** std::string &username)

  Sets the username that should be used when creating a new connection.
- **const** std::string & **getUsername** () **const**

  Gets the username that this factory will use when creating a new connection instance.
- void **setPassword** (**const** std::string &password)

  Sets the password that should be used when creating a new connection.
- **const** std::string & **getPassword** () **const**

  Gets the password that this factory will use when creating a new connection instance.
- std::string **getClientId** () **const**

Gets the Configured Client Id.

- void **setClientId** (**const** std::string &clientId)

  Sets the Client Id.

- void **setBrokerURI** (**const** std::string &uri)

  Sets the Broker URI that should be used when creating a new connection instance.

- void **setBrokerURI** (**const decaf::net::URI** &uri)

  Sets the Broker URI that should be used when creating a new connection instance.

- **const decaf::net::URI** & **getBrokerURI** () **const**

  Gets the Broker URI that this factory will use when creating a new connection instance.

- void **setExceptionListener** (**cms::ExceptionListener** ∗listener)

  Set an CMS ExceptionListener that will be set on eat connection once it has been created.

- **cms::ExceptionListener** ∗ **getExceptionListener** () **const**

  Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.

- void **setPrefetchPolicy** (**PrefetchPolicy** ∗policy)

  *Sets the **PrefetchPolicy** (p. 1635) instance that this factory should use when it creates new Connection instances.*

- **PrefetchPolicy** ∗ **getPrefetchPolicy** () **const**

  *Gets the pointer to the current **PrefetchPolicy** (p. 1635) that is in use by this ConnectionFactory.*

- void **setRedeliveryPolicy** (**RedeliveryPolicy** ∗policy)

  *Sets the **RedeliveryPolicy** (p. 1744) instance that this factory should use when it creates new Connection instances.*

- **RedeliveryPolicy** ∗ **getRedeliveryPolicy** () **const**

  *Gets the pointer to the current **RedeliveryPolicy** (p. 1744) that is in use by this ConnectionFactory.*

- bool **isDispatchAsync** () **const**
- void **setDispatchAsync** (bool value)

  Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

- bool **isAlwaysSyncSend** () **const**

  Gets if the Connection should always send things Synchronously.

- void **setAlwaysSyncSend** (bool value)

  Sets if the Connection should always send things Synchronously.

- bool **isUseAsyncSend** () **const**

  Gets if the useAsyncSend option is set.

- void **setUseAsyncSend** (bool value)

  Sets the useAsyncSend option.

- bool **isUseCompression** () **const**

  Gets if the Connection is configured for Message body compression.

- void **setUseCompression** (bool value)

  Sets whether Message body compression is enabled.

- void **setCompressionLevel** (int value)

  Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

- int **getCompressionLevel** () **const**

  Gets the currently configured Compression level for Message bodies.

- unsigned int **getSendTimeout** () **const**

  Gets the assigned send timeout for this Connector.

- void **setSendTimeout** (unsigned int timeout)

  Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

- unsigned int **getCloseTimeout** () **const**

  Gets the assigned close timeout for this Connector.

- void **setCloseTimeout** (unsigned int timeout)

Sets the close timeout to use when sending the disconnect request.

- unsigned int **getProducerWindowSize** () **const**

  Gets the configured producer window size for Producers that are created from this connector.

- void **setProducerWindowSize** (unsigned int windowSize)

  Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

- bool **isMessagePrioritySupported** () **const**
- void **setMessagePrioritySupported** (bool value)

  Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Static Public Member Functions

- static **cms::Connection** * **createConnection** (**const** std::string &uri, **const** std::string &username, **const** std::string &password, **const** std::string &clientId="")

  Creates a connection with the specified user identity.

Static Public Attributes

- static **const** std::string **DEFAULT_URI**

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (**const Pointer**< **transport::Transport** > &transport, **const Pointer**< **decaf::util::Properties** > &properties)

  *Create a new **ActiveMQConnection** (p. 145) instnace using the provided Transport and Properties.*

6.17.1 Constructor & Destructor Documentation

6.17.1.1 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory ( )

6.17.1.2 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory (const std::string & *uri,* const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters

url	the URI of the Broker we are connecting to.
username	to authenticate with, defaults to ""
password	to authenticate with, defaults to ""

6.17.1.3 activemq::core::ActiveMQConnectionFactory::ActiveMQConnectionFactory (const decaf::net::URI & *uri,* const std::string & *username* = "", const std::string & *password* = "")

Constructor.

Parameters

uri	the URI of the Broker we are connecting to.
username	to authenticate with, defaults to ""
password	to authenticate with, defaults to ""

6.17.1.4 virtual activemq::core::ActiveMQConnectionFactory::~ActiveMQConnectionFactory ( ) throw () [virtual]

6.17.2 Member Function Documentation

6.17.2.1 virtual ActiveMQConnection* activemq::core::ActiveMQConnectionFactory::createActiveMQConnection (const Pointer< transport::Transport > & *transport*, const Pointer< decaf::util::Properties > & *properties*) [protected, virtual]

Create a new **ActiveMQConnection** (p. 145) instnace using the provided Transport and Properties.

Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 145) that is created.

Parameters

transport	The Transport that the Connection should use to communicate with the Broker.
properties	The Properties that are assigned to the new Connection instance.

Returns

a new **ActiveMQConnection** (p. 145) pointer instance.

Reimplemented in **activemq::core::ActiveMQXAConnectionFactory** (p. 337).

6.17.2.2 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection ( ) [virtual]

Creates a connection with the default user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Returns

a Connection Pointer

Exceptions

CMSException	

Implements **cms::ConnectionFactory** (p. 743).

6.17.2.3 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*) [virtual]

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters

username	to authenticate with
password	to authenticate with

Returns

a Connection Pointer

Exceptions

CMSException	

Implements **cms::ConnectionFactory** (p. 743).

6.17.2.4 virtual cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *username,* const std::string & *password,* const std::string & *clientId*) [virtual]

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters

username	to authenticate with
password	to authenticate with
clientId	to assign to connection if "" then a random cleint Id is created for this connection.

Returns

a Connection Pointer

Exceptions

CMSException	

Implements **cms::ConnectionFactory** (p. 743).

6.17.2.5 static cms::Connection* activemq::core::ActiveMQConnectionFactory::createConnection (const std::string & *uri,* const std::string & *username,* const std::string & *password,* const std::string & *clientId* = " ") [static]

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the Connection.start method is explicitly called.

Parameters

uri	The URI of the Broker we are connecting to.
username	The name of the user to authenticate with.
password	The password for the user to authenticate with.
clientId	The unique client id to assign to connection, defaults to "".

Exceptions

CMSException.	

6.17.2.6 const decaf::net::URI& activemq::core::ActiveMQConnectionFactory::getBrokerURI ( ) const

Gets the Broker URI that this factory will use when creating a new connection instance.

Returns

brokerURI string

6.17.2.7 std::string activemq::core::ActiveMQConnectionFactory::getClientId ( ) const

Gets the Configured Client Id.

Returns

the clientId.

6.17.2.8 unsigned int activemq::core::ActiveMQConnectionFactory::getCloseTimeout ( ) const

Gets the assigned close timeout for this Connector.

Returns

the close timeout configured in the connection uri

6.17.2.9 int activemq::core::ActiveMQConnectionFactory::getCompressionLevel ( ) const

Gets the currently configured Compression level for Message bodies.

Returns

the int value of the current compression level.

6.17.2.10 cms::ExceptionListener* activemq::core::ActiveMQConnectionFactory::getExceptionListener ( ) const

Returns the currently set ExceptionListener that will be set on any new Connection instance that is created by this factory.

Returns

a pointer to a CMS ExceptionListener instance or NULL if not set.

6.17.2.11 const std::string& activemq::core::ActiveMQConnectionFactory::getPassword ( ) const

Gets the password that this factory will use when creating a new connection instance.

Returns

password string, "" for default credentials

6.17.2.12 PrefetchPolicy* activemq::core::ActiveMQConnectionFactory::getPrefetchPolicy ( ) const

Gets the pointer to the current **PrefetchPolicy** (p. 1635) that is in use by this ConnectionFactory.

Returns

a pointer to this objects **PrefetchPolicy** (p. 1635).

6.17.2.13 unsigned int activemq::core::ActiveMQConnectionFactory::getProducerWindowSize ( ) const

Gets the configured producer window size for Producers that are created from this connector.

This only applies if there is no send timeout and the producer is able to send asynchronously.

Returns

size in bytes of messages that this producer can produce before it must block and wait for ProducerAck messages to free resources.

6.17.2.14 RedeliveryPolicy* activemq::core::ActiveMQConnectionFactory::getRedeliveryPolicy ( ) const

Gets the pointer to the current **RedeliveryPolicy** (p. 1744) that is in use by this ConnectionFactory.

Returns

a pointer to this objects **RedeliveryPolicy** (p. 1744).

6.17.2.15 unsigned int activemq::core::ActiveMQConnectionFactory::getSendTimeout ( ) const

Gets the assigned send timeout for this Connector.

Returns

the send timeout configured in the connection uri

6.17.2.16 const std::string& activemq::core::ActiveMQConnectionFactory::getUsername ( ) const

Gets the username that this factory will use when creating a new connection instance.

Returns

username string, "" for default credentials

6.17.2.17 bool activemq::core::ActiveMQConnectionFactory::isAlwaysSyncSend ( ) const

Gets if the Connection should always send things Synchronously.

Returns

true if sends should always be Synchronous.

6.17.2.18 bool activemq::core::ActiveMQConnectionFactory::isDispatchAsync ( ) const

Returns

The value of the dispatch asynchronously option sent to the broker.

6.17.2.19 bool activemq::core::ActiveMQConnectionFactory::isMessagePrioritySupported ( ) const

Returns

true if the Connections that this factory creates should support the message based priority settings.

6.17.2.20 bool activemq::core::ActiveMQConnectionFactory::isUseAsyncSend ( ) const

Gets if the useAsyncSend option is set.

Returns

true if on false if not.

6.17.2.21 bool activemq::core::ActiveMQConnectionFactory::isUseCompression ( ) const

Gets if the Connection is configured for Message body compression.

Returns

if the Message body will be Compressed or not.

6.17.2.22 void activemq::core::ActiveMQConnectionFactory::setAlwaysSyncSend (bool *value*)

Sets if the Connection should always send things Synchronously.

Parameters

value	true if sends should always be Synchronous.

6.17.2.23 void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const std::string & *uri*)

Sets the Broker URI that should be used when creating a new connection instance.

Parameters

brokerURI	The string form of the Broker URI, this will be converted to a URI object.

6.17.2.24 void activemq::core::ActiveMQConnectionFactory::setBrokerURI (const decaf::net::URI & *uri*)

Sets the Broker URI that should be used when creating a new connection instance.

Parameters

brokerURI	The URI of the broker that this client will connect to.

6.17.2.25 void activemq::core::ActiveMQConnectionFactory::setClientId (const std::string & *clientId*)

Sets the Client Id.

Parameters

clientId	- The new clientId value.

6.17.2.26 void activemq::core::ActiveMQConnectionFactory::setCloseTimeout (unsigned int *timeout*)

Sets the close timeout to use when sending the disconnect request.

Parameters

timeout	- The time to wait for a close message.

6.17.2.27 void activemq::core::ActiveMQConnectionFactory::setCompressionLevel (int *value*)

Sets the Compression level used when Message body compression is enabled, a value of -1 causes the Compression Library to use the default setting which is a balance of speed and compression.

The range of compression levels is [0..9] where 0 indicates best speed and 9 indicates best compression.

Parameters

value	A signed int value that controls the compression level.

6.17.2.28 void activemq::core::ActiveMQConnectionFactory::setDispatchAsync (bool *value*)

Should messages be dispatched synchronously or asynchronously from the producer thread for non-durable topics in the broker? For fast consumers set this to false.

For slow consumers set it to true so that dispatching will not block fast consumers. .

Parameters

value	The value of the dispatch asynchronously option sent to the broker.

6.17.2.29 void activemq::core::ActiveMQConnectionFactory::setExceptionListener (cms::ExceptionListener * *listener*)

Set an CMS ExceptionListener that will be set on eat connection once it has been created.

The factory does not take ownership of this pointer, the client must ensure that its lifetime is scoped to the connection that it is applied to.

Parameters

listener	The listener to set on the connection or NULL for no listener.

6.17.2.30 void activemq::core::ActiveMQConnectionFactory::setMessagePrioritySupported (bool *value*)

Set whether or not this factory should create Connection objects with the Message priority support function enabled.

Parameters

value	Boolean indicating if Message priority should be enabled.

6.17.2.31 void activemq::core::ActiveMQConnectionFactory::setPassword (const std::string & *password*)

Sets the password that should be used when creating a new connection.

Parameters

password	string

6.17.2.32 void activemq::core::ActiveMQConnectionFactory::setPrefetchPolicy (PrefetchPolicy * *policy*)

Sets the **PrefetchPolicy** (p. 1635) instance that this factory should use when it creates new Connection instances.

The **PrefetchPolicy** (p. 1635) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

policy	The new **PrefetchPolicy** (p. 1635) that the ConnectionFactory should clone for Connections.

6.17.2.33 void activemq::core::ActiveMQConnectionFactory::setProducerWindowSize (unsigned int *windowSize*)

Sets the size in Bytes of messages that a producer can send before it is blocked to await a ProducerAck from the broker that frees enough memory to allow another message to be sent.

Parameters

windowSize	- The size in bytes of the Producers memory window.

6.17.2.34 void activemq::core::ActiveMQConnectionFactory::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 1744) instance that this factory should use when it creates new Connection instances.

The **RedeliveryPolicy** (p. 1744) passed becomes the property of the factory and will be deleted when the factory is destroyed.

Parameters

policy	The new **RedeliveryPolicy** (p. 1744) that the ConnectionFactory should clone for Connections.

6.17.2.35 void activemq::core::ActiveMQConnectionFactory::setSendTimeout (unsigned int *timeout*)

Sets the send timeout to use when sending Message objects, this will cause all messages to be sent using a Synchronous request is non-zero.

Parameters

timeout	- The time to wait for a response.

6.17.2.36 void activemq::core::ActiveMQConnectionFactory::setUseAsyncSend (bool *value*)

Sets the useAsyncSend option.

Parameters

value	- true to activate, false to disable.

6.17.2.37 void activemq::core::ActiveMQConnectionFactory::setUseCompression (bool *value*)

Sets whether Message body compression is enabled.

Parameters

value	Boolean indicating if Message body compression is enabled.

6.17.2.38 void activemq::core::ActiveMQConnectionFactory::setUsername (const std::string & *username*)

Sets the username that should be used when creating a new connection.

Parameters

username	string

6.17.3 Field Documentation

6.17.3.1 const std::string activemq::core::ActiveMQConnectionFactory::DEFAULT_URI [static]

The documentation for this class was generated from the following file:

6.18 activemq::core::ActiveMQConnectionMetaData Class Reference

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 145) class.

`#include <src/main/activemq/core/ActiveMQConnectionMetaData.h>`

Inheritance diagram for activemq::core::ActiveMQConnectionMetaData:

Public Member Functions

- **ActiveMQConnectionMetaData** ()
- virtual ~**ActiveMQConnectionMetaData** () throw ()
- virtual std::string **getCMSVersion** () **const**

  Gets the CMS API version.
- virtual int **getCMSMajorVersion** () **const**

  Gets the CMS major version number.
- virtual int **getCMSMinorVersion** () **const**

  Gets the CMS minor version number.

- virtual std::string **getCMSProviderName** () **const**

  Gets the CMS provider name.
- virtual std::string **getProviderVersion** () **const**

  Gets the CMS provider version.
- virtual int **getProviderMajorVersion** () **const**

  Gets the CMS provider major version number.
- virtual int **getProviderMinorVersion** () **const**

  Gets the CMS provider minor version number.
- virtual std::vector< std::string > **getCMSXPropertyNames** () **const**

  Gets an Vector of the CMSX property names.

6.18.1 Detailed Description

This class houses all the various settings and information that is used by an instance of an **ActiveMQConnection** (p. 145) class.

Since

3.0

6.18.2 Constructor & Destructor Documentation

6.18.2.1 activemq::core::ActiveMQConnectionMetaData::ActiveMQConnectionMetaData ( )

6.18.2.2 virtual activemq::core::ActiveMQConnectionMetaData::~ActiveMQConnectionMetaData ( ) throw () [virtual]

6.18.3 Member Function Documentation

6.18.3.1 virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMajorVersion ( ) const [virtual]

Gets the CMS major version number.

Returns

the CMS API major version number

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 760).

6.18.3.2 virtual int activemq::core::ActiveMQConnectionMetaData::getCMSMinorVersion ( ) const [virtual]

Gets the CMS minor version number.

Returns

the CMS API minor version number

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 760).

6.18.3.3 virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSProviderName ( ) const [virtual]

Gets the CMS provider name.

Returns

the CMS provider name

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 760).

6.18.3.4 virtual std::string activemq::core::ActiveMQConnectionMetaData::getCMSVersion ( ) const [virtual]

Gets the CMS API version.

Returns

the CMS API Version in String form.

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 761).

6.18.3.5 virtual std::vector<std::string> activemq::core::ActiveMQConnectionMetaData::getCMSXPropertyNames ( ) const [virtual]

Gets an Vector of the CMSX property names.

Returns

an Vector of CMSX property names

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 761).

6.18.3.6 virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMajorVersion ( ) const [virtual]

Gets the CMS provider major version number.

Returns

the CMS provider major version number

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 761).

6.18.3.7 virtual int activemq::core::ActiveMQConnectionMetaData::getProviderMinorVersion ( ) const [virtual]

Gets the CMS provider minor version number.

Returns

the CMS provider minor version number

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 761).

6.18.3.8 virtual std::string activemq::core::ActiveMQConnectionMetaData::getProviderVersion ( ) const [virtual]

Gets the CMS provider version.

Returns

the CMS provider version

Exceptions

CMSException	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implements **cms::ConnectionMetaData** (p. 762).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConnectionMetaData.h**

6.19 activemq::core::ActiveMQConstants Class Reference

Class holding constant values for various ActiveMQ specific things Each constant is defined as an enumeration and has functions that convert back an forth between string and enum values.

`#include <src/main/activemq/core/ActiveMQConstants.h>`

Data Structures

- class **StaticInitializer**

Public Types

- enum **TransactionState** {
  TRANSACTION_STATE_BEGIN = 0, **TRANSACTION_STATE_PREPARE** = 1, **TRANSACTION_STATE_COMMITONEPHASE** = 2, **TRANSACTION_STATE_COMMITTWOPHASE** = 3,

6.20 activemq::core::ActiveMQConsumer Class Reference

`#include <src/main/activemq/core/ActiveMQConsumer.h>`

Inheritance diagram for activemq::core::ActiveMQConsumer:

Public Member Functions

- **ActiveMQConsumer** (**ActiveMQSession** *session, **const Pointer**< **commands::ConsumerId** > &id, **const Pointer**< **commands::ActiveMQDestination** > &destination, **const** std::string &name, **const** std::string &selector, int prefetch, int maxPendingMessageCount, bool noLocal, bool browser, bool dispatchAsync, **cms::MessageListener** *listener)

  Constructor.
- virtual ~**ActiveMQConsumer** () throw ()
- virtual void **start** ()

  Starts the service.
- virtual void **stop** ()

  Stops this service.
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual **cms::Message** * **receive** ()

  Synchronously Receive a Message.
- virtual **cms::Message** * **receive** (int millisecs)

  Synchronously Receive a Message, time out after defined interval.
- virtual **cms::Message** * **receiveNoWait** ()

  Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

- virtual void **setMessageListener** (**cms::MessageListener** ∗listener)

  Sets the MessageListener that this class will send notifs on.
- virtual **cms::MessageListener** ∗ **getMessageListener** () **const**

  Gets the MessageListener that this class will send mew Message notification events to.
- virtual std::string **getMessageSelector** () **const**

  Gets this message consumer's message selector expression.
- virtual void **acknowledge** (**const Pointer**< **commands::MessageDispatch** > &**dispatch**)
- virtual void **dispatch** (**const Pointer**< **MessageDispatch** > &message)

  Dispatches a message to a particular consumer.
- void **acknowledge** ()

  Method called to acknowledge all messages that have been received so far.
- void **commit** ()

  Called to Commit the current set of messages in this Transaction.
- void **rollback** ()

  Called to Roll back the current set of messages in this Transaction.
- void **doClose** ()

  Performs the actual close operation on this consumer.
- void **dispose** ()

  Cleans up this objects internal resources.
- **const Pointer**
  < **commands::ConsumerInfo** > & **getConsumerInfo** () **const**

  Get the Consumer information for this consumer.
- **const Pointer**
  < **commands::ConsumerId** > & **getConsumerId** () **const**

  Get the Consumer Id for this consumer.
- bool **isClosed** () **const**
- bool **isSynchronizationRegistered** () **const**

  *Has this Consumer Transaction **Synchronization** (p. 2056) been added to the transaction.*
- void **setSynchronizationRegistered** (bool value)

  *Sets the **Synchronization** (p. 2056) Registered state of this consumer.*
- bool **iterate** ()

  Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.
- void **deliverAcks** ()

  Forces this consumer to send all pending acks to the broker.
- void **clearMessagesInProgress** ()

  Called on a Failover to clear any pending messages.
- void **inProgressClearRequired** ()

  Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.
- long long **getLastDeliveredSequenceId** () **const**

  Gets the currently set Last Delivered Sequence Id.
- void **setLastDeliveredSequenceId** (long long value)

  Sets the value of the Last Delivered Sequence Id.
- int **getMessageAvailableCount** () **const**
- void **setRedeliveryPolicy** (**RedeliveryPolicy** ∗policy)

  *Sets the **RedeliveryPolicy** (p. 1744) this Consumer should use when a rollback is performed on a transacted Consumer.*
- **RedeliveryPolicy** ∗ **getRedeliveryPolicy** () **const**

  Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.
- void **setFailureError** (**decaf::lang::Exception** ∗error)

  Sets the Exception that has caused this Consumer to be in a failed state.
- **decaf::lang::Exception** ∗ **getFailureError** () **const**

  Gets the error that caused this Consumer to be in a Failed state, or NULL if there is no Error.

Protected Member Functions

- **Pointer< MessageDispatch > dequeue** (long long timeout)

  Used by synchronous receive methods to wait for messages to come in.
- void **beforeMessageIsConsumed** (**const Pointer< commands::MessageDispatch >** &**dispatch**)

  Pre-consume processing.
- void **afterMessageIsConsumed** (**const Pointer< commands::MessageDispatch >** &**dispatch**, bool messageExpired)

  Post-consume processing.

6.20.1 Constructor & Destructor Documentation

6.20.1.1 activemq::core::ActiveMQConsumer::ActiveMQConsumer (ActiveMQSession * *session,* const Pointer< commands::ConsumerId > & *id,* const Pointer< commands::ActiveMQDestination > & *destination,* const std::string & *name,* const std::string & *selector,* int *prefetch,* int *maxPendingMessageCount,* bool *noLocal,* bool *browser,* bool *dispatchAsync,* cms::MessageListener * *listener*)

Constructor.

6.20.1.2 virtual activemq::core::ActiveMQConsumer::~ActiveMQConsumer ( ) throw () [virtual]

6.20.2 Member Function Documentation

6.20.2.1 virtual void activemq::core::ActiveMQConsumer::acknowledge (const Pointer< commands::MessageDispatch > & *dispatch*) [virtual]

6.20.2.2 void activemq::core::ActiveMQConsumer::acknowledge ( )

Method called to acknowledge all messages that have been received so far.

Exceptions

CMSException	if an error occurs while ack'ing the message.

6.20.2.3 void activemq::core::ActiveMQConsumer::afterMessageIsConsumed (const Pointer< commands::MessageDispatch > & *dispatch,* bool *messageExpired*) [protected]

Post-consume processing.

Parameters

dispatch	- the consumed message
messageExpired	- flag indicating if the message has expired.

6.20.2.4 void activemq::core::ActiveMQConsumer::beforeMessageIsConsumed (const Pointer< commands::MessageDispatch > & *dispatch*) [protected]

Pre-consume processing.

Parameters

dispatch	- the message being consumed.

6.20.2.5 void activemq::core::ActiveMQConsumer::clearMessagesInProgress ( )

Called on a Failover to clear any pending messages.

6.20.2.6 virtual void activemq::core::ActiveMQConsumer::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSException	- If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 633).

6.20.2.7 void activemq::core::ActiveMQConsumer::commit ( )

Called to Commit the current set of messages in this Transaction.

Exceptions

ActiveMQException	if an error occurs while performing the operation.

6.20.2.8 void activemq::core::ActiveMQConsumer::deliverAcks ( )

Forces this consumer to send all pending acks to the broker.

Exceptions

ActiveMQException	if an error occurs while performing the operation.

6.20.2.9 Pointer<MessageDispatch> activemq::core::ActiveMQConsumer::dequeue (long long *timeout*) [protected]

Used by synchronous receive methods to wait for messages to come in.

Parameters

timeout	- The maximum number of milliseconds to wait before returning.

If -1, it will block until a messages is received or this consumer is closed. If 0, will not block at all. If $>$ 0, will wait at a maximum the specified number of milliseconds before returning.

Returns

the message, if received within the allotted time. Otherwise NULL.

Exceptions

InvalidStateException	if this consumer is closed upon entering this method.

6.20.2.10 virtual void activemq::core::ActiveMQConsumer::dispatch (const Pointer< MessageDispatch > & *message*) [virtual]

Dispatches a message to a particular consumer.

Parameters

message	The message to be dispatched to a waiting consumer.

Implements **activemq::core::Dispatcher** (p. 956).

6.20.2.11 void activemq::core::ActiveMQConsumer::dispose ( )

Cleans up this objects internal resources.

Exceptions

ActiveMQException	if an error occurs while performing the operation.

6.20.2.12 void activemq::core::ActiveMQConsumer::doClose ( )

Performs the actual close operation on this consumer.

Exceptions

ActiveMQException	if an error occurs while performing the operation.

6.20.2.13 const Pointer<commands::ConsumerId>& activemq::core::ActiveMQConsumer::getConsumerId ( ) const

Get the Consumer Id for this consumer.

Returns

Reference to a Consumer Id Object

6.20.2.14 const Pointer<commands::ConsumerInfo>& activemq::core::ActiveMQConsumer::getConsumerInfo ( ) const

Get the Consumer information for this consumer.

Returns

Reference to a Consumer Info Object

6.20.2.15 decaf::lang::Exception* activemq::core::ActiveMQConsumer::getFailureError ( ) const

Gets the error that caused this Consumer to be in a Failed state, or NULL if there is no Error.

Returns

pointer to the error that faulted this Consumer or NULL.

6.20.2.16 long long activemq::core::ActiveMQConsumer::getLastDeliveredSequenceId ( ) const

Gets the currently set Last Delivered Sequence Id.

Returns

long long containing the sequence id of the last delivered Message.

6.20.2.17 int activemq::core::ActiveMQConsumer::getMessageAvailableCount ( ) const

Returns

the number of Message's this consumer is waiting to Dispatch.

6.20.2.18 virtual cms::MessageListener* activemq::core::ActiveMQConsumer::getMessageListener ( ) const [virtual]

Gets the MessageListener that this class will send mew Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1456).

6.20.2.19 virtual std::string activemq::core::ActiveMQConsumer::getMessageSelector ( ) const [virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1456).

6.20.2.20 RedeliveryPolicy* activemq::core::ActiveMQConsumer::getRedeliveryPolicy ( ) const

Gets a pointer to this Consumer's Redelivery Policy object, the Consumer retains ownership of this pointer so the caller should not delete it.

Returns

a Pointer to a **RedeliveryPolicy** (p. 1744) that is in use by this Consumer.

6.20.2.21 void activemq::core::ActiveMQConsumer::inProgressClearRequired ( )

Signals that a Failure occurred and that anything in-progress in the consumer should be cleared.

6.20.2.22 bool activemq::core::ActiveMQConsumer::isClosed ( ) const

Returns

if this Consumer has been closed.

6.20.2.23 bool activemq::core::ActiveMQConsumer::isSynchronizationRegistered ( ) const

Has this Consumer Transaction **Synchronization** (p. 2056) been added to the transaction.

Returns

true if the synchronization has been added.

6.20.2.24 bool activemq::core::ActiveMQConsumer::iterate ( )

Deliver any pending messages to the registered MessageListener if there is one, return true if not all dispatched, or false if no listener or all pending messages have been dispatched.

6.20.2.25 virtual cms::Message* activemq::core::ActiveMQConsumer::receive ( ) [virtual]

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.20.2.26 virtual cms::Message* activemq::core::ActiveMQConsumer::receive (int *millisecs*) [virtual]

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.20.2.27 virtual cms::Message* activemq::core::ActiveMQConsumer::receiveNoWait ( ) [virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.20.2.28 void activemq::core::ActiveMQConsumer::rollback ( )

Called to Roll back the current set of messages in this Transaction.

Exceptions

ActiveMQException	if an error occurs while performing the operation.

6.20.2.29 void activemq::core::ActiveMQConsumer::setFailureError (decaf::lang::Exception * *error*)

Sets the Exception that has caused this Consumer to be in a failed state.

Parameters

error	The error that is to be thrown when a Receive call is made.

6.20.2.30 void activemq::core::ActiveMQConsumer::setLastDeliveredSequenceId (long long *value*)

Sets the value of the Last Delivered Sequence Id.

Parameters

value	The new value to assign to the Last Delivered Sequence Id property.

6.20.2.31 virtual void activemq::core::ActiveMQConsumer::setMessageListener (cms::MessageListener * *listener*) [virtual]

Sets the MessageListener that this class will send notifs on.

Parameters

listener	The listener of messages received by this consumer.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1458).

6.20.2.32 void activemq::core::ActiveMQConsumer::setRedeliveryPolicy (RedeliveryPolicy * *policy*)

Sets the **RedeliveryPolicy** (p. 1744) this Consumer should use when a rollback is performed on a transacted Consumer.

The Consumer takes ownership of the passed pointer. The Consumer's redelivery policy can never be null, a call to this method with a NULL pointer is ignored.

Parameters

policy	Pointer to a Redelivery Policy object that his Consumer will use.

6.20.2.33 void activemq::core::ActiveMQConsumer::setSynchronizationRegistered (bool *value*)

Sets the **Synchronization** (p. 2056) Registered state of this consumer.

Parameters

value	- true if registered false otherwise.

6.20.2.34 virtual void activemq::core::ActiveMQConsumer::start ( ) [virtual]

Starts the service.

Exceptions

CMSException	if an internal error occurs while starting.

Implements **cms::Startable** (p. 1964).

6.20.2.35 virtual void activemq::core::ActiveMQConsumer::stop ( ) [virtual]

Stops this service.

Exceptions

CMSException	- if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2017).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQConsumer.h**

6.21 activemq::library::ActiveMQCPP Class Reference

`#include <src/main/activemq/library/ActiveMQCPP.h>`

Public Member Functions

- virtual ~**ActiveMQCPP** ()

Static Public Member Functions

- static void **initializeLibrary** ()

  Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf library.
- static void **initializeLibrary** (int argc, char **argv)

  Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf library.
- static void **shutdownLibrary** ()

  Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

Protected Member Functions

- **ActiveMQCPP** ()
- **ActiveMQCPP** (**const ActiveMQCPP** &)
- **ActiveMQCPP** & **operator=** (**const ActiveMQCPP** &)

6.21.1 Constructor & Destructor Documentation

6.21.1.1 activemq::library::ActiveMQCPP::ActiveMQCPP ( ) [inline, protected]

6.21.1.2 activemq::library::ActiveMQCPP::ActiveMQCPP (const ActiveMQCPP &) [protected]

6.21.1.3 virtual activemq::library::ActiveMQCPP::~ActiveMQCPP ( ) [inline, virtual]

6.21.2 Member Function Documentation

6.21.2.1 static void activemq::library::ActiveMQCPP::initializeLibrary ( ) [static]

Initialize the ActiveMQ-CPP Library constructs, this method will init all the internal Registry objects and initialize the Decaf library.

Exceptions

runtime_error	if an error occurs while initializing this library.

6.21.2.2 static void activemq::library::ActiveMQCPP::initializeLibrary (int *argc*, char ** *argv*) [static]

Initialize the ActiveMQ-CPP Library constructs, this method will initialize all the internal Registry objects and initialize the Decaf library.

This method takes the args passed to the main method of process for use is setting system properties and configuring the ActiveMQ-CPP Library.

Parameters

argc	- the count of arguments passed to this Process.
argv	- the array of string arguments passed to this process.

Exceptions

runtime_error	if an error occurs while initializing this library.

6.21.2.3 ActiveMQCPP& activemq::library::ActiveMQCPP::operator= (const ActiveMQCPP &) [protected]

6.21.2.4 static void activemq::library::ActiveMQCPP::shutdownLibrary ( ) [static]

Shutdown the ActiveMQ-CPP Library, freeing any resources that could not be freed up to this point.

All the user created ActiveMQ-CPP objects and Decaf Library objects should have been destroyed by the time this method is called.

The documentation for this class was generated from the following file:

6.22.1 Constructor & Destructor Documentation

6.22.1.1 activemq::commands::ActiveMQDestination::ActiveMQDestination ( )

6.22.1.2 activemq::commands::ActiveMQDestination::ActiveMQDestination (const std::string & *physicalName*)

6.22.1.3 virtual activemq::commands::ActiveMQDestination::~ActiveMQDestination ( ) throw () [virtual]

6.22.2 Member Function Documentation

6.22.2.1 virtual ActiveMQDestination* activemq::commands::ActiveMQDestination::cloneDataStructure ( ) const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 294), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 308).

6.22.2.2 virtual void activemq::commands::ActiveMQDestination::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 308).

Referenced by activemq::commands::ActiveMQTempDestination::copyDataStructure().

6.22.2.3 static Pointer<ActiveMQDestination> activemq::commands::ActiveMQDestination::createDestination (int *type*, const std::string & *name*) [static]

Creates a Destination given the String Name to use and a Type.

Parameters

type	- The Type of Destination to Create
name	- The Name to use in the creation of the Destination

Returns

Pointer to a new **ActiveMQDestination** (p. 191) instance.

6.22.2.4 static std::string activemq::commands::ActiveMQDestination::createTemporaryName (const std::string & *clientId*) [inline, static]

Create a temporary name from the clientId.

Parameters

clientId	

Returns

6.22.2.5 virtual bool activemq::commands::ActiveMQDestination::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 309).

Referenced by activemq::commands::ActiveMQTempDestination::equals().

6.22.2.6 static std::string activemq::commands::ActiveMQDestination::getClientId (const ActiveMQDestination * *destination*) [static]

From a temporary destination find the clientId of the Connection that created it.

Parameters

destination	

Returns

the clientId or null if not a temporary destination

6.22.2.7 virtual const cms::Destination* activemq::commands::ActiveMQDestination::getCMSDestination ( ) const [inline, virtual]

Returns

the **cms::Destination** (p. 936) interface pointer that the objects that derive from this class implement.

Reimplemented in **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTempQueue** (p. 302), and **activemq::commands::ActiveMQTempTopic** (p. 309).

6.22.2.8 virtual unsigned char activemq::commands::ActiveMQDestination::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTempQueue** (p. 302), and **activemq::commands::ActiveMQTempTopic** (p. 309).

6.22.2.9 virtual cms::Destination::DestinationType activemq::commands::ActiveMQDestination::getDestinationType ( ) const [pure virtual]

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implemented in **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 324), **activemq::commands::ActiveMQTempQueue** (p. 303), and **activemq::commands::ActiveMQTempTopic** (p. 310).

6.22.2.10 const activemq::util::ActiveMQProperties& activemq::commands::ActiveMQDestination::getOptions ( ) const [inline]

Returns

a reference (const) to the options properties for this Destination.

6.22.2.11 virtual std::string activemq::commands::ActiveMQDestination::getOrderedTarget ( ) const [inline, virtual]

Returns

Returns the orderedTarget.

6.22.2.12 virtual const std::string& activemq::commands::ActiveMQDestination::getPhysicalName ( ) const [inline, virtual]

Fetch this destination's physical name.

Returns

const string containing the name

6.22.2.13 virtual std::string& activemq::commands::ActiveMQDestination::getPhysicalName ( ) [inline, virtual]

6.22.2.14 virtual bool activemq::commands::ActiveMQDestination::isAdvisory ( ) const [inline, virtual]

Returns

Returns the advisory.

6.22.2.15 virtual bool activemq::commands::ActiveMQDestination::isComposite ( ) const [inline, virtual]

Returns true if this destination represents a collection of destinations; allowing a set of destinations to be published to or subscribed from in one CMS operation.

Returns

true if this destination represents a collection of child destinations.

6.22.2.16 virtual bool activemq::commands::ActiveMQDestination::isConnectionAdvisory ( ) const [inline, virtual]

Returns

true if this is a destination for Connection advisories

6.22.2.17 virtual bool activemq::commands::ActiveMQDestination::isConsumerAdvisory ( ) const [inline, virtual]

Returns

true if this is a destination for Consumer advisories

6.22.2.18 virtual bool activemq::commands::ActiveMQDestination::isExclusive ( ) const [inline, virtual]

Returns

Returns the exclusive.

6.22.2.19 virtual bool activemq::commands::ActiveMQDestination::isOrdered ( ) const [inline, virtual]

Returns

Returns the ordered.

6.22.2.20 virtual bool activemq::commands::ActiveMQDestination::isProducerAdvisory ( ) const [inline, virtual]

Returns

true if this is a destination for Producer advisories

6.22.2.21 virtual bool activemq::commands::ActiveMQDestination::isQueue ( ) const [inline, virtual]

Returns true if a Queue Destination.

Returns

true/false

6.22.2.22 virtual bool activemq::commands::ActiveMQDestination::isTemporary ( ) const [inline, virtual]

Returns true if a temporary Destination.

Returns

true/false

References cms::Destination::TEMPORARY_QUEUE, and cms::Destination::TEMPORARY_TOPIC.

6.22.2.23 virtual bool activemq::commands::ActiveMQDestination::isTopic ( ) const [inline, virtual]

Returns true if a Topic Destination.

Returns

true/false

References cms::Destination::TEMPORARY_TOPIC, and cms::Destination::TOPIC.

6.22.2.24 virtual bool activemq::commands::ActiveMQDestination::isWildcard ( ) const [inline, virtual]

Returns

true if the destination matches multiple possible destinations

6.22.2.25 virtual void activemq::commands::ActiveMQDestination::setAdvisory (bool *advisory*) [inline, virtual]

Parameters

advisory	The advisory to set.

6.22.2.26 virtual void activemq::commands::ActiveMQDestination::setExclusive (bool *exclusive*) [inline, virtual]

Parameters

exclusive	The exclusive to set.

6.22.2.27 virtual void activemq::commands::ActiveMQDestination::setOrdered (bool *ordered*) [inline, virtual]

Parameters

ordered	The ordered to set.

6.22.2.28 virtual void activemq::commands::ActiveMQDestination::setOrderedTarget (const std::string & *orderedTarget*) [inline, virtual]

Parameters

orderedTarget	The orderedTarget to set.

6.22.2.29 virtual void activemq::commands::ActiveMQDestination::setPhysicalName (const std::string & *physicalName*) [virtual]

Set this destination's physical name.

Returns

const string containing the name

6.22.2.30 virtual std::string activemq::commands::ActiveMQDestination::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

Reimplemented in **activemq::commands::ActiveMQTempDestination** (p. 296), **activemq::commands::ActiveMQQueue** (p. 252), **activemq::commands::ActiveMQTopic** (p. 324), **activemq::commands::ActiveMQTempQueue** (p. 303), and **activemq::commands::ActiveMQTempTopic** (p. 310).

6.22.3 Field Documentation

6.22.3.1 bool activemq::commands::ActiveMQDestination::advisory [protected]

6.22.3.2 const std::string activemq::commands::ActiveMQDestination::ADVISORY_PREFIX [static, protected]

prefix for Advisory message destinations

  Tight Marhsal to the given stream.

6.23.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQDestinationMarshaller** (p. 200).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.23.2 Constructor & Destructor Documentation

6.23.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::ActiveMQDestinationMarshaller ( ) [inline]

6.23.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::∼ActiveMQDestinationMarshaller ( ) [inline, virtual]

6.23.3 Member Function Documentation

6.23.3.1 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 256), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 326), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 297).

6.23.3.2 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 256), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 326), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.23.3.3 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 257), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 326), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.23.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 257), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 306), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 313), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 327), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

6.23.3.5 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 258), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 306), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 313), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 327), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQDestinationMarshaller.h**

6.24 activemq::exceptions::ActiveMQException Class Reference

`#include <src/main/activemq/exceptions/ActiveMQException.h>`

Inheritance diagram for activemq::exceptions::ActiveMQException:

Public Member Functions

- **ActiveMQException** () throw ()

  Default Constructor.
- **ActiveMQException** (**const ActiveMQException** &ex) throw ()

  Copy Constructor.
- **ActiveMQException** (**const decaf::lang::Exception** &ex) throw ()

  Copy Constructor.
- **ActiveMQException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual ∼**ActiveMQException** () throw ()
- virtual **ActiveMQException** ∗ **clone** () **const**

  Clones this exception.
- virtual **cms::CMSException convertToCMSException** () **const**

  Converts this exception to a new CMSException.

6.24.1 Constructor & Destructor Documentation

6.24.1.1 activemq::exceptions::ActiveMQException::ActiveMQException ( ) throw ()

Default Constructor.

6.24.1.2 activemq::exceptions::ActiveMQException::ActiveMQException (const ActiveMQException & *ex*) throw ()

Copy Constructor.

Parameters

ex	The Exception whose internal data is copied into this instance.

6.24.1.3 activemq::exceptions::ActiveMQException::ActiveMQException (const decaf::lang::Exception & *ex*) throw ()

Copy Constructor.

Parameters

ex	The Exception whose internal data is copied into this instance.

6.24.1.4 activemq::exceptions::ActiveMQException::ActiveMQException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message.

Parameters

file	The file name where exception occurs.
lineNumber	The line number where the exception occurred.
msg	The message to report.
...	The list of primitives that are formatted into the message.

6.24.1.5 virtual activemq::exceptions::ActiveMQException::~ActiveMQException ( ) throw () [virtual]

6.24.2 Member Function Documentation

6.24.2.1 virtual ActiveMQException* activemq::exceptions::ActiveMQException::clone ( ) const [virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this Exception object

Reimplemented from **decaf::lang::Exception** (p. 992).

Reimplemented in **activemq::exceptions::BrokerException** (p. 437), and **activemq::exceptions::ConnectionFailedException** (p. 745).

6.24.2.2 virtual cms::CMSException activemq::exceptions::ActiveMQException::convertToCMSException ( ) const [virtual]

Converts this exception to a new CMSException.

Returns

a CMSException with the data from this exception

The documentation for this class was generated from the following file:

- src/main/activemq/exceptions/**ActiveMQException.h**

6.25 activemq::commands::ActiveMQMapMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQMapMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQMapMessage:

Public Member Functions

- **ActiveMQMapMessage** ()
- virtual ∼**ActiveMQMapMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual bool **isMarshalAware** () **const**

  Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.
- virtual **ActiveMQMapMessage** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual void **beforeMarshal** (**wireformat::WireFormat** ∗wireFormat)

  Called before marshaling is started to prepare the object to be marshaled.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual void **clearBody** () throw (cms::CMSException)

  Clears out the body of the message.
- virtual **cms::MapMessage** ∗ **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual bool **isEmpty** () **const**

  *Returns true if there are no values stored in the **MapMessage** (p. 1379) body.*

  Returns

  *true if the body of the **MapMessage** (p. 1379) contains no elements.*

  Exceptions

CMSException (p. 640)	*if the operation fails due to an internal error.*

- virtual std::vector< std::string > **getMapNames** () **const**

  *Returns an Enumeration of all the names in the **MapMessage** (p. 1379) object.*

  Returns

  *STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1379)*

  Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*

- virtual bool **itemExists** (**const** std::string &name) **const**

  *Indicates whether an item exists in this **MapMessage** (p. 1379) object.*

  Parameters

name	*String name of the Object in question*

  Returns

  boolean value indicating if the name is in the map

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*

- virtual bool **getBoolean** (**const** std::string &name) **const**

  Returns the Boolean value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setBoolean** (**const** std::string &name, bool value)

  Sets a boolean value with the specified name into the Map.

Parameters

name	*the name of the boolean*
value	*the boolean value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWritableException	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual unsigned char **getByte** (**const** std::string &name) **const**

  Returns the Byte value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setByte** (**const** std::string &name, unsigned char value)

  Sets a Byte value with the specified name into the Map.

Parameters

name	*the name of the Byte*
value	*the Byte value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual std::vector< unsigned char > **getBytes** (**const** std::string &name) **const**

  Returns the Bytes value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setBytes** (**const** std::string &name, **const** std::vector< unsigned char > &value)

  Sets a Bytes value with the specified name into the Map.

Parameters

name	*The name of the Bytes*
value	*The Bytes value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual char **getChar** (**const** std::string &name) **const**

  Returns the Char value of the Specified name.

Parameters

name	*name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setChar** (**const** std::string &name, char value)

  Sets a Char value with the specified name into the Map.

Parameters

name	*the name of the Char*
value	*the Char value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual double **getDouble** (**const** std::string &name) **const**

  Returns the Double value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setDouble** (**const** std::string &name, double value)

  Sets a Double value with the specified name into the Map.

Parameters

name	*The name of the Double*
value	*The Double value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual float **getFloat** (**const** std::string &name) **const**

  Returns the Float value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setFloat** (**const** std::string &name, float value)

  Sets a Float value with the specified name into the Map.

Parameters

name	*The name of the Float*
value	*The Float value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual int **getInt** (**const** std::string &name) **const**

  Returns the Int value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setInt** (**const** std::string &name, int value)

  Sets a Int value with the specified name into the Map.

Parameters

name	*The name of the Int*
value	*The Int value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual long long **getLong** (**const** std::string &name) **const**

  Returns the Long value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setLong** (**const** std::string &name, long long value)

  Sets a Long value with the specified name into the Map.

Parameters

name	*The name of the Long*
value	*The Long value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual short **getShort** (**const** std::string &name) **const**

  Returns the Short value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setShort** (**const** std::string &name, short value)

  Sets a Short value with the specified name into the Map.

Parameters

name	*The name of the Short*
value	*The Short value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

- virtual std::string **getString** (**const** std::string &name) **const**

  Returns the String value of the Specified name.

Parameters

name	*Name of the value to fetch from the map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageFormatException (p. 1478)	*- if this type conversion is invalid.*

- virtual void **setString** (**const** std::string &name, **const** std::string &value)

  Sets a String value with the specified name into the Map.

Parameters

name	*The name of the String*
value	*The String value to set in the Map*

Exceptions

CMSException (p. 640)	*- if the operation fails due to an internal error.*
MessageNotWriteable-Exception (p. 1490)	*- if the **Message** (p. 1426) is in Read-only Mode.*

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQMAPMESSAGE** = 25

Protected Member Functions

- **util::PrimitiveMap** & **getMap** ()

  Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.
- **const util::PrimitiveMap** & **getMap** () **const**
- virtual void **checkMapIsUnmarshalled** () **const**

  Performs the unmarshal on the Map if needed, otherwise just returns.

6.25.1 Constructor & Destructor Documentation

6.25.1.1 activemq::commands::ActiveMQMapMessage::ActiveMQMapMessage ( )

6.25.1.2 virtual activemq::commands::ActiveMQMapMessage::~ActiveMQMapMessage ( ) throw () [virtual]

6.25.2 Member Function Documentation

6.25.2.1 virtual void activemq::commands::ActiveMQMapMessage::beforeMarshal (wireformat::WireFormat * *wireFormat*) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

Implements **activemq::wireformat::MarshalAware** (p. 1390).

6.25.2.2 virtual void activemq::commands::ActiveMQMapMessage::checkMapIsUnmarshalled ( ) const [protected, virtual]

Performs the unmarshal on the Map if needed, otherwise just returns.

Exceptions

NullPointerException	if the internal Map is Null.

6.25.2.3 virtual void activemq::commands::ActiveMQMapMessage::clearBody ( ) throw (cms::CMSException) [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSException	- if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230).

6.25.2.4 virtual cms::MapMessage* activemq::commands::ActiveMQMapMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.25.2.5 virtual ActiveMQMapMessage* activemq::commands::ActiveMQMapMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.25.2.6 virtual void activemq::commands::ActiveMQMapMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.25.2.7 virtual bool activemq::commands::ActiveMQMapMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230).

6.25.2.8 virtual bool activemq::commands::ActiveMQMapMessage::getBoolean (const std::string & *name*) const [virtual]

Returns the Boolean value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1381).

6.25.2.9 virtual unsigned char activemq::commands::ActiveMQMapMessage::getByte (const std::string & *name*) const [virtual]

Returns the Byte value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1382).

6.25.2.10 virtual std::vector<unsigned char> activemq::commands::ActiveMQMapMessage::getBytes (const std::string & *name*) const [virtual]

Returns the Bytes value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1382).

6.25.2.11 virtual char activemq::commands::ActiveMQMapMessage::getChar (const std::string & *name*) const [virtual]

Returns the Char value of the Specified name.

Parameters

name	name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1382).

6.25.2.12 virtual unsigned char activemq::commands::ActiveMQMapMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.25.2.13 virtual double activemq::commands::ActiveMQMapMessage::getDouble (const std::string & *name*) const [virtual]

Returns the Double value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1382).

6.25.2.14 virtual float activemq::commands::ActiveMQMapMessage::getFloat (const std::string & *name*) const [virtual]

Returns the Float value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1383).

6.25.2.15 virtual int activemq::commands::ActiveMQMapMessage::getInt (const std::string & *name*) const [virtual]

Returns the Int value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1383).

6.25.2.16 virtual long long activemq::commands::ActiveMQMapMessage::getLong (const std::string & *name*) const [virtual]

Returns the Long value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1383).

6.25.2.17 util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap ( ) [protected]

Fetches a reference to this objects PrimitiveMap, if one needs to be created or unmarshaled, this will perform the correct steps.

Returns

reference to a PrimtiveMap;

Exceptions

NullPointerException	if the internal Map is Null.

6.25.2.18 const util::PrimitiveMap& activemq::commands::ActiveMQMapMessage::getMap ( ) const [protected]

6.25.2.19 virtual std::vector< std::string > activemq::commands::ActiveMQMapMessage::getMapNames ( ) const [virtual]

Returns an Enumeration of all the names in the **MapMessage** (p. 1379) object.

Returns

STL Vector of String values, each of which is the name of an item in the **MapMessage** (p. 1379)

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 1384).

6.25.2.20 virtual short activemq::commands::ActiveMQMapMessage::getShort (const std::string & *name*) const [virtual]

Returns the Short value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1384).

6.25.2.21 virtual std::string activemq::commands::ActiveMQMapMessage::getString (const std::string & *name*) const [virtual]

Returns the String value of the Specified name.

Parameters

name	Name of the value to fetch from the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageFormatException *(p. 1478)*	- if this type conversion is invalid.

Implements **cms::MapMessage** (p. 1384).

6.25.2.22 virtual bool activemq::commands::ActiveMQMapMessage::isEmpty ( ) const [virtual]

Returns true if there are no values stored in the **MapMessage** (p. 1379) body.

Returns

true if the body of the **MapMessage** (p. 1379) contains no elements.

Exceptions

CMSException *(p. 640)*	if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 1385).

6.25.2.23 virtual bool activemq::commands::ActiveMQMapMessage::isMarshalAware ( ) const [inline, virtual]

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::Message** (p. 1421).

6.25.2.24 virtual bool activemq::commands::ActiveMQMapMessage::itemExists (const std::string & *name*) const [virtual]

Indicates whether an item exists in this **MapMessage** (p. 1379) object.

Parameters

name	String name of the Object in question

Returns

boolean value indicating if the name is in the map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.

Implements **cms::MapMessage** (p. 1385).

6.25.2.25 virtual void activemq::commands::ActiveMQMapMessage::setBoolean (const std::string & *name,* bool *value*) [virtual]

Sets a boolean value with the specified name into the Map.

Parameters

name	the name of the boolean
value	the boolean value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWritable-Exception	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1385).

6.25.2.26 virtual void activemq::commands::ActiveMQMapMessage::setByte (const std::string & *name,* unsigned char *value*) [virtual]

Sets a Byte value with the specified name into the Map.

Parameters

name	the name of the Byte
value	the Byte value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1385).

6.25.2.27 virtual void activemq::commands::ActiveMQMapMessage::setBytes (const std::string & *name*, const std::vector< unsigned char > & *value*) [virtual]

Sets a Bytes value with the specified name into the Map.

Parameters

name	The name of the Bytes
value	The Bytes value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1386).

6.25.2.28 virtual void activemq::commands::ActiveMQMapMessage::setChar (const std::string & *name*, char *value*) [virtual]

Sets a Char value with the specified name into the Map.

Parameters

name	the name of the Char
value	the Char value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1386).

6.25.2.29 virtual void activemq::commands::ActiveMQMapMessage::setDouble (const std::string & *name*, double *value*) [virtual]

Sets a Double value with the specified name into the Map.

Parameters

name	The name of the Double
value	The Double value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1386).

6.25.2.30 virtual void activemq::commands::ActiveMQMapMessage::setFloat (const std::string & *name,* float *value*) [virtual]

Sets a Float value with the specified name into the Map.

Parameters

name	The name of the Float
value	The Float value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1387).

6.25.2.31 virtual void activemq::commands::ActiveMQMapMessage::setInt (const std::string & *name,* int *value*) [virtual]

Sets a Int value with the specified name into the Map.

Parameters

name	The name of the Int
value	The Int value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1387).

6.25.2.32 virtual void activemq::commands::ActiveMQMapMessage::setLong (const std::string & *name,* long long *value*) [virtual]

Sets a Long value with the specified name into the Map.

Parameters

name	The name of the Long
value	The Long value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1387).

6.25.2.33 virtual void activemq::commands::ActiveMQMapMessage::setShort (const std::string & *name,* short *value*) [virtual]

Sets a Short value with the specified name into the Map.

Parameters

name	The name of the Short
value	The Short value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1388).

6.25.2.34 virtual void activemq::commands::ActiveMQMapMessage::setString (const std::string & *name,* const std::string & *value*) [virtual]

Sets a String value with the specified name into the Map.

Parameters

name	The name of the String
value	The String value to set in the Map

Exceptions

CMSException *(p. 640)*	- if the operation fails due to an internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the **Message** (p. 1426) is in Read-only Mode.

Implements **cms::MapMessage** (p. 1388).

6.25.2.35 virtual std::string activemq::commands::ActiveMQMapMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.25.3 Field Documentation

6.25.3.1 const unsigned char activemq::commands::ActiveMQMapMessage::ID_ACTIVEMQMAPMESSAGE = 25 [static]

  Tight Marhsal to the given stream.

6.26.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQMapMessageMarshaller** (p. 220).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.26.2 Constructor & Destructor Documentation

6.26.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::ActiveMQMapMessageMarshaller ( ) [inline]

6.26.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::~ActiveMQMapMessageMarshaller ( ) [inline, virtual]

6.26.3 Member Function Documentation

6.26.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.26.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.26.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.26.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.26.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.26.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.26.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQMapMessageMarshaller.h**

6.27 activemq::commands::ActiveMQMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQMessage:

Public Member Functions

- **ActiveMQMessage** ()
- virtual ~**ActiveMQMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **ActiveMQMessage** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQMESSAGE** = 23

6.27.1 Constructor & Destructor Documentation

6.27.1.1 activemq::commands::ActiveMQMessage::ActiveMQMessage ( )

6.27.1.2 virtual activemq::commands::ActiveMQMessage::~ActiveMQMessage ( ) throw () [inline, virtual]

6.27.2 Member Function Documentation

6.27.2.1 virtual cms::Message* activemq::commands::ActiveMQMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.27.2.2 virtual ActiveMQMessage* activemq::commands::ActiveMQMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.27.2.3 virtual void activemq::commands::ActiveMQMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.27.2.4 virtual bool activemq::commands::ActiveMQMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230).

6.27.2.5 virtual unsigned char activemq::commands::ActiveMQMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.27.2.6 virtual std::string activemq::commands::ActiveMQMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.28.3 Member Function Documentation

6.28.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.28.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.28.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.28.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.28.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.28.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.28.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.30 activemq::commands::ActiveMQObjectMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQObjectMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQObjectMessage:

Public Member Functions

- **ActiveMQObjectMessage** ()
- virtual ~**ActiveMQObjectMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQObjectMessage** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual **cms::Message** * **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQOBJECTMESSAGE** = 26

6.30.1 Constructor & Destructor Documentation

6.30.1.1 activemq::commands::ActiveMQObjectMessage::ActiveMQObjectMessage ( )

6.30.1.2 virtual activemq::commands::ActiveMQObjectMessage::~ActiveMQObjectMessage ( ) throw () [inline, virtual]

6.30.2 Member Function Documentation

6.30.2.1 virtual cms::Message* activemq::commands::ActiveMQObjectMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.30.2.2 virtual ActiveMQObjectMessage* activemq::commands::ActiveMQObjectMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.30.2.3 virtual void activemq::commands::ActiveMQObjectMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.30.2.4 virtual bool activemq::commands::ActiveMQObjectMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230).

6.30.2.5 virtual unsigned char activemq::commands::ActiveMQObjectMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.30.2.6 virtual std::string activemq::commands::ActiveMQObjectMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.30.3 Field Documentation

6.30.3.1 const unsigned char activemq::commands::ActiveMQObjectMessage::ID_ACTIVEMQOBJECTMESSAGE = 26 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQObjectMessage.h**

6.31 activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 235).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQObjectMessageMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller:

Public Member Functions

- **ActiveMQObjectMessageMarshaller** ()
- virtual ~**ActiveMQObjectMessageMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.31.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQObjectMessageMarshaller** (p. 235).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.31.2 Constructor & Destructor Documentation

6.31.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::-ActiveMQObjectMessageMarshaller ( ) [inline]

6.31.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQObject-MessageMarshaller::~ActiveMQObjectMessageMarshaller ( ) [inline, virtual]

6.31.3 Member Function Documentation

6.31.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal-::generated::ActiveMQObjectMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.31.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessage-Marshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.31.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessage-Marshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.31.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.31.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.31.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.31.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQObjectMessageMarshaller.h**

6.32 activemq::core::ActiveMQProducer Class Reference

`#include <src/main/activemq/core/ActiveMQProducer.h>`

Inheritance diagram for activemq::core::ActiveMQProducer:

Public Member Functions

- **ActiveMQProducer** (**ActiveMQSession** *session, **const Pointer**< **commands::ProducerId** > &producerId, **const Pointer**< **commands::ActiveMQDestination** > &destination, long long sendTimeout)

  *Constructor, creates an instance of an **ActiveMQProducer** (p. 238).*
- virtual ~**ActiveMQProducer** () throw ()
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- virtual void **send** (**cms::Message** *message)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**const cms::Destination** *destination, **cms::Message** *message)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**const cms::Destination** *destination, **cms::Message** *message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

- virtual void **setDeliveryMode** (int mode)

  Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () **const**

  Gets the delivery mode for this Producer.
- virtual void **setDisableMessageID** (bool value)

  Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () **const**

  Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value)

  Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () **const**

  Gets if Message Time Stamps are disabled for this Producer.
- virtual void **setPriority** (int priority)

  Sets the Priority that this Producers sends messages at.
- virtual int **getPriority** () **const**

  Gets the Priority level that this producer sends messages at.
- virtual void **setTimeToLive** (long long time)

  Sets the Time to Live that this Producers sends messages with.
- virtual long long **getTimeToLive** () **const**

  Gets the Time to Live that this producer sends messages with.
- virtual void **setSendTimeout** (long long time)

  Sets the Send Timeout that this Producers sends messages with.
- virtual long long **getSendTimeout** () **const**

  Gets the Send Timeout that this producer sends messages with.
- bool **isClosed** () **const**
- **const Pointer**
  < commands::ProducerInfo > & **getProducerInfo** () **const**

  Retries this object ProducerInfo pointer.
- **const Pointer**
  < commands::ProducerId > & **getProducerId** () **const**

  Retries this object ProducerId or NULL if closed.
- virtual void **onProducerAck** (**const commands::ProducerAck** &ack)

  Handles the work of Processing a ProducerAck Command from the Broker.
- void **dispose** ()

  Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker.

6.32.1 Constructor & Destructor Documentation

6.32.1.1 activemq::core::ActiveMQProducer::ActiveMQProducer (ActiveMQSession * *session*, const Pointer< commands::ProducerId > & *producerId*, const Pointer< commands::ActiveMQDestination > & *destination*, long long *sendTimeout*)

Constructor, creates an instance of an **ActiveMQProducer** (p. 238).

Parameters

session	The Session which is the parent of this Producer.
producerId	Pointer to a ProducerId object which identifies this producer.
destination	The assigned Destination this Producer sends to, or null if not set. The Producer does not own the Pointer passed.
sendTimeout	The configured send timeout for this Producer.

6.32.1.2 virtual activemq::core::ActiveMQProducer::~ActiveMQProducer ( ) throw () [virtual]

6.32.2 Member Function Documentation

6.32.2.1 virtual void activemq::core::ActiveMQProducer::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSException	- If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 633).

6.32.2.2 void activemq::core::ActiveMQProducer::dispose ( )

Performs Producer object cleanup but doesn't attempt to send the Remove command to the broker.

Called when the parent resource if closed first to avoid the message send and avoid any exceptions that might be thrown from an attempt to send a remove command to a failed transport.

6.32.2.3 virtual int activemq::core::ActiveMQProducer::getDeliveryMode ( ) const [inline, virtual]

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Implements **cms::MessageProducer** (p. 1493).

6.32.2.4 virtual bool activemq::core::ActiveMQProducer::getDisableMessageID ( ) const [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns

a boolean indicating state enable / disable (true / false) for MessageIds.

Implements **cms::MessageProducer** (p. 1493).

6.32.2.5 virtual bool activemq::core::ActiveMQProducer::getDisableMessageTimeStamp ( ) const [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating state of enable / disable (true / false)

Implements **cms::MessageProducer** (p. 1493).

6.32.2.6 virtual int activemq::core::ActiveMQProducer::getPriority ( ) const [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Implements **cms::MessageProducer** (p. 1494).

6.32.2.7 const Pointer<commands::ProducerId>& activemq::core::ActiveMQProducer::getProducerId ( ) const [inline]

Retries this object ProducerId or NULL if closed.

Returns

ProducerId Reference

6.32.2.8 const Pointer<commands::ProducerInfo>& activemq::core::ActiveMQProducer::getProducerInfo ( ) const [inline]

Retries this object ProducerInfo pointer.

Returns

ProducerInfo Reference

6.32.2.9 virtual long long activemq::core::ActiveMQProducer::getSendTimeout ( ) const [inline, virtual]

Gets the Send Timeout that this producer sends messages with.

Returns

The default send timeout value in milliseconds.

6.32.2.10 virtual long long activemq::core::ActiveMQProducer::getTimeToLive ( ) const [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns

The default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 1494).

6.32.2.11 bool activemq::core::ActiveMQProducer::isClosed ( ) const [inline]

Returns

true if this Producer has been closed.

6.32.2.12 virtual void activemq::core::ActiveMQProducer::onProducerAck (const commands::ProducerAck & *ack*) [virtual]

Handles the work of Processing a ProducerAck Command from the Broker.

Parameters

ack	- The ProducerAck message received from the Broker.

6.32.2.13 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message	The message to be sent.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1494).

6.32.2.14 virtual void activemq::core::ActiveMQProducer::send (cms::Message * *message,* int *deliveryMode,* int *priority,* long long *timeToLive*) [virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1495).

6.32.2.15 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination	The destination on which to send the message
message	the message to be sent.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1495).

6.32.2.16 virtual void activemq::core::ActiveMQProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination	The destination on which to send the message
message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1496).

6.32.2.17 virtual void activemq::core::ActiveMQProducer::setDeliveryMode (int *mode*) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters

mode	- The DeliveryMode to use for Message sends.

Implements **cms::MessageProducer** (p. 1496).

6.32.2.18 virtual void activemq::core::ActiveMQProducer::setDisableMessageID (bool *value*) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters

value	- boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 1496).

6.32.2.19 virtual void activemq::core::ActiveMQProducer::setDisableMessageTimeStamp (bool *value*) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters

value	- boolean indicating enable / disable (true / false)

Implements **cms::MessageProducer** (p. 1497).

6.32.2.20 virtual void activemq::core::ActiveMQProducer::setPriority (int *priority*) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters

priority	int value for Priority level

Implements **cms::MessageProducer** (p. 1497).

6.32.2.21 virtual void activemq::core::ActiveMQProducer::setSendTimeout (long long *time*) [inline, virtual]

Sets the Send Timeout that this Producers sends messages with.

Parameters

time	The new default send timeout value in milliseconds.

6.32.2.22 virtual void activemq::core::ActiveMQProducer::setTimeToLive (long long *time*) [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

Parameters

time	The new default time to live value in milliseconds.

Implements **cms::MessageProducer** (p. 1497).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQProducer.h**

6.33 activemq::util::ActiveMQProperties Class Reference

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 1705) object.

`#include <src/main/activemq/util/ActiveMQProperties.h>`

Inheritance diagram for activemq::util::ActiveMQProperties:

Public Member Functions

- **ActiveMQProperties** ()
- virtual ∼**ActiveMQProperties** () throw ()
- virtual **decaf::util::Properties** & **getProperties** ()
- virtual **const** **decaf::util::Properties** & **getProperties** () **const**
- virtual void **setProperties** (**decaf::util::Properties** &props)
- virtual int **size** () **const**

  Returns the current count of all the Properties that are currently stored in the Properties object.
- virtual bool **isEmpty** () **const**

  Returns true if the properties object is empty.
- virtual **const** char ∗ **getProperty** (**const** std::string &name) **const**

  Looks up the value for the given property.
- virtual std::string **getProperty** (**const** std::string &name, **const** std::string &defaultValue) **const**

  Looks up the value for the given property.
- virtual void **setProperty** (**const** std::string &name, **const** std::string &value)

  Sets the value for a given property.
- virtual bool **hasProperty** (**const** std::string &name) **const**

  Check to see if the Property exists in the set.
- virtual std::string **remove** (**const** std::string &name)

  Removes the property with the given name.
- virtual std::vector< std::string > **propertyNames** () **const**

  Returns a vector containing all the names of the properties currently stored in the Properties object.
- virtual std::vector< std::pair < std::string, std::string > > **toArray** () **const**

  Method that serializes the contents of the property map to an array.
- virtual void **copy** (**const** CMSProperties ∗source)
- virtual CMSProperties ∗ **clone** () **const**

  Clones this object.
- virtual void **clear** ()

  Clears all properties from the map.
- virtual std::string **toString** () **const**

  Formats the contents of the Properties Object into a string that can be logged, etc.

6.33.1 Detailed Description

Implementation of the CMSProperties interface that delegates to a **decaf::util::Properties** (p. 1705) object.

Since

2.0

6.33.2 Constructor & Destructor Documentation

6.33.2.1 activemq::util::ActiveMQProperties::ActiveMQProperties ( )

6.33.2.2 virtual activemq::util::ActiveMQProperties::~ActiveMQProperties ( ) throw () [virtual]

6.33.3 Member Function Documentation

6.33.3.1 virtual void activemq::util::ActiveMQProperties::clear ( ) [inline, virtual]

Clears all properties from the map.

Implements **cms::CMSProperties** (p. 645).

6.33.3.2 virtual CMSProperties* activemq::util::ActiveMQProperties::clone ( ) const [virtual]

Clones this object.

Returns

a replica of this object.

Implements **cms::CMSProperties** (p. 645).

6.33.3.3 virtual void activemq::util::ActiveMQProperties::copy (const CMSProperties * *source*) [virtual]

6.33.3.4 virtual decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties ( ) [inline, virtual]

6.33.3.5 virtual const decaf::util::Properties& activemq::util::ActiveMQProperties::getProperties ( ) const [inline, virtual]

6.33.3.6 virtual const char* activemq::util::ActiveMQProperties::getProperty (const std::string & *name*) const [inline, virtual]

Looks up the value for the given property.

Parameters

name	The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implements **cms::CMSProperties** (p. 645).

6.33.3.7 virtual std::string activemq::util::ActiveMQProperties::getProperty (const std::string & *name,* const std::string & *defaultValue*) const [inline, virtual]

Looks up the value for the given property.

Parameters

name	the name of the property to be looked up.
defaultValue	The value to be returned if the given property does not exist.

Returns

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

Implements **cms::CMSProperties** (p. 646).

6.33.3.8 virtual bool activemq::util::ActiveMQProperties::hasProperty (const std::string & *name*) const [inline, virtual]

Check to see if the Property exists in the set.

Parameters

name	the name of the property to check

Returns

true if property exists, false otherwise.

Implements **cms::CMSProperties** (p. 646).

6.33.3.9 virtual bool activemq::util::ActiveMQProperties::isEmpty ( ) const [inline, virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implements **cms::CMSProperties** (p. 646).

6.33.3.10 virtual std::vector<std::string> activemq::util::ActiveMQProperties::propertyNames ( ) const [inline, virtual]

Returns a vector containing all the names of the properties currently stored in the Properties object.

Returns

an STL std::vector<std::string> with all the currently stored property names.

Implements **cms::CMSProperties** (p. 646).

6.33.3.11 virtual std::string activemq::util::ActiveMQProperties::remove (const std::string & *name*) [inline, virtual]

Removes the property with the given name.

If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters

name	the name of the property to be removed.

Returns

the value that was removed from the Properties, or empty string.

Implements **cms::CMSProperties** (p. 647).

6.33.3.12 virtual void activemq::util::ActiveMQProperties::setProperties (decaf::util::Properties & *props*) [inline, virtual]

6.33.3.13 virtual void activemq::util::ActiveMQProperties::setProperty (const std::string & *name,* const std::string & *value*) [inline, virtual]

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name	The name of the value to be written.
value	The value to be written.

Implements **cms::CMSProperties** (p. 647).

6.33.3.14 virtual int activemq::util::ActiveMQProperties::size ( ) const [inline, virtual]

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns

the number of properties currently stored.

Implements **cms::CMSProperties** (p. 647).

6.33.3.15 virtual std::vector< std::pair< std::string, std::string > > activemq::util::ActiveMQProperties::toArray ( ) const [inline, virtual]

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implements **cms::CMSProperties** (p. 647).

6.33.3.16 virtual std::string activemq::util::ActiveMQProperties::toString ( ) const [inline, virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implements **cms::CMSProperties** (p. 647).

The documentation for this class was generated from the following file:

- src/main/activemq/util/**ActiveMQProperties.h**

6.34 activemq::commands::ActiveMQQueue Class Reference

`#include <src/main/activemq/commands/ActiveMQQueue.h>`

Inheritance diagram for activemq::commands::ActiveMQQueue:

Public Member Functions

- **ActiveMQQueue** ()
- **ActiveMQQueue** (**const** std::string &name)
- virtual ∼**ActiveMQQueue** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQQueue** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual **const cms::Destination** ∗ **getCMSDestination** () **const**
- virtual
  cms::Destination::DestinationType getDestinationType () **const**

  Returns the Type of Destination that this object represents.
- virtual **cms::Destination** ∗ **clone** () **const**

  Creates a new instance of this destination type that is a copy of this one, and returns it.
- virtual void **copy** (**const cms::Destination** &source)

  Copies the contents of the given Destination object to this one.
- virtual **const cms::CMSProperties** & **getCMSProperties** () **const**

  Retrieve any properties that might be part of the destination that was specified.
- virtual bool **equals** (**const cms::Destination** &other) **const**

  Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getQueueName** () **const**

  Gets the name of this queue.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQQUEUE** = 100

6.34.1 Constructor & Destructor Documentation

6.34.1.1 activemq::commands::ActiveMQQueue::ActiveMQQueue ( )

6.34.1.2 activemq::commands::ActiveMQQueue::ActiveMQQueue (const std::string & *name*)

6.34.1.3 virtual activemq::commands::ActiveMQQueue::∼ActiveMQQueue ( ) throw () [virtual]

6.34.2 Member Function Documentation

6.34.2.1 virtual cms::Destination* activemq::commands::ActiveMQQueue::clone ( ) const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 937).

6.34.2.2 virtual ActiveMQQueue* activemq::commands::ActiveMQQueue::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

6.34.2.3 virtual void activemq::commands::ActiveMQQueue::copy (const cms::Destination & *source*) [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters

source	The source Destination object.

Implements **cms::Destination** (p. 938).

6.34.2.4 virtual void activemq::commands::ActiveMQQueue::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

6.34.2.5 virtual bool activemq::commands::ActiveMQQueue::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 194).

6.34.2.6 virtual bool activemq::commands::ActiveMQQueue::equals (const cms::Destination & *other*) const [virtual]

Compares two Destination instances to determine if they represent the same logic Destination.

Parameters

other	The other destination to compare this one to.

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 938).

6.34.2.7 virtual const cms::Destination* activemq::commands::ActiveMQQueue::getCMSDestination ( ) const [inline, virtual]

Returns

the **cms::Destination** (p. 936) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.34.2.8 virtual const cms::CMSProperties& activemq::commands::ActiveMQQueue::getCMSProperties ( ) const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 938).

6.34.2.9 virtual unsigned char activemq::commands::ActiveMQQueue::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.34.2.10 virtual cms::Destination::DestinationType activemq::commands::ActiveMQQueue::getDestinationType ( ) const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 195).

References cms::Destination::QUEUE.

6.34.2.11 virtual std::string activemq::commands::ActiveMQQueue::getQueueName ( ) const [inline, virtual]

Gets the name of this queue.

Returns

The queue name.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Queue** (p. 1722).

6.34.2.12 virtual std::string activemq::commands::ActiveMQQueue::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 198).

6.34.3 Field Documentation

6.34.3.1 const unsigned char activemq::commands::ActiveMQQueue::ID_ACTIVEMQQUEUE = 100 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQQueue.h**

6.35 activemq::core::ActiveMQQueueBrowser Class Reference

`#include <src/main/activemq/core/ActiveMQQueueBrowser.h>`

Inheritance diagram for activemq::core::ActiveMQQueueBrowser:

Public Member Functions

- **ActiveMQQueueBrowser** (**ActiveMQSession** *session, **const Pointer**< **commands::ConsumerId** > &consumerId, **const Pointer**< **commands::ActiveMQDestination** > &destination, **const** std::string &selector, bool dispatchAsync)
- virtual ~**ActiveMQQueueBrowser** () throw ()
- virtual **const cms::Queue** * **getQueue** () **const**
- virtual std::string **getMessageSelector** () **const**
- virtual **cms::MessageEnumeration** * **getEnumeration** ()

  Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them.
- virtual void **close** ()

Closes this object and deallocates the appropriate resources.

- virtual bool **hasMoreMessages** ()

  Returns true if there are more Message in the Browser that can be retrieved via the `nextMessage` *method.*

- virtual **cms::Message** * **nextMessage** ()

  Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown.

Friends

- class **Browser**

6.35.1 Constructor & Destructor Documentation

6.35.1.1 activemq::core::ActiveMQQueueBrowser::ActiveMQQueueBrowser (ActiveMQSession * *session,* const Pointer< commands::ConsumerId > & *consumerId,* const Pointer< commands::ActiveMQDestination > & *destination,* const std::string & *selector,* bool *dispatchAsync*)

6.35.1.2 virtual activemq::core::ActiveMQQueueBrowser::~ActiveMQQueueBrowser ( ) throw () [virtual]

6.35.2 Member Function Documentation

6.35.2.1 virtual void activemq::core::ActiveMQQueueBrowser::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSException	- If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 633).

6.35.2.2 virtual cms::MessageEnumeration* activemq::core::ActiveMQQueueBrowser::getEnumeration ( ) [virtual]

Gets a pointer to an Enumeration object for browsing the Messages currently in the Queue in the order that a client would receive them.

The pointer returned is owned by the browser and should not be deleted by the client application.

Returns

a pointer to a Queue Enumeration, this Pointer is owned by the QueueBrowser and should not be deleted by the client.

Exceptions

CMSException	if an internal error occurs.

Implements **cms::QueueBrowser** (p. 1727).

6.35.2.3 virtual std::string activemq::core::ActiveMQQueueBrowser::getMessageSelector ( ) const [virtual]

Returns

the MessageSelector that is used on when this browser was created or empty string if no selector was present.

Exceptions

CMSException	if an internal error occurs.

Implements **cms::QueueBrowser** (p. 1727).

6.35.2.4 virtual const cms::Queue* activemq::core::ActiveMQQueueBrowser::getQueue ( ) const [virtual]

Returns

the Queue that this browser is listening on.

Exceptions

CMSException	if an internal error occurs.

Implements **cms::QueueBrowser** (p. 1727).

6.35.2.5 virtual bool activemq::core::ActiveMQQueueBrowser::hasMoreMessages ( ) [virtual]

Returns true if there are more Message in the Browser that can be retrieved via the `nextMessage` method.

If this method returns false and the `nextMessage` method is called then an Exception will be thrown.

Returns

true if more Message's are available in the Browser.

Implements **cms::MessageEnumeration** (p. 1476).

6.35.2.6 virtual cms::Message* activemq::core::ActiveMQQueueBrowser::nextMessage ( ) [virtual]

Returns the Next Message in the Queue if one is present, if no more Message's are available then an Exception is thrown.

If a Message object pointer is returned then that object becomes the property of the caller and must be deleted by the caller when finished.

Returns

The next Message in the Queue.

Exceptions

CMSException	if no more Message's currently in the Queue.

Implements **cms::MessageEnumeration** (p. 1477).

6.36 activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 255).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQQueueMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller:

Public Member Functions

- **ActiveMQQueueMarshaller** ()
- virtual ~**ActiveMQQueueMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.36.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQQueueMarshaller** (p. 255).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.36.2 Constructor & Destructor Documentation

6.36.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::ActiveMQQueueMarshaller ( ) [inline]

6.36.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::~ActiveMQQueueMarshaller ( ) [inline, virtual]

6.36.3 Member Function Documentation

6.36.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.36.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.36.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.36.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.36.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.36.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

6.36.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQQueueMarshaller.h**

6.37 activemq::core::ActiveMQSession Class Reference

`#include <src/main/activemq/core/ActiveMQSession.h>`

Inheritance diagram for activemq::core::ActiveMQSession:

Public Member Functions

- **ActiveMQSession** (**ActiveMQConnection** *__connection__, **const Pointer**< **commands::SessionId** > &id, **cms::Session::AcknowledgeMode ackMode**, **const decaf::util::Properties** &properties)
- virtual ~**ActiveMQSession** () throw ()
- virtual void **redispatch** (**MessageDispatchChannel** &unconsumedMessages)

  Redispatches the given set of unconsumed messages to the consumers.
- virtual void **start** ()

  Stops asynchronous message delivery.
- virtual void **stop** ()

  Starts asynchronous message delivery.
- bool **isStarted** () **const**

  Indicates whether or not the session is currently in the started state.
- virtual bool **isAutoAcknowledge** () **const**
- virtual bool **isDupsOkAcknowledge** () **const**
- virtual bool **isClientAcknowledge** () **const**
- virtual bool **isIndividualAcknowledge** () **const**
- void **fire** (**const exceptions::ActiveMQException** &ex)

  Fires the given exception to the exception listener of the connection.
- virtual void **dispatch** (**const Pointer**< **MessageDispatch** > &message)

  Dispatches a message to a particular consumer.
- virtual void **close** ()

Closes this session as well as any active child consumers or producers.

- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.

- virtual void **rollback** ()

  Rolls back all messages done in this transaction and releases any locks currently held.

- virtual void **recover** ()

  Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination)

  Creates a MessageConsumer for the specified destination.

- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination, **const** std::string &selector)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createConsumer** (**const cms::Destination** *destination, **const** std::string &selector, bool noLocal)

  Creates a MessageConsumer for the specified destination, using a message selector.

- virtual **cms::MessageConsumer** * **createDurableConsumer** (**const cms::Topic** *destination, **const** std::string &name, **const** std::string &selector, bool noLocal=false)

  Creates a durable subscriber to the specified topic, using a Message selector.

- virtual **cms::MessageProducer** * **createProducer** (**const cms::Destination** *destination)

  Creates a MessageProducer to send messages to the specified destination.

- virtual **cms::QueueBrowser** * **createBrowser** (**const cms::Queue** *queue)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::QueueBrowser** * **createBrowser** (**const cms::Queue** *queue, **const** std::string &selector)

  Creates a new QueueBrowser to peek at Messages on the given Queue.

- virtual **cms::Queue** * **createQueue** (**const** std::string &queueName)

  Creates a queue identity given a Queue name.

- virtual **cms::Topic** * **createTopic** (**const** std::string &topicName)

  Creates a topic identity given a Queue name.

- virtual **cms::TemporaryQueue** * **createTemporaryQueue** ()

  Creates a TemporaryQueue object.

- virtual **cms::TemporaryTopic** * **createTemporaryTopic** ()

  Creates a TemporaryTopic object.

- virtual **cms::Message** * **createMessage** ()

  Creates a new Message.

- virtual **cms::BytesMessage** * **createBytesMessage** ()

  Creates a BytesMessage.

- virtual **cms::BytesMessage** * **createBytesMessage** (**const** unsigned char *bytes, int bytesSize)

  Creates a BytesMessage and sets the payload to the passed value.

- virtual **cms::StreamMessage** * **createStreamMessage** ()

  Creates a new StreamMessage.

- virtual **cms::TextMessage** * **createTextMessage** ()

  Creates a new TextMessage.

- virtual **cms::TextMessage** * **createTextMessage** (**const** std::string &text)

  Creates a new TextMessage and set the text to the value given.

- virtual **cms::MapMessage** * **createMapMessage** ()

  Creates a new MapMessage.

- virtual **cms::Session::AcknowledgeMode getAcknowledgeMode** () **const**

  Returns the acknowledgment mode of the session.

- virtual bool **isTransacted** () **const**

  Gets if the Sessions is a Transacted Session.

- virtual void **unsubscribe** (**const** std::string &name)

  Unsubscribes a durable subscription that has been created by a client.
- void **send** (**cms::Message** ∗message, **ActiveMQProducer** ∗producer, **util::Usage** ∗usage)

  Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.
- **cms::ExceptionListener** ∗ **getExceptionListener** ()

  This method gets any registered exception listener of this sessions connection and returns it.
- **const commands::SessionInfo** & **getSessionInfo** () **const**

  Gets the Session Information object for this session, if the session is closed than this method throws an exception.
- **const commands::SessionId** & **getSessionId** () **const**

  Gets the Session Id object for this session, if the session is closed than this method throws an exception.
- **ActiveMQConnection** ∗ **getConnection** () **const**

  *Gets the **ActiveMQConnection** (p. 145) that is associated with this session.*
- **Pointer**< **threads::Scheduler** > **getScheduler** () **const**

  Gets a Pointer to this Session's Scheduler instance.
- long long **getLastDeliveredSequenceId** () **const**

  Gets the currently set Last Delivered Sequence Id.
- void **setLastDeliveredSequenceId** (long long value)

  Sets the value of the Last Delivered Sequence Id.
- void **oneway** (**Pointer**< **commands::Command** > command)

  Sends a Command to the broker without requesting any Response be returned.
- **Pointer**< **commands::Response** > **syncRequest** (**Pointer**< **commands::Command** > command, unsigned int timeout=0)

  Sends a synchronous request and returns the response from the broker.
- void **addConsumer** (**ActiveMQConsumer** ∗consumer)

  Adds a MessageConsumer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.
- void **removeConsumer** (**const Pointer**< **commands::ConsumerId** > &consumerId)

  Dispose of a MessageConsumer from this session.
- void **addProducer** (**ActiveMQProducer** ∗producer)

  Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.
- void **removeProducer** (**ActiveMQProducer** ∗producer)

  Dispose of a MessageProducer from this session.
- virtual void **doStartTransaction** ()

  Starts if not already start a Transaction for this Session.
- **Pointer**
  < **ActiveMQTransactionContext** > **getTransactionContext** ()

  Gets the Pointer to this Session's TransactionContext.
- void **acknowledge** ()

  Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.
- void **deliverAcks** ()

  Request that this Session inform all of its consumers to deliver their pending acks.
- void **clearMessagesInProgress** ()

  Request that this Session inform all of its consumers to clear all messages that are currently in progress.
- void **wakeup** ()

  Causes the Session to wakeup its executer and ensure all messages are dispatched.
- **Pointer**< **commands::ConsumerId** > **getNextConsumerId** ()

  Get the Next available Consumer Id.
- **Pointer**< **commands::ProducerId** > **getNextProducerId** ()

  Get the Next available Producer Id.

- void **doClose** ()

  Performs the actual Session close operations.
- void **dispose** ()

  Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from ***ActiveMQConnection*** *(*p. *145) when it knows that the transport is down and the doClose method would throw an exception when it attempt to send the Remove Command.*

Protected Attributes

- SessionConfig ∗ **config**
- **Pointer**< **commands::SessionInfo** > **sessionInfo**

  SessionInfo for this Session.
- **Pointer**
  < **ActiveMQTransactionContext** > **transaction**

  Transaction Management object.
- **ActiveMQConnection** ∗ **connection**

  Connection.
- **ConsumersMap consumers**

  Map of consumers.
- **AtomicBoolean closed**

  Indicates that this connection has been closed, it is no longer usable after this becomes true.
- std::auto_ptr
  < **ActiveMQSessionExecutor** > **executor**

  Sends incoming messages to the registered consumers.
- **cms::Session::AcknowledgeMode ackMode**

  This Sessions Acknowledgment mode.
- **util::LongSequenceGenerator producerIds**

  Next available Producer Id.
- **util::LongSequenceGenerator producerSequenceIds**

  Next available Producer Sequence Id.
- **util::LongSequenceGenerator consumerIds**

  Next available Consumer Id.
- long long **lastDeliveredSequenceId**

  Last Delivered Sequence Id.

Friends

- class **ActiveMQSessionExecutor**

6.37.1 Constructor & Destructor Documentation

6.37.1.1 activemq::core::ActiveMQSession::ActiveMQSession (ActiveMQConnection ∗ *connection,* const Pointer< commands::SessionId > & *id,* cms::Session::AcknowledgeMode *ackMode,* const decaf::util::Properties & *properties*)

6.37.1.2 virtual activemq::core::ActiveMQSession::∼ActiveMQSession ( ) throw () [virtual]

6.37.2 Member Function Documentation

6.37.2.1 void activemq::core::ActiveMQSession::acknowledge ( )

Request that the Session inform all its consumers to Acknowledge all Message's that have been received so far.

6.37.2.2 void activemq::core::ActiveMQSession::addConsumer (ActiveMQConsumer * *consumer*)

Adds a MessageConsumer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters

consumer	The **ActiveMQConsumer** (p. 181) instance to add to this session.

Exceptions

ActiveMQException	if an internal error occurs.

6.37.2.3 void activemq::core::ActiveMQSession::addProducer (ActiveMQProducer * *producer*)

Adds a MessageProducer to this session registering it with the Connection and store a reference to it so the session can ensure that all resources are closed when the session is closed.

Parameters

consumer	The **ActiveMQProducer** (p. 238) instance to add to this session.

Exceptions

ActiveMQException	if an internal error occurs.

6.37.2.4 void activemq::core::ActiveMQSession::clearMessagesInProgress ( )

Request that this Session inform all of its consumers to clear all messages that are currently in progress.

6.37.2.5 virtual void activemq::core::ActiveMQSession::close ( ) [virtual]

Closes this session as well as any active child consumers or producers.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1833).

6.37.2.6 virtual void activemq::core::ActiveMQSession::commit ( ) [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 1834).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 339).

6.37.2.7 virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * *queue*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue	the Queue to browse

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if the destination given is invalid.

Implements **cms::Session** (p. 1834).

6.37.2.8 virtual cms::QueueBrowser* activemq::core::ActiveMQSession::createBrowser (const cms::Queue * *queue,* const std::string & *selector*) [virtual]

Creates a new QueueBrowser to peek at Messages on the given Queue.

Parameters

queue	the Queue to browse
selector	the Message selector to filter which messages are browsed.

Returns

New QueueBrowser that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if the destination given is invalid.

Implements **cms::Session** (p. 1834).

6.37.2.9 virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage ( ) [virtual]

Creates a BytesMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1835).

6.37.2.10 virtual cms::BytesMessage* activemq::core::ActiveMQSession::createBytesMessage (const unsigned char * *bytes*, int *bytesSize*) [virtual]

Creates a BytesMessage and sets the payload to the passed value.

Parameters

bytes	an array of bytes to set in the message
bytesSize	the size of the bytes array, or number of bytes to use

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1835).

6.37.2.11 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination*) [virtual]

Creates a MessageConsumer for the specified destination.

Parameters

destination	the Destination that this consumer receiving messages for.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.

Implements **cms::Session** (p. 1835).

6.37.2.12 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination*, const std::string & *selector*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination	the Destination that this consumer receiving messages for.
selector	the Message Selector to use

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1836).

6.37.2.13 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createConsumer (const cms::Destination * *destination,* const std::string & *selector,* bool *noLocal*) [virtual]

Creates a MessageConsumer for the specified destination, using a message selector.

Parameters

destination	the Destination that this consumer receiving messages for.
selector	the Message Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1836).

6.37.2.14 virtual cms::MessageConsumer* activemq::core::ActiveMQSession::createDurableConsumer (const cms::Topic * *destination,* const std::string & *name,* const std::string & *selector,* bool *noLocal* = false) [virtual]

Creates a durable subscriber to the specified topic, using a Message selector.

Sessions that create durable consumers must use the same client Id as was used the last time the subscription was created in order to receive all messages that were delivered while the client was offline.

Parameters

destination	the topic to subscribe to
name	The name used to identify the subscription
selector	the Message Selector to use
noLocal	if true, and the destination is a topic, inhibits the delivery of messages published by its own connection. The behavior for NoLocal is not specified if the destination is a queue.

Returns

pointer to a new durable MessageConsumer that is owned by the caller (caller deletes)

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.
InvalidSelectorException	- if the message selector is invalid.

Implements **cms::Session** (p. 1837).

6.37.2.15 virtual cms::MapMessage* activemq::core::ActiveMQSession::createMapMessage ( ) [virtual]

Creates a new MapMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1837).

6.37.2.16 virtual cms::Message* activemq::core::ActiveMQSession::createMessage ( ) [virtual]

Creates a new Message.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1837).

6.37.2.17 virtual cms::MessageProducer* activemq::core::ActiveMQSession::createProducer (const cms::Destination * *destination*) [virtual]

Creates a MessageProducer to send messages to the specified destination.

Parameters

destination	the Destination to send on

Returns

New MessageProducer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.
InvalidDestinationException	- if an invalid destination is specified.

Implements **cms::Session** (p. 1838).

6.37.2.18 virtual cms::Queue* activemq::core::ActiveMQSession::createQueue (const std::string & *queueName*) [virtual]

Creates a queue identity given a Queue name.

Parameters

queueName	the name of the new Queue

Returns

new Queue pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1838).

6.37.2.19 virtual cms::StreamMessage* activemq::core::ActiveMQSession::createStreamMessage ( ) [virtual]

Creates a new StreamMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1838).

6.37.2.20 virtual cms::TemporaryQueue* activemq::core::ActiveMQSession::createTemporaryQueue ( ) [virtual]

Creates a TemporaryQueue object.

Returns

new TemporaryQueue pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

6.37.2.21 virtual cms::TemporaryTopic* activemq::core::ActiveMQSession::createTemporaryTopic ( ) [virtual]

Creates a TemporaryTopic object.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

6.37.2.22 virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage ( ) [virtual]

Creates a new TextMessage.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

6.37.2.23 virtual cms::TextMessage* activemq::core::ActiveMQSession::createTextMessage (const std::string & *text*) [virtual]

Creates a new TextMessage and set the text to the value given.

Parameters

text	the initial text for the message

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1839).

6.37.2.24 virtual cms::Topic* activemq::core::ActiveMQSession::createTopic (const std::string & *topicName*) [virtual]

Creates a topic identity given a Queue name.

Parameters

topicName	the name of the new Topic

Returns

new Topic pointer that is owned by the caller.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

6.37.2.25 void activemq::core::ActiveMQSession::deliverAcks ( )

Request that this Session inform all of its consumers to deliver their pending acks.

6.37.2.26 virtual void activemq::core::ActiveMQSession::dispatch (const Pointer< MessageDispatch > & *message*) [virtual]

Dispatches a message to a particular consumer.

Parameters

message	- the message to be dispatched

Implements **activemq::core::Dispatcher** (p. 956).

6.37.2.27 void activemq::core::ActiveMQSession::dispose ( )

Cleans up the Session object's resources without attempting to send the Remove command to the broker, this can be called from **ActiveMQConnection** (p. 145) when it knows that the transport is down and the doClose method would throw an exception when it attempt to send the Remove Command.

6.37.2.28 void activemq::core::ActiveMQSession::doClose ( )

Performs the actual Session close operations.

This method is meant for use by **ActiveMQConnection** (p. 145), the connection object calls this when it has been closed to skip some of the extraneous processing done by the client level close method.

6.37.2.29 virtual void activemq::core::ActiveMQSession::doStartTransaction ( ) [virtual]

Starts if not already start a Transaction for this Session.

If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions

ActiveMQException	if this is not a Transacted Session.

Reimplemented in **activemq::core::ActiveMQXASession** (p. 339).

6.37.2.30 void activemq::core::ActiveMQSession::fire (const exceptions::ActiveMQException & *ex*)

Fires the given exception to the exception listener of the connection.

6.37.2.31 virtual cms::Session::AcknowledgeMode activemq::core::ActiveMQSession::getAcknowledgeMode ( ) const [virtual]

Returns the acknowledgment mode of the session.

Returns

the Sessions Acknowledge Mode

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

6.37.2.32 ActiveMQConnection* activemq::core::ActiveMQSession::getConnection ( ) const [inline]

Gets the **ActiveMQConnection** (p. 145) that is associated with this session.

6.37.2.33 cms::ExceptionListener* activemq::core::ActiveMQSession::getExceptionListener ( )

This method gets any registered exception listener of this sessions connection and returns it.

Mainly intended for use by the objects that this session creates so that they can notify the client of exceptions that occur in the context of another thread.

Returns

cms::ExceptionListener (p. 996) pointer or NULL

6.37.2.34 long long activemq::core::ActiveMQSession::getLastDeliveredSequenceId ( ) const [inline]

Gets the currently set Last Delivered Sequence Id.

Returns

long long containing the sequence id of the last delivered Message.

6.37.2.35 Pointer<commands::ConsumerId> activemq::core::ActiveMQSession::getNextConsumerId ( )

Get the Next available Consumer Id.

Returns

the next id in the sequence.

6.37.2.36 Pointer<commands::ProducerId> activemq::core::ActiveMQSession::getNextProducerId ( )

Get the Next available Producer Id.

Returns

the next id in the sequence.

6.37.2.37 Pointer<threads::Scheduler> activemq::core::ActiveMQSession::getScheduler ( ) const

Gets a Pointer to this Session's Scheduler instance.

6.37.2.38 const commands::SessionId& activemq::core::ActiveMQSession::getSessionId ( ) const [inline]

Gets the Session Id object for this session, if the session is closed than this method throws an exception.

Returns

SessionId Reference

6.37.2.39 const commands::SessionInfo& activemq::core::ActiveMQSession::getSessionInfo ( ) const [inline]

Gets the Session Information object for this session, if the session is closed than this method throws an exception.

Returns

SessionInfo Reference

6.37.2.40 Pointer<ActiveMQTransactionContext> activemq::core::ActiveMQSession::getTransactionContext ( ) [inline]

Gets the Pointer to this Session's TransactionContext.

Returns

a Pointer to this Session's TransactionContext

6.37.2.41 virtual bool activemq::core::ActiveMQSession::isAutoAcknowledge ( ) const [inline, virtual]

Reimplemented in **activemq::core::ActiveMQXASession** (p. 339).

References cms::Session::AUTO_ACKNOWLEDGE.

6.37.2.42 virtual bool activemq::core::ActiveMQSession::isClientAcknowledge ( ) const [inline, virtual]

References cms::Session::CLIENT_ACKNOWLEDGE.

6.37.2.43 virtual bool activemq::core::ActiveMQSession::isDupsOkAcknowledge ( ) const [inline, virtual]

References cms::Session::DUPS_OK_ACKNOWLEDGE.

6.37.2.44 virtual bool activemq::core::ActiveMQSession::isIndividualAcknowledge ( ) const [inline, virtual]

References cms::Session::INDIVIDUAL_ACKNOWLEDGE.

6.37.2.45 bool activemq::core::ActiveMQSession::isStarted ( ) const

Indicates whether or not the session is currently in the started state.

6.37.2.46 virtual bool activemq::core::ActiveMQSession::isTransacted ( ) const [virtual]

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1840).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 340).

6.37.2.47 void activemq::core::ActiveMQSession::oneway (Pointer< commands::Command > *command*)

Sends a Command to the broker without requesting any Response be returned.

Parameters

command	The message to send to the Broker.

Exceptions

ActiveMQException	if not currently connected, or if the operation fails for any reason.

6.37.2.48 virtual void activemq::core::ActiveMQSession::recover ( ) [virtual]

Stops message delivery in this session, and restarts message delivery with the oldest unacknowledged message.

All consumers deliver messages in a serial order. Acknowledging a received message automatically acknowledges all messages that have been delivered to the client.

Restarting a session causes it to take the following actions:

- Stop message delivery
  - Mark all messages that might have been delivered but not acknowledged as "redelivered"
  - Restart the delivery sequence including all unacknowledged messages that had been previously delivered. Redelivered messages do not have to be delivered in exactly their original delivery order.

Exceptions

CMSException	- if the CMS provider fails to stop and restart message delivery due to some internal error.
IllegalStateException	- if the method is called by a transacted session.

Implements **cms::Session** (p. 1840).

6.37.2.49 virtual void activemq::core::ActiveMQSession::redispatch (MessageDispatchChannel & *unconsumedMessages*) [virtual]

Redispatches the given set of unconsumed messages to the consumers.

Parameters

unconsumed-Messages	- unconsumed messages to be redelivered.

6.37.2.50 void activemq::core::ActiveMQSession::removeConsumer (const Pointer< commands::ConsumerId > & *consumerId*)

Dispose of a MessageConsumer from this session.

Removes it from the Connection and clean up any resources associated with it.

Parameters

consumerId	The ConsumerId of the MessageConsumer to remove from this Session.

Exceptions

ActiveMQException	if an internal error occurs.

6.37.2.51 void activemq::core::ActiveMQSession::removeProducer (ActiveMQProducer * *producer*)

Dispose of a MessageProducer from this session.

Removes it from the Connection and clean up any resources associated with it.

Parameters

producerId	The ProducerId of the MessageProducer to remove from this session.

Exceptions

ActiveMQException	if an internal error occurs.

6.37.2.52 virtual void activemq::core::ActiveMQSession::rollback ( ) [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Implements **cms::Session** (p. 1841).

Reimplemented in **activemq::core::ActiveMQXASession** (p. 340).

6.37.2.53 void activemq::core::ActiveMQSession::send (cms::Message * *message*, ActiveMQProducer * *producer*, util::Usage * *usage*)

Sends a message from the Producer specified using this session's connection the message will be sent using the best available means depending on the configuration of the connection.

Asynchronous sends will be chosen if at all possible.

Parameters

message	The message to send to the broker.
producer	The sending Producer
usage	Pointer to a Usage tracker which if set will be increased by the size of the given message.

Exceptions

CMSException	

6.37.2.54 void activemq::core::ActiveMQSession::setLastDeliveredSequenceId (long long *value*) [inline]

Sets the value of the Last Delivered Sequence Id.

Parameters

value	The new value to assign to the Last Delivered Sequence Id property.

6.37.2.55 virtual void activemq::core::ActiveMQSession::start ( ) [virtual]

Stops asynchronous message delivery.

Implements **cms::Startable** (p. 1964).

6.37.2.56 virtual void activemq::core::ActiveMQSession::stop ( ) [virtual]

Starts asynchronous message delivery.

Implements **cms::Stoppable** (p. 2017).

6.37.2.57 Pointer<commands::Response> activemq::core::ActiveMQSession::syncRequest (Pointer< commands::Command > *command*, unsigned int *timeout* = 0)

Sends a synchronous request and returns the response from the broker.

Converts any error responses into an exception.

Parameters

command	The command to send to the broker.
timeout	The time to wait for a response, default is zero or infinite.

Returns

Pointer to a Response object that the broker has returned for the Command sent.

Exceptions

ActiveMQException	thrown if an error response was received from the broker, or if any other error occurred.

6.37.2.58 virtual void activemq::core::ActiveMQSession::unsubscribe (const std::string & *name*) [virtual]

Unsubscribes a durable subscription that has been created by a client.

This method deletes the state being maintained on behalf of the subscriber by its provider. It is erroneous for a client to delete a durable subscription while there is an active MessageConsumer or Subscriber for the subscription, or while a consumed message is part of a pending transaction or has not been acknowledged in the session.

Parameters

name	The name used to identify this subscription

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Session** (p. 1841).

6.37.2.59 void activemq::core::ActiveMQSession::wakeup ( )

Causes the Session to wakeup its executer and ensure all messages are dispatched.

6.37.3 Friends And Related Function Documentation

6.37.3.1 friend class ActiveMQSessionExecutor [friend]

6.37.4 Field Documentation

6.37.4.1 cms::Session::AcknowledgeMode activemq::core::ActiveMQSession::ackMode [protected]

This Sessions Acknowledgment mode.

6.37.4.2 AtomicBoolean activemq::core::ActiveMQSession::closed [protected]

Indicates that this connection has been closed, it is no longer usable after this becomes true.

6.37.4.3 SessionConfig* activemq::core::ActiveMQSession::config [protected]

6.37.4.4 ActiveMQConnection* activemq::core::ActiveMQSession::connection [protected]

Connection.

6.37.4.5 util::LongSequenceGenerator activemq::core::ActiveMQSession::consumerIds [protected]

Next available Consumer Id.

6.37.4.6 ConsumersMap activemq::core::ActiveMQSession::consumers [protected]

Map of consumers.

6.37.4.7 std::auto_ptr<ActiveMQSessionExecutor> activemq::core::ActiveMQSession::executor [protected]

Sends incoming messages to the registered consumers.

6.37.4.8 long long activemq::core::ActiveMQSession::lastDeliveredSequenceId [protected]

Last Delivered Sequence Id.

6.37.4.9 util::LongSequenceGenerator activemq::core::ActiveMQSession::producerIds [protected]

Next available Producer Id.

6.37.4.10 util::LongSequenceGenerator activemq::core::ActiveMQSession::producerSequenceIds [protected]

Next available Producer Sequence Id.

6.37.4.11 Pointer<commands::SessionInfo> activemq::core::ActiveMQSession::sessionInfo [protected]

SessionInfo for this Session.

6.37.4.12 Pointer<ActiveMQTransactionContext> activemq::core::ActiveMQSession::transaction [protected]

Transaction Management object.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQSession.h**

6.38 activemq::core::ActiveMQSessionExecutor Class Reference

Delegate dispatcher for a single session.

`#include <src/main/activemq/core/ActiveMQSessionExecutor.h>`

Inheritance diagram for activemq::core::ActiveMQSessionExecutor:

Public Member Functions

- **ActiveMQSessionExecutor** (**ActiveMQSession** ∗session)

  Creates an un-started executor for the given session.
- virtual ∼**ActiveMQSessionExecutor** ()

  *Calls **stop()** (p. 278) then **clear()** (p. 277).*
- virtual void **execute** (**const Pointer**< **MessageDispatch** > &data)

  Executes the dispatch.
- virtual void **executeFirst** (**const Pointer**< **MessageDispatch** > &data)

  Executes the dispatch.
- virtual void **clearMessagesInProgress** ()

  Removes all messages in the Dispatch Channel so that non are delivered.
- virtual bool **hasUncomsumedMessages** () **const**
- virtual void **wakeup** ()

  wakeup this executer and dispatch any pending messages.
- virtual void **start** ()

  Starts the dispatching.
- virtual void **stop** ()

  Stops dispatching.
- virtual void **close** ()

  Terminates the dispatching thread.
- virtual bool **isRunning** () **const**
- virtual bool **isEmpty** ()
- virtual void **clear** ()

  Removes all queued messages and destroys them.
- virtual bool **iterate** ()

  *Iterates on the **MessageDispatchChannel** (p. 1462) sending all pending messages to the Consumers they are destined for.*
- std::vector< **Pointer**
  < **MessageDispatch** > > **getUnconsumedMessages** ()

6.38.1 Detailed Description

Delegate dispatcher for a single session.

Contains a thread to provide for asynchronous dispatching.

6.38.2 Constructor & Destructor Documentation

6.38.2.1 activemq::core::ActiveMQSessionExecutor::ActiveMQSessionExecutor (ActiveMQSession * *session*)

Creates an un-started executor for the given session.

6.38.2.2 virtual activemq::core::ActiveMQSessionExecutor::~ActiveMQSessionExecutor ( ) [virtual]

Calls **stop()** (p. 278) then **clear()** (p. 277).

6.38.3 Member Function Documentation

6.38.3.1 virtual void activemq::core::ActiveMQSessionExecutor::clear ( ) [inline, virtual]

Removes all queued messages and destroys them.

6.38.3.2 virtual void activemq::core::ActiveMQSessionExecutor::clearMessagesInProgress ( ) [inline, virtual]

Removes all messages in the Dispatch Channel so that non are delivered.

6.38.3.3 virtual void activemq::core::ActiveMQSessionExecutor::close ( ) [inline, virtual]

Terminates the dispatching thread.

Once this is called, the executor is no longer usable.

6.38.3.4 virtual void activemq::core::ActiveMQSessionExecutor::execute (const Pointer< MessageDispatch > & *data*) [virtual]

Executes the dispatch.

Adds the given data to the end of the queue.

Parameters

data	- the data to be dispatched.

6.38.3.5 virtual void activemq::core::ActiveMQSessionExecutor::executeFirst (const Pointer< MessageDispatch > & *data*) [virtual]

Executes the dispatch.

Adds the given data to the beginning of the queue.

Parameters

data	- the data to be dispatched.

6.38.3.6 std::vector< Pointer<MessageDispatch> > activemq::core::ActiveMQSessionExecutor::getUnconsumedMessages ( ) [inline]

Returns

a vector containing all the unconsumed messages, this clears the Message Dispatch Channel when called.

6.38.3.7 virtual bool activemq::core::ActiveMQSessionExecutor::hasUncomsumedMessages ( ) const [inline, virtual]

Returns

true if there are any pending messages in the dispatch channel.

6.38.3.8 virtual bool activemq::core::ActiveMQSessionExecutor::isEmpty ( ) [inline, virtual]

Returns

true if there are no messages in the Dispatch Channel.

6.38.3.9 virtual bool activemq::core::ActiveMQSessionExecutor::isRunning ( ) const [inline, virtual]

Returns

true indicates if the executor is started

6.38.3.10 virtual bool activemq::core::ActiveMQSessionExecutor::iterate ( ) [virtual]

Iterates on the **MessageDispatchChannel** (p. 1462) sending all pending messages to the Consumers they are destined for.

Returns

false if there are no more messages to dispatch.

Implements **activemq::threads::Task** (p. 2073).

6.38.3.11 virtual void activemq::core::ActiveMQSessionExecutor::start ( ) [virtual]

Starts the dispatching.

6.38.3.12 virtual void activemq::core::ActiveMQSessionExecutor::stop ( ) [virtual]

Stops dispatching.

6.38.3.13 virtual void activemq::core::ActiveMQSessionExecutor::wakeup ( ) [virtual]

wakeup this executer and dispatch any pending messages.

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQSessionExecutor.h**

6.39 activemq::commands::ActiveMQStreamMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQStreamMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQStreamMessage:

Public Member Functions

- **ActiveMQStreamMessage** ()
- virtual ~**ActiveMQStreamMessage** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQStreamMessage** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual void **onSend** ()

  *Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.*
- virtual **cms::StreamMessage** * **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual void **clearBody** ()

  Clears out the body of the message.
- virtual void **reset** ()
- virtual bool **readBoolean** () **const**

  Reads a Boolean from the Stream message stream.
- virtual void **writeBoolean** (bool value)

  Writes a boolean to the Stream message stream as a 1-byte value.
- virtual unsigned char **readByte** () **const**

  Reads a Byte from the Stream message stream.
- virtual void **writeByte** (unsigned char value)

  Writes a byte to the Stream message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) **const**

  Reads a byte array from the Stream message stream.
- virtual void **writeBytes** (**const** std::vector< unsigned char > &value)

  Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char *buffer, int length) **const**

  Reads a portion of the Stream message stream.
- virtual void **writeBytes** (**const** unsigned char *value, int offset, int length)

  Writes a portion of a byte array to the Stream message stream.
- virtual char **readChar** () **const**

  Reads a Char from the Stream message stream.
- virtual void **writeChar** (char value)

  Writes a char to the Stream message stream as a 1-byte value.
- virtual float **readFloat** () **const**

  Reads a 32 bit float from the Stream message stream.
- virtual void **writeFloat** (float value)

Writes a float to the Stream message stream as a 4 byte value.

- virtual double **readDouble** () **const**

  Reads a 64 bit double from the Stream message stream.

- virtual void **writeDouble** (double value)

  Writes a double to the Stream message stream as a 8 byte value.

- virtual short **readShort** () **const**

  Reads a 16 bit signed short from the Stream message stream.

- virtual void **writeShort** (short value)

  Writes a signed short to the Stream message stream as a 2 byte value.

- virtual unsigned short **readUnsignedShort** () **const**

  Reads a 16 bit unsigned short from the Stream message stream.

- virtual void **writeUnsignedShort** (unsigned short value)

  Writes a unsigned short to the Stream message stream as a 2 byte value.

- virtual int **readInt** () **const**

  Reads a 32 bit signed integer from the Stream message stream.

- virtual void **writeInt** (int value)

  Writes a signed int to the Stream message stream as a 4 byte value.

- virtual long long **readLong** () **const**

  Reads a 64 bit long from the Stream message stream.

- virtual void **writeLong** (long long value)

  Writes a long long to the Stream message stream as a 8 byte value.

- virtual std::string **readString** () **const**

  Reads an ASCII String from the Stream message stream.

- virtual void **writeString** (**const** std::string &value)

  Writes an ASCII String to the Stream message stream.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQSTREAMMESSAGE** = 27

6.39.1 Constructor & Destructor Documentation

6.39.1.1 activemq::commands::ActiveMQStreamMessage::ActiveMQStreamMessage ( )

6.39.1.2 virtual activemq::commands::ActiveMQStreamMessage::~ActiveMQStreamMessage ( ) throw () [virtual]

6.39.2 Member Function Documentation

6.39.2.1 virtual void activemq::commands::ActiveMQStreamMessage::clearBody ( ) [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSException	- if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230).

6.39.2.2 virtual cms::StreamMessage* activemq::commands::ActiveMQStreamMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.39.2.3 virtual ActiveMQStreamMessage* activemq::commands::ActiveMQStreamMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.39.2.4 virtual void activemq::commands::ActiveMQStreamMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.39.2.5 virtual bool activemq::commands::ActiveMQStreamMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230).

6.39.2.6 virtual unsigned char activemq::commands::ActiveMQStreamMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.39.2.7 virtual void activemq::commands::ActiveMQStreamMessage::onSend ( ) [virtual]

Allows derived **Message** (p. 1412) classes to perform tasks before a message is sent.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate**< **cms::StreamMessage** > (p. 232).

6.39.2.8 virtual bool activemq::commands::ActiveMQStreamMessage::readBoolean ( ) const [virtual]

Reads a Boolean from the Stream message stream.

Returns

boolean value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2022).

6.39.2.9 virtual unsigned char activemq::commands::ActiveMQStreamMessage::readByte ( ) const [virtual]

Reads a Byte from the Stream message stream.

Returns

unsigned char value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2022).

6.39.2.10 virtual int activemq::commands::ActiveMQStreamMessage::readBytes (std::vector< unsigned char > & *value*) const [virtual]

Reads a byte array from the Stream message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value	buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2022).

6.39.2.11 virtual int activemq::commands::ActiveMQStreamMessage::readBytes (unsigned char * *buffer,* int *length*) const [virtual]

Reads a portion of the Stream message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an CMSException is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer	the buffer into which the data is read
length	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2023).

6.39.2.12 virtual char activemq::commands::ActiveMQStreamMessage::readChar ( ) const [virtual]

Reads a Char from the Stream message stream.

Returns

char value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2024).

6.39.2.13 virtual double activemq::commands::ActiveMQStreamMessage::readDouble ( ) const [virtual]

Reads a 64 bit double from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2024).

6.39.2.14 virtual float activemq::commands::ActiveMQStreamMessage::readFloat ( ) const [virtual]

Reads a 32 bit float from the Stream message stream.

Returns

double value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2024).

6.39.2.15 virtual int activemq::commands::ActiveMQStreamMessage::readInt ( ) const [virtual]

Reads a 32 bit signed integer from the Stream message stream.

Returns

int value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2025).

6.39.2.16 virtual long long activemq::commands::ActiveMQStreamMessage::readLong ( ) const [virtual]

Reads a 64 bit long from the Stream message stream.

Returns

long long value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2025).

6.39.2.17 virtual short activemq::commands::ActiveMQStreamMessage::readShort ( ) const [virtual]

Reads a 16 bit signed short from the Stream message stream.

Returns

short value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2026).

6.39.2.18 virtual std::string activemq::commands::ActiveMQStreamMessage::readString ( ) const [virtual]

Reads an ASCII String from the Stream message stream.

Returns

String from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2026).

6.39.2.19 virtual unsigned short activemq::commands::ActiveMQStreamMessage::readUnsignedShort ( ) const [virtual]

Reads a 16 bit unsigned short from the Stream message stream.

Returns

unsigned short value from stream

Exceptions

CMSException	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException	- if unexpected end of message stream has been reached.
MessageFormatException	- if this type conversion is invalid.
MessageNotReadable-Exception	- if the message is in write-only mode.

Implements **cms::StreamMessage** (p. 2026).

6.39.2.20 virtual void activemq::commands::ActiveMQStreamMessage::reset ( ) [virtual]

6.39.2.21 virtual std::string activemq::commands::ActiveMQStreamMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.39.2.22 virtual void activemq::commands::ActiveMQStreamMessage::writeBoolean (bool *value*) [virtual]

Writes a boolean to the Stream message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value	boolean to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2027).

6.39.2.23 virtual void activemq::commands::ActiveMQStreamMessage::writeByte (unsigned char *value*) [virtual]

Writes a byte to the Stream message stream as a 1-byte value.

Parameters

value	byte to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2027).

6.39.2.24 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes (const std::vector< unsigned char > & *value*) [virtual]

Writes a byte array to the Stream message stream using the vector size as the number of bytes to write.

Parameters

value	bytes to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2027).

6.39.2.25 virtual void activemq::commands::ActiveMQStreamMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [virtual]

Writes a portion of a byte array to the Stream message stream.

size as the number of bytes to write.

Parameters

value	bytes to write to the stream
offset	the initial offset within the byte array
length	the number of bytes to use

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2028).

6.39.2.26 virtual void activemq::commands::ActiveMQStreamMessage::writeChar (char *value*) [virtual]

Writes a char to the Stream message stream as a 1-byte value.

Parameters

value	char to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2028).

6.39.2.27 virtual void activemq::commands::ActiveMQStreamMessage::writeDouble (double *value*) [virtual]

Writes a double to the Stream message stream as a 8 byte value.

Parameters

value	double to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2028).

6.39.2.28 virtual void activemq::commands::ActiveMQStreamMessage::writeFloat (float *value*) [virtual]

Writes a float to the Stream message stream as a 4 byte value.

Parameters

value	float to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2029).

6.39.2.29 virtual void activemq::commands::ActiveMQStreamMessage::writeInt (int *value*) [virtual]

Writes a signed int to the Stream message stream as a 4 byte value.

Parameters

value	signed int to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2029).

6.39.2.30 virtual void activemq::commands::ActiveMQStreamMessage::writeLong (long long *value*) [virtual]

Writes a long long to the Stream message stream as a 8 byte value.

Parameters

value	signed long long to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2029).

6.39.2.31 virtual void activemq::commands::ActiveMQStreamMessage::writeShort (short *value*) [virtual]

Writes a signed short to the Stream message stream as a 2 byte value.

Parameters

value	signed short to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2030).

6.39.2.32 virtual void activemq::commands::ActiveMQStreamMessage::writeString (const std::string & *value*) [virtual]

Writes an ASCII String to the Stream message stream.

Parameters

value	String to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2030).

6.39.2.33 virtual void activemq::commands::ActiveMQStreamMessage::writeUnsignedShort (unsigned short *value*) [virtual]

Writes a unsigned short to the Stream message stream as a 2 byte value.

Parameters

value	unsigned short to write to the stream

Exceptions

CMSException	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception	- if the message is in read-only mode.

Implements **cms::StreamMessage** (p. 2030).

6.39.3 Field Documentation

6.39.3.1 const unsigned char activemq::commands::ActiveMQStreamMessage::ID_ACTIVEMQSTREAMMESSAGE = 27 [static]

The documentation for this class was generated from the following file:

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.40.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQStreamMessageMarshaller** (p. 290).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.40.2 Constructor & Destructor Documentation

6.40.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::-ActiveMQStreamMessageMarshaller ( ) [inline]

6.40.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQStream-MessageMarshaller::~ActiveMQStreamMessageMarshaller ( ) [inline, virtual]

6.40.3 Member Function Documentation

6.40.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal-::generated::ActiveMQStreamMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.40.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.40.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.40.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.40.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.40.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.40.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQStreamMessageMarshaller.h**

6.41 activemq::commands::ActiveMQTempDestination Class Reference

`#include <src/main/activemq/commands/ActiveMQTempDestination.h>`

Inheritance diagram for activemq::commands::ActiveMQTempDestination:

Public Member Functions

- **ActiveMQTempDestination** ()
- **ActiveMQTempDestination** (**const** std::string &name)
- virtual ∼**ActiveMQTempDestination** () throw ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTempDestination** ∗ **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** ∗src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** ∗value) **const**

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*
- virtual void **close** ()

  Closes this object and deallocates the appropriate resources.
- void **setConnection** (**core::ActiveMQConnection** ∗**connection**)

  Sets the Parent Connection that is notified when this destination is destroyed.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQTEMPDESTINATION** = 0

Protected Attributes

- **core::ActiveMQConnection** ∗ **connection**

  Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.41.1 Constructor & Destructor Documentation

6.41.1.1 activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination ( )

6.41.1.2 activemq::commands::ActiveMQTempDestination::ActiveMQTempDestination (const std::string & *name*)

6.41.1.3 virtual activemq::commands::ActiveMQTempDestination::∼ActiveMQTempDestination ( ) throw () [virtual]

6.41.2 Member Function Documentation

6.41.2.1 virtual ActiveMQTempDestination∗ activemq::commands::ActiveMQTempDestination::cloneDataStructure ( ) const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 308).

6.41.2.2 virtual void activemq::commands::ActiveMQTempDestination::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSException	- If an error occurs while the resource is being closed.

Implements **cms::Closeable** (p. 633).

6.41.2.3 virtual void activemq::commands::ActiveMQTempDestination::copyDataStructure (const DataStructure * *src*) [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 308).

References activemq::commands::ActiveMQDestination::copyDataStructure().

6.41.2.4 virtual bool activemq::commands::ActiveMQTempDestination::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 194).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 309).

References activemq::commands::ActiveMQDestination::equals().

6.41.2.5 virtual unsigned char activemq::commands::ActiveMQTempDestination::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 302), and **activemq::commands::ActiveMQTempTopic** (p. 309).

6.41.2.6 void activemq::commands::ActiveMQTempDestination::setConnection (core::ActiveMQConnection * *connection*) [inline]

Sets the Parent Connection that is notified when this destination is destroyed.

Parameters

connection	The parent connection to be used to destroy this destination if closed..

6.41.2.7 virtual std::string activemq::commands::ActiveMQTempDestination::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 198).

Reimplemented in **activemq::commands::ActiveMQTempQueue** (p. 303), and **activemq::commands::ActiveMQTempTopic** (p. 310).

6.41.3 Field Documentation

6.41.3.1 core::ActiveMQConnection* activemq::commands::ActiveMQTempDestination::connection [protected]

Connection that we call back on close to allow this resource to be cleaned up correctly at this end and at the Broker End.

6.41.3.2 const unsigned char activemq::commands::ActiveMQTempDestination::ID_ACTIVEMQTEMPDESTINATION = 0 [static]

- virtual void **tightUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.42.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempDestinationMarshaller** (p. 296).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.42.2 Constructor & Destructor Documentation

6.42.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::-ActiveMQTempDestinationMarshaller ( ) [inline]

6.42.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTemp-DestinationMarshaller::∼ActiveMQTempDestinationMarshaller ( ) [inline, virtual]

6.42.3 Member Function Documentation

6.42.3.1 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestination-Marshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312).

6.42.3.2 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312).

6.42.3.3 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312).

6.42.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 306), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 313).

6.42.3.5 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 306), and **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 313).

The documentation for this class was generated from the following file:

  Compares two Destination instances to determine if they represent the same logic Destination.
- virtual std::string **getQueueName** () **const**

  Gets the name of this queue.
- virtual void **destroy** ()

  Destroy's the Temporary Destination at the Provider.

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQTEMPQUEUE** = 102

6.43.1 Constructor & Destructor Documentation

6.43.1.1 activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue ( )

6.43.1.2 activemq::commands::ActiveMQTempQueue::ActiveMQTempQueue (const std::string & *name*)

6.43.1.3 virtual activemq::commands::ActiveMQTempQueue::∼ActiveMQTempQueue ( ) throw () [virtual]

6.43.2 Member Function Documentation

6.43.2.1 virtual cms::Destination∗ activemq::commands::ActiveMQTempQueue::clone ( ) const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 937).

6.43.2.2 virtual ActiveMQTempQueue* activemq::commands::ActiveMQTempQueue::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 294).

6.43.2.3 virtual void activemq::commands::ActiveMQTempQueue::copy (const cms::Destination & *source*) [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters

source	The source Destination object.

Implements **cms::Destination** (p. 938).

6.43.2.4 virtual void activemq::commands::ActiveMQTempQueue::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.43.2.5 virtual void activemq::commands::ActiveMQTempQueue::destroy ( ) [virtual]

Destroy's the Temporary Destination at the Provider.

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::TemporaryQueue** (p. 2091).

6.43.2.6 virtual bool activemq::commands::ActiveMQTempQueue::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.43.2.7 virtual bool activemq::commands::ActiveMQTempQueue::equals (const cms::Destination & *other*) const [virtual]

Compares two Destination instances to determine if they represent the same logic Destination.

Parameters

other	The other destination to compare this one to.

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 938).

6.43.2.8 virtual const cms::Destination* activemq::commands::ActiveMQTempQueue::getCMSDestination ( ) const [inline, virtual]

Returns

the **cms::Destination** (p. 936) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.43.2.9 virtual const cms::CMSProperties& activemq::commands::ActiveMQTempQueue::getCMSProperties ( ) const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 938).

6.43.2.10 virtual unsigned char activemq::commands::ActiveMQTempQueue::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.43.2.11 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempQueue::getDestinationType ( ) const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 195).

References cms::Destination::TEMPORARY_QUEUE.

6.43.2.12 virtual std::string activemq::commands::ActiveMQTempQueue::getQueueName ( ) const [inline, virtual]

Gets the name of this queue.

Returns

The queue name.

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::TemporaryQueue** (p. 2091).

6.43.2.13 virtual std::string activemq::commands::ActiveMQTempQueue::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 296).

6.43.3 Field Documentation

6.43.3.1 const unsigned char activemq::commands::ActiveMQTempQueue::ID_ACTIVEMQTEMPQUEUE = 102 [static]

The documentation for this class was generated from the following file:

6.44 activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 303).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTempQueueMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller:

Public Member Functions

- **ActiveMQTempQueueMarshaller** ()
- virtual ~**ActiveMQTempQueueMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.44.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempQueueMarshaller** (p. 303).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.44.2 Constructor & Destructor Documentation

6.44.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::ActiveMQTempQueueMarshaller ( ) [inline]

6.44.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::~ActiveMQTempQueueMarshaller ( ) [inline, virtual]

6.44.3 Member Function Documentation

6.44.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.44.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.44.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 297).

6.44.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.44.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.44.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

6.44.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

The documentation for this class was generated from the following file:

6.45.1.1 activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic ( )

6.45.1.2 activemq::commands::ActiveMQTempTopic::ActiveMQTempTopic (const std::string & *name*)

6.45.1.3 virtual activemq::commands::ActiveMQTempTopic::~ActiveMQTempTopic ( ) throw () [virtual]

6.45.2 Member Function Documentation

6.45.2.1 virtual cms::Destination* activemq::commands::ActiveMQTempTopic::clone ( ) const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 937).

6.45.2.2 virtual ActiveMQTempTopic* activemq::commands::ActiveMQTempTopic::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 294).

6.45.2.3 virtual void activemq::commands::ActiveMQTempTopic::copy (const cms::Destination & *source*) [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters

source	The source Destination object.

Implements **cms::Destination** (p. 938).

6.45.2.4 virtual void activemq::commands::ActiveMQTempTopic::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.45.2.5 virtual void activemq::commands::ActiveMQTempTopic::destroy ( ) [virtual]

Destroy's the Temporary Destination at the Provider.

Exceptions

CMSException	

Implements **cms::TemporaryTopic** (p. 2092).

6.45.2.6 virtual bool activemq::commands::ActiveMQTempTopic::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.45.2.7 virtual bool activemq::commands::ActiveMQTempTopic::equals (const cms::Destination & *other*) const [virtual]

Compares two Destination instances to determine if they represent the same logic Destination.

Parameters

other	The other destination to compare this one to.

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 938).

6.45.2.8 virtual const cms::Destination* activemq::commands::ActiveMQTempTopic::getCMSDestination ( ) const [inline, virtual]

Returns

the **cms::Destination** (p. 936) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.45.2.9 virtual const cms::CMSProperties& activemq::commands::ActiveMQTempTopic::getCMSProperties ( ) const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 938).

6.45.2.10 virtual unsigned char activemq::commands::ActiveMQTempTopic::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 295).

6.45.2.11 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTempTopic::getDestinationType ( ) const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 195).

References cms::Destination::TEMPORARY_TOPIC.

6.45.2.12 virtual std::string activemq::commands::ActiveMQTempTopic::getTopicName ( ) const [inline, virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::TemporaryTopic** (p. 2092).

6.45.2.13 virtual std::string activemq::commands::ActiveMQTempTopic::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQTempDestination** (p. 296).

6.45.3 Field Documentation

6.45.3.1 const unsigned char activemq::commands::ActiveMQTempTopic::ID_ACTIVEMQTEMPTOPIC = 103 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQTempTopic.h**

6.46 activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 310).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTempTopicMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller:

Public Member Functions

- **ActiveMQTempTopicMarshaller** ()
- virtual ~**ActiveMQTempTopicMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.46.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTempTopicMarshaller** (p. 310).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.46.2 Constructor & Destructor Documentation

6.46.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::ActiveMQTempTopicMarshaller ( ) [inline]

6.46.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::~ActiveMQTempTopicMarshaller ( ) [inline, virtual]

6.46.3 Member Function Documentation

6.46.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.46.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.46.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 297).

6.46.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.46.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 298).

6.46.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

6.46.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQTempDestinationMarshaller** (p. 299).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTempTopicMarshaller.h**

6.47 activemq::commands::ActiveMQTextMessage Class Reference

`#include <src/main/activemq/commands/ActiveMQTextMessage.h>`

Inheritance diagram for activemq::commands::ActiveMQTextMessage:

Public Member Functions

- **ActiveMQTextMessage** ()

  *Get the **DataStructure*** (p. *877) Type as defined in CommandTypes.h.*
- virtual **ActiveMQTextMessage** * **cloneDataStructure** () **const**

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const**

  *Returns a string containing the information for this **DataStructure*** (p. *877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const**

  *Compares the **DataStructure*** (p. *877) passed in to this one, and returns if they are equivalent.*
- virtual void **clearBody** ()

  Clears out the body of the message.
- virtual void **beforeMarshal** (**wireformat::WireFormat** *wireFormat)

  Called before marshaling is started to prepare the object to be marshaled.
- virtual unsigned int **getSize** () **const**

  Returns the Size of this message in Bytes.
- virtual **cms::TextMessage** * **clone** () **const**

  Clone this message exactly, returns a new instance that the caller is required to delete.
- virtual std::string **getText** () **const**

  Gets the message character buffer.
- virtual void **setText** (**const** char *msg)

  Sets the message contents, does not take ownership of the passed char, but copies it instead.*
- virtual void **setText** (**const** std::string &msg)

  Sets the message contents.

Data Fields

- std::auto_ptr< std::string > **text**

Static Public Attributes

- static **const** unsigned char **ID_ACTIVEMQTEXTMESSAGE** = 28

6.47.1 Constructor & Destructor Documentation

6.47.1.1 activemq::commands::ActiveMQTextMessage::ActiveMQTextMessage ( )

6.47.1.2 virtual activemq::commands::ActiveMQTextMessage::~ActiveMQTextMessage ( ) throw () [virtual]

6.47.2 Member Function Documentation

6.47.2.1 virtual void activemq::commands::ActiveMQTextMessage::beforeMarshal (wireformat::WireFormat * *wireFormat*) [virtual]

Called before marshaling is started to prepare the object to be marshaled.

Parameters

wireFormat	The wireformat object to control marshaling

Exceptions

IOException	if an I/O error occurs.

Implements **activemq::wireformat::MarshalAware** (p. 1390).

6.47.2.2 virtual void activemq::commands::ActiveMQTextMessage::clearBody ( ) [virtual]

Clears out the body of the message.

This does not clear the headers or properties.

Exceptions

CMSException	- if an internal error occurs.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230).

6.47.2.3 virtual cms::TextMessage* activemq::commands::ActiveMQTextMessage::clone ( ) const [inline, virtual]

Clone this message exactly, returns a new instance that the caller is required to delete.

Returns

new copy of this message

Implements **cms::Message** (p. 1430).

6.47.2.4 virtual ActiveMQTextMessage* activemq::commands::ActiveMQTextMessage::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Message** (p. 1417).

6.47.2.5 virtual void activemq::commands::ActiveMQTextMessage::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Message** (p. 1417).

6.47.2.6 virtual bool activemq::commands::ActiveMQTextMessage::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230).

6.47.2.7 virtual unsigned char activemq::commands::ActiveMQTextMessage::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Message** (p. 1419).

6.47.2.8 virtual unsigned int activemq::commands::ActiveMQTextMessage::getSize ( ) const [virtual]

Returns the Size of this message in Bytes.

Returns

number of bytes this message equates to.

Reimplemented from **activemq::commands::Message** (p. 1420).

6.47.2.9 virtual std::string activemq::commands::ActiveMQTextMessage::getText ( ) const [virtual]

Gets the message character buffer.

Returns

The message character buffer.

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::TextMessage** (p. 2093).

6.47.2.10 virtual void activemq::commands::ActiveMQTextMessage::setText (const char * *msg*) [virtual]

Sets the message contents, does not take ownership of the passed char*, but copies it instead.

Parameters

msg	The message buffer.

Exceptions

CMSException	- if an internal error occurs.
MessageNotWriteable-Exception	- if the message is in read-only mode..

Implements **cms::TextMessage** (p. 2094).

6.47.2.11 virtual void activemq::commands::ActiveMQTextMessage::setText (const std::string & *msg*) [virtual]

Sets the message contents.

Parameters

msg	The message buffer.

Exceptions

CMSException	- if an internal error occurs.
MessageNotWriteable-Exception	- if the message is in read-only mode..

Implements **cms::TextMessage** (p. 2094).

6.47.2.12 virtual std::string activemq::commands::ActiveMQTextMessage::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Message** (p. 1424).

6.47.3 Field Documentation

6.47.3.1 const unsigned char activemq::commands::ActiveMQTextMessage::ID_ACTIVEMQTEXTMESSAGE = 28 [static]

6.48.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::∼ActiveMQTextMessageMarshaller ( ) [inline, virtual]

6.48.3 Member Function Documentation

6.48.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.48.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.48.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.48.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.48.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.48.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.48.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

The documentation for this class was generated from the following file:

6.49.1 Constructor & Destructor Documentation

6.49.1.1 activemq::commands::ActiveMQTopic::ActiveMQTopic ( )

6.49.1.2 activemq::commands::ActiveMQTopic::ActiveMQTopic (const std::string & *name*)

6.49.1.3 virtual activemq::commands::ActiveMQTopic::~ActiveMQTopic ( ) throw () [virtual]

6.49.2 Member Function Documentation

6.49.2.1 virtual cms::Destination* activemq::commands::ActiveMQTopic::clone ( ) const [inline, virtual]

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implements **cms::Destination** (p. 937).

6.49.2.2 virtual ActiveMQTopic* activemq::commands::ActiveMQTopic::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

6.49.2.3 virtual void activemq::commands::ActiveMQTopic::copy (const cms::Destination & *source*) [inline, virtual]

Copies the contents of the given Destination object to this one.

Parameters

source	The source Destination object.

Implements **cms::Destination** (p. 938).

6.49.2.4 virtual void activemq::commands::ActiveMQTopic::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 193).

6.49.2.5 virtual bool activemq::commands::ActiveMQTopic::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 194).

6.49.2.6 virtual bool activemq::commands::ActiveMQTopic::equals (const cms::Destination & *other*) const [virtual]

Compares two Destination instances to determine if they represent the same logic Destination.

Parameters

other	The other destination to compare this one to.

Returns

true if the two destinations are the same.

Implements **cms::Destination** (p. 938).

6.49.2.7 virtual const cms::Destination* activemq::commands::ActiveMQTopic::getCMSDestination ( ) const [inline, virtual]

Returns

the **cms::Destination** (p. 936) interface pointer that the objects that derive from this class implement.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.49.2.8 virtual const cms::CMSProperties& activemq::commands::ActiveMQTopic::getCMSProperties ( ) const [inline, virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a CMSProperties object.

Implements **cms::Destination** (p. 938).

6.49.2.9 virtual unsigned char activemq::commands::ActiveMQTopic::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 195).

6.49.2.10 virtual cms::Destination::DestinationType activemq::commands::ActiveMQTopic::getDestinationType ( ) const [inline, virtual]

Returns the Type of Destination that this object represents.

Returns

int type qualifier.

Implements **activemq::commands::ActiveMQDestination** (p. 195).

References cms::Destination::TOPIC.

6.49.2.11 virtual std::string activemq::commands::ActiveMQTopic::getTopicName ( ) const [inline, virtual]

Gets the name of this topic.

Returns

The topic name.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::Topic** (p. 2142).

6.49.2.12 virtual std::string activemq::commands::ActiveMQTopic::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::ActiveMQDestination** (p. 198).

6.49.3 Field Documentation

6.49.3.1 const unsigned char activemq::commands::ActiveMQTopic::ID_ACTIVEMQTOPIC = 101 [static]

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**ActiveMQTopic.h**

6.50 activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller Class Reference

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 324).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ActiveMQTopicMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller:

Public Member Functions

- **ActiveMQTopicMarshaller** ()
- virtual ~**ActiveMQTopicMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.50.1 Detailed Description

Marshaling code for Open Wire Format for **ActiveMQTopicMarshaller** (p. 324).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.50.2 Constructor & Destructor Documentation

6.50.2.1 activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::ActiveMQTopicMarshaller ( ) [inline]

6.50.2.2 virtual activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::~ActiveMQTopicMarshaller ( ) [inline, virtual]

6.50.3 Member Function Documentation

6.50.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.50.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.50.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.50.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.50.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 201).

6.50.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

6.50.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ActiveMQDestinationMarshaller** (p. 202).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ActiveMQTopicMarshaller.h**

6.51 activemq::core::ActiveMQTransactionContext Class Reference

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

`#include <src/main/activemq/core/ActiveMQTransactionContext.h>`

Inheritance diagram for activemq::core::ActiveMQTransactionContext:

Public Member Functions

- **ActiveMQTransactionContext** (**ActiveMQSession** ∗session, **const decaf::util::Properties** &properties)

  Constructor.
- virtual ∼**ActiveMQTransactionContext** ()
- virtual void **addSynchronization** (**const Pointer**< **Synchronization** > &sync)

  *Adds a **Synchronization** (p. 2056) to this Transaction.*
- virtual void **removeSynchronization** (**const Pointer**< **Synchronization** > &sync)

  *Removes a **Synchronization** (p. 2056) to this Transaction.*
- virtual void **begin** ()

  Begins a new transaction if one is not currently in progress.
- virtual void **commit** ()

  Commit the current Transaction.
- virtual void **rollback** ()

  Rollback the current Transaction.
- virtual **const**
  decaf::lang::Pointer
  < **commands::TransactionId** > & **getTransactionId** () **const**

  Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.
- virtual bool **isInTransaction** () **const**

  Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.
- virtual bool **isInLocalTransaction** () **const**

  Checks to see if there is currently an Local Transaction in progess, returns false if not, true otherwise.
- virtual bool **isInXATransaction** () **const**

  Checks to see if there is currently an XA Transaction in progess, returns false if not, true otherwise.
- virtual void **commit** (**const cms::Xid** ∗xid, bool onePhase)

  Commits a global transaction.
- virtual void **end** (**const cms::Xid** ∗xid, int flags)

  Ends the work done for a transaction branch.
- virtual void **forget** (**const cms::Xid** ∗xid)

  Informs the Resource Manager that it can forget about a specified transaction branch.
- virtual int **getTransactionTimeout** () **const**

  Gets the transaction timeout value for this XAResource.
- virtual bool **isSameRM** (**const cms::XAResource** ∗theXAResource)

  Returns true if the ResourceManager for this XAResource is the same as the Resource Manager for a supplied XAResource.
- virtual int **prepare** (**const cms::Xid** ∗xid)

  Requests the Resource manager to prepare to commit a specified transaction.
- virtual int **recover** (int flag, **cms::Xid** ∗∗recovered)

  Get a list of prepared transaction branches.
- virtual void **rollback** (**const cms::Xid** ∗xid)

  Requests the Resource Manager to rollback a specified transaction branch.
- virtual bool **setTransactionTimeout** (int seconds)

Sets the transaction timeout value for this XAResource.

- virtual void **start** (**const cms::Xid** ∗xid, int flags)

  Starts work for a specified transaction branch.

6.51.1 Detailed Description

Transaction Management class, hold messages that are to be redelivered upon a request to roll-back.

The Transaction represents an always running transaction, when it is committed or rolled back it silently creates a new transaction for the next set of messages. The only way to permanently end this transaction is to delete it.

Since

2.0

6.51.2 Constructor & Destructor Documentation

6.51.2.1 activemq::core::ActiveMQTransactionContext::ActiveMQTransactionContext (ActiveMQSession ∗ *session,* const decaf::util::Properties & *properties*)

Constructor.

Parameters

session	The session that contains this transaction
properties	Configuration parameters for this object

6.51.2.2 virtual activemq::core::ActiveMQTransactionContext::∼ActiveMQTransactionContext ( ) [virtual]

6.51.3 Member Function Documentation

6.51.3.1 virtual void activemq::core::ActiveMQTransactionContext::addSynchronization (const Pointer< Synchronization > & *sync*) [virtual]

Adds a **Synchronization** (p. 2056) to this Transaction.

Parameters

sync	- The **Synchronization** (p. 2056) instance to add.

6.51.3.2 virtual void activemq::core::ActiveMQTransactionContext::begin ( ) [virtual]

Begins a new transaction if one is not currently in progress.

Exceptions

ActiveMQException	

6.51.3.3 virtual void activemq::core::ActiveMQTransactionContext::commit ( ) [virtual]

Commit the current Transaction.

Exceptions

ActiveMQException	

6.51.3.4 virtual void activemq::core::ActiveMQTransactionContext::commit (const cms::Xid * *xid,* bool *onePhase*) [virtual]

Commits a global transaction.

Parameters

xid	the XID which identifies the global transaction.
onePhase	true if the resource manager should use a one-phase commit protocol to commit the transaction.

Exceptions

XAException	if an error occurred.

Possible errors are identified by the errorcode in the XAException and include: XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, XA_HEURMIX, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO. In addition, one of the XA_RB* errors can occur if the transaction was not committed and onePhase was set to true. On completion of this method, the Resource Manager has rolled back the transaction and released resources held by the transaction.

Implements **cms::XAResource** (p. 2271).

6.51.3.5 virtual void activemq::core::ActiveMQTransactionContext::end (const cms::Xid * *xid,* int *flags*) [virtual]

Ends the work done for a transaction branch.

The Resource Manager disconnects the XA resource from the transaction branch and allows the transaction to complete.

Parameters

xid	the XID which identifies the global transaction. Should have previously been used as the parameter to a start. method.
flags	a flags integer - one of: XAResource::TMSUCCESS, XAResource::TMFAIL, or XAResource::TMSUSPEND.

TMSUCCESS means that this section of work completed successfully.

TMFAIL means that this section of work failed. The Resource Manager can mark the transaction for rollback only.

TMSUSPEND means that this section of work is suspended and not yet complete. The associated transaction context is also suspended and must be restarted with a call to **start(Xid, int)** (p. **??**) with the TMRESUME flag.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.

Implements **cms::XAResource** (p. 2271).

6.51.3.6 virtual void activemq::core::ActiveMQTransactionContext::forget (const cms::Xid * *xid*) [virtual]

Informs the Resource Manager that it can forget about a specified transaction branch.

Parameters

xid	the XID which identifies the global transaction.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implements **cms::XAResource** (p. 2272).

6.51.3.7 virtual const decaf::lang::Pointer<commands::TransactionId>& activemq::core::ActiveMQTransactionContext::getTransactionId ( ) const [virtual]

Get the Transaction Id object for the current Transaction, returns NULL if no transaction is running.

Returns

TransactionInfo

Exceptions

InvalidStateException	if a Transaction is not in progress.

6.51.3.8 virtual int activemq::core::ActiveMQTransactionContext::getTransactionTimeout ( ) const [virtual]

Gets the transaction timeout value for this XAResource.

The default timeout value is the default timeout value set for the Resource Manager.

Returns

the transaction timeout value for this XAResource in seconds.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implements **cms::XAResource** (p. 2272).

6.51.3.9 virtual bool activemq::core::ActiveMQTransactionContext::isInLocalTransaction ( ) const [virtual]

Checks to see if there is currently an Local Transaction in progess, returns false if not, true otherwise.

Returns

true if an Local Transaction is in progress.

6.51.3.10 virtual bool activemq::core::ActiveMQTransactionContext::isInTransaction ( ) const [virtual]

Checks to see if there is currently a Transaction in progress returns false if not, true otherwise.

Returns

true if a transaction is in progress.

6.51.3.11 virtual bool activemq::core::ActiveMQTransactionContext::isInXATransaction ( ) const [virtual]

Checks to see if there is currently an XA Transaction in progess, returns false if not, true otherwise.

Returns

true if an XA Transaction is in progress.

6.51.3.12 virtual bool activemq::core::ActiveMQTransactionContext::isSameRM (const cms::XAResource * *theXAResource*) [virtual]

Returns true if the ResourceManager for this XAResource is the same as the Resource Manager for a supplied XAResource.

Parameters

theXAResource	an XAResource object

Returns

true if the Resource Manager for this XAResource is the same as the Resource Manager for `theXAResource`.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR and XAER_RMFAIL.

Implements **cms::XAResource** (p. 2272).

6.51.3.13 virtual int activemq::core::ActiveMQTransactionContext::prepare (const cms::Xid * *xid*) [virtual]

Requests the Resource manager to prepare to commit a specified transaction.

Parameters

xid	the XID which identifies the global transaction.

Returns

an integer: XA_RDONLY or XA_OK. XA_OK implies that the transaction work has been prepared normally, XA_RDONLY implies that the transaction branch is read only and has been committed. If there is a failure which requires a rollback, an XAException is raised.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XA_RB∗, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implements **cms::XAResource** (p. 2273).

6.51.3.14 virtual int activemq::core::ActiveMQTransactionContext::recover (int *flag,* cms::Xid ∗∗ *recovered*) [virtual]

Get a list of prepared transaction branches.

Typically used by a transaction manager during recovery to find transaction branches that are in prepared or heuristically completed states.

Parameters

flag	an integer. Must be one of: XAResource::TMSTARTRSCAN, XAResource::TMENDRSCAN, XAResource::TMNOFLAGS.

Returns

an array of zero or more XIDs identifying the transaction branches in the prepared or heuristically completed states.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, XAER_INVAL, and XAER_PROTO.

Implements **cms::XAResource** (p. 2273).

6.51.3.15 virtual void activemq::core::ActiveMQTransactionContext::removeSynchronization (const Pointer< Synchronization > & *sync*) [virtual]

Removes a **Synchronization** (p. 2056) to this Transaction.

Parameters

sync	- The **Synchronization** (p. 2056) instance to add.

6.51.3.16 virtual void activemq::core::ActiveMQTransactionContext::rollback ( ) [virtual]

Rollback the current Transaction.

Exceptions

ActiveMQException	

6.51.3.17 virtual void activemq::core::ActiveMQTransactionContext::rollback (const cms::Xid ∗ *xid*) [virtual]

Requests the Resource Manager to rollback a specified transaction branch.

Parameters

xid	the XID which identifies the transaction branch.

Exceptions

XAException	if an error occurs.

Implements **cms::XAResource** (p. 2273).

6.51.3.18 virtual bool activemq::core::ActiveMQTransactionContext::setTransactionTimeout (int *seconds*) [virtual]

Sets the transaction timeout value for this XAResource.

If the value is set to 0, the default timeout value for the Resource Manager is used.

Parameters

seconds	the new Timeout value in seconds.

Returns

true if the transaction timeout value has been updated, false otherwise.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XAER_RMERR, XAER_RMFAIL, or XAER_INVAL.

Implements **cms::XAResource** (p. 2274).

6.51.3.19 virtual void activemq::core::ActiveMQTransactionContext::start (const cms::Xid * *xid,* int *flags*) [virtual]

Starts work for a specified transaction branch.

Parameters

xid	the XID which identifies the transaction branch.
flags	an integer. Must be one of XAResource::TMNOFLAGS, XAResource::TMJOIN, or XAResource::TMRESUME.

TMJOIN implies that the start applies to joining a transaction previously passed to the Resource Manager.

TMRESUME implies that the start applies to a suspended transaction that should be restarted.

If TMNOFLAGS is specified, then if the transaction has been previously seen by the Resource Manager, an XAException is raised with the code XAER_DUPID.

Exceptions

XAException	if an error occurs. Possible error identified in the errorcode include: XA_RB*, XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

Implements **cms::XAResource** (p. 2274).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQTransactionContext.h**

6.52 activemq::core::ActiveMQXAConnection Class Reference

`#include <src/main/activemq/core/ActiveMQXAConnection.h>`

Inheritance diagram for activemq::core::ActiveMQXAConnection:

Public Member Functions

- **ActiveMQXAConnection** (**const Pointer**< **transport::Transport** > &transport, **const Pointer**< **decaf::util::Properties** > &properties)
- virtual ~**ActiveMQXAConnection** () throw ()
- virtual **cms::XASession** * **createXASession** ()

  Creates an XASession object.
- virtual **cms::Session** * **createSession** (**cms::Session::AcknowledgeMode** ackMode)

  *Creates a new **Session** (p. 1830) to work for this **Connection** (p. 725) using the specified acknowledgment mode.*

  Parameters

ackMode	*the Acknowledgment Mode to use.*

  Exceptions

CMSException (p. 640)	

6.52.1 Constructor & Destructor Documentation

6.52.1.1 activemq::core::ActiveMQXAConnection::ActiveMQXAConnection (const Pointer< transport::Transport > & *transport,* const Pointer< decaf::util::Properties > & *properties*)

6.52.1.2 virtual activemq::core::ActiveMQXAConnection::~ActiveMQXAConnection ( ) throw () [virtual]

6.52.2 Member Function Documentation

6.52.2.1 virtual cms::Session* activemq::core::ActiveMQXAConnection::createSession (cms::Session::AcknowledgeMode *ackMode*) [virtual]

Creates a new **Session** (p. 1830) to work for this **Connection** (p. 725) using the specified acknowledgment mode.

Parameters

ackMode	the Acknowledgment Mode to use.

Exceptions

CMSException *(p. 640)*	

Reimplemented from **activemq::core::ActiveMQConnection** (p. 152).

6.52.2.2 virtual cms::XASession* activemq::core::ActiveMQXAConnection::createXASession ( ) [virtual]

Creates an XASession object.

Returns

a newly created XASession instance, caller owns the pointer.

Exceptions

CMSException	If the XAConnection object fails to create the XASession instance due to an internal error.

Implements **cms::XAConnection** (p. 2262).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXAConnection.h**

6.53 activemq::core::ActiveMQXAConnectionFactory Class Reference

`#include <src/main/activemq/core/ActiveMQXAConnectionFactory.h>`

- virtual **cms::XAConnection** * **createXAConnection** ()

  Creates an XAConnection with the default user name and password.
- virtual **cms::XAConnection** * **createXAConnection** (**const** std::string &userName, **const** std::string &password)

  Creates an XA connection with the specified user name and password.

Protected Member Functions

- virtual **ActiveMQConnection** * **createActiveMQConnection** (**const Pointer**< **transport::Transport** > &transport, **const Pointer**< **decaf::util::Properties** > &properties)

  *Create a new **ActiveMQConnection** (p. 145) instnace using the provided Transport and Properties.*

6.53.1 Constructor & Destructor Documentation

6.53.1.1 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory ( )

6.53.1.2 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory (const std::string & *uri,* const std::string & *username* = " ", const std::string & *password* = " ")

Constructor.

Parameters

uri	the URI of the Broker we are connecting to.
username	to authenticate with, defaults to ""
password	to authenticate with, defaults to ""

6.53.1.3 activemq::core::ActiveMQXAConnectionFactory::ActiveMQXAConnectionFactory (const decaf::net::URI & *uri,* const std::string & *username* = " ", const std::string & *password* = " ")

Constructor.

Parameters

uri	the URI of the Broker we are connecting to.
username	to authenticate with, defaults to ""
password	to authenticate with, defaults to ""

6.53.1.4 virtual activemq::core::ActiveMQXAConnectionFactory::~ActiveMQXAConnectionFactory ( ) throw () [virtual]

6.53.2 Member Function Documentation

6.53.2.1 virtual ActiveMQConnection* activemq::core::ActiveMQXAConnectionFactory::createActiveMQConnection (const Pointer< transport::Transport > & *transport,* const Pointer< decaf::util::Properties > & *properties*) [protected, virtual]

Create a new **ActiveMQConnection** (p. 145) instnace using the provided Transport and Properties.

Subclasses can override this to control the actual type of **ActiveMQConnection** (p. 145) that is created.

Parameters

transport	The Transport that the Connection should use to communicate with the Broker.
properties	The Properties that are assigned to the new Connection instance.

Returns

a new **ActiveMQConnection** (p. 145) pointer instance.

Reimplemented from **activemq::core::ActiveMQConnectionFactory** (p. 168).

6.53.2.2 virtual cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection ( ) [virtual]

Creates an XAConnection with the default user name and password.

The connection is created in stopped mode just as the standard Connection object is created from the ConnectionFactory. No messages will be delivered until the Connection.start method is explicitly called.

Returns

a new XAConnectionFactory instance, the caller owns the returned pointer.

Exceptions

CMSException	if an internal error occurs while creating the Connection.
CMSSecurityException	if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 2264).

6.53.2.3 virtual cms::XAConnection* activemq::core::ActiveMQXAConnectionFactory::createXAConnection (const std::string & *userName,* const std::string & *password*) [virtual]

Creates an XA connection with the specified user name and password.

The connection is created in stopped mode just as the standard ConnectionFactory creates a new Connection. No messages will be delivered until the Connection.start method is explicitly called.

Returns

a new XAConnectionFactory instance, the caller owns the returned pointer.

Exceptions

CMSException	if an internal error occurs while creating the Connection.
CMSSecurityException	if the client authentication fails because the user name or password are invalid.

Implements **cms::XAConnectionFactory** (p. 2264).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXAConnectionFactory.h**

6.54 activemq::core::ActiveMQXASession Class Reference

`#include <src/main/activemq/core/ActiveMQXASession.h>`

Inheritance diagram for activemq::core::ActiveMQXASession:

Public Member Functions

- **ActiveMQXASession** (**ActiveMQConnection** *__connection__, **const Pointer**< **commands::SessionId** > &sessionId, **const decaf::util::Properties** &properties)
- virtual ~**ActiveMQXASession** () throw ()
- virtual bool **isTransacted** () **const**

  Gets if the Sessions is a Transacted Session.
- virtual bool **isAutoAcknowledge** () **const**
- virtual void **doStartTransaction** ()

  Starts if not already start a Transaction for this Session.
- virtual void **commit** ()

  Commits all messages done in this transaction and releases any locks currently held.
- virtual void **rollback** ()

Rolls back all messages done in this transaction and releases any locks currently held.

- virtual **cms::XAResource** * **getXAResource** () **const**

  Returns the XA resource associated with this Session to the caller.

6.54.1 Constructor & Destructor Documentation

6.54.1.1 activemq::core::ActiveMQXASession::ActiveMQXASession (ActiveMQConnection * *connection,* const Pointer< commands::SessionId > & *sessionId,* const decaf::util::Properties & *properties*)

6.54.1.2 virtual activemq::core::ActiveMQXASession::~ActiveMQXASession ( ) throw () [virtual]

6.54.2 Member Function Documentation

6.54.2.1 virtual void activemq::core::ActiveMQXASession::commit ( ) [virtual]

Commits all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 262).

6.54.2.2 virtual void activemq::core::ActiveMQXASession::doStartTransaction ( ) [virtual]

Starts if not already start a Transaction for this Session.

If the session is not a Transacted Session then an exception is thrown. If a transaction is already in progress then this method has no effect.

Exceptions

ActiveMQException	if this is not a Transacted Session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 269).

6.54.2.3 virtual cms::XAResource* activemq::core::ActiveMQXASession::getXAResource ( ) const [virtual]

Returns the XA resource associated with this Session to the caller.

The client can use the provided XA resource to interact with the XA Transaction Manager in use in the client application.

Returns

an XAResouce instance to the caller, the caller does not own this pointer and should not delete it.

Implements **cms::XASession** (p. 2276).

6.54.2.4 virtual bool activemq::core::ActiveMQXASession::isAutoAcknowledge ( ) const [virtual]

Reimplemented from **activemq::core::ActiveMQSession** (p. 271).

6.54.2.5 virtual bool activemq::core::ActiveMQXASession::isTransacted ( ) const [virtual]

Gets if the Sessions is a Transacted Session.

Returns

transacted true - false.

Exceptions

CMSException	- If an internal error occurs.

Reimplemented from **activemq::core::ActiveMQSession** (p. 271).

6.54.2.6 virtual void activemq::core::ActiveMQXASession::rollback ( ) [virtual]

Rolls back all messages done in this transaction and releases any locks currently held.

Exceptions

CMSException	- If an internal error occurs.
IllegalStateException	- if the method is not called by a transacted session.

Reimplemented from **activemq::core::ActiveMQSession** (p. 273).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**ActiveMQXASession.h**

6.55 decaf::util::zip::Adler32 Class Reference

Clas that can be used to compute an Adler-32 **Checksum** (p. 628) for a data stream.

`#include <src/main/decaf/util/zip/Adler32.h>`

Inheritance diagram for decaf::util::zip::Adler32:

Public Member Functions

- **Adler32** ()
- virtual ∼**Adler32** ()
- virtual long long **getValue** () **const**
- virtual void **reset** ()

  Reset the checksum to its initial value.
- virtual void **update** (**const** std::vector< unsigned char > &buffer)

  Updates the current checksum with the specified vector of bytes.
- virtual void **update** (**const** std::vector< unsigned char > &buffer, int offset, int length)

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (**const** unsigned char *buffer, int size, int offset, int length)

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)

  Updates the current checksum with the specified byte value.

6.55.1 Detailed Description

Clas that can be used to compute an Adler-32 **Checksum** (p. 628) for a data stream.

The Alder-32 checksum trades reliability for speed over the CRC-32 algorithm.

Since

1.0

6.55.2 Constructor & Destructor Documentation

6.55.2.1 decaf::util::zip::Adler32::Adler32 ( )

6.55.2.2 virtual decaf::util::zip::Adler32::~Adler32 ( ) [virtual]

6.55.3 Member Function Documentation

6.55.3.1 virtual long long decaf::util::zip::Adler32::getValue ( ) const [virtual]

Returns

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 629).

6.55.3.2 virtual void decaf::util::zip::Adler32::reset ( ) [virtual]

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 629).

6.55.3.3 virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & *buffer*) [virtual]

Updates the current checksum with the specified vector of bytes.

Parameters

buffer	The buffer to read the updated bytes from.

Implements **decaf::util::zip::Checksum** (p. 629).

6.55.3.4 virtual void decaf::util::zip::Adler32::update (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 629).

6.55.3.5 virtual void decaf::util::zip::Adler32::update (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
size	The size of the passed buffer.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

NullPointerException	if the passed buffer is NULL.
IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 629).

6.55.3.6 virtual void decaf::util::zip::Adler32::update (int *byte*) [virtual]

Updates the current checksum with the specified byte value.

Parameters

byte	The byte value to update the current **Checksum** (p. 628) with (0..255).

Implements **decaf::util::zip::Checksum** (p. 630).

6.56 decaf::lang::Appendable Class Reference

An object to which char sequences and values can be appended.

`#include <src/main/decaf/lang/Appendable.h>`

Inheritance diagram for decaf::lang::Appendable:

Public Member Functions

- virtual ~**Appendable** ()
- virtual **Appendable** & **append** (char value)=0

  *Appends the specified character to this **Appendable** (p. 342).*
- virtual **Appendable** & **append** (**const CharSequence** *csq)=0

  *Appends the specified character sequence to this **Appendable** (p. 342).*
- virtual **Appendable** & **append** (**const CharSequence** *csq, int start, int end)=0

  *Appends a subsequence of the specified character sequence to this **Appendable** (p. 342).*

6.56.1 Detailed Description

An object to which char sequences and values can be appended.

The **Appendable** (p. 342) interface must be implemented by any class whose instances are intended to receive formatted output from a Formatter.

TODO The characters to be appended should be valid Unicode characters as described in Unicode **Character** (p. 593) Representation. Note that supplementary characters may be composed of multiple 16-bit char values.

Appendables are not necessarily safe for multithreaded access. **Thread** (p. 2094) safety is the responsibility of classes that extend and implement this interface.

Since this interface may be implemented by existing classes with different styles of error handling there is no guarantee that errors will be propagated to the invoker.

Since

1.0

6.56.2 Constructor & Destructor Documentation

6.56.2.1 virtual decaf::lang::Appendable::~Appendable ( ) [inline, virtual]

6.56.3 Member Function Documentation

6.56.3.1 virtual Appendable& decaf::lang::Appendable::append (char *value*) [pure virtual]

Appends the specified character to this **Appendable** (p. 342).

Parameters

value	The character to append.

Returns

a Reference to this **Appendable** (p. 342)

Exceptions

Exception *(p. 990)*	if an error occurs.

Implemented in **decaf::io::Writer** (p. 2256), and **decaf::nio::CharBuffer** (p. 612).

6.56.3.2 virtual Appendable& decaf::lang::Appendable::append (const CharSequence * *csq*) [pure virtual]

Appends the specified character sequence to this **Appendable** (p. 342).

Parameters

csq	The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".

Returns

a Reference to this **Appendable** (p. 342).

Exceptions

Exception *(p. 990)*	if an error occurs.

Implemented in **decaf::io::Writer** (p. 2256), and **decaf::nio::CharBuffer** (p. 612).

6.56.3.3 virtual Appendable& decaf::lang::Appendable::append (const CharSequence * *csq,* int *start,* int *end*) [pure virtual]

Appends a subsequence of the specified character sequence to this **Appendable** (p. 342).

Parameters

csq	- The character sequence from which a subsequence will be appended. If csq is NULL, then characters will be appended as if csq contained the string "null".
start	The index of the first character in the subsequence.
end	The index of the character following the last character in the subsequence.

Returns

a Reference to this **Appendable** (p. 342)

Exceptions

Exception *(p. 990)*	if an error occurs.
IndexOutOfBounds-Exception	start is greater than end, or end is greater than csq.length()

Implemented in **decaf::nio::CharBuffer** (p. 613), and **decaf::io::Writer** (p. 2257).

6.57 decaf::internal::AprPool Class Reference

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

`#include <src/main/decaf/internal/AprPool.h>`

Public Member Functions

- **AprPool** ()
- virtual ~**AprPool** ()
- apr_pool_t * **getAprPool** () **const**

  Gets the internal APR Pool.
- void **cleanup** ()

  Clears data that was allocated by this pool.

Static Public Member Functions

- static apr_pool_t * **getGlobalPool** ()

  Gets a pointer to the Global APR Pool used for the Application.

6.57.1 Detailed Description

Wraps an APR pool object so that classes in decaf can create a static member for use in static methods where apr function calls that need a pool are made.

6.57.2 Constructor & Destructor Documentation

6.57.2.1 decaf::internal::AprPool::AprPool ( )

6.57.2.2 virtual decaf::internal::AprPool::~AprPool ( ) [virtual]

6.57.3 Member Function Documentation

6.57.3.1 void decaf::internal::AprPool::cleanup ( )

Clears data that was allocated by this pool.

Users should call this after getting the data from the APR functions and copying it to someplace safe.

6.57.3.2 apr_pool_t* decaf::internal::AprPool::getAprPool ( ) const

Gets the internal APR Pool.

Returns

the internal APR pool

6.57.3.3 static apr_pool_t* decaf::internal::AprPool::getGlobalPool ( ) [static]

Gets a pointer to the Global APR Pool used for the Application.

Returns

pointer to the global APR Pool

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**AprPool.h**

6.58 decaf::util::ArrayList< E > Class Template Reference

`#include <src/main/decaf/util/ArrayList.h>`

Inheritance diagram for decaf::util::ArrayList< E >:

Public Member Functions

- **ArrayList** ()
- **ArrayList** (**const Collection**< E > &collection)
- **ArrayList** (**const ArrayList**< E > &arrayList)
- **ArrayList** (int initialCapacity)

- virtual ~**ArrayList** ()
- **ArrayList**< E > & **operator=** (**const ArrayList**< E > &list)
- **ArrayList**< E > & **operator=** (**const Collection**< E > &collection)
- void **ensureCapacity** (int minimumCapacity)

  *Increases the capacity of this **ArrayList** (p. 345) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.*
- void **trimToSize** ()

  *Trims the internal array to match the current size of the **ArrayList** (p. 345).*
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.
- virtual int **size** () **const**

  Returns the number of elements in this collection.
- virtual E **set** (int index, **const** E &element)

  Replaces the element at the specified position in this list with the specified element.
- virtual E **get** (int index) **const**

  Gets the element contained at position passed.
- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.
- virtual void **add** (int index, **const** E &element)

  Inserts the specified element at the specified position in this list.
- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
  The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

  Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

  Returns

  true if this collection changed as a result of the call

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).
- virtual bool **addAll** (int index, **const Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters

value	*The reference to the element to remove from this **Collection** (p. 660).*

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list.

- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	*The value to check for presence in the collection.*

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

- virtual int **indexOf** (**const** E &value) **const**

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual int **lastIndexOf** (**const** E &value) **const**

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

- virtual std::vector< E > **toArray** () **const**

  *Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).*

- virtual std::string **toString** () **const**

template<typename E> class decaf::util::ArrayList< E >

6.58.1 Constructor & Destructor Documentation

6.58.1.1 template<typename E> decaf::util::ArrayList< E >::ArrayList ( ) [inline]

References decaf::util::ArrayList< E >::ensureCapacity().

6.58.1.3 template<typename E> decaf::util::ArrayList< E >::ArrayList (const ArrayList< E > & *arrayList*) [inline]

References decaf::util::AbstractList< E >::iterator(), and decaf::util::ArrayList< E >::size().

6.58.1.4 template<typename E> decaf::util::ArrayList< E >::ArrayList (int *initialCapacity*) [inline]

6.58.1.5 template<typename E> virtual decaf::util::ArrayList< E >::~ArrayList ( ) [inline, virtual]

References DECAF_CATCHALL_NOTHROW.

6.58.2 Member Function Documentation

6.58.2.1 template<typename E> virtual bool decaf::util::ArrayList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 98).

6.58.2.2 template<typename E> virtual void decaf::util::ArrayList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1287).

6.58.2.3 template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 87).

References decaf::util::Collection< E >::size(), and decaf::util::Collection< E >::toArray().

Referenced by decaf::util::ArrayList< E >::operator=().

6.58.2.4 template<typename E> virtual bool decaf::util::ArrayList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their

indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractList< E >** (p. 99).

References decaf::util::Collection< E >::size(), and decaf::util::Collection< E >::toArray().

6.58.2.5 template<typename E> virtual void decaf::util::ArrayList< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

Referenced by decaf::util::ArrayList< E >::operator=().

6.58.2.6 template<typename E> virtual bool decaf::util::ArrayList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

References decaf::util::ArrayList< E >::indexOf().

6.58.2.7 template<typename E> void decaf::util::ArrayList< E >::ensureCapacity (int *minimumCapacity*) [inline]

Increases the capacity of this **ArrayList** (p. 345) instance, if necessary, to ensure that it can hold at least the number of elements specified by the minimum capacity argument.

If the capacity is already greater than or equal to the minimum capacity argument then the array is left unchanged.

Parameters

minimum-Capacity	The desired minimum capacity for this **ArrayList** (p. 345).

References decaf::lang::System::arraycopy().

Referenced by decaf::util::ArrayList< E >::ArrayList().

6.58.2.8 template<typename E> virtual E decaf::util::ArrayList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

Implements **decaf::util::List< E >** (p. 1289).

6.58.2.9 template<typename E> virtual int decaf::util::ArrayList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 100).

Referenced by decaf::util::ArrayList< E >::contains(), and decaf::util::ArrayList< E >::remove().

6.58.2.10 template<typename E> virtual bool decaf::util::ArrayList< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 354) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.58.2.11 template<typename E> virtual int decaf::util::ArrayList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Reimplemented from **decaf::util::AbstractList< E >** (p. 102).

6.58.2.12 template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const ArrayList< E > & *list*) [inline]

References decaf::util::ArrayList< E >::addAll(), and decaf::util::ArrayList< E >::clear().

6.58.2.13 template<typename E> ArrayList<E>& decaf::util::ArrayList< E >::operator= (const Collection< E > & *collection*) [inline]

References decaf::util::ArrayList< E >::addAll(), and decaf::util::ArrayList< E >::clear().

6.58.2.14 template<typename E> virtual bool decaf::util::ArrayList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

References decaf::util::ArrayList< E >::indexOf(), and decaf::util::ArrayList< E >::removeAt().

6.58.2.15 template<typename E> virtual E decaf::util::ArrayList< E >::removeAt (int *index*) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Reimplemented from **decaf::util::AbstractList< E >** (p. 104).

References decaf::lang::System::arraycopy().

Referenced by decaf::util::ArrayList< E >::remove().

6.58.2.16 template<typename E> virtual E decaf::util::ArrayList< E >::set (int *index*, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1294).

6.58.2.17 template<typename E> virtual int decaf::util::ArrayList< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

Referenced by decaf::util::ArrayList< E >::ArrayList().

6.58.2.18 template<typename E> virtual std::vector<E> decaf::util::ArrayList< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 94).

6.58.2.19 template<typename E> virtual std::string decaf::util::ArrayList< E >::toString ( ) const [inline, virtual]

References decaf::lang::Integer::toString().

6.58.2.20 template<typename E> void decaf::util::ArrayList< E >::trimToSize ( ) [inline]

Trims the internal array to match the current size of the **ArrayList** (p. 345).

This compacts the internal array to save storage space used by this **ArrayList** (p. 345).

References decaf::lang::System::arraycopy().

The documentation for this class was generated from the following file:

6.59 decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator Class Reference

`#include <src/main/decaf/util/concurrent/CopyOnWriteArrayList.h>`

Inheritance diagram for decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator:

Public Member Functions

- **ArrayListIterator** (**const ArrayPointer**< E > &array, int index)
- virtual ~**ArrayListIterator** ()
- virtual E **next** ()

  Returns the next element in the iteration.
- virtual bool **hasNext** () **const**

  Returns true if the iteration has more elements.
- virtual void **remove** ()

  Removes from the underlying collection the last element returned by the iterator (optional operation).
- virtual void **add** (**const** E &e **DECAF_UNUSED**)
- virtual void **set** (**const** E &e **DECAF_UNUSED**)

- virtual bool **hasPrevious** () **const**

  Returns true if this list iterator has more elements when traversing the list in the reverse direction.

- virtual E **previous** ()

  Returns the previous element in the list.

- virtual int **nextIndex** () **const**

  Returns the index of the element that would be returned by a subsequent call to next.

- virtual int **previousIndex** () **const**

  Returns the index of the element that would be returned by a subsequent call to previous.

template<typename E> class decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator

6.59.1 Constructor & Destructor Documentation

6.59.1.1 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::ArrayListIterator (const ArrayPointer< E > & *array,* int *index*) [inline]

References decaf::lang::ArrayPointer< T, REFCOUNTER >::length().

6.59.1.2 template<typename E> virtual decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::~ArrayListIterator ( ) [inline, virtual]

6.59.2 Member Function Documentation

6.59.2.1 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::add (const E &e *DECAF_UNUSED*) [inline, virtual]

6.59.2.2 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::hasNext ( ) const [inline, virtual]

Returns true if the iteration has more elements.

Returns false if the next call to next would result in an **NoSuchElementException** (p. 1537) to be thrown.

Returns

true if there are more elements available for iteration.

Implements **decaf::util::Iterator< E >** (p. 1209).

6.59.2.3 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::hasPrevious ( ) const [inline, virtual]

Returns true if this list iterator has more elements when traversing the list in the reverse direction.

(In other words, returns true if previous would return an element rather than throwing an exception.)

Returns

true if the list iterator has more elements when traversing the list in the reverse direction.

Implements **decaf::util::ListIterator< E >** (p. 1296).

6.59.2.4 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::next ( ) [inline, virtual]

Returns the next element in the iteration.

Calling this method repeatedly until the **hasNext()** (p. 356) method returns false will return each element in the underlying collection exactly once.

Returns

the next element in the iteration of elements.

Exceptions

NoSuchElementException *(p. 1537)*	if the iteration has no more elements.

Implements **decaf::util::Iterator< E >** (p. 1209).

6.59.2.5 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::nextIndex ( ) const [inline, virtual]

Returns the index of the element that would be returned by a subsequent call to next.

(Returns list size if the list iterator is at the end of the list.)

Returns

the index of the element that would be returned by a subsequent call to next, or list size if list iterator is at end of list.

Implements **decaf::util::ListIterator< E >** (p. 1296).

6.59.2.6 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previous ( ) [inline, virtual]

Returns the previous element in the list.

This method may be called repeatedly to iterate through the list backwards, or intermixed with calls to next to go back and forth. (Note that alternating calls to next and previous will return the same element repeatedly.)

Returns

the previous element in the list.

Exceptions

NoSuchElementException *(p. 1537)*	if the iteration has no previous element.

Implements **decaf::util::ListIterator< E >** (p. 1296).

6.59.2.7 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::previousIndex ( ) const [inline, virtual]

Returns the index of the element that would be returned by a subsequent call to previous.

(Returns -1 if the list iterator is at the beginning of the list.)

Returns

the index of the element that would be returned by a subsequent call to previous, or -1 if list iterator is at beginning of list.

Implements **decaf::util::ListIterator< E >** (p. 1297).

6.59.2.8 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::remove ( ) [inline, virtual]

Removes from the underlying collection the last element returned by the iterator (optional operation).

This method can be called only once per call to next. The behavior of an iterator is unspecified if the underlying collection is modified while the iteration is in progress in any way other than by calling this method.

Exceptions

UnsupportedOperation-Exception	if the remove operation is not supported by this **Iterator** (p. 1209).
IllegalStateException	if the next method has not yet been called, or the remove method has already been called after the last call to the next method.

Implements **decaf::util::Iterator< E >** (p. 1210).

6.59.2.9 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::set (const E &e *DECAF_UNUSED*) [inline, virtual]

6.60.1 Detailed Description

template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter>class decaf::lang::ArrayPointer< T, REFCOUNTER >

Decaf's implementation of a Smart **Pointer** (p. 1614) that is a template on a Type and is **Thread** (p. 2094) Safe if the default Reference Counter is used.

This **Pointer** (p. 1614) type allows for the substitution of different Reference Counter implementations which provide a means of using invasive reference counting if desired using a custom implementation of `ReferenceCounter`.

The Decaf smart pointer provide comparison operators for comparing **Pointer** (p. 1614) instances in the same manner as normal pointer, except that it does not provide an overload of operators (<, <=, >, >=). To allow use of a **Pointer** (p. 1614) in a STL container that requires it, **Pointer** (p. 1614) provides an implementation of std::less.

Since

1.0

6.60.2 Member Typedef Documentation

6.60.2.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef const T& decaf::lang::ArrayPointer< T, REFCOUNTER >::ConstReferenceType

6.60.2.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef REFCOUNTER decaf::lang::ArrayPointer< T, REFCOUNTER >::CounterType

6.60.2.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T* decaf::lang::ArrayPointer< T, REFCOUNTER >::PointerType

6.60.2.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> typedef T& decaf::lang::ArrayPointer< T, REFCOUNTER >::ReferenceType

6.60.3 Constructor & Destructor Documentation

6.60.3.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer ( ) [inline]

Default Constructor.

Initialized the contained array pointer to NULL, using the subscript operator results in an exception unless reset to contain a real value.

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::clone(), and decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::reset().

6.60.3.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (int *size*) [inline]

Create a new **ArrayPointer** (p. 358) instance and allocates an internal array that is sized using the passed in size value.

Parameters

size	The size of the array to allocate for this **ArrayPointer** (p. 358) instance.

6.60.3.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (int *size,* const T & *fillWith*) [inline]

Create a new **ArrayPointer** (p. 358) instance and allocates an internal array that is sized using the passed in size value.

The array elements are initialized with the given value.

Parameters

size	The size of the array to allocate for this **ArrayPointer** (p. 358) instance.
fillWith	The value to initialize each element of the newly allocated array with.

6.60.3.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (const PointerType *value,* int *size*) [inline, explicit]

Explicit Constructor, creates an **ArrayPointer** (p. 358) that contains value with a single reference.

This object now has ownership until a call to release.

Parameters

value	The pointer to the instance of the array we are taking ownership of.
size	The size of the array this object is taking ownership of.

6.60.3.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> decaf::lang::ArrayPointer< T, REFCOUNTER >::ArrayPointer (const ArrayPointer< T, REFCOUNTER > & *value*) throw () [inline]

Copy constructor.

Copies the value contained in the **ArrayPointer** (p. 358) to the new instance and increments the reference counter.

6.60.3.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> virtual decaf::lang::ArrayPointer< T, REFCOUNTER >::~ArrayPointer ( ) throw () [inline, virtual]

6.60.4 Member Function Documentation

6.60.4.1 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ArrayPointer decaf::lang::ArrayPointer< T, REFCOUNTER >::clone ( ) const [inline]

Creates a new **ArrayPointer** (p. 358) instance that is a clone of the value contained in this **ArrayPointer** (p. 358).

Returns

an **ArrayPointer** (p. 358) that contains a copy of the data in this **ArrayPointer** (p. 358).

6.60.4.2 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> PointerType decaf::lang::ArrayPointer< T, REFCOUNTER >::get ( ) const [inline]

Gets the real array pointer that is contained within this **Pointer** (p. 1614).

This is not really safe since the caller could delete or alter the pointer but it mimics the STL auto_ptr and gives access in cases where the caller absolutely needs the real **Pointer** (p. 1614). Use at your own risk.

Returns

the contained pointer.

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::clone(), decaf::lang::ArrayPointerComparator< T, R >::compare(), decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator!=(), decaf::lang::operator!=(), decaf::lang::ArrayPointerComparator< T, R >::operator()(), std::less< decaf::lang::ArrayPointer< T > >::operator()(), decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator==(), decaf::lang::operator==(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set().

6.60.4.3 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> int decaf::lang::ArrayPointer< T, REFCOUNTER >::length ( ) const [inline]

Returns the current size of the contained array or zero if the array is NULL.

Returns

the size of the array or zero if the array is NULL

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< E >::ArrayListIterator::ArrayListIterator(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::contains(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::get(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::indexOf(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::lastIndexOf(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::toArray().

6.60.4.4 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator! ( ) const [inline]

6.60.4.5 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator!= (const ArrayPointer< T1, R1 > & *right*) const [inline]

6.60.4.6 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ArrayPointer& decaf::lang::ArrayPointer< T, REFCOUNTER >::operator= (const ArrayPointer< T, REFCOUNTER > & *right*) throw () [inline]

Assigns the value of right to this **Pointer** (p. 1614) and increments the reference Count.

Parameters

right	- **Pointer** (p. 1614) on the right hand side of an operator= call to this.

6.60.4.7 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > ArrayPointer& decaf::lang::ArrayPointer< T, REFCOUNTER >::operator= (const ArrayPointer< T1, R1 > & *right*) throw () [inline]

6.60.4.8 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> template<typename T1 , typename R1 > bool decaf::lang::ArrayPointer< T, REFCOUNTER >::operator== (const ArrayPointer< T1, R1 > & *right*) const [inline]

6.60.4.9 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ReferenceType decaf::lang::ArrayPointer< T, REFCOUNTER >::operator[] (int *index*) [inline]

Dereference Operator, returns a reference to the Contained value.

This method throws an NullPointerException if the contained value is NULL.

Returns

reference to the contained pointer.

Exceptions

NullPointerException	if the contained value is Null

6.60.4.10 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> ConstReferenceType decaf::lang::ArrayPointer< T, REFCOUNTER >::operator[] (int *index*) const [inline]

6.60.4.11 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> T* decaf::lang::ArrayPointer< T, REFCOUNTER >::release ( ) [inline]

Releases the **Pointer** (p. 1614) held and resets the internal pointer value to Null.

This method is not guaranteed to be safe if the **Pointer** (p. 1614) is held by more than one object or this method is called from more than one thread.

Parameters

value	- The new value to contain.

Returns

The pointer instance that was held by this **Pointer** (p. 1614) object, the pointer is no longer owned by this **Pointer** (p. 1614) and won't be freed when this **Pointer** (p. 1614) goes out of scope.

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::ArrayPointer().

6.60.4.12 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::ArrayPointer< T, REFCOUNTER >::reset (T * *value,* int *size* = 0) [inline]

Resets the **ArrayPointer** (p. 358) to hold the new value.

Before the new value is stored reset checks if the old value should be destroyed and if so calls delete. Call reset with a value of NULL is supported and acts to set this **Pointer** (p. 1614) to a NULL pointer.

Parameters

value	The new array pointer value to contain.
size	The size of the new array value this object now contains.

6.60.4.13 template<typename T, typename REFCOUNTER = decaf::util::concurrent::atomic::AtomicRefCounter> void decaf::lang::ArrayPointer< T, REFCOUNTER >::swap (ArrayPointer< T, REFCOUNTER > & *value*) throw () [inline]

Exception (p. 990) Safe Swap Function.

Parameters

value	- the value to swap with this.

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::operator=(), and decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::swap().

6.61.1 Detailed Description

template<typename T, typename R = decaf::util::concurrent::atomic::AtomicRefCounter>class decaf::lang::ArrayPointerComparator< T, R >

This implementation of Comparator is designed to allows objects in a Collection to be sorted or tested for equality based on the value of the value of the actual pointer to the array being contained in this **ArrayPointer** (p. 358).

This allows for a basic ordering to be acheived in Decaf containers.

Custom implementations are possible where an array of some type has a logical natural ordering such as array of integers where the sum of all ints in the array is used.

6.61.2 Constructor & Destructor Documentation

6.62.2.1 template<typename E > static void decaf::util::Arrays::fill (E * *array,* int *size,* const E & *value*) [inline, static]

Fills an array with the specified element.

Parameters

array	The Array to fill.
size	The actual size of the array passed.
value	The value to fill the array with.

Exceptions

NullPointerException	if array is Null.
IllegalArgumentException	if the size parameter is negative, or the start index is greater than the end index.

Referenced by decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >::ArrayPointer().

6.62.2.2 template<typename E > static void decaf::util::Arrays::fill (E * *array*, int *size*, int *start*, int *end*, const E & *value*) [inline, static]

Fills an array with the specified element within the range given.

Parameters

array	The Array to fill.
size	The actual size of the array passed.
start	The index to start the fill from (inclusive).
end	The index to fill to (exclusive).
value	The value to fill the array with.

Exceptions

NullPointerException	if array is Null.
IllegalArgumentException	if the size parameter is negative, or the start index is greater than the end index.
IndexOutOfBounds-Exception	if the start index is negative or the end index is greater than the size parameter.

6.63 decaf::util::concurrent::atomic::AtomicBoolean Class Reference

A boolean value that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicBoolean.h>`

Public Member Functions

- **AtomicBoolean** ()

  *Creates a new **AtomicBoolean** (p. 366) whose initial value is false.*
- **AtomicBoolean** (bool initialValue)

  *Creates a new **AtomicBoolean** (p. 366) with the initial value.*
- virtual ~**AtomicBoolean** ()
- bool **get** () **const**

  *Gets the current value of this **AtomicBoolean** (p. 366).*
- void **set** (bool newValue)

  Unconditionally sets to the given value.
- bool **compareAndSet** (bool expect, bool update)

  Atomically sets the value to the given updated value if the current value == the expected value.
- bool **getAndSet** (bool newValue)

  Atomically sets to the given value and returns the previous value.
- std::string **toString** () **const**

  Returns the String representation of the current value.

6.63.1 Detailed Description

A boolean value that may be updated atomically.

An **AtomicBoolean** (p. 366) is used in applications such as atomically updated flags, and cannot be used as a replacement for a Boolean.

6.63.2 Constructor & Destructor Documentation

6.63.2.1 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean ( )

Creates a new **AtomicBoolean** (p. 366) whose initial value is false.

6.63.2.2 decaf::util::concurrent::atomic::AtomicBoolean::AtomicBoolean (bool *initialValue*)

Creates a new **AtomicBoolean** (p. 366) with the initial value.

Parameters

initialValue	- The initial value of this boolean.

6.63.2.3 virtual decaf::util::concurrent::atomic::AtomicBoolean::~AtomicBoolean ( ) [inline, virtual]

6.63.3 Member Function Documentation

6.63.3.1 bool decaf::util::concurrent::atomic::AtomicBoolean::compareAndSet (bool *expect,* bool *update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

expect	- the expected value
update	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.63.3.2 bool decaf::util::concurrent::atomic::AtomicBoolean::get ( ) const [inline]

Gets the current value of this **AtomicBoolean** (p. 366).

Returns

the currently set value.

6.63.3.3 bool decaf::util::concurrent::atomic::AtomicBoolean::getAndSet (bool *newValue*)

Atomically sets to the given value and returns the previous value.

Parameters

newValue	- the new value

Returns

the previous value

6.63.3.4 void decaf::util::concurrent::atomic::AtomicBoolean::set (bool *newValue*) [inline]

Unconditionally sets to the given value.

Parameters

newValue	- the new value

6.63.3.5 std::string decaf::util::concurrent::atomic::AtomicBoolean::toString ( ) const

Returns the String representation of the current value.

Returns

the String representation of the current value.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicBoolean.h**

6.64 decaf::util::concurrent::atomic::AtomicInteger Class Reference

An int value that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicInteger.h>`

Inheritance diagram for decaf::util::concurrent::atomic::AtomicInteger:

Public Member Functions

- **AtomicInteger** ()

  *Create a new **AtomicInteger** (*p. *368) with an initial value of 0.*
- **AtomicInteger** (int initialValue)

  *Create a new **AtomicInteger** (*p. *368) with the given initial value.*
- virtual ∼**AtomicInteger** ()
- int **get** () **const**

  Gets the current value.
- void **set** (int newValue)

  Sets to the given value.
- int **getAndSet** (int newValue)

  Atomically sets to the given value and returns the old value.
- bool **compareAndSet** (int expect, int update)

  Atomically sets the value to the given updated value if the current value == the expected value.
- int **getAndIncrement** ()

  Atomically increments by one the current value.
- int **getAndDecrement** ()

Atomically decrements by one the current value.

- int **getAndAdd** (int delta)

  Atomically adds the given value to the current value.
- int **incrementAndGet** ()

  Atomically increments by one the current value.
- int **decrementAndGet** ()

  Atomically decrements by one the current value.
- int **addAndGet** (int delta)

  Atomically adds the given value to the current value.
- std::string **toString** () **const**

  Returns the String representation of the current value.
- int **intValue** () **const**

  Description copied from class: Number Returns the value of the specified number as an int.
- long long **longValue** () **const**

  Description copied from class: Number Returns the value of the specified number as a long.
- float **floatValue** () **const**

  Description copied from class: Number Returns the value of the specified number as a float.
- double **doubleValue** () **const**

  Description copied from class: Number Returns the value of the specified number as a double.

6.64.1 Detailed Description

An int value that may be updated atomically.

An **AtomicInteger** (p. 368) is used in applications such as atomically incremented counters, and cannot be used as a replacement for an Integer. However, this class does extend Number to allow uniform access by tools and utilities that deal with numerically-based classes.

6.64.2 Constructor & Destructor Documentation

6.64.2.1 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger ( )

Create a new **AtomicInteger** (p. 368) with an initial value of 0.

6.64.2.2 decaf::util::concurrent::atomic::AtomicInteger::AtomicInteger (int *initialValue*)

Create a new **AtomicInteger** (p. 368) with the given initial value.

Parameters

initialValue	- The initial value of this object.

6.64.2.3 virtual decaf::util::concurrent::atomic::AtomicInteger::~AtomicInteger ( ) [inline, virtual]

6.64.3 Member Function Documentation

6.64.3.1 int decaf::util::concurrent::atomic::AtomicInteger::addAndGet (int *delta*)

Atomically adds the given value to the current value.

Parameters

delta	- the value to add.

Returns

the updated value.

6.64.3.2 bool decaf::util::concurrent::atomic::AtomicInteger::compareAndSet (int *expect,* int *update*)

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

expect	- the expected value
update	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.64.3.3 int decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet ( )

Atomically decrements by one the current value.

Returns

the updated value.

Referenced by decaf::util::concurrent::atomic::AtomicRefCounter::release().

6.64.3.4 double decaf::util::concurrent::atomic::AtomicInteger::doubleValue ( ) const [virtual]

Description copied from class: Number Returns the value of the specified number as a double.

This may involve rounding.

Returns

the numeric value represented by this object after conversion to type double.

Implements **decaf::lang::Number** (p. 1544).

6.64.3.5 float decaf::util::concurrent::atomic::AtomicInteger::floatValue ( ) const [virtual]

Description copied from class: Number Returns the value of the specified number as a float.

This may involve rounding.

Returns

the numeric value represented by this object after conversion to type float.

Implements **decaf::lang::Number** (p. 1544).

6.64.3.6 int decaf::util::concurrent::atomic::AtomicInteger::get ( ) const [inline]

Gets the current value.

Returns

the current value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo(), decaf::util::concurrent::LinkedBlockingQueue< E >::offer(), decaf::util::concurrent::LinkedBlockingQueue< E >::peek(), decaf::util::concurrent::LinkedBlockingQueue< E >::poll(), decaf::util::concurrent::LinkedBlockingQueue< E >::put(), decaf::util::concurrent::LinkedBlockingQueue< E >::remainingCapacity(), decaf::util::concurrent::LinkedBlockingQueue< E >::size(), decaf::util::concurrent::LinkedBlockingQueue< E >::take(), decaf::util::concurrent::LinkedBlockingQueue< E >::toArray(), and decaf::util::concurrent::LinkedBlockingQueue< E >::toString().

6.64.3.7 int decaf::util::concurrent::atomic::AtomicInteger::getAndAdd (int *delta*)

Atomically adds the given value to the current value.

Parameters

delta	- The value to add.

Returns

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo().

6.64.3.8 int decaf::util::concurrent::atomic::AtomicInteger::getAndDecrement ( )

Atomically decrements by one the current value.

Returns

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::poll(), and decaf::util::concurrent::LinkedBlockingQueue< E >::take().

6.64.3.9 int decaf::util::concurrent::atomic::AtomicInteger::getAndIncrement ( )

Atomically increments by one the current value.

Returns

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::offer(), and decaf::util::concurrent::LinkedBlockingQueue< E >::put().

6.64.3.10 int decaf::util::concurrent::atomic::AtomicInteger::getAndSet (int *newValue*)

Atomically sets to the given value and returns the old value.

Parameters

newValue	- the new value.

Returns

the previous value.

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::clear().

6.64.3.11 int decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet ( )

Atomically increments by one the current value.

Returns

the updated value.

Referenced by decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter().

6.64.3.12 int decaf::util::concurrent::atomic::AtomicInteger::intValue ( ) const [virtual]

Description copied from class: Number Returns the value of the specified number as an int.

This may involve rounding or truncation.

Returns

the numeric value represented by this object after conversion to type int.

Implements **decaf::lang::Number** (p. 1544).

6.64.3.13 long long decaf::util::concurrent::atomic::AtomicInteger::longValue ( ) const [virtual]

Description copied from class: Number Returns the value of the specified number as a long.

This may involve rounding or truncation.

Returns

the numeric value represented by this object after conversion to type long long.

Implements **decaf::lang::Number** (p. 1545).

6.64.3.14 void decaf::util::concurrent::atomic::AtomicInteger::set (int *newValue*) [inline]

Sets to the given value.

Parameters

newValue	- the new value

Referenced by decaf::util::concurrent::LinkedBlockingQueue< E >::clear().

6.64.3.15 std::string decaf::util::concurrent::atomic::AtomicInteger::toString ( ) const

Returns the String representation of the current value.

Returns

the String representation of the current value.

The documentation for this class was generated from the following file:

6.65 decaf::util::concurrent::atomic::AtomicRefCounter Class Reference

`#include <src/main/decaf/util/concurrent/atomic/AtomicRefCounter.h>`

Inherited by **decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >**, **decaf::lang::ArrayPointer< E >**, **decaf::lang::ArrayPointer< ServiceListener * >**, **decaf::lang::ArrayPointer< unsigned char >**, **decaf::lang::Pointer< activemq::threads::TaskRunner >**, **decaf::lang::Pointer< ActiveMQDestination >**, **decaf::lang::Pointer< ActiveMQTransactionContext >**, **decaf::lang::Pointer< BackupTransportPool >**, **decaf::lang::Pointer< BooleanExpression >**, **decaf::lang::Pointer< BrokerError >**, **decaf::lang::Pointer< BrokerId >**, **decaf::lang::Pointer< ByteArrayAdapter >**, **decaf::lang::Pointer< CloseTransportsTask >**, **decaf::lang::Pointer< cms::Destination >**, **decaf::lang::Pointer< commands::ActiveMQDestination >**, **decaf::lang::Pointer< commands::ConsumerId >**, **decaf::lang::Pointer< commands::ConsumerInfo >**, **decaf::lang::Pointer< commands::Message >**, **decaf::lang::Pointer< commands::ProducerInfo >**, **decaf::lang::Pointer< commands::SessionInfo >**, **decaf::lang::Pointer< commands::WireFormatInfo >**, **decaf::lang::Pointer< Comparator< E > >**, **decaf::lang::Pointer< CompositeTaskRunner >**, **decaf::lang::Pointer< ConnectionId >**, **decaf::lang::Pointer< ConnectionInfo >**, **decaf::lang::Pointer< ConsumerId >**, **decaf::lang::Pointer< ConsumerInfo >**, **decaf::lang::Pointer< core::ActiveMQAckHandler >**, **decaf::lang::Pointer< DataStructure >**, **decaf::lang::Pointer< decaf::lang::Runnable >**, **decaf::lang::Pointer< decaf::lang::Thread >**, **decaf::lang::Pointer< Exception >**, **decaf::lang::Pointer< LogManagerInternals >**, **decaf::lang::Pointer< Message >**, **decaf::lang::Pointer< MessageAck >**, **decaf::lang::Pointer< MessageDispatchChannel >**, **decaf::lang::Pointer< MessageId >**, **decaf::lang::Pointer< ProducerId >**, **decaf::lang::Pointer< ProducerInfo >**, **decaf::lang::Pointer< Properties >**, **decaf::lang::Pointer< QueueNode< E > >**, **decaf::lang::Pointer< Response >**, **decaf::lang::Pointer< ResponseBuilder >**, **decaf::lang::Pointer< SessionId >**, **decaf::lang::Pointer< SessionInfo >**, **decaf::lang::Pointer< Tracked >**, **decaf::lang::Pointer< TransactionId >**, **decaf::lang::Pointer< TransactionState >**, **decaf::lang::Pointer< Transport >**, **decaf::lang::Pointer< TransportListener >**, **decaf::lang::Pointer< URI >**, **decaf::lang::Pointer< URIPool >**, and **decaf::lang::Pointer< wireformat::WireFormat >**.

Public Member Functions

- **AtomicRefCounter** ()
- **AtomicRefCounter** (**const AtomicRefCounter** &other)
- virtual ~**AtomicRefCounter** ()

Protected Member Functions

- void **swap** (**AtomicRefCounter** &other)

  Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.
- bool **release** ()

  Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the internal counter is destroyed and this instance is now considered to be unreferenced.

6.65.1 Constructor & Destructor Documentation

6.65.1.1 decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter ( ) [inline]

6.65.1.2 decaf::util::concurrent::atomic::AtomicRefCounter::AtomicRefCounter (const AtomicRefCounter & *other*) [inline]

References decaf::util::concurrent::atomic::AtomicInteger::incrementAndGet().

6.65.1.3 virtual decaf::util::concurrent::atomic::AtomicRefCounter::~AtomicRefCounter ( ) [inline, virtual]

6.65.2 Member Function Documentation

6.65.2.1 bool decaf::util::concurrent::atomic::AtomicRefCounter::release ( ) [inline, protected]

Removes a reference to the counter Atomically and returns if the counter has reached zero, once the counter hits zero, the internal counter is destroyed and this instance is now considered to be unreferenced.

Returns

true if the count is now zero.

Reimplemented in **decaf::lang::ArrayPointer< ServiceListener * >** (p. 363), **decaf::lang::ArrayPointer< E >** (p. 363), **decaf::lang::ArrayPointer< unsigned char >** (p. 363), **decaf::lang::ArrayPointer< decaf::util::LinkedList< Pointer< MessageDispatch > > >** (p. 363), **decaf::lang::Pointer< MessageAck >** (p. 1619), **decaf::lang::Pointer< BooleanExpression >** (p. 1619), **decaf::lang::Pointer< commands::ConsumerId >** (p. 1619), **decaf::lang::Pointer< BrokerError >** (p. 1619), **decaf::lang::Pointer< Transport >** (p. 1619), **decaf::lang::Pointer< wireformat::WireFormat >** (p. 1619), **decaf::lang::Pointer< MessageDispatchChannel >** (p. 1619), **decaf::lang::Pointer< commands::WireFormatInfo >** (p. 1619), **decaf::lang::Pointer< CloseTransportsTask >** (p. 1619), **decaf::lang::Pointer< CompositeTaskRunner >** (p. 1619), **decaf::lang::Pointer< ActiveMQTransactionContext >** (p. 1619), **decaf::lang::Pointer< commands::ProducerInfo >** (p. 1619), **decaf::lang::Pointer< Comparator< E > >** (p. 1619), **decaf::lang::Pointer< BrokerId >** (p. 1619), **decaf::lang::Pointer< LogManagerInternals >** (p. 1619), **decaf::lang::Pointer< commands::SessionInfo >** (p. 1619), **decaf::lang::Pointer< Message >** (p. 1619), **decaf::lang::Pointer< URI >** (p. 1619), **decaf::lang::Pointer< DataStructure >** (p. 1619), **decaf::lang::Pointer< activemq::threads::TaskRunner >** (p. 1619), **decaf::lang::Pointer< commands::ActiveMQDestination >** (p. 1619), **decaf::lang::Pointer< ConsumerInfo >** (p. 1619), **decaf::lang::Pointer< ConnectionId >** (p. 1619), **decaf::lang::Pointer< decaf::lang::Runnable >** (p. 1619), **decaf::lang::Pointer< Properties >** (p. 1619), **decaf::lang::Pointer< BackupTransportPool >** (p. 1619), **decaf::lang::Pointer< ProducerInfo >** (p. 1619), **decaf::lang::Pointer< decaf::lang::Thread >** (p. 1619), **decaf::lang::Pointer< MessageId >** (p. 1619), **decaf::lang::Pointer< Response >** (p. 1619), **decaf::lang::Pointer< QueueNode< E > >** (p. 1619), **decaf::lang::Pointer< SessionId >** (p. 1619), **decaf::lang::Pointer< cms::Destination >** (p. 1619), **decaf::lang::Pointer< TransportListener >** (p. 1619), **decaf::lang::Pointer< ActiveMQDestination >** (p. 1619), **decaf::lang::Pointer< ProducerId >** (p. 1619), **decaf::lang::Pointer< ResponseBuilder >** (p. 1619), **decaf::lang::Pointer< SessionInfo >** (p. 1619), **decaf::lang::Pointer< commands::Message >** (p. 1619), **decaf::lang::Pointer< Tracked >** (p. 1619), **decaf::lang::Pointer< ConnectionInfo >** (p. 1619), **decaf::lang::Pointer< core::ActiveMQAckHandler >** (p. 1619), **decaf::lang::Pointer< Exception >** (p. 1619), **decaf::lang::Pointer< TransactionState >** (p. 1619), **decaf::lang::Pointer< commands::ConsumerInfo >** (p. 1619), **decaf::lang::Pointer< ConsumerId >** (p. 1619), **decaf::lang::Pointer< URIPool >** (p. 1619), **decaf::lang::Pointer< ByteArrayAdapter >** (p. 1619), and **decaf::lang::Pointer< TransactionId >** (p. 1619).

References decaf::util::concurrent::atomic::AtomicInteger::decrementAndGet().

6.65.2.2 void decaf::util::concurrent::atomic::AtomicRefCounter::swap (AtomicRefCounter & *other*) [inline, protected]

Swaps this instance's reference counter with the one given, this allows for copy-and-swap semantics of this object.

Parameters

other	The value to swap with this one's.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicRefCounter.h**

6.66 decaf::util::concurrent::atomic::AtomicReference< T > Class Template Reference

An Pointer reference that may be updated atomically.

`#include <src/main/decaf/util/concurrent/atomic/AtomicReference.h>`

Public Member Functions

- **AtomicReference** ()
- **AtomicReference** (T *value)
- virtual ~**AtomicReference** ()
- T * **get** () **const**

  Gets the Current Value.
- void **set** (T *newValue)

  Sets the Current value of this Reference.
- bool **compareAndSet** (T *expect, T *update)

  Atomically sets the value to the given updated value if the current value == the expected value.
- T * **getAndSet** (T *newValue)

  Atomically sets to the given value and returns the old value.
- std::string **toString** () **const**

  Returns the String representation of the current value.

6.66.1 Detailed Description

template<typename T>class decaf::util::concurrent::atomic::AtomicReference< T >

An Pointer reference that may be updated atomically.

6.66.2 Constructor & Destructor Documentation

6.66.2.1 template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference ( ) [inline]

6.66.2.2 template<typename T > decaf::util::concurrent::atomic::AtomicReference< T >::AtomicReference (T * *value*) [inline]

6.66.2.3 template<typename T > virtual decaf::util::concurrent::atomic::AtomicReference< T >::~AtomicReference ( ) [inline, virtual]

6.66.3 Member Function Documentation

6.66.3.1 template<typename T > bool decaf::util::concurrent::atomic::AtomicReference< T >::compareAndSet (T * *expect*, T * *update*) [inline]

Atomically sets the value to the given updated value if the current value == the expected value.

Parameters

expect	- the expected value
update	- the new value

Returns

true if successful. False return indicates that the actual value was not equal to the expected value.

6.66.3.2 template<typename T > T* decaf::util::concurrent::atomic::AtomicReference< T >::get ( ) const [inline]

Gets the Current Value.

Returns

the current value of this Reference.

6.66.3.3 template<typename T > T* decaf::util::concurrent::atomic::AtomicReference< T >::getAndSet (T * *newValue*) [inline]

Atomically sets to the given value and returns the old value.

Parameters

newValue-	the new value

Returns

the previous value.

6.66.3.4 template<typename T > void decaf::util::concurrent::atomic::AtomicReference< T >::set (T * *newValue*) [inline]

Sets the Current value of this Reference.

Parameters

newValue	The new Value of this Reference.

6.66.3.5 template<typename T > std::string decaf::util::concurrent::atomic::AtomicReference< T >::toString ( ) const [inline]

Returns the String representation of the current value.

Returns

string representation of the current value.

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/atomic/**AtomicReference.h**

6.67 activemq::transport::failover::BackupTransport Class Reference

`#include <src/main/activemq/transport/failover/BackupTransport.h>`

Inheritance diagram for activemq::transport::failover::BackupTransport:

Public Member Functions

- **BackupTransport** (**BackupTransportPool** *failover)
- virtual ~**BackupTransport** ()
- **decaf::net::URI getUri** () **const**

  Gets the URI assigned to this Backup.
- void **setUri** (**const decaf::net::URI** &uri)

  *Sets the URI assigned to this **Transport** (p. 2161).*
- **const Pointer**< **Transport** > & **getTransport** ()

  Gets the currently held transport.
- void **setTransport** (**const Pointer**< **Transport** > &transport)

  Sets the held transport, if not NULL then start to listen for exceptions from the held transport.
- virtual void **onException** (**const decaf::lang::Exception** &ex)

  Event handler for an exception from a command transport.
- bool **isClosed** () **const**

  *Has the **Transport** (p. 2161) been shutdown and no longer usable.*
- void **setClosed** (bool value)

  *Sets the closed flag on this **Transport** (p. 2161).*

6.67.1 Constructor & Destructor Documentation

6.67.1.1 activemq::transport::failover::BackupTransport::BackupTransport (BackupTransportPool * *failover*)

6.67.1.2 virtual activemq::transport::failover::BackupTransport::~BackupTransport ( ) [virtual]

6.67.2 Member Function Documentation

6.67.2.1 const Pointer<Transport>& activemq::transport::failover::BackupTransport::getTransport ( ) [inline]

Gets the currently held transport.

Returns

pointer to the held transport or NULL if not set.

6.67.2.2 decaf::net::URI activemq::transport::failover::BackupTransport::getUri ( ) const [inline]

Gets the URI assigned to this Backup.

Returns

the assigned URI

6.67.2.3 bool activemq::transport::failover::BackupTransport::isClosed ( ) const [inline]

Has the **Transport** (p. 2161) been shutdown and no longer usable.

Returns

true if the **Transport** (p. 2161)

6.67.2.4 virtual void activemq::transport::failover::BackupTransport::onException (const decaf::lang::Exception & *ex*) [virtual]

Event handler for an exception from a command transport.

The **BackupTransport** (p. 377) closes its internal **Transport** (p. 2161) when an exception is received and returns the URI to the pool of URIs to attempt connections to.

Parameters

ex	The exception that was passed to this listener to handle.

Implements **activemq::transport::TransportListener** (p. 2177).

6.67.2.5 void activemq::transport::failover::BackupTransport::setClosed (bool *value*) [inline]

Sets the closed flag on this **Transport** (p. 2161).

Parameters

value	- true for closed.

6.67.2.6 void activemq::transport::failover::BackupTransport::setTransport (const Pointer< Transport > & *transport*) [inline]

Sets the held transport, if not NULL then start to listen for exceptions from the held transport.

Parameters

transport	The transport to hold.

6.67.2.7 void activemq::transport::failover::BackupTransport::setUri (const decaf::net::URI & *uri*) [inline]

Sets the URI assigned to this **Transport** (p. 2161).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**BackupTransport.h**

6.68 activemq::transport::failover::BackupTransportPool Class Reference

`#include <src/main/activemq/transport/failover/BackupTransportPool.h>`

Inheritance diagram for activemq::transport::failover::BackupTransportPool:

Public Member Functions

- **BackupTransportPool** (**const Pointer**< **CompositeTaskRunner** > &taskRunner, **const Pointer**< **CloseTransportsTask** > &closeTask, **const Pointer**< **URIPool** > &uriPool)
- **BackupTransportPool** (int backupPoolSize, **const Pointer**< **CompositeTaskRunner** > &taskRunner, **const Pointer**< **CloseTransportsTask** > &closeTask, **const Pointer**< **URIPool** > &uriPool)
- virtual ~**BackupTransportPool** ()
- virtual bool **isPending** () **const**

  Return true if we don't currently have enough Connected Transports.
- **Pointer**< **BackupTransport** > **getBackup** ()

  *Get a Connected **Transport** (p. 2161) from the pool of Backups if any are present, otherwise it return a NULL Pointer.*
- virtual bool **iterate** ()

  Connect to a Backup Broker if we haven't already connected to the max number of Backups.
- int **getBackupPoolSize** () **const**

  Gets the Max number of Backups this Task will create.
- void **setBackupPoolSize** (int size)

  Sets the Max number of Backups this Task will create.
- bool **isEnabled** () **const**

  *Gets if the backup **Transport** (p. 2161) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.*
- void **setEnabled** (bool value)

  *Sets if this Backup **Transport** (p. 2161) Pool is enabled.*

Friends

- class **BackupTransport**

6.68.1 Constructor & Destructor Documentation

6.68.1.1 activemq::transport::failover::BackupTransportPool::BackupTransportPool (const Pointer< CompositeTaskRunner > & *taskRunner,* const Pointer< CloseTransportsTask > & *closeTask,* const Pointer< URIPool > & *uriPool*)

6.68.1.2 activemq::transport::failover::BackupTransportPool::BackupTransportPool (int *backupPoolSize,* const Pointer< CompositeTaskRunner > & *taskRunner,* const Pointer< CloseTransportsTask > & *closeTask,* const Pointer< URIPool > & *uriPool*)

6.68.1.3 virtual activemq::transport::failover::BackupTransportPool::~BackupTransportPool ( ) [virtual]

6.68.2 Member Function Documentation

6.68.2.1 Pointer<BackupTransport> activemq::transport::failover::BackupTransportPool::getBackup ( )

Get a Connected **Transport** (p. 2161) from the pool of Backups if any are present, otherwise it return a NULL Pointer.

Returns

Pointer to a Connected **Transport** (p. 2161) or NULL

6.68.2.2 int activemq::transport::failover::BackupTransportPool::getBackupPoolSize ( ) const [inline]

Gets the Max number of Backups this Task will create.

Returns

the max number of active BackupTransports that will be created.

6.68.2.3 bool activemq::transport::failover::BackupTransportPool::isEnabled ( ) const [inline]

Gets if the backup **Transport** (p. 2161) Pool has been enabled or not, when not enabled no backups are created and any that were are destroyed.

Returns

true if enable.

6.68.2.4 virtual bool activemq::transport::failover::BackupTransportPool::isPending ( ) const [virtual]

Return true if we don't currently have enough Connected Transports.

Implements **activemq::threads::CompositeTask** (p. 692).

6.68.2.5 virtual bool activemq::transport::failover::BackupTransportPool::iterate ( ) [virtual]

Connect to a Backup Broker if we haven't already connected to the max number of Backups.

Implements **activemq::threads::Task** (p. 2073).

6.68.2.6 void activemq::transport::failover::BackupTransportPool::setBackupPoolSize (int *size*) [inline]

Sets the Max number of Backups this Task will create.

Parameters

size	- the max number of active BackupTransports that will be created.

6.68.2.7 void activemq::transport::failover::BackupTransportPool::setEnabled (bool *value*)

Sets if this Backup **Transport** (p. 2161) Pool is enabled.

When not enabled no Backups are created and any that were are destroyed.

Parameters

value	- true to enable backup creation, false to disable.

6.68.3 Friends And Related Function Documentation

6.68.3.1 friend class BackupTransport [friend]

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**BackupTransportPool.h**

6.69 activemq::commands::BaseCommand Class Reference

`#include <src/main/activemq/commands/BaseCommand.h>`

6.69.1 Constructor & Destructor Documentation

6.69.1.1 activemq::commands::BaseCommand::BaseCommand ( ) [inline]

6.69.1.2 virtual activemq::commands::BaseCommand::~BaseCommand ( ) [inline, virtual]

6.69.2 Member Function Documentation

6.69.2.1 virtual void activemq::commands::BaseCommand::copyDataStructure (const DataStructure * *src*) [inline, virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::Message** (p. 1417), **activemq::commands::ConsumerInfo** (p. 785), **activemq::commands::BrokerError** (p. 434), **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::BrokerInfo** (p. 445), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::MessageAck** (p. 1449), **activemq::commands::ConsumerControl** (p. 771), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::ConnectionControl** (p. 730), **activemq::commands::DestinationInfo** (p. 940), **activemq::commands::MessagePull** (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1460), **activemq::commands::MessageDispatchNotification** (p. 1470), **activemq::commands::TransactionInfo** (p. 2150), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::RemoveSubscriptionInfo** (p. 1765), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1759), **activemq::commands::DataArrayResponse** (p. 829), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 997), **activemq::commands::ReplayCommand** (p. 1771), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::Response** (p. 1782), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::FlushCommand** (p. 1069), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::ShutdownInfo** (p. 1884), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::WireFormatInfo** (p. 2242), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 224).

References getCommandId(), and isResponseRequired().

6.69.2.2 virtual bool activemq::commands::BaseCommand::equals (const DataStructure * *value*) const [inline, virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

Reimplemented in **activemq::commands::Message** (p. 1417), **activemq::commands::ConsumerInfo** (p. 785), **activemq::commands::ActiveMQBytesMessage** (p. 132), **activemq::commands::BrokerInfo** (p. 445), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::MessageAck** (p. 1450), **activemq::commands::ConsumerControl** (p. 771), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::ConnectionControl** (p. 730), **activemq::commands::DestinationInfo** (p. 941),

activemq::commands::MessagePull (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1460), **activemq::commands::MessageDispatchNotification** (p. 1470), **activemq::commands::TransactionInfo** (p. 2150), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::RemoveSubscriptionInfo** (p. 1765), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1759), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 864), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1069), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230), **activemq::commands::ActiveMQBlobMessage** (p. 124), **activemq::commands::WireFormatInfo** (p. 2242), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 224).

References activemq::commands::BaseDataStructure::equals().

6.69.2.3 virtual int activemq::commands::BaseCommand::getCommandId ( ) const [inline, virtual]

Gets the **Command** (p. 671) Id of this **Message** (p. 1412).

Returns

Command (p. 671) Id

Implements **activemq::commands::Command** (p. 671).

Referenced by copyDataStructure().

6.69.2.4 virtual bool activemq::commands::BaseCommand::isBrokerInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::BrokerInfo** (p. 446).

6.69.2.5 virtual bool activemq::commands::BaseCommand::isConnectionControl ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::ConnectionControl** (p. 730).

6.69.2.6 virtual bool activemq::commands::BaseCommand::isConnectionInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::ConnectionInfo** (p. 754).

6.69.2.7 virtual bool activemq::commands::BaseCommand::isConsumerInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::ConsumerInfo** (p. 786).

6.69.2.8 virtual bool activemq::commands::BaseCommand::isKeepAliveInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::KeepAliveInfo** (p. 1235).

6.69.2.9 virtual bool activemq::commands::BaseCommand::isMessage ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::Message** (p. 1421).

6.69.2.10 virtual bool activemq::commands::BaseCommand::isMessageAck ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::MessageAck** (p. 1451).

6.69.2.11 virtual bool activemq::commands::BaseCommand::isMessageDispatch ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::MessageDispatch** (p. 1461).

6.69.2.12 virtual bool activemq::commands::BaseCommand::isMessageDispatchNotification ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 672).

Reimplemented in **activemq::commands::MessageDispatchNotification** (p. 1471).

6.69.2.13 virtual bool activemq::commands::BaseCommand::isProducerAck ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::ProducerAck** (p. 1685).

6.69.2.14 virtual bool activemq::commands::BaseCommand::isProducerInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::ProducerInfo** (p. 1700).

6.69.2.15 virtual bool activemq::commands::BaseCommand::isRemoveInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::RemoveInfo** (p. 1760).

6.69.2.16 virtual bool activemq::commands::BaseCommand::isRemoveSubscriptionInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::RemoveSubscriptionInfo** (p. 1766).

6.69.2.17 virtual bool activemq::commands::BaseCommand::isResponse ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::Response** (p. 1783).

6.69.2.18 virtual bool activemq::commands::BaseCommand::isResponseRequired ( ) const [inline, virtual]

Is a **Response** (p. 1781) required for this **Command** (p. 671).

Returns

true if a response is required.

Implements **activemq::commands::Command** (p. 673).

Referenced by copyDataStructure().

6.69.2.19 virtual bool activemq::commands::BaseCommand::isShutdownInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::ShutdownInfo** (p. 1885).

6.69.2.20 virtual bool activemq::commands::BaseCommand::isTransactionInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::TransactionInfo** (p. 2151).

6.69.2.21 virtual bool activemq::commands::BaseCommand::isWireFormatInfo ( ) const [inline, virtual]

Implements **activemq::commands::Command** (p. 673).

Reimplemented in **activemq::commands::WireFormatInfo** (p. 2245).

6.69.2.22 virtual void activemq::commands::BaseCommand::setCommandId (int *id*) [inline, virtual]

Sets the **Command** (p. 671) Id of this **Message** (p. 1412).

Parameters

id	**Command** (p. 671) Id

Implements **activemq::commands::Command** (p. 674).

6.69.2.23 virtual void activemq::commands::BaseCommand::setResponseRequired (const bool *required*) [inline, virtual]

Set if this **Message** (p. 1412) requires a **Response** (p. 1781).

Parameters

required	true if response is required

Implements **activemq::commands::Command** (p. 674).

6.69.2.24 virtual std::string activemq::commands::BaseCommand::toString ( ) const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implements **activemq::commands::Command** (p. 674).

Reimplemented in **activemq::commands::Message** (p. 1424), **activemq::commands::ConsumerInfo** (p. 788), **activemq::commands::ActiveMQBytesMessage** (p. 138), **activemq::commands::BrokerInfo** (p. 447), **activemq::commands::ConnectionInfo** (p. 755), **activemq::commands::MessageAck** (p. 1451), **activemq::commands::ConsumerControl** (p. 772), **activemq::commands::ProducerInfo** (p. 1700), **activemq::commands::ConnectionControl** (p. 731), **activemq::commands::DestinationInfo** (p. 942), **activemq::commands::MessagePull** (p. 1505), **activemq::commands::SessionInfo** (p. 1851), **activemq::commands::MessageDispatch** (p. 1461), **activemq::commands::MessageDispatchNotification** (p. 1472), **activemq::commands::TransactionInfo** (p. 2151), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::RemoveSubscriptionInfo** (p. 1766), **activemq::commands::ActiveMQStreamMessage** (p. 286), **activemq::commands::ProducerAck** (p. 1685), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::ActiveMQMapMessage** (p. 219), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 865), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1070), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::ActiveMQBlobMessage** (p. 125), **activemq::commands::WireFormatInfo** (p. 2247), **activemq::commands::ActiveMQTextMessage** (p. 317), **activemq::commands::ActiveMQObjectMessage** (p. 235), and **activemq::commands::ActiveMQMessage** (p. 225).

6.70.1 Detailed Description

Marshaling code for Open Wire Format for **BaseCommandMarshaller** (p. 386).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.70.2 Constructor & Destructor Documentation

6.70.2.1 activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::BaseCommandMarshaller ( ) [inline]

6.70.2.2 virtual activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::~BaseCommandMarshaller ( ) [inline, virtual]

6.70.3 Member Function Documentation

6.70.3.1 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 221), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 236), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 319), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 449), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 734), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 740), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 757), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 774), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 790), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 796), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 866), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 944), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1072), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1178), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1237), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 1453), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1467), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1474), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1507), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 1687), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 1703), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 1762), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 1769), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 1774), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 1853), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 1887), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2153), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1487).

6.70.3.2 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 319), **activemq::wireformat::**

::openwire::marshal::generated::BrokerInfoMarshaller (p. 450), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 734), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 740), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 757), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 774), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 791), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 797), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 832), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 867), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 944), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1000), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1072), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1238), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 1454), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1467), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1474), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1508), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 1687), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 1703), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 1762), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 1769), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 1775), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 1853), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 1887), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2153), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.70.3.3 virtual int activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 450), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 734), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 740), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 758), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 775), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 791), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 797), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire-**

::marshal::generated::DataResponseMarshaller (p. 867), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 945), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1072), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1238), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 1454), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1468), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1475), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1508), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 1688), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 1703), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 1763), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 1769), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 1775), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 1853), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 1888), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2154), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1488).

6.70.3.4 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 145), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 228), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 450), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 735), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 741), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 758), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 775), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 791), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 797), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 867), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 945), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1073), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1179), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1238), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller**

(p. 1454), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1468), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1475), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1508), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 1688), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 1704), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 1763), **activemq::wireformat::openwire::marshal::generated::RemoveSubscriptionInfoMarshaller** (p. 1770), **activemq::wireformat::openwire::marshal::generated::ReplayCommandMarshaller** (p. 1775), **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791), **activemq::wireformat::openwire::marshal::generated::SessionInfoMarshaller** (p. 1854), **activemq::wireformat::openwire::marshal::generated::ShutdownInfoMarshaller** (p. 1888), **activemq::wireformat::openwire::marshal::generated::TransactionInfoMarshaller** (p. 2154), and **activemq::wireformat::openwire::marshal::generated::MessageMarshaller** (p. 1489).

6.70.3.5 virtual void activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

Reimplemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 145), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 223), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 228), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 238), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 451), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 735), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 741), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 759), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 776), **activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller** (p. 792), **activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller** (p. 798), **activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller** (p. 833), **activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller** (p. 868), **activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller** (p. 945), **activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller** (p. 1001), **activemq::wireformat::openwire::marshal::generated::FlushCommandMarshaller** (p. 1073), **activemq::wireformat::openwire::marshal::generated::IntegerResponseMarshaller** (p. 1180), **activemq::wireformat::openwire::marshal::generated::KeepAliveInfoMarshaller** (p. 1239), **activemq::wireformat::openwire::marshal::generated::MessageAckMarshaller** (p. 1455), **activemq::wireformat::openwire::marshal::generated::MessageDispatchMarshaller** (p. 1468), **activemq::wireformat::openwire::marshal::generated::MessageDispatchNotificationMarshaller** (p. 1475), **activemq::wireformat::openwire::marshal::generated::MessagePullMarshaller** (p. 1509), **activemq::wireformat::openwire::marshal::generated::ProducerAckMarshaller** (p. 1688), **activemq::wireformat::openwire::marshal::generated::ProducerInfoMarshaller** (p. 1704), **activemq::wireformat::openwire::marshal::generated::RemoveInfoMarshaller** (p. 1764), **activemq::wireformat::openwire::marshal::generated::**

6.71 activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller Class Reference

Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.

`#include <src/main/activemq/wireformat/openwire/marshal/BaseDataStream-Marshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller:

Public Member Functions

- virtual ~**BaseDataStreamMarshaller** ()
- virtual int **tightMarshal1** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **utils::BooleanStream** *bs AMQCPP_UNUSED)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED, **utils::Boolean-Stream** *bs AMQCPP_UNUSED)

  Tight Marshal to the given stream.
- virtual void **tightUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED, **utils::Boolean-Stream** *bs AMQCPP_UNUSED)

  Tight Un-Marshal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataOutputStream** *ds AMQCPP_UNUSED)

  Tight Marshal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *format AMQCPP_UNUSED, **commands::DataStructure** *command AMQCPP_UNUSED, **decaf::io::DataInputStream** *dis AMQCPP_UNUSED)

  Loose Un-Marshal to the given stream.

Static Public Member Functions

- static std::string **toString** (**const commands::MessageId** *id)

  Converts the object to a String.
- static std::string **toString** (**const commands::ProducerId** *id)

  Converts the object to a String.
- static std::string **toString** (**const commands::TransactionId** *txnId)

  Converts the given transaction ID into a String.
- static std::string **toHexFromBytes** (**const** std::vector< unsigned char > &data)

  given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Protected Member Functions

- virtual **commands::DataStructure** * **tightUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unmarshal the cached object.
- virtual int **tightMarshalCachedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.
- virtual void **tightMarshalCachedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed streams returning nothing.
- virtual void **looseMarshalCachedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *data, **decaf::io::DataOutputStream** *dataOut)

  Loosely marshals the passed DataStructure based object to the passed stream returning nothing.
- virtual **commands::DataStructure** * **looseUnmarshalCachedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  Loose Unmarshal the cached object.
- virtual int **tightMarshalNestedObject1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.
- virtual void **tightMarshalNestedObject2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly marshals the passed DataStructure based object to the passed streams returning nothing.
- virtual **commands::DataStructure** * **tightUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Unmarshal the nested object.
- virtual **commands::DataStructure** * **looseUnmarshalNestedObject** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn)

  Loose Unmarshal the nested object.
- virtual void **looseMarshalNestedObject** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *object, **decaf::io::DataOutputStream** *dataOut)

  Loose marshall the nested object.
- virtual std::string **tightUnmarshalString** (**decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Performs Tight Unmarshaling of String Objects.
- virtual int **tightMarshalString1** (**const** std::string &value, **utils::BooleanStream** *bs)

  Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.
- virtual void **tightMarshalString2** (**const** std::string &value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marshals the passed string to the streams passed.
- virtual void **looseMarshalString** (**const** std::string value, **decaf::io::DataOutputStream** *dataOut)

  Loose Marshal the String to the DataOuputStream passed.
- virtual std::string **looseUnmarshalString** (**decaf::io::DataInputStream** *dataIn)

  Loose Un-Marshal the String to the DataOuputStream passed.
- virtual int **tightMarshalLong1** (**OpenWireFormat** *wireFormat, long long value, **utils::BooleanStream** *bs)

  Tightly marshal the long long to the BooleanStream passed.
- virtual void **tightMarshalLong2** (**OpenWireFormat** *wireFormat, long long value, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tightly marshal the long long to the Streams passed.
- virtual long long **tightUnmarshalLong** (**OpenWireFormat** *wireFormat, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

Tight marshal the long long type.

- virtual void **looseMarshalLong** (**OpenWireFormat** ∗wireFormat, long long value, **decaf::io::DataOutputStream** ∗dataOut)

  Tightly marshal the long long to the BooleanStream passed.

- virtual long long **looseUnmarshalLong** (**OpenWireFormat** ∗wireFormat, **decaf::io::DataInputStream** ∗dataIn)

  Loose marshal the long long type.

- virtual std::vector< unsigned char > **tightUnmarshalByteArray** (**decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Unmarshal an array of char.

- virtual std::vector< unsigned char > **looseUnmarshalByteArray** (**decaf::io::DataInputStream** ∗dataIn)

  Loose Unmarshal an array of char.

- virtual std::vector< unsigned char > **tightUnmarshalConstByteArray** (**decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs, int size)

  Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual std::vector< unsigned char > **looseUnmarshalConstByteArray** (**decaf::io::DataInputStream** ∗dataIn, int size)

  Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

- virtual **commands::DataStructure** ∗ **tightUnmarshalBrokerError** (**OpenWireFormat** ∗wireFormat, **decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Unarshall the Error object.

- virtual int **tightMarshalBrokerError1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗data, **utils::BooleanStream** ∗bs)

  Tight Marshal the Error object.

- virtual void **tightMarshalBrokerError2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗data, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marshal the Error object.

- virtual **commands::DataStructure** ∗ **looseUnmarshalBrokerError** (**OpenWireFormat** ∗wireFormat, **decaf::io::DataInputStream** ∗dataIn)

  Loose Unarshal the Error object.

- virtual void **looseMarshalBrokerError** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗data, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marshal the Error object.

- template<typename T >
  int **tightMarshalObjectArray1** (**OpenWireFormat** ∗wireFormat, std::vector< T > objects, **utils::BooleanStream** ∗bs)

  Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

- template<typename T >
  void **tightMarshalObjectArray2** (**OpenWireFormat** ∗wireFormat, std::vector< T > objects, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- template<typename T >
  void **looseMarshalObjectArray** (**OpenWireFormat** ∗wireFormat, std::vector< T > objects, **decaf::io::DataOutputStream** ∗dataOut)

  Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

- virtual std::string **readAsciiString** (**decaf::io::DataInputStream** ∗dataIn)

  Given an DataInputStream read a know ASCII formatted string from the input and return that string.

6.71.1 Detailed Description

Base class for all Marshallers that marshal DataStructures to and from the wire using the OpenWire protocol.

Since

2.0

6.71.2 Constructor & Destructor Documentation

6.71.2.1 virtual activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::~BaseDataStreamMarshaller ( ) [inline, virtual]

6.71.3 Member Function Documentation

6.71.3.1 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED) [inline, virtual]

Tight Marshal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

6.71.3.2 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalBrokerError (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Tight Marshal the Error object.

Parameters

wireFormat	- The OpenwireFormat properties
data	- Error to Marshal
dataOut	- stream to write marshalled data to

Exceptions

IOException	if an error occurs.

6.71.3.3 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalCachedObject (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loosely marshals the passed DataStructure based object to the passed stream returning nothing.

Parameters

wireFormat	- The OpenwireFormat properties
data	- DataStructure Object Pointer to marshal
dataOut	- stream to write marshaled data to

Exceptions

IOException	if an error occurs.

6.71.3.4 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalLong (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

wireFormat	- The OpenwireFormat properties
value	- long long to marshal
dataOut	- DataOutputStream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.5 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalNestedObject (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loose marshall the nested object.

Parameters

wireFormat	- The OpenwireFormat properties
object	- DataStructure Object Pointer to marshal
dataOut	- stream to write marshaled data to

Exceptions

IOException	if an error occurs.

6.71.3.6 template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, decaf::io::DataOutputStream * *dataOut*) [inline, protected]

Loosely Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

wireFormat	- The OpenwireFormat properties
objects	- array of DataStructure object pointers.
dataOut	- stream to write marshalled data to

Returns

size of the marshalled data

Exceptions

IOException	if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, decaf::io::DataOutputStream::writeBoolean(), and decaf::io::DataOutputStream::writeShort().

6.71.3.7 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalString (const std::string *value*, decaf::io::DataOutputStream * *dataOut*) [protected, virtual]

Loose Marshal the String to the DataOuputStream passed.

Parameters

value	- string to marshal
dataOut	- stream to write marshaled form to

Exceptions

IOException	if an error occurs.

6.71.3.8 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED) [inline, virtual]

Loose Un-Marshal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

6.71.3.9 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalBrokerError (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unarshal the Error object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshalled form from

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.10 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalByteArray (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal an array of char.

Parameters

dataIn	- the DataInputStream to Un-Marshal from

Returns

the unmarshalled vector of chars.

Exceptions

IOException	if an error occurs.

6.71.3.11 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalCachedObject (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal the cached object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.12 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalConstByteArray (decaf::io::DataInputStream * *dataIn*, int *size*) [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

dataIn	- the DataInputStream to Un-Marshal from
size	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

IOException	if an error occurs.

6.71.3.13 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose marshal the long long type.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from

Returns

the unmarshaled long long

Exceptions

IOException	if an error occurs.

6.71.3.14 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalNestedObject (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Unmarshal the nested object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.15 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseUnmarshalString (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Loose Un-Marshal the String to the DataOuputStream passed.

Parameters

dataIn	- stream to read marshaled form from

Returns

the unmarshaled string

Exceptions

IOException	if an error occurs.

6.71.3.16 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::readAsciiString (decaf::io::DataInputStream * *dataIn*) [protected, virtual]

Given an DataInputStream read a know ASCII formatted string from the input and return that string.

Parameters

dataIn	- DataInputStream to read from

Returns

string value read from stream

6.71.3.17 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal1 (OpenWireFormat *format *AMQCPP_UNUSED*, commands::DataStructure *command *AMQCPP_UNUSED*, utils::BooleanStream *bs *AMQCPP_UNUSED*) [inline, virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.18 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshal2 (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataOutputStream *ds AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) [inline, virtual]

Tight Marshal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.19 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshal the Error object.

Parameters

wireFormat	- The OpenwireFormat properties
data	- Error to Marshal
bs	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

IOException	if an error occurs.

6.71.3.20 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalBrokerError2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshal the Error object.

Parameters

wireFormat	- The OpenwireFormat properties
data	- Error to Marshal
dataOut	- stream to write marshalled data to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.21 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedObject1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

wireFormat	- The OpenwireFormat properties
data	- DataStructure Object Pointer to marshal
bs	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

IOException	if an error occurs.

6.71.3.22 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalCachedObject2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *data*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

wireFormat	- The OpenwireFormat properties
data	- DataStructure Object Pointer to marshal
bs	- boolean stream to marshal to.
dataOut	- stream to write marshaled data to

Exceptions

IOException	if an error occurs.

6.71.3.23 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong1 (OpenWireFormat * *wireFormat*, long long *value*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshal the long long to the BooleanStream passed.

Parameters

wireFormat	- The OpenwireFormat properties
value	- long long to marshal
bs	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

IOException	if an error occurs.

6.71.3.24 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalLong2 (OpenWireFormat * *wireFormat*, long long *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshal the long long to the Streams passed.

Parameters

wireFormat	- The OpenwireFormat properties
value	- long long to marshal
dataOut	- stream to write marshaled form to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.25 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject1 (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed BooleanStream returning the size of the data marshaled.

Parameters

wireFormat	- The OpenwireFormat properties
object	- DataStructure Object Pointer to marshal
bs	- boolean stream to marshal to.

Returns

size of data written.

Exceptions

IOException	if an error occurs.

6.71.3.26 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalNestedObject2 (OpenWireFormat * *wireFormat*, commands::DataStructure * *object*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tightly marshals the passed DataStructure based object to the passed streams returning nothing.

Parameters

wireFormat	- The OpenwireFormat properties
object	- DataStructure Object Pointer to marshal
bs	- boolean stream to marshal to.
dataOut	- stream to write marshaled data to

Exceptions

IOException	if an error occurs.

6.71.3.27 template<typename T > int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1 (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, utils::BooleanStream * *bs*) [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream, and return the size that the tight marshalling is going to take.

Parameters

wireFormat	- The OpenwireFormat properties
objects	- array of DataStructure object pointers.
bs	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

IOException	if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, and activemq::wireformat::openwire::utils::BooleanStream::writeBoolean().

6.71.3.28 template<typename T > void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2 (OpenWireFormat * *wireFormat*, std::vector< T > *objects*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [inline, protected]

Tightly Marshal an array of DataStructure objects to the provided boolean stream and data output stream.

Parameters

wireFormat	- The OpenwireFormat properties
objects	- array of DataStructure object pointers.
dataOut	- stream to write marshalled data to
bs	- boolean stream to marshal to.

Returns

size of the marshalled data

Exceptions

IOException	if an error occurs.

References AMQ_CATCH_EXCEPTION_CONVERT, AMQ_CATCH_RETHROW, AMQ_CATCHALL_THROW, activemq::wireformat::openwire::utils::BooleanStream::readBoolean(), and decaf::io::DataOutputStream::writeShort().

6.71.3.29 virtual int activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString1 (const std::string & *value*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshals the String to a Booleans Stream Object, returns the marshaled size.

Parameters

value	- string to marshal
bs	- BooleanStream to use.

Returns

size of marshaled string.

Exceptions

IOException	if an error occurs.

6.71.3.30 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalString2 (const std::string & *value*, decaf::io::DataOutputStream * *dataOut*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Marshals the passed string to the streams passed.

Parameters

value	- string to marshal
dataOut	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

6.71.3.31 virtual void activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshal (OpenWireFormat *format AMQCPP_UNUSED, commands::DataStructure *command AMQCPP_UNUSED, decaf::io::DataInputStream *dis AMQCPP_UNUSED, utils::BooleanStream *bs AMQCPP_UNUSED) [inline, virtual]

Tight Un-Marshal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to Un-Marshal from.

Exceptions

IOException	if an error occurs.

6.71.3.32 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalBrokerError (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unarshall the Error object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshalled form from
bs	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.33 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalByteArray (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal an array of char.

Parameters

dataIn	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Returns

the unmarshaled vector of chars.

Exceptions

IOException	if an error occurs.

6.71.3.34 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalCachedObject (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal the cached object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from
bs	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.35 virtual std::vector<unsigned char> activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalConstByteArray (decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*, int *size*) [protected, virtual]

Tight Unmarshal a fixed size array from that data input stream and return an stl vector of char as the resultant.

Parameters

dataIn	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.
size	- size of the const array to unmarshal

Returns

the unmarshaled vector of chars.

Exceptions

IOException	if an error occurs.

6.71.3.36 virtual long long activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalLong (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight marshal the long long type.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from
bs	- boolean stream to marshal to.

Returns

the unmarshaled long long

Exceptions

IOException	if an error occurs.

6.71.3.37 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalNestedObject (OpenWireFormat * *wireFormat*, decaf::io::DataInputStream * *dataIn*, utils::BooleanStream * *bs*) [protected, virtual]

Tight Unmarshal the nested object.

Parameters

wireFormat	- The OpenwireFormat properties
dataIn	- stream to read marshaled form from
bs	- boolean stream to marshal to.

Returns

pointer to a new DataStructure Object

Exceptions

IOException	if an error occurs.

6.71.3.38 virtual std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightUnmarshalString (decaf::io::DataInputStream * *dataIn,* utils::BooleanStream * *bs*) [protected, virtual]

Performs Tight Unmarshaling of String Objects.

Parameters

dataIn	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Returns

the unmarshaled string.

Exceptions

IOException	if an error occurs.

6.71.3.39 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toHexFromBytes (const std::vector< unsigned char > & *data*) [static]

given an array of bytes, convert that array to a Hexidecimal coded string that represents that data.

Parameters

data	- unsigned char data array pointer

Returns

a string coded in hex that represents the data

6.71.3.40 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::MessageId * *id*) [static]

Converts the object to a String.

Parameters

id	- MessageId pointer

Returns

string representing the id

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::getCMSMessageID().

6.71.3.41 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::ProducerId * *id*) [static]

Converts the object to a String.

Parameters

id	- ProducerId pointer

Returns

string representing the id

6.71.3.42 static std::string activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::toString (const commands::TransactionId * *txnId*) [static]

Converts the given transaction ID into a String.

Parameters

txnId	- TransactionId poitner

Returns

string representation of the id

The documentation for this class was generated from the following file:

6.72.1 Constructor & Destructor Documentation

6.72.1.1 virtual activemq::commands::BaseDataStructure::~BaseDataStructure ( ) [inline, virtual]

6.72.2 Member Function Documentation

6.72.2.1 virtual void activemq::commands::BaseDataStructure::afterMarshal (wireformat::WireFormat ∗wireFormat *AMQCPP_UNUSED*) [inline, virtual]

6.72.2.2 virtual void activemq::commands::BaseDataStructure::afterUnmarshal (wireformat::WireFormat ∗wireFormat *AMQCPP_UNUSED*) [inline, virtual]

Reimplemented in **activemq::commands::WireFormatInfo** (p. 2242), and **activemq::commands::Message** (p. 1416).

6.72.2.3 virtual void activemq::commands::BaseDataStructure::beforeMarshal (wireformat::WireFormat ∗wireFormat *AMQCPP_UNUSED*) [inline, virtual]

Reimplemented in **activemq::commands::WireFormatInfo** (p. 2242), and **activemq::commands::Message** (p. 1417).

6.72.2.4 virtual void activemq::commands::BaseDataStructure::beforeUnmarshal (wireformat::WireFormat ∗wireFormat *AMQCPP_UNUSED*) [inline, virtual]

6.72.2.5 virtual void activemq::commands::BaseDataStructure::copyDataStructure (const DataStructure ∗src *AMQCPP_UNUSED*) [inline, virtual]

Reimplemented in **activemq::commands::BooleanExpression** (p. 427).

6.72.2.6 virtual bool activemq::commands::BaseDataStructure::equals (const DataStructure ∗value *AMQCPP_UNUSED*) const [inline, virtual]

Referenced by activemq::commands::BooleanExpression::equals(), and activemq::commands::BaseCommand::equals().

6.72.2.7 virtual std::vector<unsigned char> activemq::commands::BaseDataStructure::getMarshaledForm (wireformat::WireFormat ∗wireFormat *AMQCPP_UNUSED*) [inline, virtual]

6.72.2.8 virtual bool activemq::commands::BaseDataStructure::isMarshalAware ( ) const [inline, virtual]

Determine if the class implementing this interface is really wanting to be told about marshaling.

Normally if you didn't want to be marshal aware you just wouldn't implement this interface but since this is C++ and we don't have true interfaces we need a flat inheritance hierarchy, so we always implement this.

Returns

true if this class cares about marshaling.

Implements **activemq::wireformat::MarshalAware** (p. 1391).

Reimplemented in **activemq::commands::Message** (p. 1421), **activemq::commands::WireFormatInfo** (p. 2244), and **activemq::commands::ActiveMQMapMessage** (p. 216).

6.72.2.9 virtual void activemq::commands::BaseDataStructure::setMarshaledForm (wireformat::WireFormat *wireFormat *AMQCPP_UNUSED*, const std::vector< char > &data *AMQCPP_UNUSED*) [inline, virtual]

6.72.2.10 virtual std::string activemq::commands::BaseDataStructure::toString ( ) const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implements **activemq::commands::DataStructure** (p. 881).

Reimplemented in **activemq::commands::Message** (p. 1424), **activemq::commands::ActiveMQDestination** (p. 198), **activemq::commands::ConsumerInfo** (p. 788), **activemq::commands::MessageId** (p. 1482), **activemq::commands::SessionId** (p. 1845), **activemq::commands::ActiveMQBytesMessage** (p. 138), **activemq::commands::BrokerInfo** (p. 447), **activemq::commands::ConnectionInfo** (p. 755), **activemq::commands::ProducerId** (p. 1694), **activemq::commands::ConnectionId** (p. 747), **activemq::commands::MessageAck** (p. 1451), **activemq::commands::ConsumerId** (p. 779), **activemq::commands::ConsumerControl** (p. 772), **activemq::commands::JournalTopicAck** (p. 1219), **activemq::commands::ProducerInfo** (p. 1700), **activemq::commands::ConnectionControl** (p. 731), **activemq::commands::DestinationInfo** (p. 942), **activemq::commands::MessagePull** (p. 1505), **activemq::commands::SessionInfo** (p. 1851), **activemq::commands::MessageDispatch** (p. 1461), **activemq::commands::MessageDispatchNotification** (p. 1472), **activemq::commands::SubscriptionInfo** (p. 2042), **activemq::commands::XATransactionId** (p. 2281), **activemq::commands::TransactionInfo** (p. 2151), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::JournalQueueAck** (p. 1212), **activemq::commands::JournalTransaction** (p. 1230), **activemq::commands::RemoveSubscriptionInfo** (p. 1766), **activemq::commands::ActiveMQStreamMessage** (p. 286), **activemq::commands::ActiveMQTempDestination** (p. 296), **activemq::commands::LocalTransactionId** (p. 1300), **activemq::commands::NetworkBridgeFilter** (p. 1529), **activemq::commands::ProducerAck** (p. 1685), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::ActiveMQMapMessage** (p. 219), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 865), **activemq::commands::DiscoveryEvent** (p. 951), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::PartialCommand** (p. 1610), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::BrokerId** (p. 439), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1224), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1070), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::LastPartialCommand** (p. 1247), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::TransactionId** (p. 2145), **activemq::commands::BaseCommand** (p. 386), **activemq::commands::ActiveMQBlobMessage** (p. 125), **activemq::commands::Command** (p. 674), **activemq::commands::WireFormatInfo** (p. 2247), **activemq::commands::ActiveMQQueue** (p. 252), **activemq::commands::ActiveMQTopic** (p. 324), **activemq::commands::ActiveMQTextMessage** (p. 317), **activemq::commands::ActiveMQTempQueue** (p. 303), **activemq::commands::ActiveMQTempTopic** (p. 310), **activemq::commands::ActiveMQObjectMessage** (p. 235), **activemq::commands::ActiveMQMessage** (p. 225), and **activemq::commands::BooleanExpression** (p. 428).

Referenced by activemq::commands::BooleanExpression::toString(), and activemq::commands::BaseCommand-::toString().

6.73 decaf::net::BindException Class Reference

`#include <src/main/decaf/net/BindException.h>`

Inheritance diagram for decaf::net::BindException:

Public Member Functions

- **BindException** () throw ()

  Default Constructor.
- **BindException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **BindException** (**const BindException** &ex) throw ()

  Copy Constructor.
- **BindException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **BindException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **BindException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **BindException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**BindException** () throw ()

6.73.1 Constructor & Destructor Documentation

6.73.1.1 decaf::net::BindException::BindException ( ) throw () [inline]

Default Constructor.

6.73.1.2 decaf::net::BindException::BindException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.73.1.3 decaf::net::BindException::BindException (const BindException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.73.1.4 decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.73.1.5 decaf::net::BindException::BindException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.73.1.6 decaf::net::BindException::BindException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.73.1.7 virtual decaf::net::BindException::~BindException ( ) throw () [inline, virtual]

6.73.2 Member Function Documentation

6.73.2.1 virtual BindException* decaf::net::BindException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 1916).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**BindException.h**

6.74 decaf::io::BlockingByteArrayInputStream Class Reference

This is a blocking version of a byte buffer stream.

`#include <src/main/decaf/io/BlockingByteArrayInputStream.h>`

Inheritance diagram for decaf::io::BlockingByteArrayInputStream:

Public Member Functions

- **BlockingByteArrayInputStream** ()

  Default Constructor - uses a default internal buffer.
- **BlockingByteArrayInputStream** (**const** unsigned char *buffer, int bufferSize)

  Constructor that initializes the internal buffer.
- virtual ~**BlockingByteArrayInputStream** ()
- virtual void **setByteArray** (**const** unsigned char *buffer, int bufferSize)

- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs while closing the **InputStream** (p. 1134).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
  *The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

Parameters

num	*The number of bytes to skip.*

Returns

total bytes skipped

Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.74.1 Detailed Description

This is a blocking version of a byte buffer stream.

Read operations block until the requested data becomes available in the internal buffer via a call to setByteArray.

6.74.2 Constructor & Destructor Documentation

6.74.2.1 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream ( )

Default Constructor - uses a default internal buffer.

6.74.2.2 decaf::io::BlockingByteArrayInputStream::BlockingByteArrayInputStream (const unsigned char * *buffer,* int *bufferSize*)

Constructor that initializes the internal buffer.

See also

setByteArray (p. 416).

6.74.2.3 virtual decaf::io::BlockingByteArrayInputStream::~BlockingByteArrayInputStream ( ) [virtual]

6.74.3 Member Function Documentation

6.74.3.1 virtual int decaf::io::BlockingByteArrayInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.74.3.2 virtual void decaf::io::BlockingByteArrayInputStream::close ( ) [virtual]

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.74.3.3 virtual int decaf::io::BlockingByteArrayInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.74.3.4 virtual int decaf::io::BlockingByteArrayInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

6.74.3.5 virtual void decaf::io::BlockingByteArrayInputStream::setByteArray (const unsigned char * *buffer,* int *bufferSize*) [virtual]

6.74.3.6 virtual long long decaf::io::BlockingByteArrayInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1140).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**BlockingByteArrayInputStream.h**

6.75 decaf::util::concurrent::BlockingQueue< E > Class Template Reference

A **decaf::util::Queue** (p. 1723) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

6.75.1 Detailed Description

template<typename E>class decaf::util::concurrent::BlockingQueue< E >

A **decaf::util::Queue** (p. 1723) that additionally supports operations that wait for the queue to become non-empty when retrieving an element, and wait for space to become available in the queue when storing an element.

`BlockingQueue` (p. 417) methods come in four forms, with different ways of handling operations that cannot be satisfied immediately, but may be satisfied at some point in the future: one throws an exception, the second returns a special value (either `true` or `false`, depending on the operation), the third blocks the current thread indefinitely until the operation can succeed, and the fourth blocks for only a given maximum time limit before giving up. These methods are summarized in the following table:

	Throws exception	*Boolean Flag*	*Blocks*	*Times out*

Insert	**add(e)** (p. 109)	**offer(e)** (p. 420)	**put(e)** (p. 421)	**offer(e, time, unit)** (p. **??**)
Remove	**remove()** (p. 111)	**poll()** (p. 421)	**take()** (p. 422)	**poll(time, unit)** (p. **??**)
Examine	**element()** (p. 111)	**peek()** (p. 1725)	*not applicable*	*not applicable*

A **BlockingQueue** (p. 417) may be capacity bounded. At any given time it may have a `remainingCapacity` beyond which no additional elements can be `put` without blocking. A **BlockingQueue** (p. 417) without any intrinsic capacity constraints always reports a remaining capacity of `Integer::MAX_VALUE`.

BlockingQueue (p. 417) implementations are designed to be used primarily for producer-consumer queues, but additionally support **decaf::util::Collection** (p. 660) interface. So, for example, it is possible to remove an arbitrary element from a queue using `remove(x)`. However, such operations are in general *not* performed very efficiently, and are intended for only occasional use, such as when a queued message is cancelled.

BlockingQueue (p. 417) implementations are thread-safe. All queuing methods achieve their effects atomically using internal locks or other forms of concurrency control. However, the *bulk* **Collection** (p. 660) operations `addAll`, `containsAll`, `retainAll` and `removeAll` are *not* necessarily performed atomically unless specified otherwise in an implementation. So it is possible, for example, for `addAll(c)` to fail (throwing an exception) after adding only some of the elements in `c`.

A **BlockingQueue** (p. 417) does *not* intrinsically support any kind of "close" or "shutdown" operation to indicate that no more items will be added. The needs and usage of such features tend to be implementation-dependent. For example, a common tactic is for producers to insert special *end-of-stream* or *poison* objects, that are interpreted accordingly when taken by consumers.

Usage example, based on a typical producer-consumer scenario. Note that a **BlockingQueue** (p. 417) can safely be used with multiple producers and multiple consumers.

```
 class Producer : public Runnable {
 private:

    BlockingQueue* queue;

public:

    Producer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
         try {
             while( true ) { queue->put( produce() ); }
         } catch( InterruptedException& ex ) { ... handle ...}
     }

    Object produce() { ... }
 }

class Consumer : public Runnable {
 private:

    BlockingQueue* queue;

public:

    Consumer( BlockingQueue* q ) : queue( q ) {}

    virtual void run() {
         try {
             while( true ) { consume( queue->take() (p. 422) ); }
         } catch( InterruptedException& ex ) { ... handle ...}
     }
```

```
    void consume( Object& x ) { ... }
 }

int main( int argc, char** argv ) {

    BlockingQueue (p. 417) q = new SomeQueueImplementation();
     Producer p( &q );
     Consumer c1( &q );
     Consumer c2( &q );
     Thread t1( &p ).start();
     Thread t2( &c1 ).start();
     Thread t3( &c2 ).start();
 }
```

Memory consistency effects: As with other concurrent collections, actions in a thread prior to placing an object into a **BlockingQueue** (p. 417) *happen-before* actions subsequent to the access or removal of that element from the **BlockingQueue** (p. 417) in another thread.

Since

1.0

6.75.2 Constructor & Destructor Documentation

6.75.2.1 template<typename E> virtual decaf::util::concurrent::BlockingQueue< E >::~BlockingQueue ( ) [inline, virtual]

6.75.3 Member Function Documentation

6.75.3.1 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo (Collection< E > & *c*) [pure virtual]

Removes all available elements from this queue and adds them to the given collection.

This operation may be more efficient than repeatedly polling this queue. A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into

Returns

the number of elements transferred

Exceptions

UnsupportedOperation-Exception	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1260), and **decaf::util::concurrent::-SynchronousQueue< E >** (p. 2060).

6.75.3.2 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::drainTo (Collection< E > & *c*, int *maxElements*) [pure virtual]

Removes at most the given number of available elements from this queue and adds them to the given collection.

A failure encountered while attempting to add elements to collection `c` may result in elements being in neither, either or both collections when the associated exception is thrown. Attempts to drain a queue to itself result in `IllegalArgumentException`. Further, the behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

Parameters

c	the collection to transfer elements into
maxElements	the maximum number of elements to transfer

Returns

the number of elements transferred

Exceptions

UnsupportedOperationException	if addition of elements is not supported by the specified collection
IllegalArgumentException	if the specified collection is this queue, or some property of an element of this queue prevents it from being added to the specified collection

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1261), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2060).

6.75.3.3 template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::offer (const E & *e*, long long *timeout*, const TimeUnit & *unit*) [pure virtual]

Inserts the specified element into this queue, waiting up to the specified wait time if necessary for space to become available.

Parameters

e	the element to add
timeout	how long to wait before giving up, in units of `unit`
unit	a **`TimeUnit`** (p. 2134) determining how to interpret the `timeout` parameter

Returns

`true` if successful, or `false` if the specified waiting time elapses before space is available

Exceptions

InterruptedException	if interrupted while waiting
NullPointerException	if the specified element is null
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1262), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2062).

6.75.3.4 template<typename E> virtual bool decaf::util::concurrent::BlockingQueue< E >::poll (E & *result,* long long *timeout,* const TimeUnit & *unit*) [pure virtual]

Retrieves and removes the head of this queue, waiting up to the specified wait time if necessary for an element to become available.

Parameters

result	the referenced value that will be assigned the value retrieved from the **Queue** (p. 1723). Undefined if this methods returned false.
timeout	how long to wait before giving up, in units of `unit`
unit	a **`TimeUnit`** (p. 2134) determining how to interpret the `timeout` parameter.

Returns

`true` if successful or `false` if the specified waiting time elapses before an element is available.

Exceptions

InterruptedException	if interrupted while waiting

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1263), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2062).

6.75.3.5 template<typename E> virtual void decaf::util::concurrent::BlockingQueue< E >::put (const E & *value*) [pure virtual]

Inserts the specified element into this queue, waiting if necessary for space to become available.

Parameters

value	the element to add

Exceptions

InterruptedException	if interrupted while waiting
NullPointerException	if the specified element is null
IllegalArgumentException	if some property of the specified element prevents it from being added to this queue

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1264), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2063).

6.75.3.6 template<typename E> virtual int decaf::util::concurrent::BlockingQueue< E >::remainingCapacity ( ) const [pure virtual]

Returns the number of additional elements that this queue can ideally (in the absence of memory or resource constraints) accept without blocking, or `Integer::MAX_VALUE` if there is no intrinsic limit.

Note that you *cannot* always tell if an attempt to insert an element will succeed by inspecting `remainingCapacity` because it may be the case that another thread is about to insert or remove an element.

Returns

the remaining capacity

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1265), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2063).

6.75.3.7 template<typename E> virtual E decaf::util::concurrent::BlockingQueue< E >::take ( ) [pure virtual]

Retrieves and removes the head of this queue, waiting if necessary until an element becomes available.

Returns

the head of this queue

Exceptions

InterruptedException	if interrupted while waiting

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1266), and **decaf::util::concurrent::SynchronousQueue< E >** (p. 2064).

6.76.1 Constructor & Destructor Documentation

6.76.1.1 decaf::lang::Boolean::Boolean (bool *value*)

Parameters

value	- primitive boolean to wrap.

6.76.1.2 decaf::lang::Boolean::Boolean (const std::string & *value*)

Parameters

value	- **String** (p. 2031) value to convert to a boolean.

6.76.1.3 virtual decaf::lang::Boolean::~Boolean ( ) [inline, virtual]

6.76.2 Member Function Documentation

6.76.2.1 bool decaf::lang::Boolean::booleanValue ( ) const [inline]

Returns

the primitive boolean value of this object

6.76.2.2 virtual int decaf::lang::Boolean::compareTo (const Boolean & *b*) const [virtual]

Compares this **Boolean** (p. 422) instance with another.

Parameters

b	- the **Boolean** (p. 422) instance to be compared

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **Boolean** > (p. 687).

6.76.2.3 virtual int decaf::lang::Boolean::compareTo (const bool & *b*) const [virtual]

Compares this **Boolean** (p. 422) instance with another.

Parameters

b	- the **Boolean** (p. 422) instance to be compared

Returns

zero if this object represents the same boolean value as the argument; a positive value if this object represents true and the argument represents false; and a negative value if this object represents false and the argument represents true

Implements **decaf::lang::Comparable**< **bool** > (p. 687).

6.76.2.4 bool decaf::lang::Boolean::equals (const Boolean & *b*) const [inline, virtual]

Returns

true if the two **Boolean** (p. 422) Objects have the same value.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 688).

6.76.2.5 bool decaf::lang::Boolean::equals (const bool & *b*) const [inline, virtual]

Returns

true if the two **Boolean** (p. 422) Objects have the same value.

Implements **decaf::lang::Comparable**< **bool** > (p. 688).

6.76.2.6 virtual bool decaf::lang::Boolean::operator< (const Boolean & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 688).

6.76.2.7 virtual bool decaf::lang::Boolean::operator< (const bool & *value*) const [virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 688).

6.76.2.8 virtual bool decaf::lang::Boolean::operator== (const Boolean & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Boolean** > (p. 688).

6.76.2.9 virtual bool decaf::lang::Boolean::operator== (const bool & *value*) const [virtual]

Compares equality between this object and the one passed.

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **bool** > (p. 688).

6.76.2.10 static bool decaf::lang::Boolean::parseBoolean (const std::string & *value*) [static]

Parses the **String** (p. 2031) passed and extracts an bool.

Parameters

value	The std::string value to parse

Returns

bool value

6.76.2.11 std::string decaf::lang::Boolean::toString ( ) const

Returns

the string representation of this Booleans value.

6.76.2.12 static std::string decaf::lang::Boolean::toString (bool *value*) [static]

Converts the bool to a **String** (p. 2031) representation.

Parameters

value	The bool value to convert.

Returns

std::string representation of the bool value passed.

6.76.2.13 static Boolean decaf::lang::Boolean::valueOf (bool *value*) [static]

Parameters

value	The bool value to convert to a **Boolean** (p. 422) instance.

Returns

a **Boolean** (p. 422) instance of the primitive boolean value

6.76.2.14 static Boolean decaf::lang::Boolean::valueOf (const std::string & *value*) [static]

Parameters

value	The std::string value to convert to a **Boolean** (p. 422) instance.

Returns

a **Boolean** (p. 422) instance of the string value

6.76.3 Field Documentation

6.76.3.1 const Boolean decaf::lang::Boolean::_FALSE [static]

The Class object representing the primitive false boolean.

6.76.3.2 const Boolean decaf::lang::Boolean::_TRUE [static]

The Class object representing the primitive type boolean.

The documentation for this class was generated from the following file:

6.77.1.2 virtual activemq::commands::BooleanExpression::∼BooleanExpression ( ) throw () [inline, virtual]

6.77.2 Member Function Documentation

6.77.2.1 virtual DataStructure∗ activemq::commands::BooleanExpression::cloneDataStructure ( ) const [inline, virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.77.2.2 virtual void activemq::commands::BooleanExpression::copyDataStructure (const DataStructure ∗src *AMQCPP_UNUSED*) [inline, virtual]

Reimplemented from **activemq::commands::BaseDataStructure** (p. 410).

6.77.2.3 virtual bool activemq::commands::BooleanExpression::equals (const DataStructure ∗ *value*) const [inline, virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

References activemq::commands::BaseDataStructure::equals().

6.77.2.4 virtual std::string activemq::commands::BooleanExpression::toString ( ) const [inline, virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

References activemq::commands::BaseDataStructure::toString().

- src/main/activemq/commands/**BooleanExpression.h**

6.78 activemq::wireformat::openwire::utils::BooleanStream Class Reference

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.

`#include <src/main/activemq/wireformat/openwire/utils/BooleanStream.h>`

Public Member Functions

- **BooleanStream** ()
- virtual ~**BooleanStream** () throw ()
- bool **readBoolean** ()

  Read a boolean data element from the internal data buffer.
- void **writeBoolean** (bool value)

  Writes a Boolean value to the internal data buffer.
- void **marshal** (**decaf::io::DataOutputStream** *dataOut)

  Marshal the data to a DataOutputStream.
- void **marshal** (std::vector< unsigned char > &dataOut)

  Marshal the data to a STL vector of unsigned chars.
- void **unmarshal** (**decaf::io::DataInputStream** *dataIn)

  Unmarshal a Boolean data stream from the Input Stream.
- void **clear** ()

  Clears to old position markers, data starts at the beginning.
- int **marshalledSize** ()

  Calc the size that data is marshalled to.

6.78.1 Detailed Description

Manages the writing and reading of boolean data streams to and from a data source such as a DataInputStream or DataOutputStream.

The booleans are stored as single bits in the stream, with the stream size pre-pended to the stream when the data is marshalled.

The serialized form of the size field can be between 1 and 3 bytes. If the number of used bytes < 64, size=1 byte If the number of used bytes >=64 and < 256 (size of an unsigned byte), size=2 bytes If the number of used bytes >=256, size=3 bytes

The high-order 2 bits (128 and 64) of the first byte of the size field are used to encode the information about the number of bytes in the size field. The only time the first byte will contain a value >=64 is if there are more bytes in the size field. If the first byte < 64, the value of the byte is simply the size value. If the first byte = 0xC0, the following unsigned byte is the size field. If the first byte = 0x80, the following short (two bytes) are the size field.

6.78.2.2 virtual activemq::wireformat::openwire::utils::BooleanStream::~BooleanStream ( ) throw () [virtual]

6.78.3 Member Function Documentation

6.78.3.1 void activemq::wireformat::openwire::utils::BooleanStream::clear ( )

Clears to old position markers, data starts at the beginning.

6.78.3.2 void activemq::wireformat::openwire::utils::BooleanStream::marshal (decaf::io::DataOutputStream * *dataOut*)

Marshal the data to a DataOutputStream.

Parameters

dataOut	- Stream to write the data to.

Exceptions

IOException	if an I/O error occurs during this operation.

6.78.3.3 void activemq::wireformat::openwire::utils::BooleanStream::marshal (std::vector< unsigned char > & *dataOut*)

Marshal the data to a STL vector of unsigned chars.

Parameters

dataOut	- reference to a vector to write the data to.

Exceptions

IOException	if an I/O error occurs during this operation.

6.78.3.4 int activemq::wireformat::openwire::utils::BooleanStream::marshalledSize ( )

Calc the size that data is marshalled to.

Returns

int size of marshalled data.

6.78.3.5 bool activemq::wireformat::openwire::utils::BooleanStream::readBoolean ( )

Read a boolean data element from the internal data buffer.

Returns

boolean from the stream

Exceptions

IOException	if an I/O error occurs during this operation.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2().

6.78.3.6 void activemq::wireformat::openwire::utils::BooleanStream::unmarshal (decaf::io::DataInputStream * *dataIn*)

Unmarshal a Boolean data stream from the Input Stream.

Parameters

dataIn	- Input Stream to read data from.

Exceptions

IOException	if an I/O error occurs during this operation.

6.78.3.7 void activemq::wireformat::openwire::utils::BooleanStream::writeBoolean (bool *value*)

Writes a Boolean value to the internal data buffer.

Parameters

value	- boolean data to write.

Exceptions

IOException	if an I/O error occurs during this operation.

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1().

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/utils/**BooleanStream.h**

6.79 decaf::util::concurrent::BrokenBarrierException Class Reference

`#include <src/main/decaf/util/concurrent/BrokenBarrierException.h>`

Inheritance diagram for decaf::util::concurrent::BrokenBarrierException:

Public Member Functions

- **BrokenBarrierException** () throw ()

  Default Constructor.
- **BrokenBarrierException** (**const decaf::lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **BrokenBarrierException** (**const BrokenBarrierException** &ex) throw ()

  Copy Constructor.
- **BrokenBarrierException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **BrokenBarrierException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **BrokenBarrierException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **BrokenBarrierException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**BrokenBarrierException** () throw ()

6.79.1 Constructor & Destructor Documentation

6.79.1.1 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException ( ) throw () [inline]

Default Constructor.

6.79.1.2 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.79.1.3 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const BrokenBarrierException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The Exception to copy in this new instance.

6.79.1.4 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const std::exception ∗ *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.79.1.5 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.79.1.6 decaf::util::concurrent::BrokenBarrierException::BrokenBarrierException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
cause	- The exception that was the cause for this one to be thrown.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.79.1.7 virtual decaf::util::concurrent::BrokenBarrierException::~BrokenBarrierException ( ) throw () [virtual]

6.79.2 Member Function Documentation

6.79.2.1 virtual BrokenBarrierException* decaf::util::concurrent::BrokenBarrierException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**BrokenBarrierException.h**

6.80 activemq::commands::BrokerError Class Reference

This class represents an Exception sent from the Broker.

`#include <src/main/activemq/commands/BrokerError.h>`

Inheritance diagram for activemq::commands::BrokerError:

Data Structures

- struct **StackTraceElement**

Public Member Functions

- **BrokerError** ()
- virtual ~**BrokerError** ()
- virtual unsigned char **getDataStructureType** () **const**

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **BrokerError** * **cloneDataStructure** () **const**

  Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual **decaf::lang::Pointer** < **commands::Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.
- virtual **const** std::string & **getMessage** () **const**

  Gets the string holding the error message.
- virtual void **setMessage** (**const** std::string &message)

  *Sets the string that contains the error **Message** (p. 1412).*
- virtual **const** std::string & **getExceptionClass** () **const**

  Gets the string holding the Exception Class name.
- virtual void **setExceptionClass** (**const** std::string &exceptionClass)

  Sets the string that contains the Exception Class name.
- virtual **const** **decaf::lang::Pointer** < **BrokerError** > & **getCause** () **const**

  Gets the Broker Error that caused this exception.
- virtual void **setCause** (**const decaf::lang::Pointer**< **BrokerError** > &cause)

  Sets the Broker Error that caused this exception.
- virtual **const** std::vector < **decaf::lang::Pointer** < **StackTraceElement** > > & **getStackTraceElements** () **const**

  Gets the Stack Trace Elements for the Exception.
- virtual void **setStackTraceElements** (**const** std::vector< **decaf::lang::Pointer**< **StackTraceElement** > > &stackTraceElements)

  Sets the Stack Trace Elements for this Exception.

6.80.1 Detailed Description

This class represents an Exception sent from the Broker.

The Broker sends java Throwables, so we must mimic its structure here.

6.80.2 Constructor & Destructor Documentation

6.80.2.1 activemq::commands::BrokerError::BrokerError ( )

6.80.2.2 virtual activemq::commands::BrokerError::~BrokerError ( ) [virtual]

6.80.3 Member Function Documentation

6.80.3.1 virtual BrokerError* activemq::commands::BrokerError::cloneDataStructure ( ) const [inline, virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

References copyDataStructure().

6.80.3.2 virtual void activemq::commands::BrokerError::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

Referenced by cloneDataStructure().

6.80.3.3 virtual const decaf::lang::Pointer<BrokerError>& activemq::commands::BrokerError::getCause ( ) const [inline, virtual]

Gets the Broker Error that caused this exception.

Returns

Broker Error Pointer

6.80.3.4 virtual unsigned char activemq::commands::BrokerError::getDataStructureType ( ) const [inline, virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.80.3.5 virtual const std::string& activemq::commands::BrokerError::getExceptionClass ( ) const [inline, virtual]

Gets the string holding the Exception Class name.

Returns

Exception Class name

6.80.3.6 virtual const std::string& activemq::commands::BrokerError::getMessage ( ) const [inline, virtual]

Gets the string holding the error message.

Returns

String **Message** (p. 1412)

6.80.3.7 virtual const std::vector< decaf::lang::Pointer<StackTraceElement> >& activemq::commands::BrokerError::getStackTraceElements ( ) const [inline, virtual]

Gets the Stack Trace Elements for the Exception.

Returns

Stack Trace Elements

6.80.3.8 virtual void activemq::commands::BrokerError::setCause (const decaf::lang::Pointer< BrokerError > & *cause*) [inline, virtual]

Sets the Broker Error that caused this exception.

Parameters

cause	- Broker Error

6.80.3.9 virtual void activemq::commands::BrokerError::setExceptionClass (const std::string & *exceptionClass*) [inline, virtual]

Sets the string that contains the Exception Class name.

Parameters

exceptionClass	- String Exception Class name

6.80.3.10 virtual void activemq::commands::BrokerError::setMessage (const std::string & *message*) [inline, virtual]

Sets the string that contains the error **Message** (p. 1412).

Parameters

message	- String Error **Message** (p. 1412)

6.80.3.11 virtual void activemq::commands::BrokerError::setStackTraceElements (const std::vector< decaf::lang::Pointer< StackTraceElement > > & *stackTraceElements*) [inline, virtual]

Sets the Stack Trace Elements for this Exception.

Parameters

stackTrace-Elements	- Stack Trace Elements

6.80.3.12 virtual decaf::lang::Pointer<commands::Command> activemq::commands::BrokerError::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

The documentation for this class was generated from the following file:

- src/main/activemq/commands/**BrokerError.h**

6.81 activemq::exceptions::BrokerException Class Reference

`#include <src/main/activemq/exceptions/BrokerException.h>`

Inheritance diagram for activemq::exceptions::BrokerException:

Public Member Functions

- **BrokerException** () throw ()

6.82.1 Member Typedef Documentation

6.82.1.1 typedef decaf::lang::PointerComparator<BrokerId> activemq::commands::BrokerId::COMPARATOR

6.82.2 Constructor & Destructor Documentation

6.82.2.1 activemq::commands::BrokerId::BrokerId ( )

6.82.2.2 activemq::commands::BrokerId::BrokerId (const BrokerId & *other*)

6.82.2.3 virtual activemq::commands::BrokerId::~BrokerId ( ) [virtual]

6.82.3 Member Function Documentation

6.82.3.1 virtual BrokerId* activemq::commands::BrokerId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.82.3.2 virtual int activemq::commands::BrokerId::compareTo (const BrokerId & *value*) const [virtual]

6.82.3.3 virtual void activemq::commands::BrokerId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.82.3.4 virtual bool activemq::commands::BrokerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.82.3.5 virtual bool activemq::commands::BrokerId::equals (const BrokerId & *value*) const [virtual]

6.82.3.6 virtual unsigned char activemq::commands::BrokerId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.82.3.7 virtual const std::string& activemq::commands::BrokerId::getValue ( ) const [virtual]

6.82.3.8 virtual std::string& activemq::commands::BrokerId::getValue ( ) [virtual]

6.82.3.9 virtual bool activemq::commands::BrokerId::operator< (const BrokerId & *value*) const [virtual]

6.82.3.10 BrokerId& activemq::commands::BrokerId::operator= (const BrokerId & *other*)

6.82.3.11 virtual bool activemq::commands::BrokerId::operator== (const BrokerId & *value*) const [virtual]

6.82.3.12 virtual void activemq::commands::BrokerId::setValue (const std::string & *value*) [virtual]

6.82.3.13 virtual std::string activemq::commands::BrokerId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.82.4 Field Documentation

6.82.4.1 const unsigned char activemq::commands::BrokerId::ID_BROKERID = 124 [static]

6.82.4.2 std::string activemq::commands::BrokerId::value [protected]

The documentation for this class was generated from the following file:

6.83 activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller Class Reference

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 440).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/BrokerIdMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller:

Public Member Functions

- **BrokerIdMarshaller** ()
- virtual ~**BrokerIdMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.83.1 Detailed Description

Marshaling code for Open Wire Format for **BrokerIdMarshaller** (p. 440).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.83.2 Constructor & Destructor Documentation

6.83.2.1 activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::BrokerIdMarshaller ( ) [inline]

6.83.2.2 virtual activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::~BrokerIdMarshaller ( ) [inline, virtual]

6.83.3 Member Function Documentation

6.83.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.83.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.83.3.3 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.83.3.4 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.83.3.5 virtual int activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.83.3.6 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.83.3.7 virtual void activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**BrokerIdMarshaller.h**

6.84.1 Constructor & Destructor Documentation

6.84.1.1 activemq::commands::BrokerInfo::BrokerInfo ( )

6.84.1.2 virtual activemq::commands::BrokerInfo::~BrokerInfo ( ) [virtual]

6.84.2 Member Function Documentation

6.84.2.1 virtual BrokerInfo* activemq::commands::BrokerInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.84.2.2 virtual void activemq::commands::BrokerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.84.2.3 virtual bool activemq::commands::BrokerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.84.2.4 virtual const Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId ( ) const [virtual]

6.84.2.5 virtual Pointer<BrokerId>& activemq::commands::BrokerInfo::getBrokerId ( ) [virtual]

6.84.2.6 virtual const std::string& activemq::commands::BrokerInfo::getBrokerName ( ) const [virtual]

6.84.2.7 virtual std::string& activemq::commands::BrokerInfo::getBrokerName ( ) [virtual]

6.84.2.8 virtual const std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl ( ) const [virtual]

6.84.2.9 virtual std::string& activemq::commands::BrokerInfo::getBrokerUploadUrl ( ) [virtual]

6.84.2.12 virtual long long activemq::commands::BrokerInfo::getConnectionId ( ) const [virtual]

6.84.2.13 virtual unsigned char activemq::commands::BrokerInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.84.2.14 virtual const std::string& activemq::commands::BrokerInfo::getNetworkProperties ( ) const [virtual]

6.84.2.15 virtual std::string& activemq::commands::BrokerInfo::getNetworkProperties ( ) [virtual]

6.84.2.16 virtual const std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos ( ) const [virtual]

6.84.2.17 virtual std::vector< decaf::lang::Pointer<BrokerInfo> >& activemq::commands::BrokerInfo::getPeerBrokerInfos ( ) [virtual]

6.84.2.18 virtual bool activemq::commands::BrokerInfo::isBrokerInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isBrokerInfo()** (p. 446) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 383).

6.84.2.19 virtual bool activemq::commands::BrokerInfo::isDuplexConnection ( ) const [virtual]

6.84.2.20 virtual bool activemq::commands::BrokerInfo::isFaultTolerantConfiguration ( ) const [virtual]

6.84.2.21 virtual bool activemq::commands::BrokerInfo::isMasterBroker ( ) const [virtual]

6.84.2.22 virtual bool activemq::commands::BrokerInfo::isNetworkConnection ( ) const [virtual]

6.84.2.23 virtual bool activemq::commands::BrokerInfo::isSlaveBroker ( ) const [virtual]

6.84.2.24 virtual void activemq::commands::BrokerInfo::setBrokerId (const Pointer< BrokerId > & *brokerId*) [virtual]

6.84.2.25 virtual void activemq::commands::BrokerInfo::setBrokerName (const std::string & *brokerName*) [virtual]

6.84.2.26 virtual void activemq::commands::BrokerInfo::setBrokerUploadUrl (const std::string & *brokerUploadUrl*) [virtual]

6.84.2.27 virtual void **activemq::commands::BrokerInfo::setBrokerURL** (const std::string & *brokerURL*) [virtual]

6.84.2.28 virtual void **activemq::commands::BrokerInfo::setConnectionId** (long long *connectionId*) [virtual]

6.84.2.29 virtual void **activemq::commands::BrokerInfo::setDuplexConnection** (bool *duplexConnection*) [virtual]

6.84.2.30 virtual void **activemq::commands::BrokerInfo::setFaultTolerantConfiguration** (bool *faultTolerantConfiguration*) [virtual]

6.84.2.31 virtual void **activemq::commands::BrokerInfo::setMasterBroker** (bool *masterBroker*) [virtual]

6.84.2.32 virtual void **activemq::commands::BrokerInfo::setNetworkConnection** (bool *networkConnection*) [virtual]

6.84.2.33 virtual void **activemq::commands::BrokerInfo::setNetworkProperties** (const std::string & *networkProperties*) [virtual]

6.84.2.34 virtual void **activemq::commands::BrokerInfo::setPeerBrokerInfos** (const std::vector< decaf::lang::Pointer< BrokerInfo > > & *peerBrokerInfos*) [virtual]

6.84.2.35 virtual void **activemq::commands::BrokerInfo::setSlaveBroker** (bool *slaveBroker*) [virtual]

6.84.2.36 virtual std::string **activemq::commands::BrokerInfo::toString** ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.84.2.37 virtual Pointer<Command> **activemq::commands::BrokerInfo::visit** (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.85.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.85.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.85.3.3 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::looseMarshal (OpenWireFormat ∗ *format*, commands::DataStructure ∗ *command*, decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.85.3.4 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.85.3.5 virtual int activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.85.3.6 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.85.3.7 virtual void activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.86.1 Detailed Description

A container for data of a specific primitive type.

A buffer is a linear, finite sequence of elements of a specific primitive type. Aside from its content, the essential properties of a buffer are its capacity, limit, and position:

A buffer's capacity is the number of elements it contains. The capacity of a buffer is never negative and never changes.

A buffer's limit is the index of the first element that should not be read or written. A buffer's limit is never negative and is never greater than its capacity.

A buffer's position is the index of the next element to be read or written. A buffer's position is never negative and is never greater than its limit.

There is one subclass of this class for each non-boolean primitive type.

Transferring data: Each subclass of this class defines two categories of get and put operations:

- Relative operations read or write one or more elements starting at the current position and then increment the position by the number of elements transferred. If the requested transfer exceeds the limit then a relative get operation throws a **BufferUnderflowException** (p. 474) and a relative put operation throws a **BufferOverflowException** (p. 472); in either case, no data is transferred.
- Absolute operations take an explicit element index and do not affect the position. Absolute get and put operations throw an IndexOutOfBoundsException if the index argument exceeds the limit.

Data may also, of course, be transferred in to or out of a buffer by the I/O operations of an appropriate channel, which are always relative to the current position.

Marking and resetting:

A buffer's mark is the index to which its position will be reset when the reset method is invoked. The mark is not always defined, but when it is defined it is never negative and is never greater than the position. If the mark is

defined then it is discarded when the position or the limit is adjusted to a value smaller than the mark. If the mark is not defined then invoking the reset method causes an **InvalidMarkException** (p. 1193) to be thrown.

Invariants:

The following invariant holds for the mark, position, limit, and capacity values: 0 <= mark <= position <= limit <= capacity

A newly-created buffer always has a position of zero and a mark that is undefined. The initial limit may be zero, or it may be some other value that depends upon the type of the buffer and the manner in which it is constructed. The initial content of a buffer is, in general, undefined.

Clearing, flipping, and rewinding:

In addition to methods for accessing the position, limit, and capacity values and for marking and resetting, this class also defines the following operations upon buffers:

clear() (p. 454) makes a buffer ready for a new sequence of channel-read or relative put operations: It sets the limit to the capacity and the position to zero.

flip() (p. 454) makes a buffer ready for a new sequence of channel-write or relative get operations: It sets the limit to the current position and then sets the position to zero.

rewind() (p. 456) makes a buffer ready for re-reading the data that it already contains: It leaves the limit unchanged and sets the position to zero.

Read-only buffers:

Every buffer is readable, but not every buffer is writable. The mutation methods of each buffer class are specified as optional operations that will throw a **ReadOnlyBufferException** (p. 1739) when invoked upon a read-only buffer. A read-only buffer does not allow its content to be changed, but its mark, position, and limit values are mutable. Whether or not a buffer is read-only may be determined by invoking its isReadOnly method.

Thread safety:

Buffers are not safe for use by multiple concurrent threads. If a buffer is to be used by more than one thread then access to the buffer should be controlled by appropriate synchronization.

Invocation chaining:

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained; for example, the sequence of statements

b.flip(); b.position(23); b.limit(42);

can be replaced by the single, more compact statement b.flip().position(23).limit(42);

6.86.2 Constructor & Destructor Documentation

6.86.2.1 decaf::nio::Buffer::Buffer (int *capactiy*)

6.86.2.2 decaf::nio::Buffer::Buffer (const Buffer & *other*)

6.86.2.3 virtual decaf::nio::Buffer::~Buffer ( ) [inline, virtual]

6.86.3 Member Function Documentation

6.86.3.1 virtual int decaf::nio::Buffer::capacity ( ) const [inline, virtual]

Returns

this buffer's capacity.

6.86.3.2 virtual Buffer& decaf::nio::Buffer::clear ( ) [virtual]

Clears this buffer.

The position is set to zero, the limit is set to the capacity, and the mark is discarded.

Invoke this method before using a sequence of channel-read or put operations to fill this buffer. For example:

buf.clear(); // Prepare buffer for reading in.read(buf); // Read data

This method does not actually erase the data in the buffer, but it is named as if it did because it will most often be used in situations in which that might as well be the case.

Returns

a reference to this buffer.

6.86.3.3 virtual Buffer& decaf::nio::Buffer::flip ( ) [virtual]

Flips this buffer.

The limit is set to the current position and then the position is set to zero. If the mark is defined then it is discarded.

After a sequence of channel-read or put operations, invoke this method to prepare for a sequence of channel-write or relative get operations. For example:

```
buf.put(magic);    // Prepend header
in.read(buf);      // Read data into rest of buffer
buf.flip();        // Flip buffer
out.write(buf);    // Write header + data to channel
```

This method is often used in conjunction with the compact method when transferring data from one place to another.

Returns

a reference to this buffer.

6.86.3.4 virtual bool decaf::nio::Buffer::hasRemaining ( ) const [inline, virtual]

Tells whether there are any elements between the current position and the limit.

Returns

true if, and only if, there is at least one element remaining in this buffer.

6.86.3.5 virtual bool decaf::nio::Buffer::isReadOnly ( ) const [pure virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implemented in **decaf::nio::ByteBuffer** (p. 548), **decaf::internal::nio::ByteArrayBuffer** (p. 521), **decaf::internal::nio::CharArrayBuffer** (p. 607), **decaf::internal::nio::DoubleArrayBuffer** (p. 973), **decaf::internal::nio::FloatArrayBuffer** (p. 1057), **decaf::internal::nio::IntArrayBuffer** (p. 1151), **decaf::internal::nio::LongArrayBuffer** (p. 1358), and **decaf::internal::nio::ShortArrayBuffer** (p. 1873).

6.86.3.6 virtual int decaf::nio::Buffer::limit ( ) const [inline, virtual]

Returns

this buffers Limit

6.86.3.7 virtual Buffer& decaf::nio::Buffer::limit (int *newLimit*) [virtual]

Sets this buffer's limit.

If the position is larger than the new limit then it is set to the new limit. If the mark is defined and larger than the new limit then it is discarded.

Parameters

newLimit	The new limit value; must be no larger than this buffer's capacity.

Returns

A reference to This buffer

Exceptions

IllegalArgumentException	if preconditions on the new pos don't hold.

6.86.3.8 virtual Buffer& decaf::nio::Buffer::mark ( ) [virtual]

Sets this buffer's mark at its position.

Returns

a reference to this buffer.

6.86.3.9 virtual int decaf::nio::Buffer::position ( ) const [inline, virtual]

Returns

the current position in the buffer

6.86.3.10 virtual Buffer& decaf::nio::Buffer::position (int *newPosition*) [virtual]

Sets this buffer's position.

If the mark is defined and larger than the new position then it is discarded.

Parameters

newPosition	The new postion in the buffer to set.

Returns

a reference to This buffer.

Exceptions

IllegalArgumentException	if preconditions on the new pos don't hold.

6.86.3.11 virtual int decaf::nio::Buffer::remaining ( ) const [inline, virtual]

Returns the number of elements between the current position and the limit.

Returns

The number of elements remaining in this buffer

6.86.3.12 virtual Buffer& decaf::nio::Buffer::reset ( ) [virtual]

Resets this buffer's position to the previously-marked position.

Returns

a reference to this buffer.

Exceptions

InvalidMarkException *(p. 1193)*	- If the mark has not been set

6.86.3.13 virtual Buffer& decaf::nio::Buffer::rewind ( ) [virtual]

Rewinds this buffer.

The position is set to zero and the mark is discarded.

Invoke this method before a sequence of channel-write or get operations, assuming that the limit has already been set appropriately. For example:

out.write(buf); // Write remaining data buf.rewind(); // Rewind buffer buf.get(array); // Copy data into array

Returns

a reference to this buffer.

6.86.4 Field Documentation

6.86.4.1 int decaf::nio::Buffer::_capacity [protected]

6.86.4.2 int decaf::nio::Buffer::_limit [protected]

6.86.4.3 int decaf::nio::Buffer::_mark [protected]

6.86.4.4 bool decaf::nio::Buffer::_markSet [protected]

6.86.4.5 int decaf::nio::Buffer::_position [mutable, protected]

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**Buffer.h**

6.87 decaf::io::BufferedInputStream Class Reference

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

`#include <src/main/decaf/io/BufferedInputStream.h>`

Inheritance diagram for decaf::io::BufferedInputStream:

Public Member Functions

- **BufferedInputStream** (**InputStream** ∗stream, bool **own**=false)

  Constructor.
- **BufferedInputStream** (**InputStream** ∗stream, int bufferSize, bool **own**=false)

  Constructor.
- virtual ∼**BufferedInputStream** ()
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual void **close** ()

  *Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.*
  The default implementation of this method does nothing.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs while closing the **InputStream** (p. 1134).*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
  *The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

  Parameters

num	*The number of bytes to skip.*

  Returns

  total bytes skipped

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last

marked position so that subsequent reads re-read the same bytes.
If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
Calling mark on a closed stream instance should have no effect.
The default implementation of this method does nothing.

Parameters

readLimit	*The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then:
  - *If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.*
  - *If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

  If the method markSupported returns false, then:
  - *The call to reset may throw an **IOException** (p. 1198).*
  - *If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

  *The default implementation of this method throws an **IOException** (p. 1198).*

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual bool **markSupported** () **const**

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.

  Returns

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.87.1 Detailed Description

A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.

6.87.2 Constructor & Destructor Documentation

6.87.2.1 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream,* bool *own* = `false`)

Constructor.

Parameters

stream	The target input stream to buffer.
own	Indicates if we own the stream object, defaults to false.

6.87.2.2 decaf::io::BufferedInputStream::BufferedInputStream (InputStream * *stream,* int *bufferSize,* bool *own* = false)

Constructor.

Parameters

stream	The target input stream to buffer.
bufferSize	The size in bytes to allocate for the internal buffer.
own	Indicates if we own the stream object, defaults to false.

Exceptions

IllegalArgumentException	is the size is zero or negative.

6.87.2.3 virtual decaf::io::BufferedInputStream::~BufferedInputStream ( ) [virtual]

6.87.3 Member Function Documentation

6.87.3.1 virtual int decaf::io::BufferedInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1034).

6.87.3.2 virtual void decaf::io::BufferedInputStream::close ( ) [virtual]

Closes the **InputStream** (p. 1134) freeing any resources that might have been acquired during the lifetime of this stream.

The default implementation of this method does nothing.

Exceptions

IOException *(*p. *1198)*	if an I/O error occurs while closing the **InputStream** (p. 1134).

Reimplemented from **decaf::io::FilterInputStream** (p. 1034).

6.87.3.3 virtual int decaf::io::BufferedInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.87.3.4 virtual int decaf::io::BufferedInputStream::doReadByte ( ) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.87.3.5 virtual void decaf::io::BufferedInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.87.3.6 virtual bool decaf::io::BufferedInputStream::markSupported ( ) const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.87.3.7 virtual void decaf::io::BufferedInputStream::reset ( ) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

6.87.3.8 virtual long long decaf::io::BufferedInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

The documentation for this class was generated from the following file:

6.88.2 Constructor & Destructor Documentation

6.88.2.1 decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * *stream,* bool *own* = `false`)

Constructor.

Parameters

stream	The target output stream.
own	Indicates if this class owns the stream pointer.

6.88.2.2 decaf::io::BufferedOutputStream::BufferedOutputStream (OutputStream * *stream,* int *bufferSize,* bool *own* = `false`)

Constructor.

Parameters

stream	The target output stream.
bufferSize	The size for the internal buffer.
own	Indicates if this class owns the stream pointer.

Exceptions

IllegalArgumentException	if the bufferSize given is negative.

  Wraps the passed STL Short Vector in a ShortBuffer.

6.89.1 Detailed Description

Factory class used by static methods in the **decaf::nio** (p. 74) package to create the various default version of the NIO interfaces.

Since

1.0

6.89.2 Constructor & Destructor Documentation

6.89.2.1 virtual decaf::internal::nio::BufferFactory::~BufferFactory ( ) [inline, virtual]

6.89.3 Member Function Documentation

6.89.3.1 static decaf::nio::ByteBuffer∗ decaf::internal::nio::BufferFactory::createByteBuffer (int *capacity*) [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated ByteBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.2 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new ByteBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new ByteBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.3 static decaf::nio::ByteBuffer* decaf::internal::nio::BufferFactory::createByteBuffer (std::vector< unsigned char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a ByteBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new ByteBuffer that is backed by buffer, caller owns.

6.89.3.4 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (int *capacity*) [static]

Allocates a new char buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated CharBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.5 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (char * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new CharBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new CharBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.6 static decaf::nio::CharBuffer* decaf::internal::nio::BufferFactory::createCharBuffer (std::vector< char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a CharBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new CharBuffer that is backed by buffer, caller owns.

6.89.3.7 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (int *capacity*) [static]

Allocates a new double buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.8 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (double * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new DoubleBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new DoubleBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.9 static decaf::nio::DoubleBuffer* decaf::internal::nio::BufferFactory::createDoubleBuffer (std::vector< double > & *buffer*) [static]

Wraps the passed STL Double Vector in a DoubleBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be

undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new DoubleBuffer that is backed by buffer, caller owns.

6.89.3.10 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (int *capacity*) [static]

Allocates a new float buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated FloatBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.11 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (float * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new FloatBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new FloatBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.12 static decaf::nio::FloatBuffer* decaf::internal::nio::BufferFactory::createFloatBuffer (std::vector< float > & *buffer*) [static]

Wraps the passed STL Float Vector in a FloatBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new FloatBuffer that is backed by buffer, caller owns.

6.89.3.13 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int *capacity*) [static]

Allocates a new int buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated IntBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.14 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (int * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new IntBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new IntBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.15 static decaf::nio::IntBuffer* decaf::internal::nio::BufferFactory::createIntBuffer (std::vector< int > & *buffer*) [static]

Wraps the passed STL int Vector in a IntBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new IntBuffer that is backed by buffer, caller owns.

6.89.3.16 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (int *capacity*) [static]

Allocates a new long long buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	- the internal buffer's capacity.

Returns

a newly allocated DoubleBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.17 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (long long * *buffer,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new LongBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.

length	The length of the subarray to be used.

Returns

a new LongBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.18 static decaf::nio::LongBuffer* decaf::internal::nio::BufferFactory::createLongBuffer (std::vector< long long > & *buffer*) [static]

Wraps the passed STL Long Vector in a LongBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new LongBuffer that is backed by buffer, caller owns.

6.89.3.19 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (int *capacity*) [static]

Allocates a new short buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated ShortBuffer which the caller owns.

Exceptions

IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.20 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (short * *buffer*, int *size*, int *offset*, int *length*) [static]

Wraps the passed buffer with a new ShortBuffer.

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The array that will back the new buffer.
size	The size of the specified buffer.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new ShortBuffer that is backed by buffer, caller owns the returned pointer.

Exceptions

NullPointerException	if the buffer given in Null.
IndexOutOfBounds-Exception	if the capacity specified is negative.

6.89.3.21 static decaf::nio::ShortBuffer* decaf::internal::nio::BufferFactory::createShortBuffer (std::vector< short > & *buffer*) [static]

Wraps the passed STL Short Vector in a ShortBuffer.

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new DoubleBuffer that is backed by buffer, caller owns.

6.90.1.1 decaf::nio::BufferOverflowException::BufferOverflowException ( ) throw () [inline]

Default Constructor.

6.90.1.2 decaf::nio::BufferOverflowException::BufferOverflowException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.90.1.3 decaf::nio::BufferOverflowException::BufferOverflowException (const BufferOverflowException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.90.1.4 decaf::nio::BufferOverflowException::BufferOverflowException (const char ∗ *file*, const int *lineNumber*, const std::exception ∗ *cause*, const char ∗ *msg*, ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.90.1.5 decaf::nio::BufferOverflowException::BufferOverflowException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.90.1.6 decaf::nio::BufferOverflowException::BufferOverflowException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.90.1.7 virtual decaf::nio::BufferOverflowException::~BufferOverflowException ( ) throw () [inline, virtual]

6.90.2 Member Function Documentation

6.90.2.1 virtual BufferOverflowException* decaf::nio::BufferOverflowException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**BufferOverflowException.h**

6.91 decaf::nio::BufferUnderflowException Class Reference

`#include <src/main/decaf/nio/BufferUnderflowException.h>`

Inheritance diagram for decaf::nio::BufferUnderflowException:

Public Member Functions

`#include <src/main/decaf/lang/Byte.h>`

Inheritance diagram for decaf::lang::Byte:

Public Member Functions

- **Byte** (unsigned char value)
- **Byte** (**const** std::string &value)

  *Creates a new **Byte** (p. 476) instance from the given string.*
- virtual ~**Byte** ()

- virtual int **compareTo** (**const Byte** &c) **const**

  *Compares this **Byte** (p. 476) instance with another.*
- virtual bool **operator==** (**const Byte** &c) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Byte** &c) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** unsigned char &c) **const**

  *Compares this **Byte** (p. 476) instance with a char type.*
- virtual bool **operator==** (**const** unsigned char &c) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** unsigned char &c) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (**const Byte** &c) **const**
- bool **equals** (**const** unsigned char &c) **const**
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.

Static Public Member Functions

- static std::string **toString** (unsigned char value)
- static **Byte decode** (**const** std::string &value)

  *Decodes a **String** (p. 2031) into a **Byte** (p. 476).*
- static unsigned char **parseByte** (**const** std::string &s, int radix)

  Parses the string argument as a signed unsigned char in the radix specified by the second argument.
- static unsigned char **parseByte** (**const** std::string &s)

  Parses the string argument as a signed decimal unsigned char.
- static **Byte valueOf** (unsigned char value)

  *Returns a **Character** (p. 593) instance representing the specified char value.*
- static **Byte valueOf** (**const** std::string &value)

  *Returns a **Byte** (p. 476) object holding the value given by the specified std::string.*
- static **Byte valueOf** (**const** std::string &value, int radix)

  *Returns a **Byte** (p. 476) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.*

Static Public Attributes

- static **const** unsigned char **MIN_VALUE** = 0x7F

  The minimum value that a unsigned char can take on.
- static **const** unsigned char **MAX_VALUE** = 0x80

  The maximum value that a unsigned char can take on.
- static **const** int **SIZE** = 8

  The size of the primitive charactor in bits.

6.92.1 Constructor & Destructor Documentation

6.92.1.1 decaf::lang::Byte::Byte (unsigned char *value*)

Parameters

value	- the primitive value to wrap

6.92.1.2 decaf::lang::Byte::Byte (const std::string & *value*)

Creates a new **Byte** (p. 476) instance from the given string.

Parameters

value	The string to convert to an unsigned char

Exceptions

NumberFormatException	if the string is not a valid byte.

6.92.1.3 virtual decaf::lang::Byte::~Byte ( ) [inline, virtual]

6.92.2 Member Function Documentation

6.92.2.1 virtual unsigned char decaf::lang::Byte::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.92.2.2 virtual int decaf::lang::Byte::compareTo (const Byte & *c*) const [inline, virtual]

Compares this **Byte** (p. 476) instance with another.

Parameters

c	- the **Byte** (p. 476) instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Byte** > (p. 687).

6.92.2.3 virtual int decaf::lang::Byte::compareTo (const unsigned char & *c*) const [inline, virtual]

Compares this **Byte** (p. 476) instance with a char type.

Parameters

c	- the char instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **unsigned char** > (p. 687).

6.92.2.4 static Byte decaf::lang::Byte::decode (const std::string & *value*) [static]

Decodes a **String** (p. 2031) into a **Byte** (p. 476).

Accepts decimal, hexadecimal, and octal numbers given by the following grammar:

The sequence of characters following an (optional) negative sign and/or radix specifier ("0x", "0X", "#", or leading zero) is parsed as by the **Byte::parseByte** (p. 481) method with the indicated radix (10, 16, or 8). This sequence of characters must represent a positive value or a NumberFormatException will be thrown. The result is negated if first character of the specified **String** (p. 2031) is the minus sign. No whitespace characters are permitted in the string.

Parameters

value	- The string to decode

Returns

a **Byte** (p. 476) object containing the decoded value

Exceptions

NumberFomatException	if the string is not formatted correctly.

6.92.2.5 virtual double decaf::lang::Byte::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.92.2.6 bool decaf::lang::Byte::equals (const Byte & *c*) const [inline, virtual]

Returns

true if the two **Byte** (p. 476) Objects have the same value.

Implements **decaf::lang::Comparable**< **Byte** > (p. 688).

6.92.2.7 bool decaf::lang::Byte::equals (const unsigned char & *c*) const [inline, virtual]

Returns

true if the two Bytes have the same value.

Implements **decaf::lang::Comparable< unsigned char >** (p. 688).

6.92.2.8 virtual float decaf::lang::Byte::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.92.2.9 virtual int decaf::lang::Byte::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.92.2.10 virtual long long decaf::lang::Byte::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.92.2.11 virtual bool decaf::lang::Byte::operator< (const Byte & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Byte >** (p. 688).

6.92.2.12 virtual bool decaf::lang::Byte::operator< (const unsigned char & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 688).

6.92.2.13 virtual bool decaf::lang::Byte::operator== (const Byte & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Byte >** (p. 688).

6.92.2.14 virtual bool decaf::lang::Byte::operator== (const unsigned char & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< unsigned char >** (p. 688).

6.92.2.15 static unsigned char decaf::lang::Byte::parseByte (const std::string & *s,* int *radix*) [static]

Parses the string argument as a signed unsigned char in the radix specified by the second argument.

The characters in the string must all be digits, of the specified radix (as determined by whether **Character.digit(char, int)** (p. 595) returns a nonnegative value) except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting byte value is returned.

An exception of type NumberFormatException is thrown if any of the following situations occurs:

- The first argument is null or is a string of length zero.
- The radix is either smaller than **Character.MIN_RADIX** (p. 599) or larger than **Character::MAX_RADIX** (p. 599).
- Any character of the string is not a digit of the specified radix, except that the first character may be a minus sign '-' provided that the string is longer than length 1.
- The value represented by the string is not a value of type unsigned char.

Parameters

s	- the **String** (p. 2031) containing the unsigned char to be parsed
radix	- the radix to be used while parsing s

Returns

the unsigned char represented by the string argument in the specified radix.

Exceptions

NumberFormatException	- If **String** (p. 2031) does not contain a parsable unsigned char.

6.92.2.16 static unsigned char decaf::lang::Byte::parseByte (const std::string & *s*) [static]

Parses the string argument as a signed decimal unsigned char.

The characters in the string must all be decimal digits, except that the first character may be an ASCII minus sign '-' to indicate a negative value. The resulting unsigned char value is returned, exactly as if the argument and the radix 10 were given as arguments to the parseByte(const std::string, int) method.

Parameters

s	- **String** (p. 2031) to convert to a unsigned char

Returns

the converted unsigned char value

Exceptions

NumberFormatException	if the string is not a unsigned char.

6.92.2.17 virtual short decaf::lang::Byte::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.92.2.18 std::string decaf::lang::Byte::toString ( ) const

Returns

this **Byte** (p. 476) Object as a **String** (p. 2031) Representation

6.92.2.19 static std::string decaf::lang::Byte::toString (unsigned char *value*) [static]

Returns

a string representing the primitive value as Base 10

6.92.2.20 static Byte decaf::lang::Byte::valueOf (unsigned char *value*) [inline, static]

Returns a **Character** (p. 593) instance representing the specified char value.

Parameters

value	- the primitive char to wrap.

Returns

a new **Character** (p. 593) instance that wraps this value.

6.92.2.21 static Byte decaf::lang::Byte::valueOf (const std::string & *value*) [static]

Returns a **Byte** (p. 476) object holding the value given by the specified std::string.

The argument is interpreted as representing a signed decimal unsigned char, exactly as if the argument were given to the parseByte(std::string) method. The result is a **Byte** (p. 476) object that represents the unsigned char value specified by the string.

Parameters

value	- std::string to parse as base 10

Returns

new **Byte** (p. 476) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a decimal unsigned char.

6.92.2.22 static Byte decaf::lang::Byte::valueOf (const std::string & *value,* int *radix*) [static]

Returns a **Byte** (p. 476) object holding the value extracted from the specified std::string when parsed with the radix given by the second argument.

The first argument is interpreted as representing a signed unsigned char in the radix specified by the second argument, exactly as if the argument were given to the parseByte(std::string, int) method. The result is a **Byte** (p. 476) object that represents the unsigned char value specified by the string.

Parameters

value	- std::string to parse as base (radix)
radix	- base of the string to parse.

Returns

new **Byte** (p. 476) Object wrapping the primitive

Exceptions

NumberFormatException	if the string is not a valid unsigned char.

6.92.3 Field Documentation

6.92.3.1 const unsigned char decaf::lang::Byte::MAX_VALUE = 0x80 [static]

The maximum value that a unsigned char can take on.

6.92.3.2 const unsigned char decaf::lang::Byte::MIN_VALUE = 0x7F [static]

The minimum value that a unsigned char can take on.

6.92.3.3 const int decaf::lang::Byte::SIZE = 8 [static]

The size of the primitive charactor in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Byte.h**

6.93 decaf::internal::util::ByteArrayAdapter Class Reference

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

`#include <src/main/decaf/internal/util/ByteArrayAdapter.h>`

Data Structures

- union **Array**

Public Member Functions

- **ByteArrayAdapter** (int size)

  Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.
- **ByteArrayAdapter** (unsigned char ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (char ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (double ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (float ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (long long ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (int ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- **ByteArrayAdapter** (short ∗array, int size, bool own=false)

  Creates a byte array object that wraps the given array.
- virtual ∼**ByteArrayAdapter** ()
- virtual int **getCapacity** () **const**

  Gets the size of the underlying array.
- virtual int **getCharCapacity** () **const**

Gets the size of the underlying array as if it contains chars.

- virtual int **getDoubleCapacity** () **const**

  Gets the size of the underlying array as if it contains doubles.
- virtual int **getFloatCapacity** () **const**

  Gets the size of the underlying array as if it contains doubles.
- virtual int **getLongCapacity** () **const**

  Gets the size of the underlying array as if it contains doubles.
- virtual int **getIntCapacity** () **const**

  Gets the size of the underlying array as if it contains ints.
- virtual int **getShortCapacity** () **const**

  Gets the size of the underlying array as if it contains shorts.
- virtual unsigned char * **getByteArray** ()

  Gets the pointer to the array we are wrapping.
- virtual char * **getCharArray** ()

  Gets the pointer to the array we are wrapping.
- virtual short * **getShortArray** ()

  Gets the pointer to the array we are wrapping.
- virtual int * **getIntArray** ()

  Gets the pointer to the array we are wrapping.
- virtual long long * **getLongArray** ()

  Gets the pointer to the array we are wrapping.
- virtual double * **getDoubleArray** ()

  Gets the pointer to the array we are wrapping.
- virtual float * **getFloatArray** ()

  Gets the pointer to the array we are wrapping.
- virtual void **read** (unsigned char *buffer, int size, int offset, int length) **const**

  Reads from the Byte array starting at the specified offset and reading the specified length.
- virtual void **write** (unsigned char *buffer, int size, int offset, int length)

  Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.
- virtual void **resize** (int size)

  Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.
- virtual void **clear** () throw ()

  Clear all data from that Array, setting the underlying bytes to zero.
- unsigned char & **operator[]** (int index)

  *Allows the **ByteArrayAdapter*** (p. *484)* *to be indexed as a standard array.*
- **const** unsigned char & **operator[]** (int index) **const**
- virtual unsigned char **get** (int index) **const**

  Absolute get method.
- virtual char **getChar** (int index) **const**

  Reads one byte at the given index and returns it.
- virtual double **getDouble** (int index) **const**

  Reads eight bytes at the given index and returns it.
- virtual double **getDoubleAt** (int index) **const**

  Reads eight bytes at the given byte index and returns it.
- virtual float **getFloat** (int index) **const**

  Reads four bytes at the given index and returns it.
- virtual float **getFloatAt** (int index) **const**

  Reads four bytes at the given byte index and returns it.
- virtual long long **getLong** (int index) **const**

Reads eight bytes at the given index and returns it.

- virtual long long **getLongAt** (int index) **const**

  Reads eight bytes at the given byte index and returns it.

- virtual int **getInt** (int index) **const**

  Reads four bytes at the given index and returns it.

- virtual int **getIntAt** (int index) **const**

  Reads four bytes at the given byte index and returns it.

- virtual short **getShort** (int index) **const**

  Reads two bytes at the given index and returns it.

- virtual short **getShortAt** (int index) **const**

  Reads two bytes at the given byte index and returns it.

- virtual **ByteArrayAdapter** & **put** (int index, unsigned char value)

  Writes the given byte into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putChar** (int index, char value)

  Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putDouble** (int index, double value)

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putDoubleAt** (int index, double value)

  Writes eight bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putFloat** (int index, float value)

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putFloatAt** (int index, float value)

  Writes four bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putLong** (int index, long long value)

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putLongAt** (int index, long long value)

  Writes eight bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putInt** (int index, int value)

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putIntAt** (int index, int value)

  Writes four bytes containing the given value, into this buffer at the given byte index.

- virtual **ByteArrayAdapter** & **putShort** (int index, short value)

  Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteArrayAdapter** & **putShortAt** (int index, short value)

  Writes two bytes containing the given value, into this buffer at the given byte index.

6.93.1 Detailed Description

This class adapts primitive type arrays to a base byte array so that the classes can inter-operate on the same base byte array without copying data.

All the array types are mapped down to a byte array and methods are supplied for accessing the data in any of the primitive type forms.

Methods in this class that do not return a specific value return a reference to this object so that calls can be chained.

Since

1.0

6.93.2 Constructor & Destructor Documentation

6.93.2.1 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int *size*)

Creates a byte array object that is allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.

Exceptions

IllegalArgumentException	if size is negative.

6.93.2.2 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (unsigned char * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.3 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (char * *array*, int *size*, bool *own* = `false`)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.4 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (double * *array*, int *size*, bool *own* = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.5 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (float * *array*, int *size*, bool *own* = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.6 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (long long * *array*, int *size*, bool *own* = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.7 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (int * *array,* int *size,* bool *own* = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.8 decaf::internal::util::ByteArrayAdapter::ByteArrayAdapter (short * *array,* int *size,* bool *own* = false)

Creates a byte array object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The physical array to wrap.
size	The size of the array, this is the limit we read and write to.
own	Indicates if this class is now the owner of the pointer.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the size is negative.

6.93.2.9 virtual decaf::internal::util::ByteArrayAdapter::~ByteArrayAdapter ( ) [virtual]

6.93.3 Member Function Documentation

6.93.3.1 virtual void decaf::internal::util::ByteArrayAdapter::clear ( ) throw () [virtual]

Clear all data from that Array, setting the underlying bytes to zero.

6.93.3.2 virtual unsigned char decaf::internal::util::ByteArrayAdapter::get (int *index*) const [virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

index	The index in the Buffer where the byte is to be read.

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	If index is not smaller than the buffer's limit or is negative.

6.93.3.3 virtual unsigned char* decaf::internal::util::ByteArrayAdapter::getByteArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an unsigned char* pointer to the array this object wraps.

6.93.3.4 virtual int decaf::internal::util::ByteArrayAdapter::getCapacity ( ) const [inline, virtual]

Gets the size of the underlying array.

Returns

the size the array.

6.93.3.5 virtual char decaf::internal::util::ByteArrayAdapter::getChar (int *index*) const [virtual]

Reads one byte at the given index and returns it.

Parameters

index	The index in the Buffer where the byte is to be read.

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	If index is not smaller than the buffer's limit or is negative.

6.93.3.6 virtual char* decaf::internal::util::ByteArrayAdapter::getCharArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an char* pointer to the array this object wraps.

6.93.3.7 virtual int decaf::internal::util::ByteArrayAdapter::getCharCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains chars.

Returns

the size the array.

6.93.3.8 virtual double decaf::internal::util::ByteArrayAdapter::getDouble (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The index in the Buffer where the bytes are to be read.

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.9 virtual double∗ decaf::internal::util::ByteArrayAdapter::getDoubleArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an double∗ pointer to the array this object wraps.

6.93.3.10 virtual double decaf::internal::util::ByteArrayAdapter::getDoubleAt (int *index*) const [virtual]

Reads eight bytes at the given byte index and returns it.

Parameters

index	The index in the Buffer where the bytes are to be read

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.11 virtual int decaf::internal::util::ByteArrayAdapter::getDoubleCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.12 virtual float decaf::internal::util::ByteArrayAdapter::getFloat (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The index in the Buffer where the bytes are to be read.

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.13 virtual float∗ decaf::internal::util::ByteArrayAdapter::getFloatArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an float∗ pointer to the array this object wraps.

6.93.3.14 virtual float decaf::internal::util::ByteArrayAdapter::getFloatAt (int *index*) const [virtual]

Reads four bytes at the given byte index and returns it.

Parameters

index	The index in the Buffer where the bytes are to be read

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.15 virtual int decaf::internal::util::ByteArrayAdapter::getFloatCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.16 virtual int decaf::internal::util::ByteArrayAdapter::getInt (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The index in the Buffer where the bytes are to be read.

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.17 virtual int∗ decaf::internal::util::ByteArrayAdapter::getIntArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an int∗ pointer to the array this object wraps.

6.93.3.18 virtual int decaf::internal::util::ByteArrayAdapter::getIntAt (int *index*) const [virtual]

Reads four bytes at the given byte index and returns it.

Parameters

index	The index in the Buffer where the bytes are to be read

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.19 virtual int decaf::internal::util::ByteArrayAdapter::getIntCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains ints.

Returns

the size the array.

6.93.3.20 virtual long long decaf::internal::util::ByteArrayAdapter::getLong (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The index in the Buffer where the bytes are to be read.

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.21 virtual long long∗ decaf::internal::util::ByteArrayAdapter::getLongArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an long long∗ pointer to the array this object wraps.

6.93.3.22 virtual long long decaf::internal::util::ByteArrayAdapter::getLongAt (int *index*) const [virtual]

Reads eight bytes at the given byte index and returns it.

Parameters

index	The index in the Buffer where the bytes are to be read

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.23 virtual int decaf::internal::util::ByteArrayAdapter::getLongCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains doubles.

Returns

the size the array.

6.93.3.24 virtual short decaf::internal::util::ByteArrayAdapter::getShort (int *index*) const [virtual]

Reads two bytes at the given index and returns it.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The index in the Buffer where the bytes are to be read.

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.25 virtual short∗ decaf::internal::util::ByteArrayAdapter::getShortArray ( ) [inline, virtual]

Gets the pointer to the array we are wrapping.

Changes to the data in this array are reflected by all **ByteArrayAdapter** (p. 484) objects that point to this array.

Returns

an short∗ pointer to the array this object wraps.

6.93.3.26 virtual short decaf::internal::util::ByteArrayAdapter::getShortAt (int *index*) const [virtual]

Reads two bytes at the given byte index and returns it.

Parameters

index	The index in the Buffer where the bytes are to be read

Returns

the value at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

6.93.3.27 virtual int decaf::internal::util::ByteArrayAdapter::getShortCapacity ( ) const [inline, virtual]

Gets the size of the underlying array as if it contains shorts.

Returns

the size the array.

6.93.3.28 unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int *index*)

Allows the **ByteArrayAdapter** (p. 484) to be indexed as a standard array.

calling the non constant version allows the user to change the value at index

Parameters

index	The position in the array to access, if the value is negative or greater than the size of the underlying array an IndexOutOfBoundsException is thrown.

Exceptions

IndexOutOfBounds-Exception	if the preconditions of index are not met.

6.93.3.29 const unsigned char& decaf::internal::util::ByteArrayAdapter::operator[] (int *index*) const

6.93.3.30 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::put (int *index,* unsigned char *value*) [virtual]

Writes the given byte into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.31 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putChar (int *index,* char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array

index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.32 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDouble (int *index,* double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.33 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putDoubleAt (int *index,* double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

index	The position in the Buffer to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.34 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloat (int *index,* float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.35 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putFloatAt (int *index,* float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

index	The position in the Buffer to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.36 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putInt (int *index,* int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.37 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putIntAt (int *index,* int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given byte index.

Parameters

index	The position in the Buffer to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.38 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLong (int *index,* long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.39 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putLongAt (int *index,* long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given byte index.

Parameters

index	The position in the Buffer to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.40 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShort (int *index,* short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given index.

The index is a relative to the size of the type to be read, in other words when accessing the element in the array index ∗ sizeof(type) if the actual start index of the type to be read.

Parameters

index	The position in the Buffer to write the data.
value	The value to write to the array.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.41 virtual ByteArrayAdapter& decaf::internal::util::ByteArrayAdapter::putShortAt (int *index,* short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given byte index.

Parameters

index	The position in the Buffer to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

6.93.3.42 virtual void decaf::internal::util::ByteArrayAdapter::read (unsigned char * *buffer,* int *size,* int *offset,* int *length*) const [virtual]

Reads from the Byte array starting at the specified offset and reading the specified length.

If the length is greater than the size of this underlying byte array then an BufferUnderflowException is thrown.

Parameters

buffer	The buffer to read data from this array into.
size	The size of the buffer passed.
offset	The position in this array to start reading from.
length	The amount of data to read from this array.

Exceptions

IndexOutOfBounds-Exception	if the offset + length exceeds the size.
NullPointerException	if buffer is null
BufferUnderflowException	if there is not enough data to read because the offset or the length is greater than the size of this array.

6.93.3.43 virtual void decaf::internal::util::ByteArrayAdapter::resize (int *size*) [virtual]

Resizes the underlying array to the new given size, preserving all the Data that was previously in the array, unless the resize is smaller than the current size in which case only the data that will fit into the new array is preserved.

A **ByteArrayAdapter** (p. 484) can only be resized when it owns the underlying array, if it does not then it will throw an InvalidStateException.

Parameters

size	The new size of the array.

Exceptions

IllegalArgumentException	if the size parameter is negative.
InvalidStateException	if this object does not own the buffer.

6.93.3.44 virtual void decaf::internal::util::ByteArrayAdapter::write (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Writes from the Byte array given, starting at the specified offset and writing the specified amount of data into this objects internal array.

. If the length is greater than the size of this underlying byte array then an BufferOverflowException is thrown.

Parameters

buffer	The buffer to read data from this array into.
size	The size of the buffer passed.
offset	The position in this array to start reading from.
length	The amount of data to read from this array.

Exceptions

IndexOutOfBounds-Exception	if the offset + length exceeds the size.
NullPointerException	if buffer is null
BufferOverflowException	if the amount of data to be written to this array or the offset given are larger than this array's size.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/util/**ByteArrayAdapter.h**

6.94 decaf::internal::nio::ByteArrayBuffer Class Reference

This class defines six categories of operations upon byte buffers:

`#include <src/main/decaf/internal/nio/ByteArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::ByteArrayBuffer:

Public Member Functions

- **ByteArrayBuffer** (int **capacity**, bool readOnly=false)

  *Creates a **ByteArrayBuffer** (p. 502) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **ByteArrayBuffer** (unsigned char ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **ByteArrayBuffer** (p. 502) object that wraps the given array.*
- **ByteArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **ByteArrayBuffer** (**const ByteArrayBuffer** &other)

  *Create a **ByteArrayBuffer** (p. 502) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.*
- virtual ∼**ByteArrayBuffer** ()
- virtual bool **isReadOnly** () **const**

  Tells whether or not this buffer is read-only.

  Returns

  true if, and only if, this buffer is read-only
- virtual unsigned char ∗ **array** ()

  Returns the byte array that backs this buffer.
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The array that backs this buffer

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is backed by an array but is read-only*
UnsupportedOperation-Exception	*if this buffer is not backed by an accessible array*

- virtual int **arrayOffset** () **const**

  Returns the offset within this buffer's backing array of the first element of the buffer.

*If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 540).*
Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is backed by an array but is read-only.*
UnsupportedOperation-Exception	*if this buffer is not backed by an accessible array.*

- virtual bool **hasArray** () **const**

  Tells whether or not this buffer is backed by an accessible byte array.
  If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

  Returns

  true if, and only if, this buffer is backed by an array and is not read-only.

- virtual **decaf::nio::CharBuffer** * **asCharBuffer** () **const**

  Creates a view of this byte buffer as a char buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the new Char **Buffer** (p. 451), which the caller then owns.*

- virtual **decaf::nio::DoubleBuffer** * **asDoubleBuffer** () **const**

  Creates a view of this byte buffer as a double buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the new double **Buffer** (p. 451), which the caller then owns.*

- virtual **decaf::nio::FloatBuffer** * **asFloatBuffer** () **const**

  Creates a view of this byte buffer as a float buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the new float **Buffer** (p. 451), which the caller then owns.*

- virtual **decaf::nio::IntBuffer** * **asIntBuffer** () **const**

  Creates a view of this byte buffer as a int buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the new int **Buffer** (p. 451), which the caller then owns.*

- virtual **decaf::nio::LongBuffer** * **asLongBuffer** () **const**

  Creates a view of this byte buffer as a long buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the new long **Buffer** (p. 451), which the caller then owns.*

- virtual **decaf::nio::ShortBuffer** * **asShortBuffer** () **const**

  Creates a view of this byte buffer as a short buffer.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns

  *the new short **Buffer** (p. 451), which the caller then owns.*

- virtual **ByteArrayBuffer** * **asReadOnlyBuffer** () **const**

  Creates a new, read-only byte buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.
  Returns

  The new, read-only byte buffer which the caller then owns.

- virtual **ByteArrayBuffer** & **compact** ()

  Compacts this buffer.
  *The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.
  Returns

  *a reference to this **ByteBuffer** (p. 535).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** * **duplicate** ()

  Creates a new byte buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.
  Returns

  *a new Byte **Buffer** (p. 451) which the caller owns.*

- virtual unsigned char **get** () **const**

  Relative get method.
  Reads the byte at this buffer's current position, and then increments the position.
  Returns

  The byte at the buffer's current position.

  Exceptions

BufferUnderflowException (p. 474)	*if the buffer's current position is not smaller than its limit.*

- virtual unsigned char **get** (int index) **const**

  Absolute get method.
  Reads the byte at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the byte is to be read.*

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or index is negative.*

- virtual char **getChar** ()

  Reads the next byte at this buffer's current position, and then increments the position by one.

  Returns

  the next char in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual char **getChar** (int index) **const**

  Reads one byte at the given index and returns it.

  Parameters

index	*The index in the **Buffer** (p. 451) where the byte is to be read.*

  Returns

  the char at the given index in the buffer

  Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or index is negative.*

- virtual double **getDouble** ()

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

  Returns

  the next double in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual double **getDouble** (int index) **const**

  Reads eight bytes at the given index and returns it.

  Parameters

index	*The index in the **Buffer** (p. 451) where the bytes are to be read.*

  Returns

  the double at the given index in the buffer.

  Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit, or index is negative.*

- virtual float **getFloat** ()

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

  Returns

  the next float in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual float **getFloat** (int index) **const**

  Reads four bytes at the given index and returns it.

Parameters

index	*The index in the **Buffer** (p. 451) where the bytes are to be read.*

Returns

the float at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	*if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual long long **getLong** ()

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

  Returns

  the next long long in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual long long **getLong** (int index) **const**

  Reads eight bytes at the given index and returns it.

  Parameters

index	*The index in the **Buffer** (p. 451) where the bytes are to be read.*

  Returns

  the long long at the given index in the buffer.

  Exceptions

IndexOutOfBoundsException	*if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual int **getInt** ()

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

  Returns

  the next int in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual int **getInt** (int index) **const**

  Reads four bytes at the given index and returns it.

  Parameters

index	*The index in the **Buffer** (p. 451) where the bytes are to be read.*

  Returns

  the int at the given index in the buffer.

  Exceptions

IndexOutOfBoundsException	*if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual short **getShort** ()

  Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

  Returns

  the next short in the buffer.

  Exceptions

BufferUnderflowException (p. 474)	*if there are no more bytes remaining in this buffer, meaning we have reached the set limit.*

- virtual short **getShort** (int index) **const**

  Reads two bytes at the given index and returns it.

Parameters

index	*The index in the **Buffer** (p. 451) where the bytes are to be read.*

Returns

the short at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	*if there are not enough bytes remaining to fill the requested Data Type, or index is negative.*

- virtual **ByteArrayBuffer** & **put** (unsigned char value)

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value	*- the byte value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **put** (int index, unsigned char value)

Writes the given byte into this buffer at the given index.

Parameters

index	*- position in the **Buffer** (p. 451) to write the data*
value	*- the byte to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putChar** (char value)

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value	*The value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putChar** (int index, char value)

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The value to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putDouble** (double value)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	*The value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putDouble** (int index, double value)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data*
value	*The value to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putFloat** (float value)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	*The value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putFloat** (int index, float value)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data*
value	*The value to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putLong** (long long value)

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	*The value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putLong** (int index, long long value)

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The value to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putInt** (int value)

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	*The value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putInt** (int index, int value)

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The value to write.*

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only*

- virtual **ByteArrayBuffer** & **putShort** (short value)

  Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

  Parameters

value	*The value to be written.*

  Returns

  a reference to this buffer.

  Exceptions

BufferOverflowException (p. 472)	*if there are fewer than bytes remaining in this buffer than the size of the data to be written.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** & **putShort** (int index, short value)

  Writes two bytes containing the given value, into this buffer at the given index.

  Parameters

index	*The position in the **Buffer** (p. 451) to write the data*
value	*The value to write.*

  Returns

  a reference to this buffer

  Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **ByteArrayBuffer** ∗ **slice** () **const**

  Creates a new byte buffer whose content is a shared subsequence of this buffer's content.
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the newly create **ByteBuffer** (p. 535) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **ByteArrayBuffer** (p. 502) as Read-Only or not Read-Only.*

6.94.1 Detailed Description

This class defines six categories of operations upon byte buffers:

1. Absolute and relative get and put methods that read and write single bytes;
2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array;

3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer;

4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order;

5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and

6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 518) float getFloat(int index) void **putFloat(float f)** (p. 523) void **putFloat(int index, float f)** (p. 524)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the FloatBuffer class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

Since

1.0

6.94.2 Constructor & Destructor Documentation

6.94.2.1 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (int *capacity,* bool *readOnly* = `false`)

Creates a **ByteArrayBuffer** (p. 502) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size of the array, this is the limit we read and write to.
readOnly	Should this buffer be read-only, default as false

Exceptions

IllegalArguementException	if the capacity value is negative.

6.94.2.2 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (unsigned char * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **ByteArrayBuffer** (p. 502) object that wraps the given array.

Parameters

array	The array to wrap.
size	The size of the array passed.
offset	The position that is this buffers start position.
length	The size of the sub-array, this is the limit we read and write to.
readOnly	Should this buffer be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if the preconditions of size, offset and length are violated.

6.94.2.3 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **ByteArrayBuffer** (p. 502) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap
offset	The offset into array where the buffer starts
length	The length of the array we are wrapping or limit.
readOnly	Boolean indicating if this a readOnly buffer.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.94.2.4 decaf::internal::nio::ByteArrayBuffer::ByteArrayBuffer (const ByteArrayBuffer & *other*)

Create a **ByteArrayBuffer** (p. 502) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **ByteArrayBuffer** (p. 502) this one is to mirror.

6.94.2.5 virtual decaf::internal::nio::ByteArrayBuffer::~ByteArrayBuffer ( ) [virtual]

6.94.3 Member Function Documentation

6.94.3.1 virtual unsigned char* decaf::internal::nio::ByteArrayBuffer::array ( ) [virtual]

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is backed by an array but is read-only
UnsupportedOperation-Exception	if this buffer is not backed by an accessible array

Implements **decaf::nio::ByteBuffer** (p. 539).

6.94.3.2 virtual int decaf::internal::nio::ByteArrayBuffer::arrayOffset ( ) const [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 540).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is backed by an array but is read-only.
UnsupportedOperation-Exception	if this buffer is not backed by an accessible array.

Implements **decaf::nio::ByteBuffer** (p. 540).

6.94.3.3 virtual decaf::nio::CharBuffer* decaf::internal::nio::ByteArrayBuffer::asCharBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 540).

6.94.3.4 virtual decaf::nio::DoubleBuffer* decaf::internal::nio::ByteArrayBuffer::asDoubleBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 540).

6.94.3.5 virtual decaf::nio::FloatBuffer* decaf::internal::nio::ByteArrayBuffer::asFloatBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 540).

6.94.3.6 virtual decaf::nio::IntBuffer* decaf::internal::nio::ByteArrayBuffer::asIntBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 541).

6.94.3.7 virtual decaf::nio::LongBuffer* decaf::internal::nio::ByteArrayBuffer::asLongBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 541).

6.94.3.8 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 541).

6.94.3.9 virtual decaf::nio::ShortBuffer* decaf::internal::nio::ByteArrayBuffer::asShortBuffer ( ) const [inline, virtual]

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 451), which the caller then owns.

Implements **decaf::nio::ByteBuffer** (p. 542).

6.94.3.10 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 535).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 542).

6.94.3.11 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::duplicate ( ) [virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 542).

6.94.3.12 virtual unsigned char decaf::internal::nio::ByteArrayBuffer::get ( ) const [virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

BufferUnderflowException *(p. 474)*	if the buffer's current position is not smaller than its limit.

Implements **decaf::nio::ByteBuffer** (p. 543).

6.94.3.13 virtual unsigned char decaf::internal::nio::ByteArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the byte is to be read.

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 544).

6.94.3.14 virtual char decaf::internal::nio::ByteArrayBuffer::getChar ( ) [inline, virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 544).

6.94.3.15 virtual char decaf::internal::nio::ByteArrayBuffer::getChar (int *index*) const [inline, virtual]

Reads one byte at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the byte is to be read.

Returns

the char at the given index in the buffer

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 544).

6.94.3.16 virtual double decaf::internal::nio::ByteArrayBuffer::getDouble ( ) [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 545).

6.94.3.17 virtual double decaf::internal::nio::ByteArrayBuffer::getDouble (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the double at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 545).

6.94.3.18 virtual float decaf::internal::nio::ByteArrayBuffer::getFloat ( ) [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 545).

6.94.3.19 virtual float decaf::internal::nio::ByteArrayBuffer::getFloat (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the float at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 546).

6.94.3.20 virtual int decaf::internal::nio::ByteArrayBuffer::getInt ( ) [virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 546).

6.94.3.21 virtual int decaf::internal::nio::ByteArrayBuffer::getInt (int *index*) const [virtual]

Reads four bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the int at the given index in the buffer.

Exceptions

IndexOutOfBoundsException	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 546).

6.94.3.22 virtual long long decaf::internal::nio::ByteArrayBuffer::getLong ( ) [virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 547).

6.94.3.23 virtual long long decaf::internal::nio::ByteArrayBuffer::getLong (int *index*) const [virtual]

Reads eight bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the long long at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 547).

6.94.3.24 virtual short decaf::internal::nio::ByteArrayBuffer::getShort ( ) [virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implements **decaf::nio::ByteBuffer** (p. 547).

6.94.3.25 virtual short decaf::internal::nio::ByteArrayBuffer::getShort (int *index*) const [virtual]

Reads two bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the short at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implements **decaf::nio::ByteBuffer** (p. 547).

6.94.3.26 virtual bool decaf::internal::nio::ByteArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implements **decaf::nio::ByteBuffer** (p. 548).

6.94.3.27 virtual bool decaf::internal::nio::ByteArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 548).

6.94.3.28 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::put (unsigned char *value*) [virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value	- the byte value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 550).

6.94.3.29 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::put (int *index,* unsigned char *value*) [virtual]

Writes the given byte into this buffer at the given index.

Parameters

index	- position in the **Buffer** (p. 451) to write the data
value	- the byte to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 550).

6.94.3.30 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putChar (char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 550).

6.94.3.31 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putChar (int *index,* char *value*) [virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 551).

6.94.3.32 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putDouble (double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 551).

6.94.3.33 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putDouble (int *index,* double *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 552).

6.94.3.34 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putFloat (float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 552).

6.94.3.35 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putFloat (int *index,* float *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 552).

6.94.3.36 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putInt (int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 553).

6.94.3.37 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putInt (int *index,* int *value*) [virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implements **decaf::nio::ByteBuffer** (p. 553).

6.94.3.38 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putLong (long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 554).

6.94.3.39 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putLong (int *index,* long long *value*) [virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 554).

6.94.3.40 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putShort (short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 555).

6.94.3.41 virtual ByteArrayBuffer& decaf::internal::nio::ByteArrayBuffer::putShort (int *index,* short *value*) [virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::ByteBuffer** (p. 555).

6.94.3.42 virtual void decaf::internal::nio::ByteArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **ByteArrayBuffer** (p. 502) as Read-Only or not Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.94.3.43 virtual ByteArrayBuffer* decaf::internal::nio::ByteArrayBuffer::slice ( ) const [virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 535) which the caller owns.

Implements **decaf::nio::ByteBuffer** (p. 555).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**ByteArrayBuffer.h**

6.95 decaf::io::ByteArrayInputStream Class Reference

A **ByteArrayInputStream** (p. 527) contains an internal buffer that contains bytes that may be read from the stream.

`#include <src/main/decaf/io/ByteArrayInputStream.h>`

Inheritance diagram for decaf::io::ByteArrayInputStream:

Public Member Functions

- **ByteArrayInputStream** ()

  *Creates an **ByteArrayInputStream** (p. 527) with an empty input buffer, the buffer can be initialized with a call to setByteArray.*
- **ByteArrayInputStream** (**const** std::vector< unsigned char > &buffer)

  Creates the input stream and calls setBuffer with the specified buffer object.
- **ByteArrayInputStream** (**const** unsigned char *buffer, int bufferSize, bool own=false)

*Create an instance of the **ByteArrayInputStream** (p. 527) with the given buffer as the source of input for all read operations.*

- **ByteArrayInputStream** (**const** unsigned char *buffer, int bufferSize, int offset, int length, bool own=false)

  *Create an instance of the **ByteArrayInputStream** (p. 527) with the given buffer as the source of input for all read operations.*
- virtual ~**ByteArrayInputStream** ()
- virtual void **setByteArray** (**const** std::vector< unsigned char > &buffer)

  Sets the internal buffer.
- virtual void **setByteArray** (**const** unsigned char *buffer, int bufferSize)

  Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.
- virtual void **setByteArray** (**const** unsigned char *buffer, int bufferSize, int offset, int length)

  Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.
- virtual int **available** () **const**

  Indicates the number of bytes available.
  The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.
  The default implementation of this method returns zero.

  Returns

  the number of bytes available on this input stream.

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
  *The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

  Parameters

num	*The number of bytes to skip.*

  Returns

  total bytes skipped

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

- virtual void **mark** (int readLimit)

  Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.
  If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.
  Calling mark on a closed stream instance should have no effect.
  The default implementation of this method does nothing.

  Parameters

readLimit	*The max bytes read before marked position is invalid.*

- virtual void **reset** ()

  Repositions this stream to the position at the time the mark method was last called on this input stream.
  If the method markSupported returns true, then:
  - *If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.*

– *If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.*

If the method markSupported returns false, then:

– *The call to reset may throw an **IOException** (p. 1198).*

– *If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.*

*The default implementation of this method throws an **IOException** (p. 1198).*

Exceptions

IOException (p. 1198)	*if an I/O error occurs.*

- virtual bool **markSupported** () **const**

  Determines if this input stream supports the mark and reset methods.
  Whether or not mark and reset are supported is an invariant property of a particular input stream instance.
  The default implementation of this method returns false.

  Returns

  true if this stream instance supports marks

Protected Member Functions

- virtual int **doReadByte** ()

6.95.1 Detailed Description

A **ByteArrayInputStream** (p. 527) contains an internal buffer that contains bytes that may be read from the stream.

An internal counter keeps track of the next byte to be supplied by the read method. The **ByteArrayInputStream** (p. 527) never copies the supplied buffers, only points to them, therefore the caller must ensure that the supplied buffer remain in scope, or is not deleted before this **ByteArrayInputStream** (p. 527) is freed. If the own argument of one of the constructors that accepts an array pointer is set to true than the **ByteArrayInputStream** (p. 527) instance will take ownership of the supplied pointer and delete it when that instance is destroyed.

Closing a **ByteArrayInputStream** (p. 527) has no effect. The methods in this class can be called after the stream has been closed without generating an **IOException** (p. 1198).

Since

1.0

6.95.2 Constructor & Destructor Documentation

6.95.2.1 decaf::io::ByteArrayInputStream::ByteArrayInputStream ( )

Creates an **ByteArrayInputStream** (p. 527) with an empty input buffer, the buffer can be initialized with a call to setByteArray.

6.95.2.2 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const std::vector< unsigned char > & *buffer*)

Creates the input stream and calls setBuffer with the specified buffer object.

Parameters

buffer	The buffer to be used.

6.95.2.3 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * *buffer,* int *bufferSize,* bool *own* = false)

Create an instance of the **ByteArrayInputStream** (p. 527) with the given buffer as the source of input for all read operations.

Parameters

buffer	The initial byte array to use to read from.
bufferSize	The size of the buffer.
own	Indicates if this object should take ownership of the array, default is false.

Exceptions

NullPointerException	if the buffer is Null.
IllegalArguementException	if the bufferSize is negative.

6.95.2.4 decaf::io::ByteArrayInputStream::ByteArrayInputStream (const unsigned char * *buffer,* int *bufferSize,* int *offset,* int *length,* bool *own* = false)

Create an instance of the **ByteArrayInputStream** (p. 527) with the given buffer as the source of input for all read operations.

Parameters

buffer	The initial byte array to use to read from.
bufferSize	The size of the buffer.
offset	The offset into the buffer to begin reading from.
length	The number of bytes to read past the offset.
own	Indicates if this object should take ownership of the array, default is false.

Exceptions

NullPointerException	if the buffer is Null.
IllegalArguementException	if the bufferSize is negative.

6.95.2.5 virtual decaf::io::ByteArrayInputStream::~ByteArrayInputStream ( ) [virtual]

6.95.3 Member Function Documentation

6.95.3.1 virtual int decaf::io::ByteArrayInputStream::available ( ) const [virtual]

Indicates the number of bytes available.

The default implementation of this methods returns 0. Classes that override this method may return the total number of bytes that are currently available for reading and others may simply return a value of one indicating that there is some data avaiable. The caller should view the result of this method as an absolute.

The default implementation of this method returns zero.

Returns

the number of bytes available on this input stream.

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.95.3.2 virtual int decaf::io::ByteArrayInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::InputStream** (p. 1136).

6.95.3.3 virtual int decaf::io::ByteArrayInputStream::doReadByte ( ) [protected, virtual]

Implements **decaf::io::InputStream** (p. 1137).

6.95.3.4 virtual void decaf::io::ByteArrayInputStream::mark (int *readLimit*) [virtual]

Marks the current position in the stream A subsequent call to the reset method repositions this stream at the last marked position so that subsequent reads re-read the same bytes.

If a stream instance reports that marks are supported then the stream will ensure that the same bytes can be read again after the reset method is called so long the readLimit is not reached.

Calling mark on a closed stream instance should have no effect.

The default implementation of this method does nothing.

Parameters

readLimit	The max bytes read before marked position is invalid.

Reimplemented from **decaf::io::InputStream** (p. 1137).

6.95.3.5 virtual bool decaf::io::ByteArrayInputStream::markSupported ( ) const [inline, virtual]

Determines if this input stream supports the mark and reset methods.

Whether or not mark and reset are supported is an invariant property of a particular input stream instance.

The default implementation of this method returns false.

Returns

true if this stream instance supports marks

Reimplemented from **decaf::io::InputStream** (p. 1137).

6.95.3.6 virtual void decaf::io::ByteArrayInputStream::reset ( ) [virtual]

Repositions this stream to the position at the time the mark method was last called on this input stream.

If the method markSupported returns true, then:

- If the method mark has not been called since the stream was created, or the number of bytes read from the stream since mark was last called is larger than the argument to mark at that last call, then an **IOException** (p. 1198) might be thrown.
- If such an **IOException** (p. 1198) is not thrown, then the stream is reset to a state such that all the bytes read since the most recent call to mark (or since the start of the file, if mark has not been called) will be resupplied

to subsequent callers of the read method, followed by any bytes that otherwise would have been the next input data as of the time of the call to reset.

If the method markSupported returns false, then:

- The call to reset may throw an **IOException** (p. 1198).
- If an **IOException** (p. 1198) is not thrown, then the stream is reset to a fixed state that depends on the particular type of the input stream and how it was created. The bytes that will be supplied to subsequent callers of the read method depend on the particular type of the input stream.

The default implementation of this method throws an **IOException** (p. 1198).

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.

Reimplemented from **decaf::io::InputStream** (p. 1140).

6.95.3.7 virtual void decaf::io::ByteArrayInputStream::setByteArray (const std::vector< unsigned char > & *buffer*) [virtual]

Sets the internal buffer.

The input stream will wrap around this buffer and will perform all read operations on it. The position will be reinitialized to the beginning of the specified buffer. This class will not own the given buffer - it is the caller's responsibility to free the memory of the given buffer as appropriate.

Parameters

buffer	The buffer to be used.

6.95.3.8 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

buffer	The initial byte array to use to read from.
bufferSize	The size of the buffer.

Exceptions

NullPointerException	if the buffer is Null.
IllegalArguementException	if the bufferSize is negative.

6.95.3.9 virtual void decaf::io::ByteArrayInputStream::setByteArray (const unsigned char * *buffer*, int *bufferSize*, int *offset*, int *length*) [virtual]

Sets the data that this reader uses, replaces any existing data and resets to beginning of the buffer.

Parameters

buffer	The initial byte array to use to read from.
bufferSize	The size of the buffer.

offset	The offset into the buffer to begin reading from.
length	The number of bytes to read past the offset.

Exceptions

NullPointerException	if the buffer is Null.
IllegalArguementException	if the bufferSize is negative.

6.95.3.10 virtual long long decaf::io::ByteArrayInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Reimplemented from **decaf::io::InputStream** (p. 1140).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**ByteArrayInputStream.h**

6.96 decaf::io::ByteArrayOutputStream Class Reference

`#include <src/main/decaf/io/ByteArrayOutputStream.h>`

Inheritance diagram for decaf::io::ByteArrayOutputStream:

Public Member Functions

- **ByteArrayOutputStream** ()

  Default Constructor - uses a default internal buffer of 32 bytes, the size increases as the need for more room arises.
- **ByteArrayOutputStream** (int bufferSize)

  *Creates a **ByteArrayOutputStream** (p. 533) with an internal buffer allocated with the given size.*

- virtual ~**ByteArrayOutputStream** ()
- std::pair< unsigned char *, int > **toByteArray** () **const**

  Creates a newly allocated byte array.
- long long **size** () **const**

  Gets the current count of bytes written into this ***ByteArrayOutputStream*** *(*p. *533).*
- virtual void **reset** ()

  Clear current Stream contents.
- virtual std::string **toString** () **const**

  Converts the bytes in the buffer into a standard C++ string.
- void **writeTo** (**OutputStream** *out) **const**

  Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (**const** unsigned char *buffer, int **size**, int offset, int length)

6.96.1 Constructor & Destructor Documentation

6.96.1.1 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream ( )

Default Constructor - uses a default internal buffer of 32 bytes, the size increases as the need for more room arises.

6.96.1.2 decaf::io::ByteArrayOutputStream::ByteArrayOutputStream (int *bufferSize*)

Creates a **ByteArrayOutputStream** (p. 533) with an internal buffer allocated with the given size.

Parameters

bufferSize	The size to use for the internal buffer.

Exceptions

IllegalArgumentException	if the size is less than or equal to zero.

6.96.1.3 virtual decaf::io::ByteArrayOutputStream::~ByteArrayOutputStream ( ) [virtual]

6.96.2 Member Function Documentation

6.96.2.1 virtual void decaf::io::ByteArrayOutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::OutputStream** (p. 1602).

6.96.2.2 virtual void decaf::io::ByteArrayOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Implements **decaf::io::OutputStream** (p. 1602).

6.96.2.3 virtual void decaf::io::ByteArrayOutputStream::reset ( ) [virtual]

Clear current Stream contents.

Exceptions

IOException *(p. 1198)*	

6.96.2.4 long long decaf::io::ByteArrayOutputStream::size ( ) const

Gets the current count of bytes written into this **ByteArrayOutputStream** (p. 533).

Returns

the number of valid bytes contained in the **ByteArrayOutputStream** (p. 533).

6.96.2.5 std::pair<unsigned char*, int> decaf::io::ByteArrayOutputStream::toByteArray ( ) const

Creates a newly allocated byte array.

Its size is the current size of this output stream and the valid contents of the buffer have been copied into it. The newly allocated array and its size are returned inside an STL pair structure, the caller is responsible for freeing the returned array.

Returns

an STL pair containing the copied array and its size.

6.96.2.6 virtual std::string decaf::io::ByteArrayOutputStream::toString ( ) const [virtual]

Converts the bytes in the buffer into a standard C++ string.

Returns

a string containing the bytes in the buffer

Reimplemented from **decaf::io::OutputStream** (p. 1603).

6.96.2.7 void decaf::io::ByteArrayOutputStream::writeTo (OutputStream * *out*) const

Writes the complete contents of this byte array output stream to the specified output stream argument, as if by calling the output stream's write method using out.write(buf, 0, count).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**ByteArrayOutputStream.h**

6.97 decaf::nio::ByteBuffer Class Reference

This class defines six categories of operations upon byte buffers:

Public Member Functions

- virtual ~**ByteBuffer** ()
- virtual std::string **toString** () **const**
- **ByteBuffer** & **get** (std::vector< unsigned char > buffer)

  Relative bulk get method.
- **ByteBuffer** & **get** (unsigned char *buffer, int size, int offset, int length)

  Relative bulk get method.
- **ByteBuffer** & **put** (**ByteBuffer** &src)

  This method transfers the bytes remaining in the given source buffer into this buffer.
- **ByteBuffer** & **put** (**const** unsigned char *buffer, int size, int offset, int length)

  This method transfers bytes into this buffer from the given source array.
- **ByteBuffer** & **put** (std::vector< unsigned char > &buffer)

  This method transfers the entire content of the given source byte array into this buffer.
- virtual bool **isReadOnly** () **const** =0

  Tells whether or not this buffer is read-only.
- virtual unsigned char * **array** ()=0

  Returns the byte array that backs this buffer.
- virtual int **arrayOffset** () **const** =0

  Returns the offset within this buffer's backing array of the first element of the buffer.
- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible byte array.
- virtual **CharBuffer** * **asCharBuffer** () **const** =0

  Creates a view of this byte buffer as a char buffer.
- virtual **DoubleBuffer** * **asDoubleBuffer** () **const** =0

  Creates a view of this byte buffer as a double buffer.
- virtual **FloatBuffer** * **asFloatBuffer** () **const** =0

  Creates a view of this byte buffer as a float buffer.
- virtual **IntBuffer** * **asIntBuffer** () **const** =0

  Creates a view of this byte buffer as a int buffer.
- virtual **LongBuffer** * **asLongBuffer** () **const** =0

  Creates a view of this byte buffer as a long buffer.
- virtual **ShortBuffer** * **asShortBuffer** () **const** =0

  Creates a view of this byte buffer as a short buffer.
- virtual **ByteBuffer** * **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only byte buffer that shares this buffer's content.
- virtual **ByteBuffer** & **compact** ()=0

  Compacts this buffer.
- virtual **ByteBuffer** * **duplicate** ()=0

  Creates a new byte buffer that shares this buffer's content.
- virtual unsigned char **get** () **const** =0

  Relative get method.
- virtual unsigned char **get** (int index) **const** =0

  Absolute get method.
- virtual char **getChar** ()=0

  Reads the next byte at this buffer's current position, and then increments the position by one.
- virtual char **getChar** (int index) **const** =0

  Reads one byte at the given index and returns it.
- virtual double **getDouble** ()=0

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.
- virtual double **getDouble** (int index) **const** =0

Reads eight bytes at the given index and returns it.

- virtual float **getFloat** ()=0

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual float **getFloat** (int index) **const** =0

  Reads four bytes at the given index and returns it.

- virtual long long **getLong** ()=0

  Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

- virtual long long **getLong** (int index) **const** =0

  Reads eight bytes at the given index and returns it.

- virtual int **getInt** ()=0

  Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

- virtual int **getInt** (int index) **const** =0

  Reads four bytes at the given index and returns it.

- virtual short **getShort** ()=0

  Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

- virtual short **getShort** (int index) **const** =0

  Reads two bytes at the given index and returns it.

- virtual **ByteBuffer** & **put** (unsigned char value)=0

  Writes the given byte into this buffer at the current position, and then increments the position.

- virtual **ByteBuffer** & **put** (int index, unsigned char value)=0

  Writes the given byte into this buffer at the given index.

- virtual **ByteBuffer** & **putChar** (char value)=0

  Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

- virtual **ByteBuffer** & **putChar** (int index, char value)=0

  Writes one byte containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putDouble** (double value)=0

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putDouble** (int index, double value)=0

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putFloat** (float value)=0

  Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putFloat** (int index, float value)=0

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putLong** (long long value)=0

  Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putLong** (int index, long long value)=0

  Writes eight bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putInt** (int value)=0

  Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putInt** (int index, int value)=0

  Writes four bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** & **putShort** (short value)=0

  Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

- virtual **ByteBuffer** & **putShort** (int index, short value)=0

  Writes two bytes containing the given value, into this buffer at the given index.

- virtual **ByteBuffer** ∗ **slice** () **const** =0

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

- virtual int **compareTo** (**const ByteBuffer** &value) **const**
- virtual bool **equals** (**const ByteBuffer** &value) **const**
- virtual bool **operator==** (**const ByteBuffer** &value) **const**
- virtual bool **operator<** (**const ByteBuffer** &value) **const**

Static Public Member Functions

- static **ByteBuffer** * **allocate** (int **capacity**)

  Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.
- static **ByteBuffer** * **wrap** (unsigned char *__array__, int size, int offset, int length)

  *Wraps the passed buffer with a new **ByteBuffer*** (p. *535).*
- static **ByteBuffer** * **wrap** (std::vector< unsigned char > &buffer)

  *Wraps the passed STL Byte Vector in a **ByteBuffer*** (p. *535).*

Protected Member Functions

- **ByteBuffer** (int **capacity**)

  *Creates a **ByteBuffer*** (p. *535) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.97.1 Detailed Description

This class defines six categories of operations upon byte buffers:

1. Absolute and relative get and put methods that read and write single bytes;
2. Relative bulk get methods that transfer contiguous sequences of bytes from this buffer into an array;
3. Relative bulk put methods that transfer contiguous sequences of bytes from a byte array or some other byte buffer into this buffer;
4. Absolute and relative get and put methods that read and write values of other primitive types, translating them to and from sequences of bytes in a particular byte order;
5. Methods for creating view buffers, which allow a byte buffer to be viewed as a buffer containing values of some other primitive type; and
6. Methods for compacting, duplicating, and slicing a byte buffer.

Byte buffers can be created either by allocation, which allocates space for the buffer's content, or by wrapping an existing byte array into a buffer.

Access to binary data:

This class defines methods for reading and writing values of all other primitive types, except boolean. Primitive values are translated to (or from) sequences of bytes according to the buffer's current byte order.

For access to heterogeneous binary data, that is, sequences of values of different types, this class defines a family of absolute and relative get and put methods for each type. For 32-bit floating-point values, for example, this class defines:

float **getFloat()** (p. 545) float getFloat(int index) void **putFloat(float f)** (p. 552) void **putFloat(int index, float f)** (p. 552)

Corresponding methods are defined for the types char, short, int, long, and double. The index parameters of the absolute get and put methods are in terms of bytes rather than of the type being read or written.

For access to homogeneous binary data, that is, sequences of values of the same type, this class defines methods that can create views of a given byte buffer. A view buffer is simply another buffer whose content is backed by the byte buffer. Changes to the byte buffer's content will be visible in the view buffer, and vice versa; the two buffers' position, limit, and mark values are independent. The asFloatBuffer method, for example, creates an instance of the **FloatBuffer** (p. 1058) class that is backed by the byte buffer upon which the method is invoked. Corresponding view-creation methods are defined for the types char, short, int, long, and double.

View buffers have two important advantages over the families of type-specific get and put methods described above:

A view buffer is indexed not in terms of bytes but rather in terms of the type-specific size of its values;

A view buffer provides relative bulk get and put methods that can transfer contiguous sequences of values between a buffer and an array or some other buffer of the same type; and

6.97.2 Constructor & Destructor Documentation

6.97.2.1 decaf::nio::ByteBuffer::ByteBuffer (int *capacity*) [protected]

Creates a **ByteBuffer** (p. 535) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size of the array, this is the limit we read and write to.

Exceptions

IllegalArgumentException	if capacity is negative.

6.97.2.2 virtual decaf::nio::ByteBuffer::~ByteBuffer ( ) [inline, virtual]

6.97.3 Member Function Documentation

6.97.3.1 static ByteBuffer* decaf::nio::ByteBuffer::allocate (int *capacity*) [static]

Allocates a new byte buffer whose position will be zero its limit will be its capacity and its mark is not set.

Parameters

capacity	The internal buffer's capacity.

Returns

a newly allocated **ByteBuffer** (p. 535) which the caller owns.

Exceptions

IllegalArgumentException	if capacity is negative.

6.97.3.2 virtual unsigned char* decaf::nio::ByteBuffer::array ( ) [pure virtual]

Returns the byte array that backs this buffer.

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The array that backs this buffer

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is backed by an array but is read-only
UnsupportedOperation-Exception	if this buffer is not backed by an accessible array

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 513).

6.97.3.3 virtual int decaf::nio::ByteBuffer::arrayOffset ( ) const [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer.

If this buffer is backed by an array then buffer position p corresponds to array index p + **arrayOffset()** (p. 540).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset within this buffer's array of the first element of the buffer.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is backed by an array but is read-only.
UnsupportedOperation-Exception	if this buffer is not backed by an accessible array.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 513).

6.97.3.4 virtual CharBuffer* decaf::nio::ByteBuffer::asCharBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a char buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new Char **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 513).

6.97.3.5 virtual DoubleBuffer* decaf::nio::ByteBuffer::asDoubleBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a double buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new double **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 514).

6.97.3.6 virtual FloatBuffer* decaf::nio::ByteBuffer::asFloatBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a float buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new float **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 514).

6.97.3.7 virtual IntBuffer* decaf::nio::ByteBuffer::asIntBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a int buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by four, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new int **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 514).

6.97.3.8 virtual LongBuffer* decaf::nio::ByteBuffer::asLongBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a long buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by eight, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new long **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 514).

6.97.3.9 virtual ByteBuffer* decaf::nio::ByteBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only byte buffer which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 515).

6.97.3.10 virtual ShortBuffer* decaf::nio::ByteBuffer::asShortBuffer ( ) const [pure virtual]

Creates a view of this byte buffer as a short buffer.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer divided by two, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the new short **Buffer** (p. 451), which the caller then owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 515).

6.97.3.11 virtual ByteBuffer& decaf::nio::ByteBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **ByteBuffer** (p. 535).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 515).

6.97.3.12 virtual int decaf::nio::ByteBuffer::compareTo (const ByteBuffer & *value*) const [virtual]

6.97.3.13 virtual ByteBuffer* decaf::nio::ByteBuffer::duplicate ( ) [pure virtual]

Creates a new byte buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new Byte **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 516).

6.97.3.14 virtual bool decaf::nio::ByteBuffer::equals (const ByteBuffer & *value*) const [virtual]

6.97.3.15 ByteBuffer& decaf::nio::ByteBuffer::get (std::vector< unsigned char > *buffer*)

Relative bulk get method.

This method transfers bytes from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this Byte **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length bytes remaining in this buffer

6.97.3.16 ByteBuffer& decaf::nio::ByteBuffer::get (unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Relative bulk get method.

This method transfers bytes from this buffer into the given destination array. If there are fewer bytes remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length bytes from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the passed in **Buffer** (p. 451).
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.
BufferUnderflowException *(p. 474)*	if there are fewer than length bytes remaining in this buffer.
NullPointerException	if the passed buffer is null.

6.97.3.17 virtual unsigned char decaf::nio::ByteBuffer::get ( ) const [pure virtual]

Relative get method.

Reads the byte at this buffer's current position, and then increments the position.

Returns

The byte at the buffer's current position.

Exceptions

BufferUnderflowException *(p. 474)*	if the buffer's current position is not smaller than its limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 516).

6.97.3.18 virtual unsigned char decaf::nio::ByteBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the byte at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the byte is to be read.

Returns

the byte that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 516).

6.97.3.19 virtual char decaf::nio::ByteBuffer::getChar ( ) [pure virtual]

Reads the next byte at this buffer's current position, and then increments the position by one.

Returns

the next char in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 517).

6.97.3.20 virtual char decaf::nio::ByteBuffer::getChar (int *index*) const [pure virtual]

Reads one byte at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the byte is to be read.

Returns

the char at the given index in the buffer

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 517).

6.97.3.21 virtual double decaf::nio::ByteBuffer::getDouble ( ) [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next double in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 517).

6.97.3.22 virtual double decaf::nio::ByteBuffer::getDouble (int *index*) const [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the double at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 517).

6.97.3.23 virtual float decaf::nio::ByteBuffer::getFloat ( ) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next float in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 518).

6.97.3.24 virtual float decaf::nio::ByteBuffer::getFloat (int *index*) const [pure virtual]

Reads four bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the float at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 518).

6.97.3.25 virtual int decaf::nio::ByteBuffer::getInt ( ) [pure virtual]

Reads the next four bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next int in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 518).

6.97.3.26 virtual int decaf::nio::ByteBuffer::getInt (int *index*) const [pure virtual]

Reads four bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the int at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 519).

6.97.3.27 virtual long long decaf::nio::ByteBuffer::getLong ( ) [pure virtual]

Reads the next eight bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next long long in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 519).

6.97.3.28 virtual long long decaf::nio::ByteBuffer::getLong (int *index*) const [pure virtual]

Reads eight bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the long long at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 519).

6.97.3.29 virtual short decaf::nio::ByteBuffer::getShort ( ) [pure virtual]

Reads the next two bytes at this buffer's current position, and then increments the position by that amount.

Returns

the next short in the buffer.

Exceptions

BufferUnderflowException *(p. 474)*	if there are no more bytes remaining in this buffer, meaning we have reached the set limit.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 520).

6.97.3.30 virtual short decaf::nio::ByteBuffer::getShort (int *index*) const [pure virtual]

Reads two bytes at the given index and returns it.

Parameters

index	The index in the **Buffer** (p. 451) where the bytes are to be read.

Returns

the short at the given index in the buffer.

Exceptions

IndexOutOfBounds-Exception	if there are not enough bytes remaining to fill the requested Data Type, or index is negative.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 520).

6.97.3.31 virtual bool decaf::nio::ByteBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible byte array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 520).

6.97.3.32 virtual bool decaf::nio::ByteBuffer::isReadOnly ( ) const [pure virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only

Implements **decaf::nio::Buffer** (p. 454).

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 521).

6.97.3.33 virtual bool decaf::nio::ByteBuffer::operator< (const ByteBuffer & *value*) const [virtual]

6.97.3.34 virtual bool decaf::nio::ByteBuffer::operator== (const ByteBuffer & *value*) const [virtual]

6.97.3.35 ByteBuffer& decaf::nio::ByteBuffer::put (ByteBuffer & *src*)

This method transfers the bytes remaining in the given source buffer into this buffer.

If there are more bytes remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no bytes are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() bytes from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take bytes from an place in this one.

Returns

a reference to this buffer

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining bytes in the source buffer
IllegalArgumentException	if the source buffer is this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

6.97.3.36 ByteBuffer& decaf::nio::ByteBuffer::put (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

This method transfers bytes into this buffer from the given source array.

If there are more bytes to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which bytes are to be read.
size	The size of the given array.
offset	The offset within the array of the first byte to be read.
length	The number of bytes to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.97.3.37 ByteBuffer& decaf::nio::ByteBuffer::put (std::vector< unsigned char > & *buffer*)

This method transfers the entire content of the given source byte array into this buffer.

This is the same as calling put(&buffer[0], buffer.size(), 0, buffer.size())

Parameters

buffer	The buffer whose contents are copied to this **ByteBuffer** (p. 535).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.97.3.38 virtual ByteBuffer& decaf::nio::ByteBuffer::put (unsigned char *value*) [pure virtual]

Writes the given byte into this buffer at the current position, and then increments the position.

Parameters

value	- the byte value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 521).

6.97.3.39 virtual ByteBuffer& decaf::nio::ByteBuffer::put (int *index,* unsigned char *value*) [pure virtual]

Writes the given byte into this buffer at the given index.

Parameters

index	- position in the **Buffer** (p. 451) to write the data
value	- the byte to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 521).

6.97.3.40 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (char *value*) [pure virtual]

Writes one byte containing the given value, into this buffer at the current position, and then increments the position by one.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 522).

6.97.3.41 virtual ByteBuffer& decaf::nio::ByteBuffer::putChar (int *index,* char *value*) [pure virtual]

Writes one byte containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 522).

6.97.3.42 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (double *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 522).

6.97.3.43 virtual ByteBuffer& decaf::nio::ByteBuffer::putDouble (int *index*, double *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 523).

6.97.3.44 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (float *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 523).

6.97.3.45 virtual ByteBuffer& decaf::nio::ByteBuffer::putFloat (int *index*, float *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 524).

6.97.3.46 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 524).

6.97.3.47 virtual ByteBuffer& decaf::nio::ByteBuffer::putInt (int *index,* int *value*) [pure virtual]

Writes four bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 524).

6.97.3.48 virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (long long *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 525).

6.97.3.49 virtual ByteBuffer& decaf::nio::ByteBuffer::putLong (int *index,* long long *value*) [pure virtual]

Writes eight bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The value to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 525).

6.97.3.50 virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (short *value*) [pure virtual]

Writes two bytes containing the given value, into this buffer at the current position, and then increments the position by eight.

Parameters

value	The value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there are fewer than bytes remaining in this buffer than the size of the data to be written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 526).

6.97.3.51 virtual ByteBuffer& decaf::nio::ByteBuffer::putShort (int *index,* short *value*) [pure virtual]

Writes two bytes containing the given value, into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data
value	The value to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 526).

6.97.3.52 virtual ByteBuffer* decaf::nio::ByteBuffer::slice ( ) const [pure virtual]

Creates a new byte buffer whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **ByteBuffer** (p. 535) which the caller owns.

Implemented in **decaf::internal::nio::ByteArrayBuffer** (p. 527).

6.97.3.53 virtual std::string decaf::nio::ByteBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.97.3.54 static ByteBuffer* decaf::nio::ByteBuffer::wrap (unsigned char * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **ByteBuffer** (p. 535).

The new buffer will be backed by the given byte array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the provided array.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **ByteBuffer** (p. 535) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array passed in is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.97.3.55 static ByteBuffer* decaf::nio::ByteBuffer::wrap (std::vector< unsigned char > & *buffer*) [static]

Wraps the passed STL Byte Vector in a **ByteBuffer** (p. 535).

The new buffer will be backed by the given byte array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **ByteBuffer** (p. 535) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**ByteBuffer.h**

6.98 cms::BytesMessage Class Reference

A **BytesMessage** (p. 557) object is used to send a message containing a stream of unsigned bytes.

`#include <src/main/cms/BytesMessage.h>`

Inheritance diagram for cms::BytesMessage:

Public Member Functions

- virtual ∼**BytesMessage** () throw ()
- virtual void **setBodyBytes** (**const** unsigned char ∗buffer, int numBytes)=0

  sets the bytes given to the message body.
- virtual unsigned char ∗ **getBodyBytes** () **const** =0

  Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.
- virtual int **getBodyLength** () **const** =0

  Returns the number of bytes contained in the body of this message.
- virtual void **reset** ()=0

  Puts the message body in read-only mode and repositions the stream of bytes to the beginning.
- virtual bool **readBoolean** () **const** =0

  Reads a Boolean from the Bytes message stream.
- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the bytes message stream as a 1-byte value.
- virtual unsigned char **readByte** () **const** =0

  Reads a Byte from the Bytes message stream.
- virtual void **writeByte** (unsigned char value)=0

  Writes a byte to the bytes message stream as a 1-byte value.
- virtual int **readBytes** (std::vector< unsigned char > &value) **const** =0

  Reads a byte array from the bytes message stream.
- virtual void **writeBytes** (**const** std::vector< unsigned char > &value)=0

  Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.
- virtual int **readBytes** (unsigned char ∗buffer, int length) **const** =0

  Reads a portion of the bytes message stream.
- virtual void **writeBytes** (**const** unsigned char ∗value, int offset, int length)=0

  Writes a portion of a byte array to the bytes message stream.
- virtual char **readChar** () **const** =0

  Reads a Char from the Bytes message stream.

- virtual void **writeChar** (char value)=0

  Writes a char to the bytes message stream as a 1-byte value.
- virtual float **readFloat** () **const** =0

  Reads a 32 bit float from the Bytes message stream.
- virtual void **writeFloat** (float value)=0

  Writes a float to the bytes message stream as a 4 byte value.
- virtual double **readDouble** () **const** =0

  Reads a 64 bit double from the Bytes message stream.
- virtual void **writeDouble** (double value)=0

  Writes a double to the bytes message stream as a 8 byte value.
- virtual short **readShort** () **const** =0

  Reads a 16 bit signed short from the Bytes message stream.
- virtual void **writeShort** (short value)=0

  Writes a signed short to the bytes message stream as a 2 byte value.
- virtual unsigned short **readUnsignedShort** () **const** =0

  Reads a 16 bit unsigned short from the Bytes message stream.
- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual int **readInt** () **const** =0

  Reads a 32 bit signed integer from the Bytes message stream.
- virtual void **writeInt** (int value)=0

  Writes a signed int to the bytes message stream as a 4 byte value.
- virtual long long **readLong** () **const** =0

  Reads a 64 bit long from the Bytes message stream.
- virtual void **writeLong** (long long value)=0

  Writes a long long to the bytes message stream as a 8 byte value.
- virtual std::string **readString** () **const** =0

  Reads an ASCII String from the Bytes message stream.
- virtual void **writeString** (**const** std::string &value)=0

  Writes an ASCII String to the Bytes message stream.
- virtual std::string **readUTF** () **const** =0

  *Reads an UTF String from the **BytesMessage** (p. 557) stream.*
- virtual void **writeUTF** (**const** std::string &value)=0

  *Writes an UTF String to the **BytesMessage** (p. 557) stream.*
- virtual **BytesMessage** * **clone** () **const** =0

  Clones this message.

6.98.1 Detailed Description

A **BytesMessage** (p. 557) object is used to send a message containing a stream of unsigned bytes.

It inherits from the **Message** (p. 1426) interface and adds a bytes message body. The receiver of the message supplies the interpretation of the bytes using the methods added by the **BytesMessage** (p. 557) interface.

The **BytesMessage** (p. 557) methods are based largely on those found in **decaf.io.DataInputStream** (p. 849) and **decaf.io.DataOutputStream** (p. 860).

Although the CMS API allows the use of message properties with byte messages, they are typically not used, since the inclusion of properties may affect the format.

The primitive types can be written explicitly using methods for each type. Because the C++ language is more limited when dealing with primitive types the JMS equivalent generic read and write methods that take Java objects cannot be provided in the CMS API.

When the message is first created, and when clearBody is called, the body of the message is in write-only mode. After the first call to reset has been made, the message body is in read-only mode. After a message has been sent, the client that sent it can retain and modify it without affecting the message that has been sent. The same message object can be sent multiple times. When a message has been received, the provider has called reset so that the message body is in read-only mode for the client.

If clearBody is called on a message in read-only mode, the message body is cleared and the message is in write-only mode.

If a client attempts to read a message in write-only mode, a **MessageNotReadableException** (p. 1490) is thrown.

If a client attempts to write a message in read-only mode, a **MessageNotWriteableException** (p. 1490) is thrown.

Since

1.0

6.98.2 Constructor & Destructor Documentation

6.98.2.1 virtual cms::BytesMessage::~BytesMessage ( ) throw () [virtual]

6.98.3 Member Function Documentation

6.98.3.1 virtual BytesMessage* cms::BytesMessage::clone ( ) const [pure virtual]

Clones this message.

Returns

a deep copy of this message.

Exceptions

CMSException *(p. 640)*	- if an internal error occurs while cloning the **Message** (p. 1426).

Implements **cms::Message** (p. 1430).

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 131).

6.98.3.2 virtual unsigned char* cms::BytesMessage::getBodyBytes ( ) const [pure virtual]

Gets the bytes that are contained in this message and returns them in a newly allocated array that becomes the property of the caller.

This is a copy of the data contained in this message, changing the value contained in this array has no effect on the data contained in this message.

Returns

pointer to a byte buffer that the call owns upon completion of this method.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
MessageNotReadable-Exception *(p. 1490)*	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 132).

6.98.3.3 virtual int cms::BytesMessage::getBodyLength ( ) const [pure virtual]

Returns the number of bytes contained in the body of this message.

Returns

number of bytes.

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
MessageNotReadable-Exception *(p. 1490)*	- If the message is in Write Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 132).

6.98.3.4 virtual bool cms::BytesMessage::readBoolean ( ) const [pure virtual]

Reads a Boolean from the Bytes message stream.

Returns

boolean value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 133).

6.98.3.5 virtual unsigned char cms::BytesMessage::readByte ( ) const [pure virtual]

Reads a Byte from the Bytes message stream.

Returns

unsigned char value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 133).

6.98.3.6 virtual int cms::BytesMessage::readBytes (std::vector< unsigned char > & *value*) const [pure virtual]

Reads a byte array from the bytes message stream.

If the length of vector value is less than the number of bytes remaining to be read from the stream, the vector should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of vector value, the bytes should be read into the vector. The return value of the total number of bytes read will be less than the length of the vector, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

Parameters

value	buffer to place data in

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 133).

6.98.3.7 virtual int cms::BytesMessage::readBytes (unsigned char * *buffer*, int *length*) const [pure virtual]

Reads a portion of the bytes message stream.

If the length of array value is less than the number of bytes remaining to be read from the stream, the array should be filled. A subsequent call reads the next increment, and so on.

If the number of bytes remaining in the stream is less than the length of array value, the bytes should be read into the array. The return value of the total number of bytes read will be less than the length of the array, indicating that there are no more bytes left to be read from the stream. The next read of the stream returns -1.

If length is negative, or length is greater than the length of the array value, then an IndexOutOfBoundsException is thrown. No bytes will be read from the stream for this exception case.

Parameters

buffer	the buffer into which the data is read
length	the number of bytes to read; must be less than or equal to value.length

Returns

the total number of bytes read into the buffer, or -1 if there is no more data because the end of the stream has been reached

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.

MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 134).

6.98.3.8 virtual char cms::BytesMessage::readChar ( ) const [pure virtual]

Reads a Char from the Bytes message stream.

Returns

char value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 135).

6.98.3.9 virtual double cms::BytesMessage::readDouble ( ) const [pure virtual]

Reads a 64 bit double from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 135).

6.98.3.10 virtual float cms::BytesMessage::readFloat ( ) const [pure virtual]

Reads a 32 bit float from the Bytes message stream.

Returns

double value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 135).

6.98.3.11 virtual int cms::BytesMessage::readInt ( ) const [pure virtual]

Reads a 32 bit signed integer from the Bytes message stream.

Returns

int value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 135).

6.98.3.12 virtual long long cms::BytesMessage::readLong ( ) const [pure virtual]

Reads a 64 bit long from the Bytes message stream.

Returns

long long value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 136).

6.98.3.13 virtual short cms::BytesMessage::readShort ( ) const [pure virtual]

Reads a 16 bit signed short from the Bytes message stream.

Returns

short value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 136).

6.98.3.14 virtual std::string cms::BytesMessage::readString ( ) const [pure virtual]

Reads an ASCII String from the Bytes message stream.

Returns

String from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 136).

6.98.3.15 virtual unsigned short cms::BytesMessage::readUnsignedShort ( ) const [pure virtual]

Reads a 16 bit unsigned short from the Bytes message stream.

Returns

unsigned short value from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 137).

6.98.3.16 virtual std::string cms::BytesMessage::readUTF ( ) const [pure virtual]

Reads an UTF String from the **BytesMessage** (p. 557) stream.

Returns

String from stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageEOFException *(p. 1477)*	- if unexpected end of bytes stream has been reached.
MessageNotReadable-Exception *(p. 1490)*	- if the message is in write-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 137).

6.98.3.17 virtual void cms::BytesMessage::reset ( ) [pure virtual]

Puts the message body in read-only mode and repositions the stream of bytes to the beginning.

Exceptions

CMSException *(p. 640)*	- If the provider fails to perform the reset operation.
MessageFormatException *(p. 1478)*	- If the **Message** (p. 1426) has an invalid format.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 137).

6.98.3.18 virtual void cms::BytesMessage::setBodyBytes (const unsigned char * *buffer,* int *numBytes*) [pure virtual]

sets the bytes given to the message body.

Parameters

buffer	Byte Buffer to copy
numBytes	Number of bytes in Buffer to copy

Exceptions

CMSException *(p. 640)*	- If an internal error occurs.
MessageNotWriteable-Exception *(p. 1490)*	- if in Read Only Mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 138).

6.98.3.19 virtual void cms::BytesMessage::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the bytes message stream as a 1-byte value.

The value true is written as the value (byte)1; the value false is written as the value (byte)0.

Parameters

value	boolean to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 138).

6.98.3.20 virtual void cms::BytesMessage::writeByte (unsigned char *value*) [pure virtual]

Writes a byte to the bytes message stream as a 1-byte value.

Parameters

value	byte to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 138).

6.98.3.21 virtual void cms::BytesMessage::writeBytes (const std::vector< unsigned char > & *value*) [pure virtual]

Writes a byte array to the bytes message stream using the vector size as the number of bytes to write.

Parameters

value	bytes to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 139).

6.98.3.22 virtual void cms::BytesMessage::writeBytes (const unsigned char * *value*, int *offset*, int *length*) [pure virtual]

Writes a portion of a byte array to the bytes message stream.

size as the number of bytes to write.

Parameters

value	bytes to write to the stream
offset	the initial offset within the byte array
length	the number of bytes to use

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 139).

6.98.3.23 virtual void cms::BytesMessage::writeChar (char *value*) [pure virtual]

Writes a char to the bytes message stream as a 1-byte value.

Parameters

value	char to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 139).

6.98.3.24 virtual void cms::BytesMessage::writeDouble (double *value*) [pure virtual]

Writes a double to the bytes message stream as a 8 byte value.

Parameters

value	double to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 140).

6.98.3.25 virtual void cms::BytesMessage::writeFloat (float *value*) [pure virtual]

Writes a float to the bytes message stream as a 4 byte value.

Parameters

value	float to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 140).

6.98.3.26 virtual void cms::BytesMessage::writeInt (int *value*) [pure virtual]

Writes a signed int to the bytes message stream as a 4 byte value.

Parameters

value	signed int to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 140).

6.98.3.27 virtual void cms::BytesMessage::writeLong (long long *value*) [pure virtual]

Writes a long long to the bytes message stream as a 8 byte value.

Parameters

value	signed long long to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 141).

6.98.3.28 virtual void cms::BytesMessage::writeShort (short *value*) [pure virtual]

Writes a signed short to the bytes message stream as a 2 byte value.

Parameters

value	signed short to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 141).

6.98.3.29 virtual void cms::BytesMessage::writeString (const std::string & *value*) [pure virtual]

Writes an ASCII String to the Bytes message stream.

Parameters

value	String to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 141).

6.98.3.30 virtual void cms::BytesMessage::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

value	unsigned short to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to write the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 141).

6.98.3.31 virtual void cms::BytesMessage::writeUTF (const std::string & *value*) [pure virtual]

Writes an UTF String to the **BytesMessage** (p. 557) stream.

Parameters

value	String to write to the stream

Exceptions

CMSException *(p. 640)*	- if the CMS provider fails to read the message due to some internal error.
MessageNotWriteable-Exception *(p. 1490)*	- if the message is in read-only mode.

Implemented in **activemq::commands::ActiveMQBytesMessage** (p. 142).

The documentation for this class was generated from the following file:

6.99 activemq::cmsutil::CachedConsumer Class Reference

A cached message consumer contained within a pooled session.

`#include <src/main/activemq/cmsutil/CachedConsumer.h>`

Inheritance diagram for activemq::cmsutil::CachedConsumer:

Public Member Functions

- **CachedConsumer** (**cms::MessageConsumer** ∗consumer)
- virtual ∼**CachedConsumer** () throw ()
- virtual void **close** ()

  Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **start** ()

  Starts the service.
- virtual void **stop** ()

  Stops this service.
- virtual **cms::Message** ∗ **receive** ()

  Synchronously Receive a Message.
- virtual **cms::Message** ∗ **receive** (int millisecs)

  Synchronously Receive a Message, time out after defined interval.
- virtual **cms::Message** ∗ **receiveNoWait** ()

  Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.
- virtual void **setMessageListener** (**cms::MessageListener** ∗listener)

  Sets the MessageListener that this class will send notifs on.
- virtual **cms::MessageListener** ∗ **getMessageListener** () **const**

  Gets the MessageListener that this class will send mew Message notification events to.
- virtual std::string **getMessageSelector** () **const**

  Gets this message consumer's message selector expression.

6.99.1 Detailed Description

A cached message consumer contained within a pooled session.

6.99.2 Constructor & Destructor Documentation

6.99.2.1 activemq::cmsutil::CachedConsumer::CachedConsumer (cms::MessageConsumer ∗ *consumer*) [inline]

6.99.2.2 virtual activemq::cmsutil::CachedConsumer::∼CachedConsumer ( ) throw () [inline, virtual]

6.99.3 Member Function Documentation

6.99.3.1 virtual void activemq::cmsutil::CachedConsumer::close ( ) [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 633).

6.99.3.2 virtual cms::MessageListener* activemq::cmsutil::CachedConsumer::getMessageListener ( ) const [inline, virtual]

Gets the MessageListener that this class will send mew Message notification events to.

Returns

The listener of messages received by this consumer

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1456).

6.99.3.3 virtual std::string activemq::cmsutil::CachedConsumer::getMessageSelector ( ) const [inline, virtual]

Gets this message consumer's message selector expression.

Returns

This Consumer's selector expression or "".

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1456).

6.99.3.4 virtual cms::Message* activemq::cmsutil::CachedConsumer::receive ( ) [inline, virtual]

Synchronously Receive a Message.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.99.3.5 virtual cms::Message* activemq::cmsutil::CachedConsumer::receive (int *millisecs*) [inline, virtual]

Synchronously Receive a Message, time out after defined interval.

Returns null if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.99.3.6 virtual cms::Message* activemq::cmsutil::CachedConsumer::receiveNoWait ( ) [inline, virtual]

Receive a Message, does not wait if there isn't a new message to read, returns NULL if nothing read.

Returns

new message which the caller owns and must delete.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1457).

6.99.3.7 virtual void activemq::cmsutil::CachedConsumer::setMessageListener (cms::MessageListener * *listener*) [inline, virtual]

Sets the MessageListener that this class will send notifs on.

Parameters

listener	The listener of messages received by this consumer.

Exceptions

CMSException	- If an internal error occurs.

Implements **cms::MessageConsumer** (p. 1458).

6.99.3.8 virtual void activemq::cmsutil::CachedConsumer::start ( ) [inline, virtual]

Starts the service.

Exceptions

CMSException	if an internal error occurs while starting.

Implements **cms::Startable** (p. 1964).

6.99.3.9 virtual void activemq::cmsutil::CachedConsumer::stop ( ) [inline, virtual]

Stops this service.

Exceptions

CMSException	- if an internal error occurs while stopping the Service.

Implements **cms::Stoppable** (p. 2017).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CachedConsumer.h**

6.100 activemq::cmsutil::CachedProducer Class Reference

A cached message producer contained within a pooled session.

`#include <src/main/activemq/cmsutil/CachedProducer.h>`

Inheritance diagram for activemq::cmsutil::CachedProducer:

Public Member Functions

- **CachedProducer** (**cms::MessageProducer** ∗producer)
- virtual ∼**CachedProducer** () throw ()
- virtual void **close** ()

  Does nothing - the real producer resource will be closed by the lifecycle manager.
- virtual void **send** (**cms::Message** ∗message)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**cms::Message** ∗message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**const cms::Destination** ∗destination, **cms::Message** ∗message)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **send** (**const cms::Destination** ∗destination, **cms::Message** ∗message, int deliveryMode, int priority, long long timeToLive)

  Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.
- virtual void **setDeliveryMode** (int mode)

  Sets the delivery mode for this Producer.
- virtual int **getDeliveryMode** () **const**

  Gets the delivery mode for this Producer.
- virtual void **setDisableMessageID** (bool value)

  Sets if Message Ids are disabled for this Producer.
- virtual bool **getDisableMessageID** () **const**

  Gets if Message Ids are disabled for this Producer.
- virtual void **setDisableMessageTimeStamp** (bool value)

  Sets if Message Time Stamps are disabled for this Producer.
- virtual bool **getDisableMessageTimeStamp** () **const**

Gets if Message Time Stamps are disabled for this Producer.

- virtual void **setPriority** (int priority)

  Sets the Priority that this Producers sends messages at.

- virtual int **getPriority** () **const**

  Gets the Priority level that this producer sends messages at.

- virtual void **setTimeToLive** (long long time)

  Sets the Time to Live that this Producers sends messages with.

- virtual long long **getTimeToLive** () **const**

  Gets the Time to Live that this producer sends messages with.

6.100.1 Detailed Description

A cached message producer contained within a pooled session.

6.100.2 Constructor & Destructor Documentation

6.100.2.1 activemq::cmsutil::CachedProducer::CachedProducer (cms::MessageProducer * *producer*) [inline]

6.100.2.2 virtual activemq::cmsutil::CachedProducer::~CachedProducer ( ) throw () [inline, virtual]

6.100.3 Member Function Documentation

6.100.3.1 virtual void activemq::cmsutil::CachedProducer::close ( ) [inline, virtual]

Does nothing - the real producer resource will be closed by the lifecycle manager.

Implements **cms::Closeable** (p. 633).

6.100.3.2 virtual int activemq::cmsutil::CachedProducer::getDeliveryMode ( ) const [inline, virtual]

Gets the delivery mode for this Producer.

Returns

The DeliveryMode

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1493).

6.100.3.3 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageID ( ) const [inline, virtual]

Gets if Message Ids are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1493).

6.100.3.4 virtual bool activemq::cmsutil::CachedProducer::getDisableMessageTimeStamp ( ) const [inline, virtual]

Gets if Message Time Stamps are disabled for this Producer.

Returns

boolean indicating enable / disable (true / false)

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1493).

6.100.3.5 virtual int activemq::cmsutil::CachedProducer::getPriority ( ) const [inline, virtual]

Gets the Priority level that this producer sends messages at.

Returns

int based priority level

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1494).

6.100.3.6 virtual long long activemq::cmsutil::CachedProducer::getTimeToLive ( ) const [inline, virtual]

Gets the Time to Live that this producer sends messages with.

Returns

Time to live value in milliseconds

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1494).

6.100.3.7 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

message	The message to be sent.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1494).

6.100.3.8 virtual void activemq::cmsutil::CachedProducer::send (cms::Message * *message,* int *deliveryMode,* int *priority,* long long *timeToLive*) [inline, virtual]

Sends the message to the default producer destination, but does not take ownership of the message, caller must still destroy it.

Parameters

message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1495).

6.100.3.9 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination,* cms::Message * *message*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Uses default values for deliveryMode, priority, and time to live.

Parameters

destination	The destination on which to send the message
message	the message to be sent.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.

UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1495).

6.100.3.10 virtual void activemq::cmsutil::CachedProducer::send (const cms::Destination * *destination*, cms::Message * *message*, int *deliveryMode*, int *priority*, long long *timeToLive*) [inline, virtual]

Sends the message to the designated destination, but does not take ownership of the message, caller must still destroy it.

Parameters

destination	The destination on which to send the message
message	The message to be sent.
deliveryMode	The delivery mode to be used.
priority	The priority for this message.
timeToLive	The time to live value for this message in milliseconds.

Exceptions

CMSException	- if an internal error occurs while sending the message.
MessageFormatException	- if an Invalid Message is given.
InvalidDestinationException	- if a client uses this method with a MessageProducer with an invalid destination.
UnsupportedOperation-Exception	- if a client uses this method with a MessageProducer that did not specify a destination at creation time.

Implements **cms::MessageProducer** (p. 1496).

6.100.3.11 virtual void activemq::cmsutil::CachedProducer::setDeliveryMode (int *mode*) [inline, virtual]

Sets the delivery mode for this Producer.

Parameters

mode	The DeliveryMode

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1496).

6.100.3.12 virtual void activemq::cmsutil::CachedProducer::setDisableMessageID (bool *value*) [inline, virtual]

Sets if Message Ids are disabled for this Producer.

Parameters

value	boolean indicating enable / disable (true / false)

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1496).

6.100.3.13 virtual void activemq::cmsutil::CachedProducer::setDisableMessageTimeStamp (bool *value*) [inline, virtual]

Sets if Message Time Stamps are disabled for this Producer.

Parameters

value	- boolean indicating enable / disable (true / false)

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1497).

6.100.3.14 virtual void activemq::cmsutil::CachedProducer::setPriority (int *priority*) [inline, virtual]

Sets the Priority that this Producers sends messages at.

Parameters

priority	int value for Priority level

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1497).

6.100.3.15 virtual void activemq::cmsutil::CachedProducer::setTimeToLive (long long *time*) [inline, virtual]

Sets the Time to Live that this Producers sends messages with.

This value will be used if the time to live is not specified via the send method.

Parameters

time	default time to live value in milliseconds

Exceptions

CMSException	- if an internal error occurs.

Implements **cms::MessageProducer** (p. 1497).

6.101 decaf::util::concurrent::Callable< V > Class Template Reference

A task that returns a result and may throw an exception.

`#include <src/main/decaf/util/concurrent/Callable.h>`

Public Member Functions

- virtual ~**Callable** ()
- virtual V **call** ()=0

  Computes a result, or throws an exception if unable to do so.

6.101.1 Detailed Description

template<typename V>class decaf::util::concurrent::Callable< V >

A task that returns a result and may throw an exception.

Implementors define a single method with no arguments called call. This interface differs from the Runnable interface in that a **Callable** (p. 578) object can return a result and is allowed to throw an exceptions from its call method.

The **Executors** (p. 1005) class contains utility methods to convert from other common forms to **Callable** (p. 578) classes.

Since

1.0

6.101.2 Constructor & Destructor Documentation

6.101.2.1 template<typename V > virtual decaf::util::concurrent::Callable< V >::~Callable ( ) [inline, virtual]

6.101.3 Member Function Documentation

6.101.3.1 template<typename V > virtual V decaf::util::concurrent::Callable< V >::call ( ) [pure virtual]

Computes a result, or throws an exception if unable to do so.

Returns

Computed Result.

Exceptions

Exception	If unable to compute a result.

6.102.2.2 virtual decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::∼CallerRunsPolicy ( ) [inline, virtual]

6.102.3 Member Function Documentation

6.102.3.1 virtual void decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::rejectedExecution (decaf::lang::Runnable ∗ *task*, ThreadPoolExecutor ∗executer *DECAF_UNUSED*) [inline, virtual]

References decaf::lang::Runnable::run().

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ThreadPoolExecutor.h**

6.103 decaf::util::concurrent::CancellationException Class Reference

`#include <src/main/decaf/util/concurrent/CancellationException.h>`

Inheritance diagram for decaf::util::concurrent::CancellationException:

Public Member Functions

- **CancellationException** () throw ()

  Default Constructor.
- **CancellationException** (**const decaf::lang::Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **CancellationException** (**const CancellationException** &ex) throw ()

  Copy Constructor.
- **CancellationException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **CancellationException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **CancellationException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **CancellationException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**CancellationException** () throw ()

6.103.1 Constructor & Destructor Documentation

6.103.1.1 decaf::util::concurrent::CancellationException::CancellationException ( ) throw () [inline]

Default Constructor.

6.103.1.2 decaf::util::concurrent::CancellationException::CancellationException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.103.1.3 decaf::util::concurrent::CancellationException::CancellationException (const CancellationException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	- The Exception to copy in this new instance.

6.103.1.4 decaf::util::concurrent::CancellationException::CancellationException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.103.1.5 decaf::util::concurrent::CancellationException::CancellationException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.103.1.6 decaf::util::concurrent::CancellationException::CancellationException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
cause	- The exception that was the cause for this one to be thrown.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.103.1.7 virtual decaf::util::concurrent::CancellationException::~CancellationException ( ) throw () [inline, virtual]

6.103.2 Member Function Documentation

6.103.2.1 virtual CancellationException* decaf::util::concurrent::CancellationException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CancellationException.h**

6.104 decaf::security::cert::Certificate Class Reference

Base interface for all identity certificates.

`#include <src/main/decaf/security/cert/Certificate.h>`

Inheritance diagram for decaf::security::cert::Certificate:

Public Member Functions

- virtual ~**Certificate** ()
- virtual bool **equals** (**const Certificate** &cert) **const** =0

  Compares the encoded form of the two certificates.
- virtual void **getEncoded** (std::vector< unsigned char > &output) **const** =0

  Provides the encoded form of this certificate.
- virtual std::string **getType** () **const** =0

  Returns the type of this certificate.
- virtual **PublicKey** * **getPublicKey** ()=0

  Gets the public key of this certificate.
- virtual **const PublicKey** * **getPublicKey** () **const** =0

  Gets the public key of this certificate.
- virtual void **verify** (**const PublicKey** &publicKey) **const** =0

  Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual void **verify** (**const PublicKey** &publicKey, **const** std::string &sigProvider) **const** =0

  Verifies that this certificate was signed with the private key that corresponds to the specified public key.
- virtual std::string **toString** () **const** =0

  Returns a string representation of this certificate.

6.104.1 Detailed Description

Base interface for all identity certificates.

6.104.2 Constructor & Destructor Documentation

6.104.2.1 virtual decaf::security::cert::Certificate::~Certificate ( ) [inline, virtual]

6.104.3 Member Function Documentation

6.104.3.1 virtual bool decaf::security::cert::Certificate::equals (const Certificate & *cert*) const [pure virtual]

Compares the encoded form of the two certificates.

Parameters

cert	The certificate to be tested for equality with this certificate.

Returns

true if the given certificate is equal to this certificate.

6.104.3.2 virtual void decaf::security::cert::Certificate::getEncoded (std::vector< unsigned char > & *output*) const [pure virtual]

Provides the encoded form of this certificate.

Parameters

output	Receives the encoded form of this certificate.

Exceptions

CertificateEncoding-Exception *(p. 585)*	if an encoding error occurs

6.104.3.3 virtual PublicKey* decaf::security::cert::Certificate::getPublicKey ( ) [pure virtual]

Gets the public key of this certificate.

Returns

the public key

6.104.3.4 virtual const PublicKey* decaf::security::cert::Certificate::getPublicKey ( ) const [pure virtual]

Gets the public key of this certificate.

Returns

the public key

6.104.3.5 virtual std::string decaf::security::cert::Certificate::getType ( ) const [pure virtual]

Returns the type of this certificate.

Returns

the type of this certificate

6.104.3.6 virtual std::string decaf::security::cert::Certificate::toString ( ) const [pure virtual]

Returns a string representation of this certificate.

Returns

a string representation of this certificate

6.104.3.7 virtual void decaf::security::cert::Certificate::verify (const PublicKey & *publicKey*) const [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Parameters

publicKey	The public key used to carry out the validation.

Exceptions

NoSuchAlgorithmException *(p. 1535)*	- on unsupported signature algorithms.
InvalidKeyException *(p. 1191)*	- on incorrect key.
NoSuchProviderException *(p. 1539)*	- if there's no default provider.
SignatureException *(p. 1889)*	- on signature errors.
CertificateException *(p. 587)*	- on encoding errors.

6.104.3.8 virtual void decaf::security::cert::Certificate::verify (const PublicKey & *publicKey,* const std::string & *sigProvider*) const [pure virtual]

Verifies that this certificate was signed with the private key that corresponds to the specified public key.

Uses the verification engine of the specified provider.

Parameters

publicKey	The public key used to carry out the validation.
sigProvider	The name of the signature provider

Exceptions

NoSuchAlgorithmException *(p. 1535)*	- on unsupported signature algorithms.
InvalidKeyException *(p. 1191)*	- on incorrect key.
NoSuchProviderException *(p. 1539)*	- if there's no default provider.
SignatureException *(p. 1889)*	- on signature errors.
CertificateException *(p. 587)*	- on encoding errors.

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**Certificate.h**

6.105 decaf::security::cert::CertificateEncodingException Class Reference

`#include <src/main/decaf/security/cert/CertificateEncodingException.h>`

Inheritance diagram for decaf::security::cert::CertificateEncodingException:

Public Member Functions

- **CertificateEncodingException** () throw ()

  Default Constructor.
- **CertificateEncodingException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.
- **CertificateEncodingException** (**const CertificateEncodingException** &ex) throw ()

  Copy Constructor.
- **CertificateEncodingException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occured.
- virtual
  CertificateEncodingException ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**CertificateEncodingException** () throw ()

6.105.1 Constructor & Destructor Documentation

6.105.1.1 decaf::security::cert::CertificateEncodingException::CertificateEncodingException ( ) throw () [inline]

Default Constructor.

6.105.1.2 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.105.1.3 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const CertificateEncodingException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.105.1.4 decaf::security::cert::CertificateEncodingException::CertificateEncodingException (const char ∗ *file,* const int *lineNumber,* const char ∗ *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occured.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	name where exception occurs
lineNumber	line number where the exception occurred.
msg	message to report
...	list of primitives that are formatted into the message

6.105.1.5 virtual decaf::security::cert::CertificateEncodingException::~CertificateEncodingException ( ) throw () [inline, virtual]

6.105.2 Member Function Documentation

6.105.2.1 virtual CertificateEncodingException* decaf::security::cert::CertificateEncodingException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

A deep copy of this exception.

Reimplemented from **decaf::security::cert::CertificateException** (p. 588).

The documentation for this class was generated from the following file:

- src/main/decaf/security/cert/**CertificateEncodingException.h**

6.106 decaf::security::cert::CertificateException Class Reference

`#include <src/main/decaf/security/cert/CertificateException.h>`

Inheritance diagram for decaf::security::cert::CertificateException:

Public Member Functions

6.110 decaf::lang::Character Class Reference

`#include <src/main/decaf/lang/Character.h>`

Inheritance diagram for decaf::lang::Character:

Public Member Functions

- **Character** (char value)
- virtual int **compareTo** (**const Character** &c) **const**

  *Compares this **Character** (p. 593) instance with another.*
- virtual bool **operator==** (**const Character** &c) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Character** &c) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** char &c) **const**

  *Compares this **Character** (p. 593) instance with a char type.*
- virtual bool **operator==** (**const** char &c) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** char &c) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- bool **equals** (**const Character** &c) **const**
- bool **equals** (**const** char &c) **const**
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.
- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.

Static Public Member Functions

- static **Character valueOf** (char value)

  *Returns a **Character** (p. 593) instance representing the specified char value.*
- static bool **isWhitespace** (char c)

  Indicates whether or not the given character is considered whitespace.
- static bool **isDigit** (char c)

  Indicates whether or not the given character is a digit.
- static bool **isLowerCase** (char c)

  Indicates whether or not the given character is a lower case character.
- static bool **isUpperCase** (char c)

  Indicates whether or not the given character is a upper case character.

- static bool **isLetter** (char c)

  Indicates whether or not the given character is a letter.
- static bool **isLetterOrDigit** (char c)

  Indicates whether or not the given character is either a letter or a digit.
- static bool **isISOControl** (char c)

  Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.
- static int **digit** (char c, int radix)

  Returns the numeric value of the character ch in the specified radix.

Static Public Attributes

- static **const** int **MIN_RADIX** = 2

  The minimum radix available for conversion to and from strings.
- static **const** int **MAX_RADIX** = 36

  The maximum radix available for conversion to and from strings.
- static **const** char **MIN_VALUE** = (char)0x7F

  The minimum value that a signed char can take on.
- static **const** char **MAX_VALUE** = (char)0x80

  The maximum value that a signed char can take on.
- static **const** int **SIZE** = 8

  The size of the primitive charactor in bits.

6.110.1 Constructor & Destructor Documentation

6.110.1.1 decaf::lang::Character::Character (char *value*)

Parameters

value	- char to wrap.

6.110.2 Member Function Documentation

6.110.2.1 virtual unsigned char decaf::lang::Character::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.110.2.2 virtual int decaf::lang::Character::compareTo (const Character & *c*) const [inline, virtual]

Compares this **Character** (p. 593) instance with another.

Parameters

c	- the **Character** (p. 593) instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< Character >** (p. 687).

6.110.2.3 virtual int decaf::lang::Character::compareTo (const char & *c*) const [inline, virtual]

Compares this **Character** (p. 593) instance with a char type.

Parameters

c	- the char instance to be compared

Returns

zero if this object represents the same char value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable< char >** (p. 687).

6.110.2.4 static int decaf::lang::Character::digit (char *c*, int *radix*) [static]

Returns the numeric value of the character ch in the specified radix.

If the radix is not in the range MIN_RADIX <= radix <= MAX_RADIX or if the value of ch is not a valid digit in the specified radix, -1 is returned. A character is a valid digit if at least one of the following is true:

- The method isDigit is true of the character and the single-character decomposition is less than the specified radix. In this case the decimal digit value is returned.
  - The character is one of the uppercase Latin letters 'A' through 'Z' and its code is less than radix + 'A' - 10. In this case, ch - 'A' + 10 is returned.
  - The character is one of the lowercase Latin letters 'a' through 'z' and its code is less than radix + 'a' - 10. In this case, ch - 'a' + 10 is returned.

Parameters

c	- the char to be converted
radix	- the radix of the number

Returns

the numeric value of the number represented in the given radix

6.110.2.5 virtual double decaf::lang::Character::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.110.2.6 bool decaf::lang::Character::equals (const Character & *c*) const [inline, virtual]

Returns

true if the two **Character** (p. 593) Objects have the same value.

Implements **decaf::lang::Comparable**< **Character** > (p. 688).

6.110.2.7 bool decaf::lang::Character::equals (const char & *c*) const [inline, virtual]

Returns

true if the two Characters have the same value.

Implements **decaf::lang::Comparable**< **char** > (p. 688).

6.110.2.8 virtual float decaf::lang::Character::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.110.2.9 virtual int decaf::lang::Character::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.110.2.10 static bool decaf::lang::Character::isDigit (char *c*) [inline, static]

Indicates whether or not the given character is a digit.

6.110.2.11 static bool decaf::lang::Character::isISOControl (char *c*) [inline, static]

Answers whether the character is an ISO control character, which is a char that lays in the range of 0 to 1f and 7f to 9f.

Parameters

c	- the character, including supplementary characters

Returns

true if the char is an ISO control character

6.110.2.12 static bool decaf::lang::Character::isLetter (char *c*) [inline, static]

Indicates whether or not the given character is a letter.

6.110.2.13 static bool decaf::lang::Character::isLetterOrDigit (char *c*) [inline, static]

Indicates whether or not the given character is either a letter or a digit.

6.110.2.14 static bool decaf::lang::Character::isLowerCase (char *c*) [inline, static]

Indicates whether or not the given character is a lower case character.

6.110.2.15 static bool decaf::lang::Character::isUpperCase (char *c*) [inline, static]

Indicates whether or not the given character is a upper case character.

6.110.2.16 static bool decaf::lang::Character::isWhitespace (char *c*) [inline, static]

Indicates whether or not the given character is considered whitespace.

6.110.2.17 virtual long long decaf::lang::Character::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.110.2.18 virtual bool decaf::lang::Character::operator< (const Character & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Character** > (p. 688).

6.110.2.19 virtual bool decaf::lang::Character::operator< (const char & *c*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **char** > (p. 688).

6.110.2.20 virtual bool decaf::lang::Character::operator== (const Character & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Character** > (p. 688).

6.110.2.21 virtual bool decaf::lang::Character::operator== (const char & *c*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

c	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **char** > (p. 688).

6.110.2.22 virtual short decaf::lang::Character::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

int the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.110.2.23 std::string decaf::lang::Character::toString ( ) const

Returns

this **Character** (p. 593) Object as a **String** (p. 2031) Representation

6.110.2.24 static Character decaf::lang::Character::valueOf (char *value*) [inline, static]

Returns a **Character** (p. 593) instance representing the specified char value.

Parameters

value	- the primitive char to wrap.

Returns

a new Charactor instance that wraps this value.

6.110.3 Field Documentation

6.110.3.1 const int decaf::lang::Character::MAX_RADIX = 36 [static]

The maximum radix available for conversion to and from strings.

6.110.3.2 const char decaf::lang::Character::MAX_VALUE = (char)0x80 [static]

The maximum value that a signed char can take on.

6.110.3.3 const int decaf::lang::Character::MIN_RADIX = 2 [static]

The minimum radix available for conversion to and from strings.

6.110.3.4 const char decaf::lang::Character::MIN_VALUE = (char)0x7F [static]

The minimum value that a signed char can take on.

6.110.3.5 const int decaf::lang::Character::SIZE = 8 [static]

The size of the primitive charactor in bits.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Character.h**

6.111 decaf::internal::nio::CharArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/CharArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::CharArrayBuffer:

Public Member Functions

- **CharArrayBuffer** (int size, bool **readOnly**=false)

  *Creates a **CharArrayBuffer** (p. 600) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **CharArrayBuffer** (char ∗**array**, int size, int **offset**, int **length**, bool **readOnly**=false)

  *Creates a **CharArrayBuffer** (p. 600) object that wraps the given array.*
- **CharArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int **offset**, int **length**, bool **readOnly**=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

- **CharArrayBuffer** (**const CharArrayBuffer** &other)

  *Create a **CharArrayBuffer** (p. 600) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*

- virtual ∼**CharArrayBuffer** ()
- virtual char ∗ **array** ()

  Returns the character array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  *the array that backs this **Buffer** (p. 451).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperationException	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The offset into the backing array where index zero starts.

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperationException	*if the underlying store has no array.*

- virtual **CharBuffer** ∗ **asReadOnlyBuffer** () **const**

  Creates a new, read-only char buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

  Returns

  The new, read-only char buffer which the caller then owns.

- virtual **CharBuffer** & **compact** ()

  Compacts this buffer.
  *The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

  Returns

  *a reference to this **CharBuffer** (p. 609).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*- If this buffer is read-only*

- virtual **CharBuffer** ∗ **duplicate** ()

  Creates a new char buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*a new char **Buffer** (p. 451) which the caller owns.*

- virtual char **get** ()

Relative get method.
Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return*

- virtual char **get** (int index) **const**

Absolute get method.
Reads the char at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the char is to be read.*

Returns

the char that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit or is negative.*

- virtual bool **hasArray** () **const**

Tells whether or not this buffer is backed by an accessible char array.
If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () **const**

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual **CharBuffer** & **put** (char value)

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value	*The char value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **CharBuffer** & **put** (int index, char value)

Writes the given char into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The char to write.*

Returns

a reference to this buffer.

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **CharBuffer** * **slice** () **const**

  *Creates a new **CharBuffer** (p. 609) whose content is a shared subsequence of this buffer's content.*
  The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *the newly create **CharBuffer** (p. 609) which the caller owns.*

- virtual **lang::CharSequence** * **subSequence** (int start, int end) **const**

  *Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position. The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 455) + start, and its limit will be **position()** (p. 455) + end. The new **Buffer** (p. 451) will be read-only if, and only if, this buffer is read-only.*

  Parameters

start	*The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 456).*
end	*The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 456).*

  Returns

  The new character buffer, caller owns.

  Exceptions

IndexOutOfBoundsException	*if the preconditions on start and end fail.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **CharArrayBuffer** (p. 600) as Read-Only.*

Protected Attributes

- **decaf::lang::Pointer** < **ByteArrayAdapter** > **_array**
- int **offset**
- int **length**
- bool **readOnly**

6.111.1 Constructor & Destructor Documentation

6.111.1.1 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (int *size*, bool *readOnly* = `false`)

Creates a **CharArrayBuffer** (p. 600) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.111.1.2 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (char * *array*, int *size*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a **CharArrayBuffer** (p. 600) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.111.1.3 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array*, int *offset*, int *length*, bool *readOnly* = `false`)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **CharArrayBuffer** (p. 600) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.111.1.4 decaf::internal::nio::CharArrayBuffer::CharArrayBuffer (const CharArrayBuffer & *other*)

Create a **CharArrayBuffer** (p. 600) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **CharArrayBuffer** (p. 600) this one is to mirror.

6.111.1.5 virtual decaf::internal::nio::CharArrayBuffer::~CharArrayBuffer ( ) [virtual]

6.111.2 Member Function Documentation

6.111.2.1 virtual char* decaf::internal::nio::CharArrayBuffer::array ( ) [virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 613).

6.111.2.2 virtual int decaf::internal::nio::CharArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::CharBuffer** (p. 614).

6.111.2.3 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two

buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implements **decaf::nio::CharBuffer** (p. 614).

6.111.2.4 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 609).

Exceptions

ReadOnlyBufferException *(p. 1739)*	- If this buffer is read-only

Implements **decaf::nio::CharBuffer** (p. 615).

6.111.2.5 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::duplicate ( ) [virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 615).

6.111.2.6 virtual char decaf::internal::nio::CharArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return

Implements **decaf::nio::CharBuffer** (p. 615).

6.111.2.7 virtual char decaf::internal::nio::CharArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the char at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the char is to be read.

Returns

the char that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit or is negative.

Implements **decaf::nio::CharBuffer** (p. 616).

6.111.2.8 virtual bool decaf::internal::nio::CharArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::CharBuffer** (p. 617).

6.111.2.9 virtual bool decaf::internal::nio::CharArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.111.2.10 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (char *value*) [virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value	The char value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 619).

6.111.2.11 virtual CharBuffer& decaf::internal::nio::CharArrayBuffer::put (int *index*, char *value*) [virtual]

Writes the given char into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The char to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::CharBuffer** (p. 619).

6.111.2.12 virtual void decaf::internal::nio::CharArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **CharArrayBuffer** (p. 600) as Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.111.2.13 virtual CharBuffer* decaf::internal::nio::CharArrayBuffer::slice ( ) const [virtual]

Creates a new **CharBuffer** (p. 609) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer,

and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 609) which the caller owns.

Implements **decaf::nio::CharBuffer** (p. 621).

6.111.2.14 virtual lang::CharSequence* decaf::internal::nio::CharArrayBuffer::subSequence (int *start,* int *end*) const [virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 455) + start, and its limit will be **position()** (p. 455) + end. The new **Buffer** (p. 451) will be read-only if, and only if, this buffer is read-only.

Parameters

start	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 456).
end	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 456).

Returns

The new character buffer, caller owns.

Exceptions

IndexOutOfBounds-Exception	if the preconditions on start and end fail.

Implements **decaf::nio::CharBuffer** (p. 621).

6.111.3 Field Documentation

6.111.3.1 decaf::lang::Pointer<ByteArrayAdapter> decaf::internal::nio::CharArrayBuffer::_array [protected]

6.111.3.2 int decaf::internal::nio::CharArrayBuffer::length [protected]

6.111.3.3 int decaf::internal::nio::CharArrayBuffer::offset [protected]

6.111.3.4 bool decaf::internal::nio::CharArrayBuffer::readOnly [protected]

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**CharArrayBuffer.h**

6.112 decaf::nio::CharBuffer Class Reference

This class defines four categories of operations upon character buffers:

`#include <src/main/decaf/nio/CharBuffer.h>`

Inheritance diagram for decaf::nio::CharBuffer:

Public Member Functions

- virtual ~**CharBuffer** ()
- virtual std::string **toString** () **const**
- **CharBuffer** & **append** (char value)

  Appends the specified character to this buffer.
- **CharBuffer** & **append** (**const lang::CharSequence** *value)

  Appends the specified character sequence to this buffer.
- **CharBuffer** & **append** (**const lang::CharSequence** *value, int start, int end)

  Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.
- virtual char * **array** ()=0

  Returns the character array that backs this buffer (optional operation).
- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
- virtual **CharBuffer** * **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only char buffer that shares this buffer's content.
- char **charAt** (int index) **const**

  Reads the character at the given index relative to the current position.
- virtual **CharBuffer** & **compact** ()=0

  Compacts this buffer.
- virtual **CharBuffer** * **duplicate** ()=0

  Creates a new char buffer that shares this buffer's content.
- virtual char **get** ()=0

  Relative get method.
- virtual char **get** (int index) **const** =0

  Absolute get method.
- **CharBuffer** & **get** (std::vector< char > buffer)

  Relative bulk get method.
- **CharBuffer** & **get** (char *buffer, int size, int offset, int **length**)

  Relative bulk get method.
- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible char array.
- int **length** () **const**

  Returns the length of this character buffer.
- **CharBuffer** & **put** (**CharBuffer** &src)

  This method transfers the chars remaining in the given source buffer into this buffer.
- **CharBuffer** & **put** (**const** char *buffer, int size, int offset, int **length**)

  This method transfers chars into this buffer from the given source array.
- **CharBuffer** & **put** (std::vector< char > &buffer)

  This method transfers the entire content of the given source char array into this buffer.
- virtual **CharBuffer** & **put** (char value)=0

  Writes the given char into this buffer at the current position, and then increments the position.
- virtual **CharBuffer** & **put** (int index, char value)=0

  Writes the given char into this buffer at the given index.
- **CharBuffer** & **put** (std::string &src, int start, int end)

Relative bulk put method (optional operation).

- **CharBuffer** & **put** (**const** std::string &src)

  Relative bulk put method (optional operation).

- virtual int **read** (**CharBuffer** *target)

  Attempts to read characters into the specified character buffer.

- virtual **lang::CharSequence** * **subSequence** (int start, int end) **const** =0

  Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

- virtual **CharBuffer** * **slice** () **const** =0

  *Creates a new **CharBuffer** (p. 609) whose content is a shared subsequence of this buffer's content.*

- virtual int **compareTo** (**const CharBuffer** &value) **const**

- virtual bool **equals** (**const CharBuffer** &value) **const**

- virtual bool **operator==** (**const CharBuffer** &value) **const**

- virtual bool **operator**< (**const CharBuffer** &value) **const**

Protected Member Functions

- **CharBuffer** (int **capacity**)

  *Creates a **CharBuffer** (p. 609) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.112.1 Detailed Description

This class defines four categories of operations upon character buffers:

o Absolute and relative get and put methods that read and write single characters; o Relative bulk get methods that transfer contiguous sequences of characters from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of characters from a character array, a string, or some other character buffer into this buffer. o Methods for compacting, duplicating, and slicing a character buffer.

Character buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing character array or string into a buffer, or by creating a view of an existing byte buffer

This class implements the CharSequence interface so that character buffers may be used wherever character sequences are accepted, for example in the regular-expression package decaf.util.regex.

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained. The sequence of statements

```
cb.put("text/");
cb.put(subtype);
cb.put("; charset=");
cb.put(enc);
```

can, for example, be replaced by the single statement

```
cb.put("text/").put(subtype).put("; charset=").put(enc);
```

6.112.2 Constructor & Destructor Documentation

6.112.2.1 decaf::nio::CharBuffer::CharBuffer (int *capacity*) [protected]

Creates a **CharBuffer** (p. 609) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size of the array, this is the limit we read and write to.

Exceptions

IllegalArguementException	if capacity is negative.

6.112.2.2 virtual decaf::nio::CharBuffer::~CharBuffer ( ) [inline, virtual]

6.112.3 Member Function Documentation

6.112.3.1 static CharBuffer* decaf::nio::CharBuffer::allocate (int *capacity*) [static]

Allocates a new character buffer.

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Char buffer in chars (1 byte).

Returns

the **CharBuffer** (p. 609) that was allocated, caller owns.

Exceptions

IndexOutOfBounds-Exception	if capacity is negative.

6.112.3.2 CharBuffer& decaf::nio::CharBuffer::append (char *value*) [virtual]

Appends the specified character to this buffer.

Parameters

value	The char to append.

Returns

a reference to this modified **CharBuffer** (p. 609).

Exceptions

BufferOverflowException *(p. 472)*	if there is no more space
ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.

Implements **decaf::lang::Appendable** (p. 343).

6.112.3.3 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value*) [virtual]

Appends the specified character sequence to this buffer.

If value is Null the the string "null" is appended to the buffer.

Parameters

value	The CharSequence to append.

Returns

a reference to this modified **CharBuffer** (p. 609)

Exceptions

BufferOverflowException *(p. 472)*	if there is no more space
ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.

Implements **decaf::lang::Appendable** (p. 343).

6.112.3.4 CharBuffer& decaf::nio::CharBuffer::append (const lang::CharSequence * *value,* int *start,* int *end*) [virtual]

Appends a subsequence of the specified character sequence to this buffer If value is Null the the string "null" is appended to the buffer.

Parameters

value	The CharSequence to append.
start	The index to start appending from.
end	The index to append to.

Returns

a reference to this modified **CharBuffer** (p. 609).

Exceptions

BufferOverflowException *(p. 472)*	if there is no more space

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
IndexOutOfBounds-Exception	if start $>$ end, or $>$ length of sequence.

Implements **decaf::lang::Appendable** (p. 344).

6.112.3.5 virtual char* decaf::nio::CharBuffer::array ( ) [pure virtual]

Returns the character array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 604).

6.112.3.6 virtual int decaf::nio::CharBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 605).

6.112.3.7 virtual CharBuffer* decaf::nio::CharBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only char buffer which the caller then owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 605).

6.112.3.8 char decaf::nio::CharBuffer::charAt (int *index*) const [virtual]

Reads the character at the given index relative to the current position.

Parameters

index	- The index of the character to be read relative to position

Returns

The character at index **position()** (p. 455) + index.

Exceptions

IndexOutOfBounds-Exception	if the index + the current position exceeds the size of the buffer or the index is negative.

Implements **decaf::lang::CharSequence** (p. 623).

6.112.3.9 virtual CharBuffer& decaf::nio::CharBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **CharBuffer** (p. 609).

Exceptions

ReadOnlyBufferException *(p. 1739)*	- If this buffer is read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 605).

6.112.3.10 virtual int decaf::nio::CharBuffer::compareTo (const CharBuffer & *value*) const [virtual]

6.112.3.11 virtual CharBuffer* decaf::nio::CharBuffer::duplicate ( ) [pure virtual]

Creates a new char buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new char **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 606).

6.112.3.12 virtual bool decaf::nio::CharBuffer::equals (const CharBuffer & *value*) const [virtual]

6.112.3.13 virtual char decaf::nio::CharBuffer::get ( ) [pure virtual]

Relative get method.

Reads the character at this buffer's current position, and then increments the position.

Returns

the char at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 606).

6.112.3.14 virtual char decaf::nio::CharBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the char at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the char is to be read.

Returns

the char that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit or is negative.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 606).

6.112.3.15 CharBuffer& decaf::nio::CharBuffer::get (std::vector< char > *buffer*)

Relative bulk get method.

This method transfers chars from this buffer into the given destination vector. An invocation of this method of the

form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **CharBuffer** (p. 609).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length chars remaining in this buffer.

6.112.3.16 CharBuffer& decaf::nio::CharBuffer::get (char * *buffer,* int *size,* int *offset,* int *length*)

Relative bulk get method.

This method transfers chars from this buffer into the given destination array. If there are fewer chars remaining in the buffer than are required to satisfy the request, that is, if length $>$ **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length chars from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the buffer passed.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length chars remaining in this buffer
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.112.3.17 virtual bool decaf::nio::CharBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible char array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 607).

6.112.3.18 int decaf::nio::CharBuffer::length ( ) const [inline, virtual]

Returns the length of this character buffer.

Returns

the length of this buffer from the position to the limit.

Implements **decaf::lang::CharSequence** (p. 624).

6.112.3.19 virtual bool decaf::nio::CharBuffer::operator< (const CharBuffer & *value*) const [virtual]

6.112.3.20 virtual bool decaf::nio::CharBuffer::operator== (const CharBuffer & *value*) const [virtual]

6.112.3.21 CharBuffer& decaf::nio::CharBuffer::put (CharBuffer & *src*)

This method transfers the chars remaining in the given source buffer into this buffer.

If there are more chars remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no chars are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() chars from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	- the buffer to take chars from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining chars in the source buffer.
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.112.3.22 CharBuffer& decaf::nio::CharBuffer::put (const char * *buffer,* int *size,* int *offset,* int *length*)

This method transfers chars into this buffer from the given source array.

If there are more chars to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no chars are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which chars are to be read.
size	The size of the buffer passed.
offset	The offset within the array of the first char to be read.
length	The number of chars to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.112.3.23 CharBuffer& decaf::nio::CharBuffer::put (std::vector< char > & *buffer*)

This method transfers the entire content of the given source char array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **CharBuffer** (p. 609).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.112.3.24 virtual CharBuffer& decaf::nio::CharBuffer::put (char *value*) [pure virtual]

Writes the given char into this buffer at the current position, and then increments the position.

Parameters

value	The char value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 607).

6.112.3.25 virtual CharBuffer& decaf::nio::CharBuffer::put (int *index,* char *value*) [pure virtual]

Writes the given char into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The char to write.

Returns

a reference to this buffer.

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 607).

6.112.3.26 CharBuffer& decaf::nio::CharBuffer::put (std::string & *src,* int *start,* int *end*)

Relative bulk put method (optional operation).

This method transfers characters from the given string into this buffer. If there are more characters to be copied from the string than remain in this buffer, that is, if end - start $>$ **remaining()** (p. 456), then no characters are transferred and a **BufferOverflowException** (p. 472) is thrown.

Returns

a reference to this buffer

Otherwise, this method copies n = end - start characters from the given string into this buffer, starting at the given start index and at the current position of this buffer. The position of this buffer is then incremented by n.

Parameters

src	The string to copy from.
start	The position in src to start from.
end	The position in src to stop at.

Returns

a reference to this **CharBuffer** (p. 609).

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not
IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only

6.112.3.27 CharBuffer& decaf::nio::CharBuffer::put (const std::string & *src*)

Relative bulk put method (optional operation).

This method transfers the entire content of the given source string into this buffer. An invocation of this method of the form dst.put(s) behaves in exactly the same way as the invocation.

Parameters

src	The string to copy from.

Returns

a reference to this **CharBuffer** (p. 609).

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.112.3.28 virtual int decaf::nio::CharBuffer::read (CharBuffer * *target*) [virtual]

Attempts to read characters into the specified character buffer.

The buffer is used as a repository of characters as-is: the only changes made are the results of a put operation. No flipping or rewinding of the buffer is performed.

Parameters

target	The buffer to read characters into

Returns

The number of characters added to the buffer, or string::npos if this source of characters is at its end

Exceptions

NullPointerException	if target is Null.
IllegalArgumentException	if target is this **CharBuffer** (p. 609).
ReadOnlyBufferException *(p. 1739)*	if this buffer is in read-only mode.

6.112.3.29 virtual CharBuffer* decaf::nio::CharBuffer::slice ( ) const [pure virtual]

Creates a new **CharBuffer** (p. 609) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **CharBuffer** (p. 609) which the caller owns.

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 608).

6.112.3.30 virtual lang::CharSequence* decaf::nio::CharBuffer::subSequence (int *start,* int *end*) const [pure virtual]

Creates a new character buffer that represents the specified subsequence of this buffer, relative to the current position.

The new buffer will share this buffer's content; that is, if the content of this buffer is mutable then modifications to one buffer will cause the other to be modified. The new buffer's capacity will be that of this buffer, its position will be **position()** (p. 455) + start, and its limit will be **position()** (p. 455) + end. The new **Buffer** (p. 451) will be read-only if, and only if, this buffer is read-only.

Parameters

start	The index, relative to the current position, of the first character in the subsequence; must be non-negative and no larger than **remaining()** (p. 456).
end	The index, relative to the current position, of the character following the last character in the subsequence; must be no smaller than start and no larger than **remaining()** (p. 456).

Returns

The new character buffer, caller owns.

Exceptions

IndexOutOfBounds-Exception	if the preconditions on start and end fail.

Implements **decaf::lang::CharSequence** (p. 624).

Implemented in **decaf::internal::nio::CharArrayBuffer** (p. 608).

6.112.3.31 virtual std::string decaf::nio::CharBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

Implements **decaf::lang::CharSequence** (p. 624).

6.112.3.32 static CharBuffer* decaf::nio::CharBuffer::wrap (char * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **CharBuffer** (p. 609).

The new buffer will be backed by the given char array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the array passed in.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **CharBuffer** (p. 609) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is Null.
IndexOutOfBounds-Exception	if capacity is negative.

6.112.3.33 static CharBuffer* decaf::nio::CharBuffer::wrap (std::vector< char > & *buffer*) [static]

Wraps the passed STL char Vector in a **CharBuffer** (p. 609).

The new buffer will be backed by the given char array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **CharBuffer** (p. 609) that is backed by buffer, caller owns.

The documentation for this class was generated from the following file:

- src/main/decaf/nio/**CharBuffer.h**

6.113 decaf::lang::CharSequence Class Reference

A **CharSequence** (p. 623) is a readable sequence of char values.

`#include <src/main/decaf/lang/CharSequence.h>`

Inheritance diagram for decaf::lang::CharSequence:

Public Member Functions

- virtual ~**CharSequence** ()
- virtual int **length** () **const** =0
- virtual char **charAt** (int index) **const** =0

  Returns the Char at the specified index so long as the index is not greater than the length of the sequence.
- virtual **CharSequence** * **subSequence** (int start, int end) **const** =0

  *Returns a new **CharSequence** (p. 623) that is a subsequence of this sequence.*
- virtual std::string **toString** () **const** =0

6.113.1 Detailed Description

A **CharSequence** (p. 623) is a readable sequence of char values.

This interface provides uniform, read-only access to many different kinds of char sequences.

This interface does not define that a **CharSequence** (p. 623) should implement comparable, it is therefore up to the dervied classes that implement this interface to define equality, which implies that comparison of two CharSequences does not have a contract on equality.

6.113.2 Constructor & Destructor Documentation

6.113.2.1 virtual decaf::lang::CharSequence::~CharSequence ( ) [inline, virtual]

6.113.3 Member Function Documentation

6.113.3.1 virtual char decaf::lang::CharSequence::charAt (int *index*) const [pure virtual]

Returns the Char at the specified index so long as the index is not greater than the length of the sequence.

Parameters

index	The position to return the char at.

Returns

the char at the given position.

Exceptions

IndexOutOfBounds-Exception	if index is $>$ than **length()** (p. 624) or negative

Implemented in **decaf::nio::CharBuffer** (p. 614), and **decaf::lang::String** (p. 2033).

6.113.3.2 virtual int decaf::lang::CharSequence::length ( ) const [pure virtual]

Returns

the length of the underlying character sequence.

Implemented in **decaf::nio::CharBuffer** (p. 617), and **decaf::lang::String** (p. 2034).

6.113.3.3 virtual CharSequence* decaf::lang::CharSequence::subSequence (int *start,* int *end*) const [pure virtual]

Returns a new **CharSequence** (p. 623) that is a subsequence of this sequence.

The subsequence starts with the char value at the specified index and ends with the char value at index end - 1. The length (in chars) of the returned sequence is end - start, so if start == end then an empty sequence is returned.

Parameters

start	The start index, inclusive.
end	The end index, exclusive.

Returns

a new **CharSequence** (p. 623)

Exceptions

IndexOutOfBounds-Exception	if start or end > **length()** (p. 624) or start or end are negative.

Implemented in **decaf::nio::CharBuffer** (p. 621), **decaf::internal::nio::CharArrayBuffer** (p. 608), and **decaf::lang::String** (p. 2034).

6.113.3.4 virtual std::string decaf::lang::CharSequence::toString ( ) const [pure virtual]

Returns

the string representation of this **CharSequence** (p. 623)

Implemented in **decaf::lang::String** (p. 2034), and **decaf::nio::CharBuffer** (p. 622).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**CharSequence.h**

6.114 decaf::util::zip::CheckedInputStream Class Reference

An implementation of a FilterInputStream that will maintain a **Checksum** (p. 628) of the bytes read, the **Checksum** (p. 628) can then be used to verify the integrity of the input stream.

`#include <src/main/decaf/util/zip/CheckedInputStream.h>`

Inheritance diagram for decaf::util::zip::CheckedInputStream:

Public Member Functions

- **CheckedInputStream** (InputStream *__inputStream__, **Checksum** *sum, bool **own**=false)

  *Create a new instance of a **CheckedInputStream** (p. 624).*
- virtual ~**CheckedInputStream** ()
- **Checksum** * **getChecksum** () **const**

  *Returns a Pointer to the **Checksum** (p. 628) that is in use by this **CheckedInputStream** (p. 624).*
- virtual long long **skip** (long long num)

  Skips over and discards n bytes of data from this input stream.
  The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.
  *The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.*

  Parameters

num	*The number of bytes to skip.*

  Returns

  total bytes skipped

  Exceptions

IOException (p. 1198)	*if an I/O error occurs.*
UnsupportedOperation-Exception	*if the concrete stream class does not support skipping bytes.*

Protected Member Functions

- virtual int **doReadByte** ()
- virtual int **doReadArrayBounded** (unsigned char *buffer, int size, int offset, int length)

6.114.1 Detailed Description

An implementation of a FilterInputStream that will maintain a **Checksum** (p. 628) of the bytes read, the **Checksum** (p. 628) can then be used to verify the integrity of the input stream.

Since

1.0

6.114.2 Constructor & Destructor Documentation

6.114.2.1 decaf::util::zip::CheckedInputStream::CheckedInputStream (InputStream * *inputStream,* Checksum * *sum,* bool *own* = `false`)

Create a new instance of a **CheckedInputStream** (p. 624).

Parameters

inputStream	The InputStream instance to Wrap.
sum	The **Checksum** (p. 628) instance to use (does not take ownership of the Pointer).
own	Indicates if this filer should take ownership of the InputStream.

Exceptions

NullPointerException	if the **Checksum** (p. 628) pointer is NULL.

6.114.2.2 virtual decaf::util::zip::CheckedInputStream::~CheckedInputStream ( ) [virtual]

6.114.3 Member Function Documentation

6.114.3.1 virtual int decaf::util::zip::CheckedInputStream::doReadArrayBounded (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.114.3.2 virtual int decaf::util::zip::CheckedInputStream::doReadByte ( ) [protected, virtual]

Reimplemented from **decaf::io::FilterInputStream** (p. 1035).

6.114.3.3 Checksum* decaf::util::zip::CheckedInputStream::getChecksum ( ) const [inline]

Returns a Pointer to the **Checksum** (p. 628) that is in use by this **CheckedInputStream** (p. 624).

Returns

the pointer to the **Checksum** (p. 628) instance that is in use by this object.

6.114.3.4 virtual long long decaf::util::zip::CheckedInputStream::skip (long long *num*) [virtual]

Skips over and discards n bytes of data from this input stream.

The skip method may, for a variety of reasons, end up skipping over some smaller number of bytes, possibly 0. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. The actual number of bytes skipped is returned.

The skip method of **InputStream** (p. 1134) creates a byte array and then repeatedly reads into it until num bytes have been read or the end of the stream has been reached. Subclasses are encouraged to provide a more efficient implementation of this method.

Parameters

num	The number of bytes to skip.

Returns

total bytes skipped

Exceptions

IOException *(p. 1198)*	if an I/O error occurs.
UnsupportedOperation-Exception	if the concrete stream class does not support skipping bytes.

Adds the skipped bytes into the **Checksum** (p. 628).

Reimplemented from **decaf::io::FilterInputStream** (p. 1036).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedInputStream.h**

6.115 decaf::util::zip::CheckedOutputStream Class Reference

An implementation of a FilterOutputStream that will maintain a **Checksum** (p. 628) of the bytes written, the **Checksum** (p. 628) can then be used to verify the integrity of the output stream.

`#include <src/main/decaf/util/zip/CheckedOutputStream.h>`

Inheritance diagram for decaf::util::zip::CheckedOutputStream:

Public Member Functions

- **CheckedOutputStream** (**decaf::io::OutputStream** ∗**outputStream**, **Checksum** ∗sum, bool **own**=false)

  *Create a new instance of a **CheckedOutputStream** (p. 627).*
- virtual ∼**CheckedOutputStream** ()
- **Checksum** ∗ **getChecksum** () **const**

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (**const** unsigned char ∗buffer, int size, int offset, int length)

6.115.1 Detailed Description

An implementation of a FilterOutputStream that will maintain a **Checksum** (p. 628) of the bytes written, the **Checksum** (p. 628) can then be used to verify the integrity of the output stream.

Since

1.0

6.115.2 Constructor & Destructor Documentation

6.115.2.1 decaf::util::zip::CheckedOutputStream::CheckedOutputStream (decaf::io::OutputStream * *outputStream,* Checksum * *sum,* bool *own* = false)

Create a new instance of a **CheckedOutputStream** (p. 627).

Parameters

outputStream	The OutputStream instance to Wrap.
sum	The **Checksum** (p. 628) instance to use (does not take ownership of the Pointer).
own	Indicates if this filer should take ownership of the InputStream.

Exceptions

NullPointerException	if the **Checksum** (p. 628) pointer is NULL.

6.115.2.2 virtual decaf::util::zip::CheckedOutputStream::~CheckedOutputStream ( ) [virtual]

6.115.3 Member Function Documentation

6.115.3.1 virtual void decaf::util::zip::CheckedOutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.115.3.2 virtual void decaf::util::zip::CheckedOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.115.3.3 Checksum* decaf::util::zip::CheckedOutputStream::getChecksum ( ) const [inline]

Returns

a pointer to the **Checksum** (p. 628) instance in use by this object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**CheckedOutputStream.h**

6.116 decaf::util::zip::Checksum Class Reference

An interface used to represent **Checksum** (p. 628) values in the Zip package.

`#include <src/main/decaf/util/zip/Checksum.h>`

Inheritance diagram for decaf::util::zip::Checksum:

Public Member Functions

- virtual ~**Checksum** ()
- virtual long long **getValue** () **const** =0
- virtual void **reset** ()=0

  Reset the checksum to its initial value.
- virtual void **update** (**const** std::vector< unsigned char > &buffer)=0

  Updates the current checksum with the specified vector of bytes.
- virtual void **update** (**const** std::vector< unsigned char > &buffer, int offset, int length)=0

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (**const** unsigned char *buffer, int size, int offset, int length)=0

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)=0

  Updates the current checksum with the specified byte value.

6.116.1 Detailed Description

An interface used to represent **Checksum** (p. 628) values in the Zip package.

Since

1.0

6.116.2 Constructor & Destructor Documentation

6.116.2.1 virtual decaf::util::zip::Checksum::~Checksum ( ) [inline, virtual]

6.116.3 Member Function Documentation

6.116.3.1 virtual long long decaf::util::zip::Checksum::getValue ( ) const [pure virtual]

Returns

the current checksum value.

Implemented in **decaf::util::zip::Adler32** (p. 341), and **decaf::util::zip::CRC32** (p. 826).

6.116.3.2 virtual void decaf::util::zip::Checksum::reset ( ) [pure virtual]

Reset the checksum to its initial value.

Implemented in **decaf::util::zip::Adler32** (p. 341), and **decaf::util::zip::CRC32** (p. 826).

6.116.3.3 virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & *buffer*) [pure virtual]

Updates the current checksum with the specified vector of bytes.

Parameters

buffer	The buffer to read the updated bytes from.

Implemented in **decaf::util::zip::Adler32** (p. 341), and **decaf::util::zip::CRC32** (p. 827).

6.116.3.4 virtual void decaf::util::zip::Checksum::update (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*) [pure virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implemented in **decaf::util::zip::Adler32** (p. 341), and **decaf::util::zip::CRC32** (p. 827).

6.116.3.5 virtual void decaf::util::zip::Checksum::update (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [pure virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
size	The size of the passed buffer.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

NullPointerException	if the passed buffer is NULL.
IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implemented in **decaf::util::zip::Adler32** (p. 342), and **decaf::util::zip::CRC32** (p. 827).

6.116.3.6 virtual void decaf::util::zip::Checksum::update (int *byte*) [pure virtual]

Updates the current checksum with the specified byte value.

Parameters

byte	The byte value to update the current **Checksum** (p. 628) with (0..255).

Implemented in **decaf::util::zip::Adler32** (p. 342), and **decaf::util::zip::CRC32** (p. 827).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**Checksum.h**

6.117 decaf::lang::exceptions::ClassCastException Class Reference

`#include <src/main/decaf/lang/exceptions/ClassCastException.h>`

Inheritance diagram for decaf::lang::exceptions::ClassCastException:

Public Member Functions

- **ClassCastException** () throw ()

  Default Constructor.
- **ClassCastException** (**const Exception** &ex) throw ()

  *Conversion Constructor from some other **Exception** (p. 990).*
- **ClassCastException** (**const ClassCastException** &ex) throw ()

  Copy Constructor.
- **ClassCastException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **ClassCastException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **ClassCastException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **ClassCastException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**ClassCastException** () throw ()

6.117.1 Constructor & Destructor Documentation

6.117.1.1 decaf::lang::exceptions::ClassCastException::ClassCastException ( ) throw () [inline]

Default Constructor.

6.117.1.2 decaf::lang::exceptions::ClassCastException::ClassCastException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other **Exception** (p. 990).

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.117.1.3 decaf::lang::exceptions::ClassCastException::ClassCastException (const ClassCastException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) whose data is to be copied into this one.

6.117.1.4 decaf::lang::exceptions::ClassCastException::ClassCastException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.117.1.5 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.117.1.6 decaf::lang::exceptions::ClassCastException::ClassCastException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.117.1.7 virtual decaf::lang::exceptions::ClassCastException::~ClassCastException ( ) throw () [inline, virtual]

6.117.2 Member Function Documentation

6.117.2.1 virtual ClassCastException* decaf::lang::exceptions::ClassCastException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

an new **Exception** (p. 990) instance that is a copy of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/lang/exceptions/**ClassCastException.h**

6.118 cms::Closeable Class Reference

Interface for a class that implements the close method.

`#include <src/main/cms/Closeable.h>`

Inheritance diagram for cms::Closeable:

Public Member Functions

- virtual ~**Closeable** () throw ()
- virtual void **close** ()=0

  Closes this object and deallocates the appropriate resources.

6.118.1 Detailed Description

Interface for a class that implements the close method.

A class that implements this interface should release all resources upon the close call and should throw an exception from any methods that require those resources after they have been closed.

Since

1.0

6.118.2 Constructor & Destructor Documentation

6.118.2.1 virtual cms::Closeable::~Closeable ( ) throw () [virtual]

6.118.3 Member Function Documentation

6.118.3.1 virtual void cms::Closeable::close ( ) [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

CMSException *(p. 640)*	- If an error occurs while the resource is being closed.

Implemented in **activemq::core::ActiveMQConnection** (p. 152), **activemq::core::ActiveMQSession** (p. 262), **cms::Session** (p. 1833), **activemq::core::ActiveMQProducer** (p. 240), **activemq::core::ActiveMQConsumer** (p. 184), **activemq::cmsutil::PooledSession** (p. 1623), **activemq::core::ActiveMQQueueBrowser** (p. 253), **cms::Connection** (p. 726), **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::cmsutil::CachedConsumer** (p. 570), and **activemq::cmsutil::CachedProducer** (p. 574).

The documentation for this class was generated from the following file:

- src/main/cms/**Closeable.h**

6.119 decaf::io::Closeable Class Reference

Interface for a class that implements the close method.

`#include <src/main/decaf/io/Closeable.h>`

Inheritance diagram for decaf::io::Closeable:

Public Member Functions

- virtual ~**Closeable** ()
- virtual void **close** ()=0

  Closes this object and deallocates the appropriate resources.

6.119.1 Detailed Description

Interface for a class that implements the close method.

6.119.2 Constructor & Destructor Documentation

6.119.2.1 virtual decaf::io::Closeable::~Closeable ( ) [inline, virtual]

6.119.3 Member Function Documentation

6.119.3.1 virtual void decaf::io::Closeable::close ( ) [pure virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(*p. *1198)*	if an error occurs while closing.

Implemented in **decaf::net::Socket** (p. 1905), **activemq::transport::IOTransport** (p. 1202), **activemq::transport::mock::MockTransport** (p. 1511), **activemq::wireformat::openwire::OpenWireFormatNegotiator** (p. 1597), **activemq::transport::TransportFilter** (p. 2170), **activemq::transport::failover::FailoverTransport** (p. 1013), **decaf::util::zip::InflaterInputStream** (p. 1131), **decaf::util::zip::DeflaterOutputStream** (p. 923), **activemq::transport::tcp::TcpTransport** (p. 2087), **decaf::util::logging::StreamHandler** (p. 2019), **decaf::io::FilterOutputStream** (p. 1039), **activemq::transport::correlator::ResponseCorrelator** (p. 1786), **decaf::internal::net::ssl::openssl::OpenSSLSocket** (p. 1565), **decaf::io::BufferedInputStream** (p. 459), **decaf::io::BlockingByteArrayInputStream** (p. 416), **decaf::io::FilterInputStream** (p. 1034), **decaf::internal::net::tcp::TcpSocketInputStream** (p. 2084), **activemq::transport::inactivity::InactivityMonitor** (p. 1104), **decaf::io::InputStreamReader** (p. 1144), **decaf::io::OutputStreamWriter** (p. 1607), **decaf::util::logging::ConsoleHandler** (p. 769), **decaf::internal::net::ssl::openssl::OpenSSLSocketInputStream** (p. 1581), **decaf::io::InputStream** (p. 1136), **decaf::io::OutputStream** (p. 1602), **decaf::internal::net::tcp::TcpSocketOutputStream** (p. 2086), **decaf::internal::net::ssl::openssl::OpenSSLSocketOutputStream** (p. 1583), **decaf::internal::io::StandardErrorOutputStream** (p. 1960), and **decaf::internal::io::StandardOutputStream** (p. 1962).

The documentation for this class was generated from the following file:

Public Member Functions

- **CloseTransportsTask** ()
- virtual ~**CloseTransportsTask** ()
- void **add** (**const Pointer**< **Transport** > &transport)

  *Add a new **Transport** (p. 2161) to close.*
- virtual bool **isPending** () **const**

  This Task is pending if there are transports in the Queue that need to be closed.
- virtual bool **iterate** ()

  Return true until all transports have been closed and removed from the queue.

6.120.1 Constructor & Destructor Documentation

6.120.1.1 activemq::transport::failover::CloseTransportsTask::CloseTransportsTask ( )

6.120.1.2 virtual activemq::transport::failover::CloseTransportsTask::~CloseTransportsTask ( ) [virtual]

6.120.2 Member Function Documentation

6.120.2.1 void activemq::transport::failover::CloseTransportsTask::add (const Pointer< Transport > & *transport*)

Add a new **Transport** (p. 2161) to close.

6.120.2.2 virtual bool activemq::transport::failover::CloseTransportsTask::isPending ( ) const [virtual]

This Task is pending if there are transports in the Queue that need to be closed.

Returns

true if there is a transport in the queue that needs closed.

Implements **activemq::threads::CompositeTask** (p. 692).

6.120.2.3 virtual bool activemq::transport::failover::CloseTransportsTask::iterate ( ) [virtual]

Return true until all transports have been closed and removed from the queue.

Implements **activemq::threads::Task** (p. 2073).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/failover/**CloseTransportsTask.h**

6.121 activemq::cmsutil::CmsAccessor Class Reference

Base class for **activemq.cmsutil.CmsTemplate** (p. 649) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 741) to operate on.

`#include <src/main/activemq/cmsutil/CmsAccessor.h>`

Inheritance diagram for activemq::cmsutil::CmsAccessor:

Public Member Functions

- **CmsAccessor** ()
- virtual ~**CmsAccessor** ()
- virtual **ResourceLifecycleManager** * **getResourceLifecycleManager** ()
- virtual **const ResourceLifecycleManager** * **getResourceLifecycleManager** () **const**
- virtual void **setConnectionFactory** (**cms::ConnectionFactory** *connectionFactory)

  Set the ConnectionFactory to use for obtaining CMS Connections.
- virtual **const cms::ConnectionFactory** * **getConnectionFactory** () **const**

  Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual **cms::ConnectionFactory** * **getConnectionFactory** ()

  Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.
- virtual void **setSessionAcknowledgeMode** (**cms::Session::AcknowledgeMode** sessionAcknowledgeMode)

  Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.
- virtual **cms::Session::AcknowledgeMode getSessionAcknowledgeMode** () **const**

  Return the acknowledgment mode for CMS sessions.

Protected Member Functions

- **CmsAccessor** (**const CmsAccessor** &)
- **CmsAccessor** & **operator=** (**const CmsAccessor** &)
- virtual void **init** ()

  Initializes this object and prepares it for use.
- virtual void **destroy** ()

  Shuts down this object and destroys any allocated resources.
- virtual **cms::Connection** * **createConnection** ()

  Create a CMS Connection via this template's ConnectionFactory.
- virtual **cms::Session** * **createSession** (**cms::Connection** *con)

  Create a CMS Session for the given Connection.
- virtual void **checkConnectionFactory** ()

  Verifies that the connection factory is valid.

6.121.1 Detailed Description

Base class for **activemq.cmsutil.CmsTemplate** (p. 649) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 741) to operate on.

The subclass **activemq.cmsutil.CmsDestinationAccessor** (p. 638) adds further, destination-related properties.

Not intended to be used directly.

activemq.cmsutil.CmsDestinationAccessor (p. 638)
activemq.cmsutil.CmsTemplate (p. 649)

6.121.2 Constructor & Destructor Documentation

6.121.2.1 activemq::cmsutil::CmsAccessor::CmsAccessor (const CmsAccessor &) [protected]

6.121.2.2 activemq::cmsutil::CmsAccessor::CmsAccessor ( )

6.121.2.3 virtual activemq::cmsutil::CmsAccessor::~CmsAccessor ( ) [virtual]

6.121.3 Member Function Documentation

6.121.3.1 virtual void activemq::cmsutil::CmsAccessor::checkConnectionFactory ( ) [protected, virtual]

Verifies that the connection factory is valid.

Exceptions

IllegalStateException	if this object has not been initialized.

6.121.3.2 virtual cms::Connection* activemq::cmsutil::CmsAccessor::createConnection ( ) [protected, virtual]

Create a CMS Connection via this template's ConnectionFactory.

Returns

the new CMS Connection

Exceptions

CMSException	if thrown by CMS API methods
IllegalStateException	if this object has not been initialized.

6.121.3.3 virtual cms::Session* activemq::cmsutil::CmsAccessor::createSession (cms::Connection * *con*) [protected, virtual]

Create a CMS Session for the given Connection.

Parameters

con	The CMS Connection to create a Session for

Returns

the new CMS Session

Exceptions

CMSException	if thrown by CMS API methods
IllegalStateException	if this object has not been initialized.

6.121.3.4 virtual void activemq::cmsutil::CmsAccessor::destroy ( ) [inline, protected, virtual]

Shuts down this object and destroys any allocated resources.

Exceptions

CMSException	if an error occurs during destruction.
IllegalStateException	if this object has already been destroyed.

Reimplemented in **activemq::cmsutil::CmsTemplate** (p. 651), and **activemq::cmsutil::CmsDestinationAccessor** (p. 639).

6.121.3.5 virtual const cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory ( ) const [inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.121.3.6 virtual cms::ConnectionFactory* activemq::cmsutil::CmsAccessor::getConnectionFactory ( ) [inline, virtual]

Return the ConnectionFactory that this accessor uses for obtaining CMS Connections.

6.121.3.7 virtual ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager ( ) [inline, virtual]

6.121.3.8 virtual const ResourceLifecycleManager* activemq::cmsutil::CmsAccessor::getResourceLifecycleManager ( ) const [inline, virtual]

6.121.3.9 virtual cms::Session::AcknowledgeMode activemq::cmsutil::CmsAccessor::getSessionAcknowledgeMode ( ) const [inline, virtual]

Return the acknowledgment mode for CMS sessions.

Returns

the acknowledgment mode applied by this accessor

6.121.3.10 virtual void activemq::cmsutil::CmsAccessor::init ( ) [protected, virtual]

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Exceptions

CMSException	if an error occurs during initialization.
IllegalStateException	if this object has already been initialized.

Reimplemented in **activemq::cmsutil::CmsTemplate** (p. 654), and **activemq::cmsutil::CmsDestinationAccessor** (p. 640).

6.121.3.11 CmsAccessor& activemq::cmsutil::CmsAccessor::operator= (const CmsAccessor &) [protected]

6.121.3.12 virtual void activemq::cmsutil::CmsAccessor::setConnectionFactory (cms::ConnectionFactory * *connectionFactory*) [inline, virtual]

Set the ConnectionFactory to use for obtaining CMS Connections.

6.121.3.13 virtual void activemq::cmsutil::CmsAccessor::setSessionAcknowledgeMode (cms::Session::AcknowledgeMode *sessionAcknowledgeMode*) [inline, virtual]

Set the CMS acknowledgment mode that is used when creating a CMS Session to send a message.

Default is AUTO_ACKNOWLEDGE.

Parameters

session-Acknowledge-Mode	The acknowledgment mode to assign to the Session.

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**CmsAccessor.h**

6.122 activemq::cmsutil::CmsDestinationAccessor Class Reference

6.123 cms::CMSException Class Reference

CMS API Exception that is the base for all exceptions thrown from CMS classes.

`#include <src/main/cms/CMSException.h>`

Inheritance diagram for cms::CMSException:

Public Member Functions

- **CMSException** ()
- **CMSException** (**const CMSException** &ex)
- **CMSException** (**const** std::string &message)
- **CMSException** (**const** std::string &message, **const** std::exception *cause)
- **CMSException** (**const** std::string &message, **const** std::exception *cause, **const** std::vector< std::pair< std::string, int > > &stackTrace)
- virtual ~**CMSException** () throw ()
- virtual std::string **getMessage** () **const**

  Gets the cause of the error.
- virtual **const** std::exception * **getCause** () **const**

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual std::vector< std::pair < std::string, int > > **getStackTrace** () **const**

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **setMark** (**const** char *file, **const** int lineNumber)

  Adds a file/line number to the stack trace.
- virtual void **printStackTrace** () **const**

  Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) **const**

  Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () **const**

Gets the stack trace as one contiguous string.

- virtual **const** char * **what** () **const** throw ()

  *Overloads the std::exception **what()** (p. 643) function to return the cause of the exception.*

6.123.1 Detailed Description

CMS API Exception that is the base for all exceptions thrown from CMS classes.

This class represents an error that has occurred in CMS, providers can wrap provider specific exceptions in this class by setting the cause to an instance of a provider specific exception provided it can be cast to an std::exception.

Since the contained cause exception is of type std::exception and the C++ exception class has no clone or copy method defined the contained exception can only be owned by one instance of an **CMSException** (p. 640). To that end the class hands off the exception to each successive copy so care must be taken when handling **CMSException** (p. 640) instances.

Since

1.0

6.123.2.1 cms::CMSException::CMSException ( )

6.123.2.2 cms::CMSException::CMSException (const CMSException & *ex*)

6.123.2.3 cms::CMSException::CMSException (const std::string & *message*)

6.123.2.4 cms::CMSException::CMSException (const std::string & *message,* const std::exception * *cause*)

6.123.2.5 cms::CMSException::CMSException (const std::string & *message,* const std::exception * *cause,* const std::vector< std::pair< std::string, int > > & *stackTrace*)

6.123.2.6 virtual cms::CMSException::~CMSException ( ) throw () [virtual]

6.123.3 Member Function Documentation

6.123.3.1 virtual const std::exception* cms::CMSException::getCause ( ) const [virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

6.123.3.2 virtual std::string cms::CMSException::getMessage ( ) const [virtual]

Gets the cause of the error.

Returns

string errors message

6.123.3.3 virtual std::vector< std::pair< std::string, int> > cms::CMSException::getStackTrace ( ) const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

Returns

vector containing stack trace strings

6.123.3.4 virtual std::string cms::CMSException::getStackTraceString ( ) const [virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

6.123.3.5 virtual void cms::CMSException::printStackTrace ( ) const [virtual]

Prints the stack trace to std::err.

6.123.3.6 virtual void cms::CMSException::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters

stream	the target output stream.

6.123.3.7 virtual void cms::CMSException::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters

file	The name of the file calling this method (use **FILE**).
lineNumber	The line number in the calling file (use **LINE**).

6.123.3.8 virtual const char* cms::CMSException::what ( ) const throw () [virtual]

Overloads the std::exception **what()** (p. 643) function to return the cause of the exception.

Returns

const char pointer to error message

6.125 cms::CMSProperties Class Reference

Interface for a Java-like properties object.

`#include <src/main/cms/CMSProperties.h>`

Inheritance diagram for cms::CMSProperties:

Public Member Functions

- virtual ~**CMSProperties** () throw ()
- virtual int **size** () **const** =0

  Returns the current count of all the Properties that are currently stored in the Properties object.
- virtual bool **isEmpty** () **const** =0

  Returns true if the properties object is empty.
- virtual **const** char * **getProperty** (**const** std::string &name) **const** =0

  Looks up the value for the given property.
- virtual std::string **getProperty** (**const** std::string &name, **const** std::string &defaultValue) **const** =0

  Looks up the value for the given property.
- virtual void **setProperty** (**const** std::string &name, **const** std::string &value)=0

  Sets the value for a given property.
- virtual bool **hasProperty** (**const** std::string &name) **const** =0

  Check to see if the Property exists in the set.
- virtual std::string **remove** (**const** std::string &name)=0

  Removes the property with the given name.
- virtual std::vector< std::string > **propertyNames** () **const** =0

  Returns a vector containing all the names of the properties currently stored in the Properties object.
- virtual std::vector< std::pair < std::string, std::string > > **toArray** () **const** =0

  Method that serializes the contents of the property map to an array.
- virtual void **copy** (**const CMSProperties** *source)=0

  Copies the contents of the given properties object to this one.
- virtual **CMSProperties** * **clone** () **const** =0

  Clones this object.
- virtual void **clear** ()=0

  Clears all properties from the map.
- virtual std::string **toString** () **const** =0

  Formats the contents of the Properties Object into a string that can be logged, etc.

6.125.1 Detailed Description

Interface for a Java-like properties object.

This is essentially a map of key-value string pairs.

Since

1.1

6.125.2 Constructor & Destructor Documentation

6.125.2.1 virtual cms::CMSProperties::~CMSProperties ( ) throw () [virtual]

6.125.3 Member Function Documentation

6.125.3.1 virtual void cms::CMSProperties::clear ( ) [pure virtual]

Clears all properties from the map.

Implemented in **activemq::util::ActiveMQProperties** (p. 246).

6.125.3.2 virtual CMSProperties* cms::CMSProperties::clone ( ) const [pure virtual]

Clones this object.

Returns

a replica of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 246).

6.125.3.3 virtual void cms::CMSProperties::copy (const CMSProperties * *source*) [pure virtual]

Copies the contents of the given properties object to this one.

Parameters

source	The source properties object.

6.125.3.4 virtual const char* cms::CMSProperties::getProperty (const std::string & *name*) const [pure virtual]

Looks up the value for the given property.

Parameters

name	The name of the property to be looked up.

Returns

the value of the property with the given name, if it exists. If it does not exist, returns NULL.

Implemented in **activemq::util::ActiveMQProperties** (p. 246).

6.125.3.5 virtual std::string cms::CMSProperties::getProperty (const std::string & *name,* const std::string & *defaultValue*) const [pure virtual]

Looks up the value for the given property.

Parameters

name	the name of the property to be looked up.
defaultValue	The value to be returned if the given property does not exist.

Returns

The value of the property specified by `name`, if it exists, otherwise the `defaultValue`.

Implemented in **activemq::util::ActiveMQProperties** (p. 246).

6.125.3.6 virtual bool cms::CMSProperties::hasProperty (const std::string & *name*) const [pure virtual]

Check to see if the Property exists in the set.

Parameters

name	the name of the property to check

Returns

true if property exists, false otherwise.

Implemented in **activemq::util::ActiveMQProperties** (p. 247).

6.125.3.7 virtual bool cms::CMSProperties::isEmpty ( ) const [pure virtual]

Returns true if the properties object is empty.

Returns

true if empty

Implemented in **activemq::util::ActiveMQProperties** (p. 247).

6.125.3.8 virtual std::vector<std::string> cms::CMSProperties::propertyNames ( ) const [pure virtual]

Returns a vector containing all the names of the properties currently stored in the Properties object.

Returns

an STL std::vector<std::string> with all the currently stored property names.

Implemented in **activemq::util::ActiveMQProperties** (p. 247).

6.125.3.9 virtual std::string cms::CMSProperties::remove (const std::string & *name*) [pure virtual]

Removes the property with the given name.

If the property existed in the collection then it is removed and returned, otherwise an empty string is returned.

Parameters

name	the name of the property to be removed.

Returns

the value that was removed from the Properties, or empty string.

Implemented in **activemq::util::ActiveMQProperties** (p. 247).

6.125.3.10 virtual void cms::CMSProperties::setProperty (const std::string & *name,* const std::string & *value*) [pure virtual]

Sets the value for a given property.

If the property already exists, overwrites the value.

Parameters

name	The name of the value to be written.
value	The value to be written.

Implemented in **activemq::util::ActiveMQProperties** (p. 248).

6.125.3.11 virtual int cms::CMSProperties::size ( ) const [pure virtual]

Returns the current count of all the Properties that are currently stored in the Properties object.

Returns

the number of properties currently stored.

Implemented in **activemq::util::ActiveMQProperties** (p. 248).

6.125.3.12 virtual std::vector< std::pair< std::string, std::string > > cms::CMSProperties::toArray ( ) const [pure virtual]

Method that serializes the contents of the property map to an array.

Returns

list of pairs where the first is the name and the second is the value.

Implemented in **activemq::util::ActiveMQProperties** (p. 248).

6.125.3.13 virtual std::string cms::CMSProperties::toString ( ) const [pure virtual]

Formats the contents of the Properties Object into a string that can be logged, etc.

Returns

string value of this object.

Implemented in **activemq::util::ActiveMQProperties** (p. 248).

  Executes the given action and provides it with a CMS Session and producer.
- virtual void **execute** (**const** std::string &destinationName, **ProducerCallback** ∗action)

  Executes the given action and provides it with a CMS Session and producer.
- virtual void **send** (**MessageCreator** ∗messageCreator)

Convenience method for sending a message to the default destination.

- virtual void **send** (**cms::Destination** ∗dest, **MessageCreator** ∗messageCreator)

  Convenience method for sending a message to the specified destination.

- virtual void **send** (**const** std::string &destinationName, **MessageCreator** ∗messageCreator)

  Convenience method for sending a message to the specified destination.

- virtual **cms::Message** ∗ **receive** ()

  Performs a synchronous read from the default destination.

- virtual **cms::Message** ∗ **receive** (**cms::Destination** ∗destination)

  Performs a synchronous read from the specified destination.

- virtual **cms::Message** ∗ **receive** (**const** std::string &destinationName)

  Performs a synchronous read from the specified destination.

- virtual **cms::Message** ∗ **receiveSelected** (**const** std::string &selector)

  Performs a synchronous read consuming only messages identified by the given selector.

- virtual **cms::Message** ∗ **receiveSelected** (**cms::Destination** ∗destination, **const** std::string &selector)

  Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

- virtual **cms::Message** ∗ **receiveSelected** (**const** std::string &destinationName, **const** std::string &selector)

  Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Static Public Attributes

- static **const** long long **RECEIVE_TIMEOUT_NO_WAIT**

  Timeout value indicating that a receive operation should check if a message is immediately available without blocking.

- static **const** long long **RECEIVE_TIMEOUT_INDEFINITE_WAIT**

  Timeout value indicating a blocking receive without timeout.

- static **const** int **DEFAULT_PRIORITY**

  Default message priority.

- static **const** long long **DEFAULT_TIME_TO_LIVE**

  My default, messages should live forever.

6.127.1 Detailed Description

CmsTemplate (p. 649) simplifies performing synchronous CMS operations.

This class is intended to be for CMS what Spring's JmsTemplate is for JMS. Provided with a CMS ConnectionFactory, creates and manages all other CMS resources internally.

Before using **CmsTemplate** (p. 649) the user must first set the destination (either by name or by setting the destination object directly) and then call init to initialize the object for use.

CmsTemplate (p. 649) allows the user to get access to a CMS Session through a user-defined **SessionCallback** (p. 1842). Similarly, if the user wants direct access to a CMS MessageProducer, it can provide a **ProducerCallback** (p. 1689). As a convenience, the user can bypass having to provide callbacks altogether for sending messages, by calling one of the send methods.

See also

SessionCallback (p. 1842)
ProducerCallback (p. 1689)
MessageCreator (p. 1458)

6.127.2 Constructor & Destructor Documentation

6.127.2.1 activemq::cmsutil::CmsTemplate::CmsTemplate ( )

6.127.2.2 activemq::cmsutil::CmsTemplate::CmsTemplate (cms::ConnectionFactory * *connectionFactory*)

6.127.2.3 virtual activemq::cmsutil::CmsTemplate::~CmsTemplate ( ) throw () [virtual]

6.127.3 Member Function Documentation

6.127.3.1 void activemq::cmsutil::CmsTemplate::destroy ( ) [protected, virtual]

Shuts down this object and destroys any allocated resources.

Exceptions

CMSException	if an error occurs during destruction.
IllegalStateException	if this object has already been destroyed.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 639).

6.127.3.2 virtual void activemq::cmsutil::CmsTemplate::execute (SessionCallback * *action*) [virtual]

Executes the given action within a CMS Session.

Parameters

action	the action to perform within a CMS Session

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.3 virtual void activemq::cmsutil::CmsTemplate::execute (ProducerCallback * action) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

action	the action to perform

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.4 virtual void activemq::cmsutil::CmsTemplate::execute (cms::Destination * *dest,* ProducerCallback * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

dest	the destination to send messages to
action	the action to perform

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.5 virtual void activemq::cmsutil::CmsTemplate::execute (const std::string & *destinationName,* ProducerCallback * *action*) [virtual]

Executes the given action and provides it with a CMS Session and producer.

Parameters

destinationName	the name of the destination to send messages to (to internally be resolved to an actual destination)
action	the action to perform

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.6 virtual const cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination ( ) const [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Const version of this method.

6.127.3.7 virtual cms::Destination* activemq::cmsutil::CmsTemplate::getDefaultDestination ( ) [inline, virtual]

Retrieves the default destination to be used for send/receive operations.

Returns

the default destination. Non-const version of this method.

6.127.3.8 virtual const std::string activemq::cmsutil::CmsTemplate::getDefaultDestinationName ( ) const [inline, virtual]

Gets the name of the default destination to be used for send/receive operations.

The destination type (topic/queue) is determined by the `pubSubDomain` property.

Returns

the default name of the destination for send/receive operations.

6.127.3.9 virtual int activemq::cmsutil::CmsTemplate::getDeliveryMode ( ) const [inline, virtual]

Return the delivery mode to use when sending a message.

6.127.3.10 virtual int activemq::cmsutil::CmsTemplate::getPriority ( ) const [inline, virtual]

Return the priority of a message when sending.

6.127.3.11 virtual long long activemq::cmsutil::CmsTemplate::getReceiveTimeout ( ) const [inline, virtual]

6.127.3.12 virtual long long activemq::cmsutil::CmsTemplate::getTimeToLive ( ) const [inline, virtual]

Return the time-to-live of the message when sending.

6.127.3.13 void activemq::cmsutil::CmsTemplate::init ( ) [protected, virtual]

Initializes this object and prepares it for use.

This should be called before any other methods are called. This version does nothing.

Exceptions

CMSException	if an error occurs during initialization.
IllegalStateException	if this object has already been initialized.

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 640).

6.127.3.14 virtual bool activemq::cmsutil::CmsTemplate::isExplicitQosEnabled ( ) const [inline, virtual]

If "true", then the values of deliveryMode, priority, and timeToLive will be used when sending a message.

Otherwise, the default values, that may be set administratively, will be used.

Returns

true if overriding default values of QOS parameters (deliveryMode, priority, and timeToLive)

See also

setDeliveryMode (p. 658)
setPriority (p. 658)
setTimeToLive (p. 659)

6.127.3.15 virtual bool activemq::cmsutil::CmsTemplate::isMessageIdEnabled ( ) const [inline, virtual]

6.127.3.16 virtual bool activemq::cmsutil::CmsTemplate::isMessageTimestampEnabled ( ) const [inline, virtual]

6.127.3.17 virtual bool activemq::cmsutil::CmsTemplate::isNoLocal ( ) const [inline, virtual]

6.127.3.18 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive ( ) [virtual]

Performs a synchronous read from the default destination.

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.19 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (cms::Destination * *destination*) [virtual]

Performs a synchronous read from the specified destination.

Parameters

destination	the destination to receive on

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.20 virtual cms::Message* activemq::cmsutil::CmsTemplate::receive (const std::string & *destinationName*) [virtual]

Performs a synchronous read from the specified destination.

Parameters

destinationName	the name of the destination to receive on (will be resolved to destination internally).

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.21 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & *selector*) [virtual]

Performs a synchronous read consuming only messages identified by the given selector.

Parameters

selector	the selector expression.

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.22 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (cms::Destination * *destination,* const std::string & *selector*) [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

destination	the destination to receive on.
selector	the selector expression.

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.23 virtual cms::Message* activemq::cmsutil::CmsTemplate::receiveSelected (const std::string & *destinationName,* const std::string & *selector*) [virtual]

Performs a synchronous read from the specified destination, consuming only messages identified by the given selector.

Parameters

destinationName	the name of the destination to receive on (will be resolved to destination internally).
selector	the selector expression.

Returns

the message

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs

6.127.3.24 virtual void activemq::cmsutil::CmsTemplate::send (MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the default destination.

Parameters

messageCreator	Responsible for creating the message to be sent

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.25 virtual void activemq::cmsutil::CmsTemplate::send (cms::Destination * *dest,* MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the specified destination.

Parameters

dest	The destination to send to
messageCreator	Responsible for creating the message to be sent

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.26 virtual void activemq::cmsutil::CmsTemplate::send (const std::string & *destinationName,* MessageCreator * *messageCreator*) [virtual]

Convenience method for sending a message to the specified destination.

Parameters

destinationName	The name of the destination to send to.
messageCreator	Responsible for creating the message to be sent

Exceptions

cms::CMSException *(p. 640)*	thrown if an error occurs.

6.127.3.27 virtual void activemq::cmsutil::CmsTemplate::setDefaultDestination (cms::Destination * *defaultDestination*) [inline, virtual]

Sets the destination object to be used by default for send/receive operations.

If no default destination is provided, the `defaultDestinationName` property is used to resolve this default destination for send/receive operations.

Parameters

default-Destination	the default destination

6.127.3.28 virtual void activemq::cmsutil::CmsTemplate::setDefaultDestinationName (const std::string & *defaultDestinationName*) [inline, virtual]

Sets the name of the default destination to be used from send/receive operations.

Calling this method will set the `defaultDestination` property to NULL. The destination type (topic/queue) is determined by the `pubSubDomain` property.

Parameters

default-Destination-Name	the name of the destination for send/receive to by default.

6.127.3.29 virtual void activemq::cmsutil::CmsTemplate::setDeliveryMode (int *deliveryMode*) [inline, virtual]

Set the delivery mode to use when sending a message.

Default is the Message default: "PERSISTENT".

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

deliveryMode	the delivery mode to use

See also

isExplicitQosEnabled (p. 654)

6.127.3.30 virtual void activemq::cmsutil::CmsTemplate::setDeliveryPersistent (bool *deliveryPersistent*) [inline, virtual]

Set whether message delivery should be persistent or non-persistent, specified as boolean value ("true" or "false").

This will set the delivery mode accordingly, to either "PERSISTENT" or "NON_PERSISTENT".

Default it "true" aka delivery mode "PERSISTENT".

See also

setDeliveryMode(int) (p. 658)

6.127.3.31 virtual void activemq::cmsutil::CmsTemplate::setExplicitQosEnabled (bool *explicitQosEnabled*) [inline, virtual]

Set if the QOS values (deliveryMode, priority, timeToLive) should be used for sending a message.

See also

setDeliveryMode (p. 658)
setPriority (p. 658)
setTimeToLive (p. 659)

6.127.3.32 virtual void activemq::cmsutil::CmsTemplate::setMessageIdEnabled (bool *messageIdEnabled*) [inline, virtual]

6.127.3.33 virtual void activemq::cmsutil::CmsTemplate::setMessageTimestampEnabled (bool *messageTimestampEnabled*) [inline, virtual]

6.127.3.34 virtual void activemq::cmsutil::CmsTemplate::setNoLocal (bool *noLocal*) [inline, virtual]

6.127.3.35 virtual void activemq::cmsutil::CmsTemplate::setPriority (int *priority*) [inline, virtual]

Set the priority of a message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

See also

isExplicitQosEnabled (p. 654)

6.127.3.36 virtual void activemq::cmsutil::CmsTemplate::setPubSubDomain (bool *pubSubDomain*) [inline, virtual]

Indicates whether the default destination is a topic (true) or a queue (false).

Calling this method will set the `defaultDestination` property to NULL.

Parameters

pubSubDomain	indicates whether to use pub-sub messaging (topics).

Reimplemented from **activemq::cmsutil::CmsDestinationAccessor** (p. 640).

References activemq::cmsutil::CmsDestinationAccessor::setPubSubDomain().

6.127.3.37 virtual void activemq::cmsutil::CmsTemplate::setReceiveTimeout (long long *receiveTimeout*) [inline, virtual]

6.127.3.38 virtual void activemq::cmsutil::CmsTemplate::setTimeToLive (long long *timeToLive*) [inline, virtual]

Set the time-to-live of the message when sending.

Since a default value may be defined administratively, this is only used when "isExplicitQosEnabled" equals "true".

Parameters

timeToLive	the message's lifetime (in milliseconds)

See also

isExplicitQosEnabled (p. 654)

  Removes a single instance of the specified element from the collection.
- virtual bool **removeAll** (**const Collection**< E > &collection)=0

  Removes all this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (**const Collection**< E > &collection)=0

  Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual int **size** () **const** =0

  Returns the number of elements in this collection.
- virtual std::vector< E > **toArray** () **const** =0

  Returns an array containing all of the elements in this collection.

6.129.1 Detailed Description

template<typename E>class decaf::util::Collection< E >

The root interface in the collection hierarchy.

A collection represents a group of objects, known as its elements. Some collections allow duplicate elements and others do not. Some are ordered and others unordered. This interface is typically used to pass collections around and manipulate them where maximum generality is desired.

All general-purpose **Collection** (p. 660) implementation classes (which typically implement **Collection** (p. 660) indirectly through one of its subinterfaces) should provide two "standard" constructors: a void (no arguments) constructor, which creates an empty collection, and a constructor with a single argument of type **Collection** (p. 660), which creates a new collection with the same elements as its argument. In effect, the latter constructor allows the user to copy any collection, producing an equivalent collection of the desired implementation type. There is no way to enforce this convention (as interfaces cannot contain constructors) but all of the general-purpose **Collection** (p. 660) implementations in the Decaf platform libraries comply.

The "destructive" methods contained in this interface, that is, the methods that modify the collection on which they operate, are specified to throw UnsupportedOperationException if this collection does not support the operation. If this is the case, these methods may, but are not required to, throw an UnsupportedOperationException if the invocation would have no effect on the collection. For example, invoking the addAll(Collection) method on an unmodifiable collection may, but is not required to, throw the exception if the collection to be added is empty.

Many methods in Collections Framework interfaces are defined in terms of the equals method. For example, the specification for the contains(Object o) method says: "returns true if and only if this collection contains at least one element e such that (o==null ? e==null : o.equals(e))."

Since

1.0

6.129.2 Constructor & Destructor Documentation

6.129.2.1 template<typename E> virtual decaf::util::Collection< E >::~Collection ( ) [inline, virtual]

6.129.3 Member Function Documentation

6.129.3.1 template<typename E> virtual bool decaf::util::Collection< E >::add (const E & *value*) [pure virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList< E >** (p. 1970), **decaf::util::AbstractList< E >** (p. 98), **decaf::util::AbstractList< Pointer< Transport > >** (p. 98), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 98), **decaf::util::AbstractList< CompositeTask * >** (p. 98), **decaf::util::AbstractList< URI >** (p. 98), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 98), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 98), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 98), **decaf::util::AbstractList< Pointer< Command > >** (p. 98), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 98), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 98), **decaf::util::AbstractList< cms::Destination * >** (p. 98), **decaf::util::AbstractList< cms::Session * >** (p. 98), **decaf::util::AbstractList< cms::Connection * >** (p. 98), **decaf::util::PriorityQueue< E >** (p. 1678), **decaf::util::StlSet< E >** (p. 1997), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1997), **decaf::util::StlSet< Resource * >** (p. 1997), **decaf::util::ArrayList< E >** (p. 348), **decaf::util::LinkedList< E >** (p. 1271), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1271), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1271), **decaf::util::LinkedList< CompositeTask * >** (p. 1271), **decaf::util::LinkedList< URI >** (p. 1271), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1271), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1271), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1271), **decaf::util::LinkedList< Pointer< Command > >** (p. 1271), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1271), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1271), **decaf::util::LinkedList< cms::Destination * >** (p. 1271), **decaf::util::LinkedList< cms::Session * >** (p. 1271), **decaf::util::LinkedList< cms::Connection * >** (p. 1271), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 800), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 800), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 816), and **decaf::util::AbstractQueue< E >** (p. 109).

Referenced by decaf::util::concurrent::SynchronousQueue< E >::drainTo(), and decaf::util::concurrent::LinkedBlockingQueue< E >::drainTo().

6.129.3.2 template<typename E> virtual bool decaf::util::Collection< E >::addAll (const Collection< E > & *collection*) [pure virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress.

(This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList< E >** (p. 1971), **decaf::util::ArrayList< E >** (p. 349), **decaf::util::AbstractCollection< E >** (p. 87), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 87), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 87), **decaf::util::AbstractCollection< Resource * >** (p. 87), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 87), **decaf::util::AbstractCollection< CompositeTask * >** (p. 87), **decaf::util::AbstractCollection< URI >** (p. 87), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 87), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 87), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 87), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 87), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 87), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 87), **decaf::util::AbstractCollection< cms::Destination * >** (p. 87), **decaf::util::AbstractCollection< cms::Session * >** (p. 87), **decaf::util::AbstractCollection< cms::Connection * >** (p. 87), **decaf::util::LinkedList< E >** (p. 1272), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1272), **decaf::util::LinkedList< CompositeTask * >** (p. 1272), **decaf::util::LinkedList< URI >** (p. 1272), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1272), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1272), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1272), **decaf::util::LinkedList< Pointer< Command > >** (p. 1272), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1272), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1272), **decaf::util::LinkedList< cms::Destination * >** (p. 1272), **decaf::util::LinkedList< cms::Session * >** (p. 1272), **decaf::util::LinkedList< cms::Connection * >** (p. 1272), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 802), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 802), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 817), and **decaf::util::AbstractQueue< E >** (p. 110).

6.129.3.3 template<typename E> virtual void decaf::util::Collection< E >::clear ( ) [pure virtual]

Removes all of the elements from this collection (optional operation).

This collection will be empty after this method returns unless it throws an exception.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Implemented in **decaf::util::AbstractList< E >** (p. 100), **decaf::util::AbstractList< Pointer< Transport > >** (p. 100), **decaf::util::AbstractList< cms::MessageConsumer * >** (p. 100), **decaf::util::AbstractList< CompositeTask * >** (p. 100), **decaf::util::AbstractList< URI >** (p. 100), **decaf::util::AbstractList< Pointer< MessageDispatch > >** (p. 100), **decaf::util::AbstractList< Pointer< DestinationInfo > >** (p. 100), **decaf::util::AbstractList< PrimitiveValueNode >** (p. 100), **decaf::util::AbstractList< Pointer< Command > >**

(p. 100), **decaf::util::AbstractList< Pointer< BackupTransport > >** (p. 100), **decaf::util::AbstractList< cms::MessageProducer * >** (p. 100), **decaf::util::AbstractList< cms::Destination * >** (p. 100), **decaf::util::AbstractList< cms::Session * >** (p. 100), **decaf::util::AbstractList< cms::Connection * >** (p. 100), **decaf::util::StlList< E >** (p. 1972), **decaf::util::PriorityQueue< E >** (p. 1679), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2059), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1260), **decaf::util::LinkedList< E >** (p. 1274), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1274), **decaf::util::LinkedList< CompositeTask * >** (p. 1274), **decaf::util::LinkedList< URI >** (p. 1274), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1274), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1274), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1274), **decaf::util::LinkedList< Pointer< Command > >** (p. 1274), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1274), **decaf::util::LinkedList< cms::Destination * >** (p. 1274), **decaf::util::LinkedList< cms::Session * >** (p. 1274), **decaf::util::LinkedList< cms::Connection * >** (p. 1274), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 803), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 803), **decaf::util::StlSet< E >** (p. 1998), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1998), **decaf::util::StlSet< Resource * >** (p. 1998), **decaf::util::ArrayList< E >** (p. 350), **decaf::util::AbstractQueue< E >** (p. 110), **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 818), **decaf::util::AbstractCollection< E >** (p. 88), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 88), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 88), **decaf::util::AbstractCollection< Resource * >** (p. 88), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 88), **decaf::util::AbstractCollection< CompositeTask * >** (p. 88), **decaf::util::AbstractCollection< URI >** (p. 88), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 88), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 88), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 88), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 88), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 88), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 88), **decaf::util::AbstractCollection< cms::Destination * >** (p. 88), **decaf::util::AbstractCollection< cms::Session * >** (p. 88), and **decaf::util::AbstractCollection< cms::Connection * >** (p. 88).

6.129.3.4 template<typename E> virtual bool decaf::util::Collection< E >::contains (const E & *value*) const [pure virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

Implemented in **decaf::util::StlList< E >** (p. 1972), **decaf::util::ArrayList< E >** (p. 350), **decaf::util::LinkedList< E >** (p. 1275), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1275), **decaf::util::LinkedList< CompositeTask * >** (p. 1275), **decaf::util::LinkedList< URI >** (p. 1275), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1275), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1275), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1275), **decaf::util::LinkedList< Pointer< Command > >** (p. 1275), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1275), **decaf::util::LinkedList< cms::Destination * >** (p. 1275), **decaf::util::LinkedList< cms::Session * >** (p. 1275), **decaf::util::LinkedList< cms::Connection * >** (p. 1275), **decaf::util::concurrent::CopyOnWriteArrayList< E >**

(p. 803), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 803), **decaf::util::StlSet**< **E** > (p. 1998), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 1998), **decaf::util::StlSet**< **Resource** * > (p. 1998), **decaf::util::AbstractCollection**< **E** > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 88), **decaf::util::AbstractCollection**< **Resource** * > (p. 88), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 88), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 88), **decaf::util::AbstractCollection**< **URI** > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 88), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 88), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 88), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 88), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 88), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 88), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 88), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 818).

Referenced by decaf::util::AbstractSet< Resource * >::removeAll(), decaf::util::AbstractCollection< cms::Connection * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::AbstractCollection< cms::Connection * >::retainAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll().

6.129.3.5 template<typename E> virtual bool decaf::util::Collection< E >::containsAll (const Collection< E > & *collection*) const [pure virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The **Collection** (p. 660) to compare to this one.

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

Implemented in **decaf::util::concurrent::SynchronousQueue**< **E** > (p. 2059), **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 804), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 804), **decaf::util::AbstractCollection**< **E** > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 89), **decaf::util::AbstractCollection**< **Resource** * > (p. 89), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 89), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 89), **decaf::util::AbstractCollection**< **URI** > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 89), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 89), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 89), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 89), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 89), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 89), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 89), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 818).

6.129.3.6 template<typename E> virtual void decaf::util::Collection< E >::copy (const Collection< E > & *collection*) [pure virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Implemented in **decaf::util::StlList< E >** (p. 1973), **decaf::util::LinkedList< E >** (p. 1275), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1275), **decaf::util::LinkedList< CompositeTask * >** (p. 1275), **decaf::util::LinkedList< URI >** (p. 1275), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1275), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1275), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1275), **decaf::util::LinkedList< Pointer< Command > >** (p. 1275), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1275), **decaf::util::LinkedList< cms::Destination * >** (p. 1275), **decaf::util::LinkedList< cms::Session * >** (p. 1275), **decaf::util::LinkedList< cms::Connection * >** (p. 1275), **decaf::util::StlSet< E >** (p. 1999), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1999), **decaf::util::StlSet< Resource * >** (p. 1999), **decaf::util::AbstractCollection< E >** (p. 89), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 89), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 89), **decaf::util::AbstractCollection< Resource * >** (p. 89), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 89), **decaf::util::AbstractCollection< CompositeTask * >** (p. 89), **decaf::util::AbstractCollection< URI >** (p. 89), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 89), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 89), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 89), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 89), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 89), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 89), **decaf::util::AbstractCollection< cms::Destination * >** (p. 89), **decaf::util::AbstractCollection< cms::Session * >** (p. 89), **decaf::util::AbstractCollection< cms::Connection * >** (p. 89), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 804), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 804), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 819).

6.129.3.7 template<typename E> virtual bool decaf::util::Collection< E >::equals (const Collection< E > & *value*) const [pure virtual]

Compares the passed collection to this one, if they contain the same elements, i.e.

all their elements are equivalent, then it returns true.

Returns

true if the Collections contain the same elements.

Implemented in **decaf::util::StlList< E >** (p. 1973), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 804), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 804), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2061), **decaf::util::StlSet< E >** (p. 1999), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1999), **decaf::util::StlSet< Resource * >** (p. 1999), **decaf::util::AbstractCollection< E >** (p. 90), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 90), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 90), **decaf::util::AbstractCollection< Resource * >** (p. 90), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 90), **decaf::util::AbstractCollection< CompositeTask * >** (p. 90), **decaf::util::AbstractCollection< URI >** (p. 90), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 90), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 90), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 90), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 90), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 90), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 90), **decaf::util::AbstractCollection< cms::Destination * >** (p. 90), **decaf::util::AbstractCollection< cms::Session * >** (p. 90), **decaf::util::AbstractCollection< cms::Connection * >** (p. 90), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 819).

6.129.3.8 template<typename E> virtual bool decaf::util::Collection< E >::isEmpty ( ) const [pure virtual]

Returns

true if this collection contains no elements.

Implemented in **decaf::util::StlList< E >** (p. 1974), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 806), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 806), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2061), **decaf::util::LinkedList< E >** (p. 1278), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1278), **decaf::util::LinkedList< CompositeTask * >** (p. 1278), **decaf::util::LinkedList< URI >** (p. 1278), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1278), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1278), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1278), **decaf::util::LinkedList< Pointer< Command > >** (p. 1278), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1278), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1278), **decaf::util::LinkedList< cms::Destination * >** (p. 1278), **decaf::util::LinkedList< cms::Session * >** (p. 1278), **decaf::util::LinkedList< cms::Connection * >** (p. 1278), **decaf::util::StlSet< E >** (p. 1999), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 1999), **decaf::util::StlSet< Resource * >** (p. 1999), **decaf::util::AbstractCollection< E >** (p. 90), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 90), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 90), **decaf::util::AbstractCollection< Resource * >** (p. 90), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 90), **decaf::util::AbstractCollection< CompositeTask * >** (p. 90), **decaf::util::AbstractCollection< URI >** (p. 90), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 90), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 90), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 90), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 90), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 90), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 90), **decaf::util::AbstractCollection< cms::Destination * >** (p. 90), **decaf::util::AbstractCollection< cms::Session * >** (p. 90), **decaf::util::AbstractCollection< cms::Connection * >** (p. 90), **decaf::util::ArrayList< E >** (p. 352), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 820).

Referenced by decaf::util::AbstractList< cms::Connection * >::addAll(), decaf::util::StlList< E >::addAll(), decaf::util::concurrent::SynchronousQueue< E >::containsAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll().

6.129.3.9 template<typename E> virtual bool decaf::util::Collection< E >::remove (const E & *value*) [pure virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperationExceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::StlList< E >** (p. 1976), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1265), **decaf::util::PriorityQueue< E >** (p. 1682), **decaf::util::ArrayList< E >** (p. 353), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 809), **decaf::util::concurrent::CopyOnWriteArrayList<**

ServiceListener * > (p. 809), **decaf::util::AbstractCollection**< **E** > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 92), **decaf::util::AbstractCollection**< **Resource** * > (p. 92), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 92), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 92), **decaf::util::AbstractCollection**< **URI** > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 92), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 92), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 92), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 92), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 92), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 92), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 92), **decaf::util::StlSet**< **E** > (p. 2000), **decaf::util::StlSet**< **Pointer**< **Synchronization** > > (p. 2000), **decaf::util::StlSet**< **Resource** * > (p. 2000), **decaf::util::LinkedList**< **E** > (p. 1283), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1283), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1283), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1283), **decaf::util::LinkedList**< **URI** > (p. 1283), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1283), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1283), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1283), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1283), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1283), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1283), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1283), **decaf::util::LinkedList**< **cms::Session** * > (p. 1283), **decaf::util::LinkedList**< **cms::Connection** * > (p. 1283), and **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 820).

6.129.3.10 template<typename E> virtual bool decaf::util::Collection< E >::removeAll (const Collection< E > & *collection*) [pure virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be removed from this one.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList**< **E** > (p. 809), **decaf::util::concurrent::CopyOnWriteArrayList**< **ServiceListener** * > (p. 809), **decaf::util::AbstractCollection**< **E** > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **Transport** > > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **Synchronization** > > (p. 93), **decaf::util::AbstractCollection**< **Resource** * > (p. 93), **decaf::util::AbstractCollection**< **cms::MessageConsumer** * > (p. 93), **decaf::util::AbstractCollection**< **CompositeTask** * > (p. 93), **decaf::util::AbstractCollection**< **URI** > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **MessageDispatch** > > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **DestinationInfo** > > (p. 93), **decaf::util::AbstractCollection**< **PrimitiveValueNode** > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **Command** > > (p. 93), **decaf::util::AbstractCollection**< **Pointer**< **BackupTransport** > > (p. 93), **decaf::util::AbstractCollection**< **cms::MessageProducer** * > (p. 93), **decaf::util::AbstractCollection**< **cms::Destination** * > (p. 93), **decaf::util::AbstractCollection**< **cms::Session** * > (p. 93), **decaf::util::AbstractCollection**< **cms::Connection** * > (p. 93), **decaf::util::concurrent::CopyOnWriteArraySet**< **E** > (p. 821), **decaf::util::AbstractSet**< **E** > (p. 119), **decaf::util::AbstractSet**< **Pointer**< **Synchronization** > > (p. 119), and **decaf::util::AbstractSet**< **Resource** * > (p. 119).

6.129.3.11 template<typename E> virtual bool decaf::util::Collection< E >::retainAll (const Collection< E > & *collection*) [pure virtual]

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be retained.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 810), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 810), **decaf::util::AbstractCollection< E >** (p. 93), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 93), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 93), **decaf::util::AbstractCollection< Resource * >** (p. 93), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 93), **decaf::util::AbstractCollection< CompositeTask * >** (p. 93), **decaf::util::AbstractCollection< URI >** (p. 93), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 93), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 93), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 93), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 93), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 93), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 93), **decaf::util::AbstractCollection< cms::Destination * >** (p. 93), **decaf::util::AbstractCollection< cms::Session * >** (p. 93), **decaf::util::AbstractCollection< cms::Connection * >** (p. 93), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 821).

6.129.3.12 template<typename E> virtual int decaf::util::Collection< E >::size ( ) const [pure virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implemented in **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 811), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 811), **decaf::util::StlList< E >** (p. 1977), **decaf::util::PriorityQueue< E >** (p. 1682), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2064), **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1265), **decaf::util::LinkedList< E >** (p. 1286), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1286), **decaf::util::LinkedList< CompositeTask * >** (p. 1286), **decaf::util::LinkedList< URI >** (p. 1286), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1286), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1286), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1286), **decaf::util::LinkedList< Pointer< Command > >** (p. 1286), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1286), **decaf::util::LinkedList< cms::Destination * >** (p. 1286), **decaf::util::LinkedList< cms::Session * >** (p. 1286), **decaf::util::LinkedList< cms::Connection * >** (p. 1286), **decaf::util::StlSet< E >** (p. 2000), **decaf::util::StlSet< Pointer< Synchronization > >** (p. 2000), **decaf::util::StlSet< Resource * >** (p. 2000), **decaf::util::ArrayList< E >** (p. 354), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 822).

Referenced by decaf::util::AbstractList< cms::Connection * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::ArrayList< E >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::ArrayList< E >::ArrayList(), decaf::util::AbstractList< cms::Connection * >::clear(), decaf::util::concurrent::CopyOnWriteArraySet< E >::equals(), decaf::util::AbstractCollection< cms::Connection * >::equals(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::equals(), decaf::util::AbstractCollection< cms::Connection * >::isEmpty(), decaf::util::AbstractList< cms::Connection * >::lastIndexOf(), decaf::util::AbstractSet< Resource * >::removeAll(), and decaf::util::AbstractCollection< cms::Connection * >::toArray().

6.129.3.13 template<typename E> virtual std::vector<E> decaf::util::Collection< E >::toArray ( ) const [pure virtual]

Returns an array containing all of the elements in this collection.

If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns

an array of the elements in this collection in the form of an STL vector.

Implemented in **decaf::util::concurrent::LinkedBlockingQueue< E >** (p. 1266), **decaf::util::concurrent::CopyOnWriteArrayList< E >** (p. 811), **decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >** (p. 811), **decaf::util::ArrayList< E >** (p. 355), **decaf::util::AbstractCollection< E >** (p. 94), **decaf::util::AbstractCollection< Pointer< Transport > >** (p. 94), **decaf::util::AbstractCollection< Pointer< Synchronization > >** (p. 94), **decaf::util::AbstractCollection< Resource * >** (p. 94), **decaf::util::AbstractCollection< cms::MessageConsumer * >** (p. 94), **decaf::util::AbstractCollection< CompositeTask * >** (p. 94), **decaf::util::AbstractCollection< URI >** (p. 94), **decaf::util::AbstractCollection< Pointer< MessageDispatch > >** (p. 94), **decaf::util::AbstractCollection< Pointer< DestinationInfo > >** (p. 94), **decaf::util::AbstractCollection< PrimitiveValueNode >** (p. 94), **decaf::util::AbstractCollection< Pointer< Command > >** (p. 94), **decaf::util::AbstractCollection< Pointer< BackupTransport > >** (p. 94), **decaf::util::AbstractCollection< cms::MessageProducer * >** (p. 94), **decaf::util::AbstractCollection< cms::Destination * >** (p. 94), **decaf::util::AbstractCollection< cms::Session * >** (p. 94), **decaf::util::AbstractCollection< cms::Connection * >** (p. 94), **decaf::util::LinkedList< E >** (p. 1286), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1286), **decaf::util::LinkedList< CompositeTask * >** (p. 1286), **decaf::util::LinkedList< URI >** (p. 1286), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1286), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1286), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1286), **decaf::util::LinkedList< Pointer< Command > >** (p. 1286), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1286), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1286), **decaf::util::LinkedList< cms::Destination * >** (p. 1286), **decaf::util::LinkedList< cms::Session * >** (p. 1286), **decaf::util::LinkedList< cms::Connection * >** (p. 1286), **decaf::util::concurrent::SynchronousQueue< E >** (p. 2064), and **decaf::util::concurrent::CopyOnWriteArraySet< E >** (p. 822).

Referenced by decaf::util::ArrayList< E >::addAll(), and decaf::util::StlList< E >::addAll().

6.130.1 Constructor & Destructor Documentation

6.130.1.1 virtual activemq::commands::Command::~Command ( ) [inline, virtual]

6.130.2 Member Function Documentation

6.130.2.1 virtual int activemq::commands::Command::getCommandId ( ) const [pure virtual]

Gets the **Command** (p. 671) Id of this **Message** (p. 1412).

Returns

Command (p. 671) Id

Implemented in **activemq::commands::BaseCommand** (p. 383).

6.130.2.2 virtual bool activemq::commands::Command::isBrokerInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BrokerInfo** (p. 446), and **activemq::commands::BaseCommand** (p. 383).

6.130.2.3 virtual bool activemq::commands::Command::isConnectionControl ( ) const [pure virtual]

Implemented in **activemq::commands::ConnectionControl** (p. 730), and **activemq::commands::BaseCommand** (p. 383).

6.130.2.4 virtual bool activemq::commands::Command::isConnectionInfo ( ) const [pure virtual]

Implemented in **activemq::commands::ConnectionInfo** (p. 754), and **activemq::commands::BaseCommand** (p. 383).

6.130.2.5 virtual bool activemq::commands::Command::isConsumerInfo ( ) const [pure virtual]

Implemented in **activemq::commands::ConsumerInfo** (p. 786), and **activemq::commands::BaseCommand** (p. 383).

6.130.2.6 virtual bool activemq::commands::Command::isKeepAliveInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::KeepAliveInfo** (p. 1235).

6.130.2.7 virtual bool activemq::commands::Command::isMessage ( ) const [pure virtual]

Implemented in **activemq::commands::Message** (p. 1421), and **activemq::commands::BaseCommand** (p. 384).

6.130.2.8 virtual bool activemq::commands::Command::isMessageAck ( ) const [pure virtual]

Implemented in **activemq::commands::MessageAck** (p. 1451), and **activemq::commands::BaseCommand** (p. 384).

6.130.2.9 virtual bool activemq::commands::Command::isMessageDispatch ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::MessageDispatch** (p. 1461).

6.130.2.10 virtual bool activemq::commands::Command::isMessageDispatchNotification ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::MessageDispatchNotification** (p. 1471).

6.130.2.11 virtual bool activemq::commands::Command::isProducerAck ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::ProducerAck** (p. 1685).

6.130.2.12 virtual bool activemq::commands::Command::isProducerInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::ProducerInfo** (p. 1700).

6.130.2.13 virtual bool activemq::commands::Command::isRemoveInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 384), and **activemq::commands::RemoveInfo** (p. 1760).

6.130.2.14 virtual bool activemq::commands::Command::isRemoveSubscriptionInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 385), and **activemq::commands::RemoveSubscriptionInfo** (p. 1766).

6.130.2.15 virtual bool activemq::commands::Command::isResponse ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 385), and **activemq::commands::Response** (p. 1783).

6.130.2.16 virtual bool activemq::commands::Command::isResponseRequired ( ) const [pure virtual]

Is a **Response** (p. 1781) required for this **Command** (p. 671).

Returns

true if a response is required.

Implemented in **activemq::commands::BaseCommand** (p. 385).

6.130.2.17 virtual bool activemq::commands::Command::isShutdownInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 385), and **activemq::commands::ShutdownInfo** (p. 1885).

6.130.2.18 virtual bool activemq::commands::Command::isTransactionInfo ( ) const [pure virtual]

Implemented in **activemq::commands::BaseCommand** (p. 385), and **activemq::commands::TransactionInfo** (p. 2151).

6.130.2.19 virtual bool activemq::commands::Command::isWireFormatInfo ( ) const [pure virtual]

Implemented in **activemq::commands::WireFormatInfo** (p. 2245), and **activemq::commands::BaseCommand** (p. 385).

6.130.2.20 virtual void activemq::commands::Command::setCommandId (int *id*) [pure virtual]

Sets the **Command** (p. 671) Id of this **Message** (p. 1412).

Parameters

id	**Command** (p. 671) Id

Implemented in **activemq::commands::BaseCommand** (p. 385).

6.130.2.21 virtual void activemq::commands::Command::setResponseRequired (const bool *required*) [pure virtual]

Set if this **Message** (p. 1412) requires a **Response** (p. 1781).

Parameters

required	true if response is required

Implemented in **activemq::commands::BaseCommand** (p. 386).

6.130.2.22 virtual std::string activemq::commands::Command::toString ( ) const [pure virtual]

Returns a provider-specific string that provides information about the contents of the command.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

Implemented in **activemq::commands::Message** (p. 1424), **activemq::commands::ConsumerInfo** (p. 788), **activemq::commands::ActiveMQBytesMessage** (p. 138), **activemq::commands::BrokerInfo** (p. 447), **activemq::commands::ConnectionInfo** (p. 755), **activemq::commands::MessageAck** (p. 1451), **activemq::commands::ConsumerControl** (p. 772), **activemq::commands::ProducerInfo** (p. 1700), **activemq::commands::ConnectionControl** (p. 731), **activemq::commands::DestinationInfo** (p. 942), **activemq::commands::MessagePull** (p. 1505), **activemq::commands::SessionInfo** (p. 1851), **activemq::commands::MessageDispatch** (p. 1461), **activemq::commands::MessageDispatchNotification** (p. 1472), **activemq::commands::TransactionInfo** (p. 2151), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::RemoveSubscriptionInfo** (p. 1766), **activemq::commands::ActiveMQStreamMessage** (p. 286), **activemq::commands::ProducerAck** (p. 1685), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::ActiveMQMapMessage** (p. 219), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 865), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1070), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::BaseCommand** (p. 386), **activemq::commands::ActiveMQBlobMessage** (p. 125), **activemq::commands::WireFormatInfo** (p. 2247), **activemq::commands::ActiveMQTextMessage** (p. 317), **activemq::commands::ActiveMQObjectMessage** (p. 235), and **activemq::commands::ActiveMQMessage** (p. 225).

6.130.2.23 virtual decaf::lang::Pointer<commands::Command> activemq::commands::Command::visit (activemq::state::CommandVisitor * *visitor*) [pure virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implemented in **activemq::commands::Message** (p. 1424), **activemq::commands::ConsumerInfo** (p. 788), **activemq::commands::BrokerInfo** (p. 447), **activemq::commands::ConnectionInfo** (p. 755), **activemq::commands::MessageAck** (p. 1451), **activemq::commands::ConnectionControl** (p. 731), **activemq::commands::ProducerInfo** (p. 1701), **activemq::commands::ConsumerControl** (p. 772), **activemq::commands::MessageDispatch** (p. 1462), **activemq::commands::MessageDispatchNotification** (p. 1472), **activemq::commands::MessagePull** (p. 1505), **activemq::commands::DestinationInfo** (p. 942), **activemq::commands::RemoveSubscriptionInfo** (p. 1767), **activemq::commands::TransactionInfo** (p. 2151), **activemq::commands::BrokerError** (p. 436), **activemq::commands::SessionInfo** (p. 1851), **activemq::commands::ProducerAck** (p. 1685), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::ConnectionError** (p. 738), **activemq::commands::Response** (p. 1784), **activemq::commands::Replay-**

Command (p. 1772), **activemq::commands::KeepAliveInfo** (p. 1236), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::ControlCommand** (p. 795), **activemq::commands::FlushCommand** (p. 1070), and **activemq::commands::WireFormatInfo** (p. 2248).

6.131.1 Detailed Description

Interface for an Object that can visit the various Command Objects that are sent from and to this client.

The Commands themselves implement a `visit` method that is called with an instance of this interface and each one then call the appropriate `processXXX` method.

Since

3.0

6.131.2 Constructor & Destructor Documentation

6.131.2.1 virtual activemq::state::CommandVisitor::~CommandVisitor ( ) [inline, virtual]

6.131.3 Member Function Documentation

6.131.3.1 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBeginTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 765).

6.131.3.2 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBrokerError (commands::BrokerError * *error*) [pure virtual]

6.131.3.3 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processBrokerInfo (commands::BrokerInfo * *info*) [pure virtual]

6.131.3.4 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processCommitTransactionOnePhase (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.5 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processCommitTransactionTwoPhase (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.6 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionControl (commands::ConnectionControl * *control*) [pure virtual]

6.131.3.7 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionError (commands::ConnectionError * *error*) [pure virtual]

6.131.3.8 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConnectionInfo (commands::ConnectionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.9 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConsumerControl (commands::ConsumerControl * *control*) [pure virtual]

6.131.3.10 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processConsumerInfo (commands::ConsumerInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.11 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processControlCommand (commands::ControlCommand * *command*) [pure virtual]

6.131.3.12 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processDestinationInfo (commands::DestinationInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.13 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processEndTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.14 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processFlushCommand (commands::FlushCommand * *command*) [pure virtual]

6.131.3.15 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processForgetTransaction (commands::TransactionInfo * *info*) [pure virtual]

6.131.3.16 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processKeepAliveInfo (commands::KeepAliveInfo * *info*) [pure virtual]

6.131.3.17 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessage (commands::Message * *send*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.18 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageAck (commands::MessageAck * *ack*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.19 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageDispatch (commands::MessageDispatch * *dispatch*) [pure virtual]

6.131.3.20 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessageDispatchNotification (commands::MessageDispatchNotification * *notification*) [pure virtual]

6.131.3.21 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processMessagePull (commands::MessagePull * *pull*) [pure virtual]

6.131.3.22 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processPrepareTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.23 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processProducerAck (commands::ProducerAck * *ack*) [pure virtual]

6.131.3.24 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processProducerInfo (commands::ProducerInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 766).

6.131.3.25 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRecoverTransactions (commands::TransactionInfo * *info*) [pure virtual]

6.131.3.26 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveConnection (commands::ConnectionId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.27 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveConsumer (commands::ConsumerId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.28 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveDestination (commands::DestinationInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.29 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveInfo (commands::RemoveInfo * *info*) [pure virtual]

Implemented in **activemq::state::CommandVisitorAdapter** (p. 685).

6.131.3.30 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveProducer (commands::ProducerId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.31 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveSession (commands::SessionId * *id*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.32 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRemoveSubscriptionInfo (commands::RemoveSubscriptionInfo * *info*) [pure virtual]

6.131.3.33 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processReplayCommand (commands::ReplayCommand * *replay*) [pure virtual]

6.131.3.34 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processResponse (commands::Response * *response*) [pure virtual]

6.131.3.35 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processRollbackTransaction (commands::TransactionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.131.3.36 virtual decaf::lang::Pointer<commands::Command> activemq::state::CommandVisitor::processSessionInfo (commands::SessionInfo * *info*) [pure virtual]

Implemented in **activemq::state::ConnectionStateTracker** (p. 767).

6.133 decaf::lang::Comparable< T > Class Template Reference

This interface imposes a total ordering on the objects of each class that implements it.

`#include <src/main/decaf/lang/Comparable.h>`

Public Member Functions

- virtual ~**Comparable** ()
- virtual int **compareTo** (**const** T &value) **const** =0

  Compares this object with the specified object for order.
- virtual bool **equals** (**const** T &value) **const** =0
- virtual bool **operator==** (**const** T &value) **const** =0

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** T &value) **const** =0

  Compares this object to another and returns true if this object is considered to be less than the one passed.

6.133.1 Detailed Description

template<typename T>class decaf::lang::Comparable< T >

This interface imposes a total ordering on the objects of each class that implements it.

This ordering is referred to as the class's natural ordering, and the class's compareTo method is referred to as its natural comparison method.

6.133.2 Constructor & Destructor Documentation

6.133.2.1 template<typename T> virtual decaf::lang::Comparable< T >::~Comparable ( ) [inline, virtual]

6.133.3 Member Function Documentation

6.133.3.1 template<typename T> virtual int decaf::lang::Comparable< T >::compareTo (const T & *value*) const [pure virtual]

Compares this object with the specified object for order.

Returns a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

In the foregoing description, the notation sgn(expression) designates the mathematical signum function, which is defined to return one of -1, 0, or 1 according to whether the value of expression is negative, zero or positive. The implementor must ensure sgn(x.compareTo(y)) == -sgn(y.compareTo(x)) for all x and y. (This implies that x.compareTo(y) must throw an exception iff y.compareTo(x) throws an exception.)

The implementor must also ensure that the relation is transitive: (x.compareTo(y)>0 && y.compareTo(z)>0) implies x.compareTo(z)>0.

Finally, the implementer must ensure that x.compareTo(y)==0 implies that sgn(x.compareTo(z)) == sgn(y.compareTo(z)), for all z.

It is strongly recommended, but not strictly required that (x.compareTo(y)==0) == (x.equals(y)). Generally speaking, any class that implements the **Comparable** (p. 686) interface and violates this condition should clearly indicate this fact. The recommended language is "Note: this class has a natural ordering that is inconsistent with equals."

Parameters

value	- the Object to be compared.

Returns

a negative integer, zero, or a positive integer as this object is less than, equal to, or greater than the specified object.

Implemented in **decaf::lang::Double** (p. 959), **decaf::lang::Float** (p. 1043), **decaf::lang::Integer** (p. 1165), **decaf::lang::Long** (p. 1341), **decaf::lang::Boolean** (p. 424), **decaf::lang::Short** (p. 1860), **decaf::lang::Byte** (p. 478), **decaf::lang::Character** (p. 595), **decaf::lang::Double** (p. 959), **decaf::lang::Float** (p. 1043), **decaf::lang::Boolean** (p. 423), **decaf::lang::Integer** (p. 1164), **decaf::lang::Long** (p. 1341), **decaf::lang::Byte** (p. 478), **decaf::lang::Short** (p. 1860), and **decaf::lang::Character** (p. 595).

6.133.3.2 template<typename T> virtual bool decaf::lang::Comparable< T >::equals (const T & *value*) const [pure virtual]

Returns

true if this value is considered equal to the passed value.

Implemented in **decaf::lang::Byte** (p. 479), **decaf::lang::Boolean** (p. 424), **decaf::lang::Character** (p. 596), **decaf::lang::Byte** (p. 479), **decaf::lang::Double** (p. 961), **decaf::lang::Float** (p. 1044), **decaf::lang::Character** (p. 596), **decaf::lang::Integer** (p. 1166), **decaf::lang::Long** (p. 1342), **decaf::lang::Short** (p. 1861), **decaf::lang::Boolean** (p. 424), **decaf::lang::Double** (p. 961), **decaf::lang::Float** (p. 1043), **decaf::lang::Integer** (p. 1166), **decaf::lang::Long** (p. 1342), and **decaf::lang::Short** (p. 1861).

6.133.3.3 template<typename T> virtual bool decaf::lang::Comparable< T >::operator< (const T & *value*) const [pure virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implemented in **decaf::lang::Double** (p. 963), **decaf::lang::Float** (p. 1047), **decaf::lang::Integer** (p. 1168), **decaf::lang::Long** (p. 1345), **decaf::lang::Short** (p. 1862), **decaf::lang::Boolean** (p. 424), **decaf::lang::Byte** (p. 480), **decaf::lang::Character** (p. 598), **decaf::lang::Double** (p. 962), **decaf::lang::Float** (p. 1046), **decaf::lang::Integer** (p. 1168), **decaf::lang::Long** (p. 1345), **decaf::lang::Short** (p. 1862), **decaf::lang::Boolean** (p. 424), **decaf::lang::Byte** (p. 480), and **decaf::lang::Character** (p. 598).

6.133.3.4 template<typename T> virtual bool decaf::lang::Comparable< T >::operator== (const T & *value*) const [pure virtual]

Compares equality between this object and the one passed.

Parameters

value	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implemented in **decaf::lang::Double** (p. 963), **decaf::lang::Float** (p. 1047), **decaf::lang::Integer** (p. 1169), **decaf::lang::Long** (p. 1345), **decaf::lang::Short** (p. 1863), **decaf::lang::Boolean** (p. 425), **decaf::lang::Byte** (p. 481), **decaf::lang::Character** (p. 598), **decaf::lang::Double** (p. 963), **decaf::lang::Float** (p. 1047), **decaf::lang::Integer** (p. 1168), **decaf::lang::Long** (p. 1345), **decaf::lang::Boolean** (p. 425), **decaf::lang::Short** (p. 1862), **decaf::lang::Byte** (p. 481), and **decaf::lang::Character** (p. 598).

The documentation for this class was generated from the following file:

6.134 decaf::util::Comparator< T > Class Template Reference

A comparison function, which imposes a total ordering on some collection of objects.

`#include <src/main/decaf/util/Comparator.h>`

Public Member Functions

- virtual ~**Comparator** ()
- virtual bool **operator()** (**const** T &left, **const** T &right) **const** =0

  *Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 689) to be passed to an STL **Map** (p. 1371) for use as the sorting criteria.*
- virtual int **compare** (**const** T &o1, **const** T &o2) **const** =0

  Compares its two arguments for order.

6.134.1 Detailed Description

template<typename T>class decaf::util::Comparator< T >

A comparison function, which imposes a total ordering on some collection of objects.

Comparators can be passed to a sort method (such as Collections.sort) to allow precise control over the sort order. Comparators can also be used to control the order of certain data structures.

The ordering imposed by a **Comparator** (p. 689) c on a set of elements S is said to be consistent with equals if and only if (compare(e1, e2) == 0) has the same boolean value as (e1 == e2) for every e1 and e2 in S.

Since

1.0

6.134.2 Constructor & Destructor Documentation

6.134.2.1 template<typename T> virtual decaf::util::Comparator< T >::~Comparator ( ) [inline, virtual]

6.134.3 Member Function Documentation

6.134.3.1 template<typename T> virtual int decaf::util::Comparator< T >::compare (const T & *o1,* const T & *o2*) const [pure virtual]

Compares its two arguments for order.

Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

The implementor must ensure that sgn(compare(x, y)) == -sgn(compare(y, x)) for all x and y. (This implies that compare(x, y) must throw an exception if and only if compare(y, x) throws an exception.)

The implementor must also ensure that the relation is transitive: ((compare(x, y)>0) && (compare(y, z)>0)) implies compare(x, z)>0.

Finally, the implementer must ensure that compare(x, y)==0 implies that sgn(compare(x, z))==sgn(compare(y, z)) for all z.

It is generally the case, but not strictly required that (compare(x, y)==0) == (x == y)). Generally speaking, any comparator that violates this condition should clearly indicate this fact. The recommended language is "Note: this comparator imposes orderings that are inconsistent with equals."

Parameters

o1	The first object to be compared
o2	The second object to be compared

Returns

a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.

Implemented in **decaf::util::comparators::Less**< **E** > (p. 1251).

6.134.3.2 template<typename T> virtual bool decaf::util::Comparator< T >::operator() (const T & *left,* const T & *right*) const [pure virtual]

Implementation of the Binary function interface as a means of allowing a **Comparator** (p. 689) to be passed to an STL **Map** (p. 1371) for use as the sorting criteria.

Parameters

left	The Left hand side operand.
right	The Right hand side operand.

Returns

true if the vale of left is less than the value of right.

Implemented in **decaf::util::comparators::Less**< **E** > (p. 1251).

6.137 activemq::threads::CompositeTaskRunner Class Reference

A **Task** (p. 2073) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

`#include <src/main/activemq/threads/CompositeTaskRunner.h>`

Inheritance diagram for activemq::threads::CompositeTaskRunner:

Public Member Functions

- **CompositeTaskRunner** ()
- virtual ~**CompositeTaskRunner** ()
- void **addTask** (**CompositeTask** *task)

  *Adds a new **CompositeTask** (p. 692) to the Set of Tasks that this class manages.*
- void **removeTask** (**CompositeTask** *task)

  *Removes a **CompositeTask** (p. 692) that was added previously.*

- virtual void **shutdown** (unsigned int timeout)

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()

  *Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.*
- virtual void **wakeup** ()

  *Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.
- virtual bool **iterate** ()

  Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

6.137.1 Detailed Description

A **Task** (p. 2073) Runner that can contain one or more CompositeTasks that are each checked for pending work and run if any is present in the order that the tasks were added.

Since

3.0

6.137.2 Constructor & Destructor Documentation

6.137.2.1 activemq::threads::CompositeTaskRunner::CompositeTaskRunner ( )

6.137.2.2 virtual activemq::threads::CompositeTaskRunner::~CompositeTaskRunner ( ) [virtual]

6.137.3 Member Function Documentation

6.137.3.1 void activemq::threads::CompositeTaskRunner::addTask (CompositeTask * *task*)

Adds a new **CompositeTask** (p. 692) to the Set of Tasks that this class manages.

Parameters

task	- Pointer to a **CompositeTask** (p. 692) instance.

6.137.3.2 virtual bool activemq::threads::CompositeTaskRunner::iterate ( ) [protected, virtual]

Perform one iteration of work, returns true if the task needs to run again to complete or false to indicate that the task is now complete.

Returns

true if the task should be run again or false if the task has completed and the runner should wait for a wakeup call.

Implements **activemq::threads::Task** (p. 2073).

6.137.3.3 void activemq::threads::CompositeTaskRunner::removeTask (CompositeTask * *task*)

Removes a **CompositeTask** (p. 692) that was added previously.

Parameters

task	- Pointer to a **CompositeTask** (p. 692) instance.

6.137.3.4 virtual void activemq::threads::CompositeTaskRunner::run ( ) [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 1793).

6.137.3.5 virtual void activemq::threads::CompositeTaskRunner::shutdown (unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout	- Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2074).

6.137.3.6 virtual void activemq::threads::CompositeTaskRunner::shutdown ( ) [virtual]

Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2074).

6.137.3.7 virtual void activemq::threads::CompositeTaskRunner::wakeup ( ) [virtual]

Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2074).

The documentation for this class was generated from the following file:

6.138 activemq::transport::CompositeTransport Class Reference

A Composite **Transport** (p. 2161) is a **Transport** (p. 2161) implementation that is composed of several Transports.

`#include <src/main/activemq/transport/CompositeTransport.h>`

Inheritance diagram for activemq::transport::CompositeTransport:

Public Member Functions

- virtual ~**CompositeTransport** ()

- virtual void **addURI** (bool rebalance, **const List**< **URI** > &uris)=0

  *Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2161) is a composite of.*
- virtual void **removeURI** (bool rebalance, **const List**< **URI** > &uris)=0

  *Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2161) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2161) should result in that **Transport** (p. 2161) being disposed of.*

6.138.1 Detailed Description

A Composite **Transport** (p. 2161) is a **Transport** (p. 2161) implementation that is composed of several Transports.

The composition could be such that only one **Transport** (p. 2161) exists for each URI that is composed or there could be many active Transports working at once.

Since

3.0

6.138.2 Constructor & Destructor Documentation

6.138.2.1 virtual activemq::transport::CompositeTransport::~CompositeTransport ( ) [inline, virtual]

6.138.3 Member Function Documentation

6.138.3.1 virtual void activemq::transport::CompositeTransport::addURI (bool *rebalance,* const List< URI > & *uris*) [pure virtual]

Add a URI to the list of URI's that will represent the set of Transports that this **Transport** (p. 2161) is a composite of.

Parameters

rebalance	Indicates if the addition should cause a forced reconnect or not.
uris	The new URI set to add to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1012).

6.138.3.2 virtual void activemq::transport::CompositeTransport::removeURI (bool *rebalance,* const List< URI > & *uris*) [pure virtual]

Remove a URI from the set of URI's that represents the set of Transports that this **Transport** (p. 2161) is composed of, removing a URI for which the composite has created a connected **Transport** (p. 2161) should result in that **Transport** (p. 2161) being disposed of.

Parameters

rebalance	Indicates if the removal should cause a forced reconnect or not.
uris	The new URI set to remove to the set this composite maintains.

Implemented in **activemq::transport::failover::FailoverTransport** (p. 1017).

6.139 decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR > Class Template Reference

Interface for a **Map** (p. 1371) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1371) interface.

`#include <src/main/decaf/util/concurrent/ConcurrentMap.h>`

Inheritance diagram for decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >:

Public Member Functions

- virtual ~**ConcurrentMap** ()
- virtual bool **putIfAbsent** (**const** K &key, **const** V &value)=0

  If the specified key is not already associated with a value, associate it with the given value.
- virtual bool **remove** (**const** K &key, **const** V &value)=0

  Remove entry for key only if currently mapped to given value.
- virtual bool **replace** (**const** K &key, **const** V &oldValue, **const** V &newValue)=0

  Replace entry for key only if currently mapped to given value.
- virtual V **replace** (**const** K &key, **const** V &value)=0

  Replace entry for key only if currently mapped to some value.

6.139.1 Detailed Description

template<typename K, typename V, typename COMPARATOR>class decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >

Interface for a **Map** (p. 1371) type that provides additional atomic putIfAbsent, remove, and replace methods alongside the already available **Map** (p. 1371) interface.

Since

1.0

6.139.2 Constructor & Destructor Documentation

6.139.2.1 template<typename K, typename V, typename COMPARATOR> virtual decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::~ConcurrentMap ( ) [inline, virtual]

6.139.3 Member Function Documentation

6.139.3.1 template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::putIfAbsent (const K & *key*, const V & *value*) [pure virtual]

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
```

```
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	The key to map the value to.
value	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

UnsupportedOperation-Exception	if the put operation is not supported by this map

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 710), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 710), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 710), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 710), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 710), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 710), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 710).

6.139.3.2 template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::remove (const K & *key*, const V & *value*) [pure virtual]

Remove entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == value ) ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
value	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 711), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 711), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 711), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 711), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 711), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 711), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 711).

6.139.3.3 template<typename K, typename V, typename COMPARATOR> virtual bool decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (const K & *key,* const V & *oldValue,* const V & *newValue*) [pure virtual]

Replace entry for key only if currently mapped to given value.

Acts as

```
if( ( map.containsKey( key ) && ( map.get( key ) == oldValue  ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
oldValue	value expected to be associated with the specified key.
newValue	value to be associated with the specified key.

Returns

true if the value was replaced

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 712), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 712).

6.139.3.4 template<typename K, typename V, typename COMPARATOR> virtual V decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >::replace (const K & *key,* const V & *value*) [pure virtual]

Replace entry for key only if currently mapped to some value.

Acts as

```
if( ( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException (p. 1537)(...);
};
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
value	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 1537) if there was no mapping for key.

Exceptions

NoSuchElementException *(p. 1537)*	if there was no previous mapping.

Implemented in **decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< MessageId >, Pointer< Message >, MessageId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConnectionId >, Pointer< ConnectionState >, ConnectionId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< ConsumerId >, Pointer< ConsumerState >, ConsumerId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< SessionId >, Pointer< SessionState >, SessionId::COMPARATOR >** (p. 712), **decaf::util::concurrent::ConcurrentStlMap< Pointer< LocalTransactionId >, Pointer< TransactionState >, LocalTransactionId::COMPARATOR >** (p. 712), and **decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >** (p. 712).

  ConcurrentModificationException ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**ConcurrentModificationException** () throw ()

6.140.1 Constructor & Destructor Documentation

6.140.1.1 decaf::util::ConcurrentModificationException::ConcurrentModificationException ( ) throw ()

Default Constructor.

6.140.1.2 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.140.1.3 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const ConcurrentModificationException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.140.1.4 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.140.1.5 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.140.1.6 decaf::util::ConcurrentModificationException::ConcurrentModificationException (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.140.1.7 virtual decaf::util::ConcurrentModificationException::~ConcurrentModificationException ( ) throw () [virtual]

6.140.2 Member Function Documentation

6.140.2.1 virtual ConcurrentModificationException* decaf::util::ConcurrentModificationException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Reimplemented from **decaf::lang::exceptions::RuntimeException** (p. 1796).

The documentation for this class was generated from the following file:

- src/main/decaf/util/**ConcurrentModificationException.h**

6.141 decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR > Class Template Reference

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

`#include <src/main/decaf/util/concurrent/ConcurrentStlMap.h>`

Inheritance diagram for decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >:

Public Member Functions

- **ConcurrentStlMap** ()

Default constructor - does nothing.

- **ConcurrentStlMap** (**const ConcurrentStlMap** &source)

  Copy constructor - copies the content of the given map into this one.

- **ConcurrentStlMap** (**const Map**< K, V, COMPARATOR > &source)

  Copy constructor - copies the content of the given map into this one.

- virtual ~**ConcurrentStlMap** ()
- virtual bool **equals** (**const ConcurrentStlMap** &source) **const**

- virtual bool **equals** (**const Map**< K, V, COMPARATOR > &source) **const**

  Comparison, equality is dependent on the method of determining if the element are equal.

- virtual void **copy** (**const ConcurrentStlMap** &source)

- virtual void **copy** (**const Map**< K, V, COMPARATOR > &source)

  Copies the content of the source map into this map.

- virtual void **clear** () throw (decaf::lang::exceptions::UnsupportedOperationException)

  Removes all keys and values from this map.

  Exceptions

UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual bool **containsKey** (**const** K &key) **const**

  Indicates whether or this map contains a value for the given key.

  Parameters

key	*The key to look up.*

  Returns

  true if this map contains the value, otherwise false.

- virtual bool **containsValue** (**const** V &value) **const**

  Indicates whether or this map contains a value for the given value, i.e.
  they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

  Parameters

value	*The Value to look up.*

  Returns

  true if this map contains the value, otherwise false.

- virtual bool **isEmpty** () **const**

  Returns

  *if the **Map** (p. 1371) contains any element or not, TRUE or FALSE*

- virtual int **size** () **const**

  Returns

  The number of elements (key/value pairs) in this map.

- virtual V & **get** (**const** K &key)

  *Gets the value mapped to the specified key in the **Map** (p. 1371).*
  *If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.*

  Parameters

key	*The search key.*

  Returns

  A reference to the value for the given key.

  Exceptions

NoSuchElementException (p. 1537)	*if the key requests doesn't exist in the **Map** (p. 1371).*

- virtual **const** V & **get** (**const** K &key) **const**

  *Gets the value mapped to the specified key in the **Map** (p. 1371).*
  *If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.*

  Parameters

key	*The search key.*

  Returns

  A {const} reference to the value for the given key.

  Exceptions

NoSuchElementException (p. 1537)	*if the key requests doesn't exist in the **Map** (p. 1371).*

- virtual void **put** (**const** K &key, **const** V &value)

  Sets the value for the specified key.

  Parameters

key	*The target key.*
value	*The value to be set.*

  Exceptions

UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual void **putAll** (**const ConcurrentStlMap**< K, V, COMPARATOR > &other)

- virtual void **putAll** (**const Map**< K, V, COMPARATOR > &other)

  *Stores a copy of the Mappings contained in the other **Map** (p. 1371) in this one.*

  Parameters

other	*A **Map** (p. 1371) instance whose elements are to all be inserted in this **Map** (p. 1371).*

  Exceptions

UnsupportedOperation-Exception	*If the implementing class does not support the putAll operation.*

- virtual V **remove** (**const** K &key)

  Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

  Parameters

key	*The search key.*

  Returns

  a copy of the element that was previously mapped to the given key

  Exceptions

NoSuchElementException (p. 1537)	*if this key is not in the **Map** (p. 1371).*
UnsupportedOperation-Exception	*if this map is unmodifiable.*

- virtual std::vector< K > **keySet** () **const**

  *Returns a **Set** (p. 1857) view of the mappings contained in this map.*
  *The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1210), **Set.remove** (p. 667), removeAll, retainAll and clear operations. It does not support the add or addAll operations.*

Returns

the entire set of keys in this map as a std::vector.

- virtual std::vector< V > **values** () **const**

  Returns

  the entire set of values in this map as a std::vector.

- bool **putIfAbsent** (**const** K &key, **const** V &value)

  If the specified key is not already associated with a value, associate it with the given value.

- bool **remove** (**const** K &key, **const** V &value)

  Remove entry for key only if currently mapped to given value.

- bool **replace** (**const** K &key, **const** V &oldValue, **const** V &newValue)

  Replace entry for key only if currently mapped to given value.

- V **replace** (**const** K &key, **const** V &value)

  Replace entry for key only if currently mapped to some value.

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  *Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.141.1 Detailed Description

template<typename K, typename V, typename COMPARATOR = std::less<K>>class decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >

Map (p. 1371) template that wraps around a std::map to provide a more user-friendly interface and to provide common functions that do not exist in std::map.

This version of **Map** (p. 1371) extends the **ConcurrentMap** (p. 696) inteface and implements all the methods defined in that interface. Unlike a Java ConcurrentHashMap this implementations synchronizes all methods such that any call to this class will block if another thread is already holding a lock, much like the Java HashTable.

Since

1.0

6.141.2 Constructor & Destructor Documentation

6.141.2.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap ( ) [inline]

Default constructor - does nothing.

6.141.2.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

source	The source map.

6.141.2.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::ConcurrentStlMap (const Map< K, V, COMPARATOR > & *source*) [inline]

Copy constructor - copies the content of the given map into this one.

Parameters

source	The source map.

6.141.2.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::~ConcurrentStlMap ( ) [inline, virtual]

6.141.3 Member Function Documentation

6.141.3.1 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::clear ( ) throw (decaf::lang::exceptions::UnsupportedOperationException) [inline, virtual]

Removes all keys and values from this map.

Exceptions

UnsupportedOperationException	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1373).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy().

6.141.3.2 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsKey (const K & *key*) const [inline, virtual]

Indicates whether or this map contains a value for the given key.

Parameters

key	The key to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1373).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::equals(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::remove(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

6.141.3.3 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::containsValue (const V & *value*) const [inline, virtual]

Indicates whether or this map contains a value for the given value, i.e.

they are equal, this is done by operator== so the types must pass equivalence testing in this manner.

Parameters

value	The Value to look up.

Returns

true if this map contains the value, otherwise false.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.141.3.4 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) [inline, virtual]

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::ConcurrentStlMap().

6.141.3.5 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::copy (const Map< K, V, COMPARATOR > & *source*) [inline, virtual]

Copies the content of the source map into this map.

Erases all existing data in this map.

Parameters

source	The source object to copy from.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.141.3.6 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const ConcurrentStlMap< K, V, COMPARATOR > & *source*) const [inline, virtual]

6.141.3.7 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::equals (const Map< K, V, COMPARATOR > & *source*) const [inline, virtual]

Comparison, equality is dependent on the method of determining if the element are equal.

Parameters

source	- **Map** (p. 1371) to compare to this one.

Returns

true if the **Map** (p. 1371) passed is equal in value to this one.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1374).

6.141.3.8 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & *key*) [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1375).

6.141.3.9 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual const V& decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::get (const K & *key*) const [inline, virtual]

Gets the value mapped to the specified key in the **Map** (p. 1371).

If there is no element in the map whose key is equivalent to the key provided then a **NoSuchElementException** (p. 1537) is thrown.

Parameters

key	The search key.

Returns

A {const} reference to the value for the given key.

Exceptions

NoSuchElementException *(p. 1537)*	if the key requests doesn't exist in the **Map** (p. 1371).

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1375).

6.141.3.10 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::isEmpty ( ) const [inline, virtual]

Returns

if the **Map** (p. 1371) contains any element or not, TRUE or FALSE

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1376).

6.141.3.11 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<K> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::keySet ( ) const [inline, virtual]

Returns a **Set** (p. 1857) view of the mappings contained in this map.

The set is backed by the map, so changes to the map are reflected in the set, and vice-versa. If the map is modified while an iteration over the set is in progress (except through the iterator's own remove operation, or through the setValue operation on a map entry returned by the iterator) the results of the iteration are undefined. The set supports element removal, which removes the corresponding mapping from the map, via the **Iterator.remove** (p. 1210), **Set.remove** (p. 667), removeAll, retainAll and clear operations. It does not support the add or addAll operations.

Returns

the entire set of keys in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1376).

6.141.3.12 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.141.3.13 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.141.3.14 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.141.3.15 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::put (const K & *key*, const V & *value*) [inline, virtual]

Sets the value for the specified key.

Parameters

key	The target key.
value	The value to be set.

Exceptions

UnsupportedOperation-Exception	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1377).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putAll(), decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::putIfAbsent(), and decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::replace().

6.141.3.16 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const ConcurrentStlMap< K, V, COMPARATOR > & *other*) [inline, virtual]

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::copy().

6.141.3.17 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putAll (const Map< K, V, COMPARATOR > & *other*) [inline, virtual]

Stores a copy of the Mappings contained in the other **Map** (p. 1371) in this one.

Parameters

other	A **Map** (p. 1371) instance whose elements are to all be inserted in this **Map** (p. 1371).

Exceptions

UnsupportedOperation-Exception	If the implementing class does not support the putAll operation.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1377).

6.141.3.18 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::putIfAbsent (const K & *key*, const V & *value*) [inline, virtual]

If the specified key is not already associated with a value, associate it with the given value.

This is equivalent to

```
if( !map.containsKey( key ) ) {
    map.put( key, value );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	The key to map the value to.
value	The value to map to the given key.

Returns

true if the put operation was performed otherwise return false which indicates there was a value previously mapped to the key.

Exceptions

UnsupportedOperation-Exception	if the put operation is not supported by this map

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 697).

6.141.3.19 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & *key*) [inline, virtual]

Removes the value (key/value pair) for the specified key from the map, returns a copy of the value that was mapped to the key.

Parameters

key	The search key.

Returns

a copy of the element that was previously mapped to the given key

Exceptions

NoSuchElementException *(p. 1537)*	if this key is not in the **Map** (p. 1371).
UnsupportedOperation-Exception	if this map is unmodifiable.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1378).

6.141.3.20 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::remove (const K & *key,* const V & *value*) [inline, virtual]

Remove entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == value ) ) {
    map.remove( key );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
value	value associated with the specified key.

Returns

true if the value was removed, false otherwise

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 697).

6.141.3.21 template<typename K, typename V, typename COMPARATOR = std::less<K>> bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & *key,* const V & *oldValue,* const V & *newValue*) [inline, virtual]

Replace entry for key only if currently mapped to given value.

Acts as

```
if( map.containsKey( key ) && ( map.get( key ) == oldValue ) ) {
    map.put( key, newValue );
    return true;
} else {
    return false;
}
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
oldValue	value expected to be associated with the specified key.
newValue	value to be associated with the specified key.

Returns

true if the value was replaced

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 698).

6.141.3.22 template<typename K, typename V, typename COMPARATOR = std::less<K>> V decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::replace (const K & *key,* const V & *value*) [inline, virtual]

Replace entry for key only if currently mapped to some value.

Acts as

```
if( map.containsKey( key ) ) {
    return map.put( key, value );
} else {
    throw NoSuchElementException (p. 1537)(...);
};
```

except that the action is performed atomically.

Parameters

key	key with which the specified value is associated.
value	value to be associated with the specified key.

Returns

copy of the previous value associated with specified key, or throws an **NoSuchElementException** (p. 1537) if there was no mapping for key.

Exceptions

NoSuchElementException *(p. 1537)*	if there was no previous mapping.

Implements **decaf::util::concurrent::ConcurrentMap< K, V, COMPARATOR >** (p. 699).

6.141.3.23 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual int decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::size ( ) const [inline, virtual]

Returns

The number of elements (key/value pairs) in this map.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1378).

6.141.3.24 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual bool decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::tryLock ( ) [inline, virtual]

Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.141.3.25 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.141.3.26 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual std::vector<V> decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::values ( ) const [inline, virtual]

Returns

the entire set of values in this map as a std::vector.

Implements **decaf::util::Map< K, V, COMPARATOR >** (p. 1379).

Referenced by decaf::util::concurrent::ConcurrentStlMap< Pointer< ProducerId >, Pointer< ProducerState >, ProducerId::COMPARATOR >::values().

6.141.3.27 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.141.3.28 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.141.3.29 template<typename K, typename V, typename COMPARATOR = std::less<K>> virtual void decaf::util::concurrent::ConcurrentStlMap< K, V, COMPARATOR >::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ConcurrentStlMap.h**

6.142 decaf::util::concurrent::locks::Condition Class Reference

Condition (p. 715) factors out the **Mutex** (p. 1519) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1305) implementations.

`#include <src/main/decaf/util/concurrent/locks/Condition.h>`

Public Member Functions

6.142.1 Detailed Description

Condition (p. 715) factors out the **Mutex** (p. 1519) monitor methods (wait, notify and notifyAll) into distinct objects to give the effect of having multiple wait-sets per object, by combining them with the use of arbitrary **Lock** (p. 1305) implementations.

Where a **Lock** (p. 1305) replaces the use of synchronized statements, a **Condition** (p. 715) replaces the use of the Object monitor methods.

Conditions (also known as condition queues or condition variables) provide a means for one thread to suspend execution (to "wait") until notified by another thread that some state condition may now be true. Because access to this shared state information occurs in different threads, it must be protected, so a lock of some form is associated with the condition. The key property that waiting for a condition provides is that it atomically releases the associated lock and suspends the current thread.

A **Condition** (p. 715) instance is intrinsically bound to a lock. To obtain a **Condition** (p. 715) instance for a particular **Lock** (p. 1305) instance use its newCondition() method.

As an example, suppose we have a bounded buffer which supports put and take methods. If a take is attempted on an empty buffer, then the thread will block until an item becomes available; if a put is attempted on a full buffer, then the thread will block until a space becomes available. We would like to keep waiting put threads and take threads in separate wait-sets so that we can use the optimization of only notifying a single thread at a time when items or spaces become available in the buffer. This can be achieved using two **Condition** (p. 715) instances.

class BoundedBuffer { Lock* lock = new ReentrantLock(); Condition* notFull = lock->newCondition(); Condition* notEmpty = lock->newCondition();

Object* items = new Object[100]; int putptr, takeptr, count;

public void put(Object* x) throw(InterruptedException) { lock->lock(); try { while(count == 100) notFull->**await()** (p. 717); items[putptr] = x; if (++putptr == 100) putptr = 0; ++count; notEmpty->**signal()** (p. 719); } catch(...) { lock->unlock(); } }

public Object take() throw(InterruptedException) { lock->lock(); try { while(count == 0) notEmpty->**await()** (p. 717); Object x = items[takeptr]; if (++takeptr == 100) takeptr = 0; --count; notFull->**signal()** (p. 719); return x; } catch(...) { lock->unlock(); } } }

(The ArrayBlockingQueue class provides this functionality, so there is no reason to implement this sample usage class.)

Implementation Considerations

When waiting upon a **Condition** (p. 715), a "spurious wakeup" is permitted to occur, in general, as a concession to the underlying platform semantics. This has little practical impact on most application programs as a **Condition** (p. 715) should always be waited upon in a loop, testing the state predicate that is being waited for. An implementation is free to remove the possibility of spurious wakeups but it is recommended that applications programmers always assume that they can occur and so always wait in a loop.

The three forms of condition waiting (interruptible, non-interruptible, and timed) may differ in their ease of implementation on some platforms and in their performance characteristics. In particular, it may be difficult to provide these features and maintain specific semantics such as ordering guarantees. Further, the ability to interrupt the actual suspension of the thread may not always be feasible to implement on all platforms.

Consequently, an implementation is not required to define exactly the same guarantees or semantics for all three forms of waiting, nor is it required to support interruption of the actual suspension of the thread.

An implementation is required to clearly document the semantics and guarantees provided by each of the waiting methods, and when an implementation does support interruption of thread suspension then it must obey the interruption semantics as defined in this interface.

As interruption generally implies cancellation, and checks for interruption are often infrequent, an implementation can favor responding to an interrupt over normal method return. This is true even if it can be shown that the interrupt occurred after another action may have unblocked the thread. An implementation should document this behavior.

Since

1.0

6.142.2 Constructor & Destructor Documentation

6.142.2.1 virtual decaf::util::concurrent::locks::Condition::~Condition ( ) [inline, virtual]

6.142.3 Member Function Documentation

6.142.3.1 virtual void decaf::util::concurrent::locks::Condition::await ( ) [pure virtual]

Causes the current thread to wait until it is signaled or interrupted.

The lock associated with this **Condition** (p. 715) is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of four things happens:

- Some other thread invokes the **signal()** (p. 719) method for this **Condition** (p. 715) and the current thread happens to be chosen as the thread to be awakened; or
  - Some other thread invokes the **signalAll()** (p. 720) method for this **Condition** (p. 715); or
  - Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
  - A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting and interruption of thread suspension is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 715) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal. In that case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).
InterruptedException	if the current thread is interrupted (and interruption of thread suspension is supported)
IllegalMonitorState-Exception	if the caller is not the lock owner.

6.142.3.2 virtual bool decaf::util::concurrent::locks::Condition::await (long long *time,* const TimeUnit & *unit*) [pure virtual]

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

This method is behaviorally equivalent to:

```
awaitNanos(unit.toNanos(time)) > 0
```

Parameters

time	- the maximum time to wait
unit	- the time unit of the time argument

Returns

false if the waiting time detectably elapsed before return from the method, else true

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).
InterruptedException	if the current thread is interrupted (and interruption of thread suspension is supported)
IllegalMonitorState-Exception	if the caller is not the lock owner.

6.142.3.3 virtual long long decaf::util::concurrent::locks::Condition::awaitNanos (long long *nanosTimeout*) [pure virtual]

Causes the current thread to wait until it is signaled or interrupted, or the specified waiting time elapses.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of five things happens:

- Some other thread invokes the **signal()** (p. 719) method for this **Condition** (p. 715) and the current thread happens to be chosen as the thread to be awakened; or
  - Some other thread invokes the **signalAll()** (p. 720) method for this **Condition** (p. 715); or
  - Some other thread interrupts the current thread, and interruption of thread suspension is supported; or
  - The specified waiting time elapses; or
  - A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting and interruption of thread suspension is supported,

then InterruptedException is thrown and the current thread's interrupted status is cleared. It is not specified, in the first case, whether or not the test for interruption occurs before the lock is released.

The method returns an estimate of the number of nanoseconds remaining to wait given the supplied nanosTimeout value upon return, or a value less than or equal to zero if it timed out. This value can be used to determine whether and how long to re-wait in cases where the wait returns but an awaited condition still does not hold. Typical uses of this method take the following form:

synchronized boolean aMethod(long timeout, const TimeUnit& unit) { long nanosTimeout = unit.toNanos(timeout); while (!conditionBeingWaitedFor) { if (nanosTimeout $>$ 0) nanosTimeout = theCondition-$>$awaitNanos(nanosTimeout); else return false; } // ... }

Design note: This method requires a nanosecond argument so as to avoid truncation errors in reporting remaining times. Such precision loss would make it difficult for programmers to ensure that total waiting times are not systematically shorter than specified when re-waits occur.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 715) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

An implementation can favor responding to an interrupt over normal method return in response to a signal, or over indicating the elapse of the specified waiting time. In either case the implementation must ensure that the signal is redirected to another waiting thread, if there is one.

Parameters

nanosTimeout	- the maximum time to wait, in nanoseconds

Returns

an estimate of the nanosTimeout value minus the time spent waiting upon return from this method. A positive value may be used as the argument to a subsequent call to this method to finish waiting out the desired time. A value less than or equal to zero indicates that no time remains.

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).
InterruptedException	if the current thread is interrupted (and interruption of thread suspension is supported)
IllegalMonitorStateException	if the caller is not the lock owner.

6.142.3.4 virtual void decaf::util::concurrent::locks::Condition::awaitUninterruptibly ( ) [pure virtual]

Causes the current thread to wait until it is signalled.

The lock associated with this condition is atomically released and the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happens:

- Some other thread invokes the **signal()** (p. 719) method for this **Condition** (p. 715) and the current thread happens to be chosen as the thread to be awakened; or
  - Some other thread invokes the **signalAll()** (p. 720) method for this **Condition** (p. 715); or
  - A "spurious wakeup" occurs.

In all cases, before this method can return the current thread must re-acquire the lock associated with this condition. When the thread returns it is guaranteed to hold this lock.

If the current thread's interrupted status is set when it enters this method, or it is interrupted while waiting, it will continue to wait until signalled. When it finally returns from this method its interrupted status will still be set.

Implementation Considerations

The current thread is assumed to hold the lock associated with this **Condition** (p. 715) when this method is called. It is up to the implementation to determine if this is the case and if not, how to respond. Typically, an exception will be thrown (such as IllegalMonitorStateException) and the implementation must document that fact.

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).
IllegalMonitorState-Exception	if the caller is not the lock owner.

6.142.3.5 virtual bool decaf::util::concurrent::locks::Condition::awaitUntil (const Date & *deadline*) [pure virtual]

6.142.3.6 virtual void decaf::util::concurrent::locks::Condition::signal ( ) [pure virtual]

Wakes up one waiting thread.

If any threads are waiting on this condition then one is selected for waking up. That thread must then re-acquire the lock before returning from await.

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).

6.142.3.7 virtual void decaf::util::concurrent::locks::Condition::signalAll ( ) [pure virtual]

Wakes up all waiting threads.

If any threads are waiting on this condition then they are all woken up. Each thread must re-acquire the lock before it can return from await.

Exceptions

RuntimeException	if an unexpected error occurs while trying to wait on the **Condition** (p. 715).

`#include <src/main/decaf/internal/util/concurrent/ConditionImpl.h>`

Static Public Member Functions

- static **decaf::util::concurrent::ConditionHandle** * **create** (**decaf::util::concurrent::MutexHandle** *mutex)

  Creates the Condition object and attaches it to the given MutexHandle.
- static void **destroy** (**decaf::util::concurrent::ConditionHandle** *handle)

  Destroy a previously create Condition instance.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition)

  Waits for the condition to be signaled.
- static void **wait** (**decaf::util::concurrent::ConditionHandle** *condition, long long mills, long long nanos)

  Waits for the condition to be signaled or for the time specified to ellapse.
- static void **notify** (**decaf::util::concurrent::ConditionHandle** *condition)

  Signals one Thread that is waiting on this condition to wake up.
- static void **notifyAll** (**decaf::util::concurrent::ConditionHandle** *condition)

  Signals all Threads that is waiting on this condition to wake up.

6.144.1 Member Function Documentation

6.144.1.1 static decaf::util::concurrent::ConditionHandle* decaf::internal::util::concurrent::ConditionImpl::create (decaf::util::concurrent::MutexHandle * *mutex*) [static]

Creates the Condition object and attaches it to the given MutexHandle.

Parameters

mutex	the Mutex handle that this Condition is attached to.

Returns

a newly constructed Condition handle that is attached to the given handle.

6.144.1.2 static void decaf::internal::util::concurrent::ConditionImpl::destroy (decaf::util::concurrent::ConditionHandle * *handle*) [static]

Destroy a previously create Condition instance.

Parameters

handle	The Condition handle to be destroyed.

6.144.1.3 static void decaf::internal::util::concurrent::ConditionImpl::notify (decaf::util::concurrent::ConditionHandle * *condition*) [static]

Signals one Thread that is waiting on this condition to wake up.

Parameters

condition	the handle to the condition to wait on.

6.144.1.4 static void decaf::internal::util::concurrent::ConditionImpl::notifyAll (decaf::util::concurrent::ConditionHandle * *condition*) [static]

Signals all Threads that is waiting on this condition to wake up.

Parameters

condition	the handle to the condition to wait on.

6.144.1.5 static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * *condition*) [static]

Waits for the condition to be signaled.

Parameters

condition	the handle to the condition to wait on.

6.144.1.6 static void decaf::internal::util::concurrent::ConditionImpl::wait (decaf::util::concurrent::ConditionHandle * *condition*, long long *mills*, long long *nanos*) [static]

Waits for the condition to be signaled or for the time specified to ellapse.

Parameters

condition	the handle to the condition to wait on.
mills	the time in milliseconds to wait for the condition to be signaled.
nanos	additional time in nanoseconds to wait for the thread to be signaled.

6.145 decaf::net::ConnectException Class Reference

`#include <src/main/decaf/net/ConnectException.h>`

Inheritance diagram for decaf::net::ConnectException:

Public Member Functions

- **ConnectException** () throw ()

  Default Constructor.
- **ConnectException** (**const Exception** &ex) throw ()

  Conversion Constructor from some other Exception.

- **ConnectException** (**const ConnectException** &ex) throw ()

  Copy Constructor.
- **ConnectException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **ConnectException** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **ConnectException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual **ConnectException** ∗ **clone** () **const**

  Clones this exception.
- virtual ∼**ConnectException** () throw ()

6.145.1 Constructor & Destructor Documentation

6.145.1.1 decaf::net::ConnectException::ConnectException ( ) throw () [inline]

Default Constructor.

6.145.1.2 decaf::net::ConnectException::ConnectException (const Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	An exception that should become this type of Exception

6.145.1.3 decaf::net::ConnectException::ConnectException (const ConnectException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	An exception that should become this type of Exception

6.145.1.4 decaf::net::ConnectException::ConnectException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.145.1.5 decaf::net::ConnectException::ConnectException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.145.1.6 decaf::net::ConnectException::ConnectException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.145.1.7 virtual decaf::net::ConnectException::~ConnectException ( ) throw () [inline, virtual]

6.145.2 Member Function Documentation

6.145.2.1 virtual ConnectException* decaf::net::ConnectException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new Exception instance that is a copy of this Exception object.

Reimplemented from **decaf::net::SocketException** (p. 1916).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**ConnectException.h**

6.146 cms::Connection Class Reference

The client's connection to its provider.

`#include <src/main/cms/Connection.h>`

Inheritance diagram for cms::Connection:

Public Member Functions

- virtual ~**Connection** () throw ()
- virtual void **close** ()=0

  Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).
- virtual **const ConnectionMetaData** * **getMetaData** () **const** =0

  Gets the metadata for this connection.
- virtual **Session** * **createSession** ()=0

  *Creates an AUTO_ACKNOWLEDGE **Session** (p. 1830).*
- virtual **Session** * **createSession** (**Session::AcknowledgeMode** ackMode)=0

  *Creates a new **Session** (p. 1830) to work for this **Connection** (p. 725) using the specified acknowledgment mode.*
- virtual std::string **getClientID** () **const** =0

  Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.
- virtual void **setClientID** (**const** std::string &clientID)=0

  Sets the client identifier for this connection.
- virtual **ExceptionListener** * **getExceptionListener** () **const** =0

  Gets the registered Exception Listener for this connection.
- virtual void **setExceptionListener** (**ExceptionListener** *listener)=0

  Sets the registered Exception Listener for this connection.

6.146.1 Detailed Description

The client's connection to its provider.

Connections support concurrent use.

A connection serves several purposes:

- It encapsulates an open connection with a JMS provider. It typically represents an open TCP/IP socket between a client and the service provider software.
- Its creation is where client authentication takes place.
- It can specify a unique client identifier.
- It provides a **ConnectionMetaData** (p. 759) object.
- It supports an optional **ExceptionListener** (p. 996) object.

Because the creation of a connection involves setting up authentication and communication, a connection is a relatively heavy-weight object. Most clients will do all their messaging with a single connection. Other more advanced applications may use several connections. The CMS API does not architect a reason for using multiple connections; however, there may be operational reasons for doing so.

A CMS client typically creates a connection, one or more sessions, and a number of message producers and consumers. When a connection is created, it is in stopped mode. That means that no messages are being delivered.

It is typical to leave the connection in stopped mode until setup is complete (that is, until all message consumers have been created). At that point, the client calls the connection's start method, and messages begin arriving at the connection's consumers. This setup convention minimizes any client confusion that may result from asynchronous message delivery while the client is still in the process of setting itself up.

A connection can be started immediately, and the setup can be done afterwards. Clients that do this must be prepared to handle asynchronous message delivery while they are still in the process of setting up.

A message producer can send messages while a connection is stopped.

Since

1.0

6.146.2 Constructor & Destructor Documentation

6.146.2.1 virtual cms::Connection::~Connection ( ) throw () [virtual]

6.146.3 Member Function Documentation

6.146.3.1 virtual void cms::Connection::close ( ) [pure virtual]

Closes this connection as well as any Sessions created from it (and those Sessions' consumers and producers).

Exceptions

CMSException *(p. 640)*	

Implements **cms::Closeable** (p. 633).

Implemented in **activemq::core::ActiveMQConnection** (p. 152).

6.146.3.2 virtual Session* cms::Connection::createSession ( ) [pure virtual]

Creates an AUTO_ACKNOWLEDGE **Session** (p. 1830).

Exceptions

CMSException *(p. 640)*	

Implemented in **activemq::core::ActiveMQConnection** (p. 152).

6.146.3.3 virtual Session* cms::Connection::createSession (Session::AcknowledgeMode *ackMode*) [pure virtual]

Creates a new **Session** (p. 1830) to work for this **Connection** (p. 725) using the specified acknowledgment mode.

Parameters

ackMode	the Acknowledgment Mode to use.

Exceptions

CMSException *(p. 640)*	

Implemented in **activemq::core::ActiveMQConnection** (p. 152), and **activemq::core::ActiveMQXAConnection** (p. 335).

6.146.3.4 virtual std::string cms::Connection::getClientID ( ) const [pure virtual]

Get the Client Id for this session, the client Id is provider specific and is either assigned by the connection factory or set using the setClientID method.

Returns

Client Id String for this **Connection** (p. 725).

Exceptions

CMSException *(p. 640)*	if the provider fails to return the client id or an internal error occurs.

Implemented in **activemq::core::ActiveMQConnection** (p. 154).

6.146.3.5 virtual ExceptionListener* cms::Connection::getExceptionListener ( ) const [pure virtual]

Gets the registered Exception Listener for this connection.

Returns

pointer to an exception listener or NULL

Implemented in **activemq::core::ActiveMQConnection** (p. 155).

6.146.3.6 virtual const ConnectionMetaData* cms::Connection::getMetaData ( ) const [pure virtual]

Gets the metadata for this connection.

Returns

the connection MetaData pointer (caller does not own it).

Exceptions

CMSException *(p. 640)*	if the provider fails to get the connection metadata for this connection.

See also

ConnectionMetaData (p. 759)

Since

2.0

Implemented in **activemq::core::ActiveMQConnection** (p. 155).

6.146.3.7 virtual void cms::Connection::setClientID (const std::string & *clientID*) [pure virtual]

Sets the client identifier for this connection.

The preferred way to assign a CMS client's client identifier is for it to be configured in a client-specific **ConnectionFactory** (p. 741) object and transparently assigned to the **Connection** (p. 725) object it creates.

If a client sets the client identifier explicitly, it must do so immediately after it creates the connection and before any other action on the connection is taken. After this point, setting the client identifier is a programming error that should throw an **IllegalStateException** (p. 1098).

Parameters

clientID	The unique client identifier to assign to the **Connection** (p. 725).

Exceptions

CMSException *(p. 640)*	if the provider fails to set the client id due to some internal error.
InvalidClientIDException	if the id given is somehow invalid or is a duplicate.
IllegalStateException *(p. 1098)*	if the client tries to set the id after a **Connection** (p. 725) method has been called.

Implemented in **activemq::core::ActiveMQConnection** (p. 161).

6.146.3.8 virtual void cms::Connection::setExceptionListener (ExceptionListener * *listener*) [pure virtual]

Sets the registered Exception Listener for this connection.

Parameters

listener	pointer to and **ExceptionListener** (p. 996)

Implemented in **activemq::core::ActiveMQConnection** (p. 162).

The documentation for this class was generated from the following file:

- src/main/cms/**Connection.h**

6.147.1 Constructor & Destructor Documentation

6.147.1.1 activemq::commands::ConnectionControl::ConnectionControl ( )

6.147.1.2 virtual activemq::commands::ConnectionControl::~ConnectionControl ( ) [virtual]

6.147.2 Member Function Documentation

6.147.2.1 virtual ConnectionControl* activemq::commands::ConnectionControl::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.147.2.2 virtual void activemq::commands::ConnectionControl::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.147.2.3 virtual bool activemq::commands::ConnectionControl::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.147.2.4 virtual const std::string& activemq::commands::ConnectionControl::getConnectedBrokers ( ) const [virtual]

6.147.2.21 virtual void **activemq::commands::ConnectionControl::setReconnectTo** (const std::string & *reconnectTo*) [virtual]

6.147.2.22 virtual void **activemq::commands::ConnectionControl::setResume** (bool *resume*) [virtual]

6.147.2.23 virtual void **activemq::commands::ConnectionControl::setSuspend** (bool *suspend*) [virtual]

6.147.2.24 virtual std::string **activemq::commands::ConnectionControl::toString** ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.147.2.25 virtual **Pointer**<**Command**> **activemq::commands::ConnectionControl::visit** (**activemq::state::CommandVisitor** * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.147.3 Field Documentation

  Tight Marhsal to the given stream.

6.148.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionControlMarshaller** (p. 732).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.148.2 Constructor & Destructor Documentation

6.148.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::-ConnectionControlMarshaller ( ) [inline]

6.148.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::∼-ConnectionControlMarshaller ( ) [inline, virtual]

6.148.3 Member Function Documentation

6.148.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::-ConnectionControlMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.148.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionControl-Marshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.148.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControl-Marshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.148.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller-::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.148.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.148.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.148.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

6.149.1 Constructor & Destructor Documentation

6.149.1.1 activemq::commands::ConnectionError::ConnectionError ( )

6.149.1.2 virtual activemq::commands::ConnectionError::~ConnectionError ( ) [virtual]

6.149.2 Member Function Documentation

6.149.2.1 virtual ConnectionError* activemq::commands::ConnectionError::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.149.2.2 virtual void activemq::commands::ConnectionError::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.149.2.3 virtual bool activemq::commands::ConnectionError::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.149.2.4 virtual const Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId ( ) const [virtual]

6.149.2.5 virtual Pointer<ConnectionId>& activemq::commands::ConnectionError::getConnectionId ( ) [virtual]

6.149.2.6 virtual unsigned char activemq::commands::ConnectionError::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.149.2.7 virtual const Pointer<BrokerError>& activemq::commands::ConnectionError::getException ( ) const [virtual]

6.149.2.8 virtual Pointer<BrokerError>& activemq::commands::ConnectionError::getException ( ) [virtual]

6.149.2.9 virtual void activemq::commands::ConnectionError::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.149.2.10 virtual void activemq::commands::ConnectionError::setException (const Pointer< BrokerError > & *exception*) [virtual]

6.149.2.11 virtual std::string activemq::commands::ConnectionError::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.149.2.12 virtual Pointer<Command> activemq::commands::ConnectionError::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.149.3 Field Documentation

6.149.3.1 Pointer<ConnectionId> activemq::commands::ConnectionError::connectionId [protected]

6.149.3.2 Pointer<BrokerError> activemq::commands::ConnectionError::exception [protected]

6.150.3 Member Function Documentation

6.150.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.150.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.150.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.150.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.150.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.150.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.150.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ConnectionErrorMarshaller.h**

6.151 cms::ConnectionFactory Class Reference

Defines the interface for a factory that creates connection objects, the **Connection** (p. 725) objects returned implement the CMS **Connection** (p. 725) interface and hide the CMS Provider specific implementation details behind that interface.

`#include <src/main/cms/ConnectionFactory.h>`

Inheritance diagram for cms::ConnectionFactory:

Public Member Functions

- virtual ~**ConnectionFactory** () throw ()
- virtual **Connection** * **createConnection** ()=0

  Creates a connection with the default user identity.
- virtual **cms::Connection** * **createConnection** (**const** std::string &username, **const** std::string &password)=0

  Creates a connection with the default specified identity.
- virtual **cms::Connection** * **createConnection** (**const** std::string &username, **const** std::string &password, **const** std::string &clientId)=0

  Creates a connection with the specified user identity.

Static Public Member Functions

- static **ConnectionFactory** * **createCMSConnectionFactory** (**const** std::string &brokerURI)

  Static method that is used to create a provider specific connection factory.

6.151.1 Detailed Description

Defines the interface for a factory that creates connection objects, the **Connection** (p. 725) objects returned implement the CMS **Connection** (p. 725) interface and hide the CMS Provider specific implementation details behind that interface.

A Client creates a new **ConnectionFactory** (p. 741) either directly by instantiating the provider specific implementation of the factory or by using the static method `createCMSConnectionFactory` which all providers are required to implement.

Since

1.0

6.151.2 Constructor & Destructor Documentation

6.151.2.1 virtual cms::ConnectionFactory::~ConnectionFactory ( ) throw () [virtual]

6.151.3 Member Function Documentation

6.151.3.1 static ConnectionFactory* cms::ConnectionFactory::createCMSConnectionFactory (const std::string & *brokerURI*) [static]

Static method that is used to create a provider specific connection factory.

The provider implements this method in their library and returns an instance of a **ConnectionFactory** (p. 741) derived object. Clients can use this method to remain abstracted from the specific CMS implementation being used.

Parameters

brokerURI	The remote address to use to connect to the Provider.

Returns

A pointer to a provider specific implementation of the **ConnectionFactory** (p. 741) interface, the caller is responsible for deleting this resource.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **ConnectionFactory** (p. 741).

6.151.3.2 virtual Connection* cms::ConnectionFactory::createConnection ( ) [pure virtual]

Creates a connection with the default user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 1964) method is explicitly called.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **Connection** (p. 725).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 168).

6.151.3.3 virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*) [pure virtual]

Creates a connection with the default specified identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 1964) method is explicitly called. The username and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters

username	The user name used to authenticate with the Provider.
password	The password used to authenticate with the Provider.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **Connection** (p. 725).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 168).

6.151.3.4 virtual cms::Connection* cms::ConnectionFactory::createConnection (const std::string & *username*, const std::string & *password*, const std::string & *clientId*) [pure virtual]

Creates a connection with the specified user identity.

The connection is created in stopped mode. No messages will be delivered until the **Connection.start** (p. 1964) method is explicitly called. The user name and password values passed here do not change the defaults, subsequent calls to the parameterless createConnection will continue to use the default values that were set in the Constructor.

Parameters

username	The user name used to authenticate with the Provider.
password	The password used to authenticate with the Provider.
clientId	The Client Id assigned to connection. If the id is the empty string ("") then a random client Id is created for this connection.

Returns

A pointer to a connection object, caller owns the pointer and is responsible for closing the connection and deleting the instance.

Exceptions

CMSException *(p. 640)*	if an internal error occurs while creating the **Connection** (p. 725).

Implemented in **activemq::core::ActiveMQConnectionFactory** (p. 169).

The documentation for this class was generated from the following file:

- src/main/cms/**ConnectionFactory.h**

6.152 activemq::exceptions::ConnectionFailedException Class Reference

`#include <src/main/activemq/exceptions/ConnectionFailedException.h>`

Inheritance diagram for activemq::exceptions::ConnectionFailedException:

6.153.2.3 activemq::commands::ConnectionId::ConnectionId (const SessionId * *sessionId*)

6.153.2.4 activemq::commands::ConnectionId::ConnectionId (const ProducerId * *producerId*)

6.153.2.5 activemq::commands::ConnectionId::ConnectionId (const ConsumerId * *consumerId*)

6.153.2.6 virtual activemq::commands::ConnectionId::~ConnectionId ( ) [virtual]

6.153.3 Member Function Documentation

6.153.3.1 virtual ConnectionId* activemq::commands::ConnectionId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.153.3.2 virtual int activemq::commands::ConnectionId::compareTo (const ConnectionId & *value*) const [virtual]

6.153.3.3 virtual void activemq::commands::ConnectionId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.153.3.4 virtual bool activemq::commands::ConnectionId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.153.3.5 virtual bool activemq::commands::ConnectionId::equals (const ConnectionId & *value*) const [virtual]

6.153.3.6 virtual unsigned char activemq::commands::ConnectionId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.153.3.7 virtual const std::string& activemq::commands::ConnectionId::getValue ( ) const [virtual]

6.153.3.8 virtual std::string& activemq::commands::ConnectionId::getValue ( ) [virtual]

6.153.3.9 virtual bool activemq::commands::ConnectionId::operator< (const ConnectionId & *value*) const [virtual]

6.153.3.10 ConnectionId& activemq::commands::ConnectionId::operator= (const ConnectionId & *other*)

6.153.3.11 virtual bool activemq::commands::ConnectionId::operator== (const ConnectionId & *value*) const [virtual]

6.153.3.12 virtual void activemq::commands::ConnectionId::setValue (const std::string & *value*) [virtual]

6.153.3.13 virtual std::string activemq::commands::ConnectionId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.153.4 Field Documentation

6.153.4.1 const unsigned char activemq::commands::ConnectionId::ID_CONNECTIONID = 120 [static]

Referenced by activemq::state::CommandVisitorAdapter::processRemoveInfo().

6.153.4.2 std::string activemq::commands::ConnectionId::value [protected]

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.154.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionIdMarshaller** (p. 748).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.154.2 Constructor & Destructor Documentation

6.154.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::ConnectionIdMarshaller ( ) [inline]

6.154.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::~ConnectionIdMarshaller ( ) [inline, virtual]

6.154.3 Member Function Documentation

6.154.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.154.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.154.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.154.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.154.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.154.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.154.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.155.1 Constructor & Destructor Documentation

6.155.1.1 activemq::commands::ConnectionInfo::ConnectionInfo ( )

6.155.1.2 virtual activemq::commands::ConnectionInfo::~ConnectionInfo ( ) [virtual]

6.155.2 Member Function Documentation

6.155.2.1 virtual ConnectionInfo* activemq::commands::ConnectionInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.155.2.2 virtual void activemq::commands::ConnectionInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.155.2.3 Pointer<RemoveInfo> activemq::commands::ConnectionInfo::createRemoveCommand ( ) const

6.155.2.4 virtual bool activemq::commands::ConnectionInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.155.2.5 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath ( ) const [virtual]

6.155.2.6 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::ConnectionInfo::getBrokerPath ( ) [virtual]

6.155.2.7 virtual const std::string& activemq::commands::ConnectionInfo::getClientId ( ) const [virtual]

6.155.2.8 virtual std::string& activemq::commands::ConnectionInfo::getClientId ( ) [virtual]

6.155.2.9 virtual const Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId ( ) const [virtual]

6.155.2.10 virtual Pointer<ConnectionId>& activemq::commands::ConnectionInfo::getConnectionId ( ) [virtual]

6.155.2.11 virtual unsigned char activemq::commands::ConnectionInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.155.2.12 virtual const std::string& activemq::commands::ConnectionInfo::getPassword ( ) const [virtual]

6.155.2.13 virtual std::string& activemq::commands::ConnectionInfo::getPassword ( ) [virtual]

6.155.2.14 virtual const std::string& activemq::commands::ConnectionInfo::getUserName ( ) const [virtual]

6.155.2.15 virtual std::string& activemq::commands::ConnectionInfo::getUserName ( ) [virtual]

6.155.2.16 virtual bool activemq::commands::ConnectionInfo::isBrokerMasterConnector ( ) const [virtual]

6.155.2.17 virtual bool activemq::commands::ConnectionInfo::isClientMaster ( ) const [virtual]

6.155.2.18 virtual bool activemq::commands::ConnectionInfo::isConnectionInfo ( ) const [inline, virtual]

Returns

an answer of true to the **isConnectionInfo()** (p. 754) query.

Reimplemented from **activemq::commands::BaseCommand** (p. 383).

6.155.2.19 virtual bool activemq::commands::ConnectionInfo::isFailoverReconnect ( ) const [virtual]

6.155.2.20 virtual bool activemq::commands::ConnectionInfo::isFaultTolerant ( ) const [virtual]

6.155.2.21 virtual bool activemq::commands::ConnectionInfo::isManageable ( ) const [virtual]

6.155.2.22 virtual void activemq::commands::ConnectionInfo::setBrokerMasterConnector (bool *brokerMasterConnector*) [virtual]

6.155.2.23 virtual void activemq::commands::ConnectionInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.155.2.24 virtual void activemq::commands::ConnectionInfo::setClientId (const std::string & *clientId*) [virtual]

6.155.2.25 virtual void activemq::commands::ConnectionInfo::setClientMaster (bool *clientMaster*) [virtual]

6.155.2.26 virtual void activemq::commands::ConnectionInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.155.2.27 virtual void activemq::commands::ConnectionInfo::setFailoverReconnect (bool *failoverReconnect*) [virtual]

6.155.2.28 virtual void activemq::commands::ConnectionInfo::setFaultTolerant (bool *faultTolerant*) [virtual]

6.155.2.29 virtual void activemq::commands::ConnectionInfo::setManageable (bool *manageable*) [virtual]

6.155.2.30 virtual void activemq::commands::ConnectionInfo::setPassword (const std::string & *password*) [virtual]

6.155.2.31 virtual void activemq::commands::ConnectionInfo::setUserName (const std::string & *userName*) [virtual]

6.155.2.32 virtual std::string activemq::commands::ConnectionInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.155.2.33 virtual Pointer<Command> activemq::commands::ConnectionInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.156.1 Detailed Description

Marshaling code for Open Wire Format for **ConnectionInfoMarshaller** (p. 756).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.156.2 Constructor & Destructor Documentation

6.156.2.1 activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::ConnectionInfoMarshaller ( ) [inline]

6.156.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::∼ConnectionInfoMarshaller ( ) [inline, virtual]

6.156.3 Member Function Documentation

6.156.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.156.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.156.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.156.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.156.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.156.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.156.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

  Gets the CMS provider major version number.
- virtual int **getProviderMinorVersion** () **const** =0

  Gets the CMS provider minor version number.
- virtual std::vector< std::string > **getCMSXPropertyNames** () **const** =0

  Gets an Vector of the CMSX property names.

6.157.1 Detailed Description

A **ConnectionMetaData** (p. 759) object provides information describing the **Connection** (p. 725) object.

Since

1.3

6.157.2 Constructor & Destructor Documentation

6.157.2.1 virtual cms::ConnectionMetaData::~ConnectionMetaData ( ) throw () [virtual]

6.157.3 Member Function Documentation

6.157.3.1 virtual int cms::ConnectionMetaData::getCMSMajorVersion ( ) const [pure virtual]

Gets the CMS major version number.

Returns

the CMS API major version number

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 176).

6.157.3.2 virtual int cms::ConnectionMetaData::getCMSMinorVersion ( ) const [pure virtual]

Gets the CMS minor version number.

Returns

the CMS API minor version number

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 176).

6.157.3.3 virtual std::string cms::ConnectionMetaData::getCMSProviderName ( ) const [pure virtual]

Gets the CMS provider name.

Returns

the CMS provider name

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 177).

6.157.3.4 virtual std::string cms::ConnectionMetaData::getCMSVersion ( ) const [pure virtual]

Gets the CMS API version.

Returns

the CMS API Version in String form.

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 177).

6.157.3.5 virtual std::vector<std::string> cms::ConnectionMetaData::getCMSXPropertyNames ( ) const [pure virtual]

Gets an Vector of the CMSX property names.

Returns

an Vector of CMSX property names

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 177).

6.157.3.6 virtual int cms::ConnectionMetaData::getProviderMajorVersion ( ) const [pure virtual]

Gets the CMS provider major version number.

Returns

the CMS provider major version number

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 177).

6.157.3.7 virtual int cms::ConnectionMetaData::getProviderMinorVersion ( ) const [pure virtual]

Gets the CMS provider minor version number.

Returns

the CMS provider minor version number

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 178).

6.157.3.8 virtual std::string cms::ConnectionMetaData::getProviderVersion ( ) const [pure virtual]

Gets the CMS provider version.

Returns

the CMS provider version

Exceptions

CMSException *(p. 640)*	If the CMS Provider fails to retrieve the metadata due to some internal error.

Implemented in **activemq::core::ActiveMQConnectionMetaData** (p. 178).

6.160 decaf::util::logging::ConsoleHandler Class Reference

This **Handler** (p. 1085) publishes log records to System.err.

`#include <src/main/decaf/util/logging/ConsoleHandler.h>`

Inheritance diagram for decaf::util::logging::ConsoleHandler:

Public Member Functions

- **ConsoleHandler** ()
- virtual ~**ConsoleHandler** ()
- virtual void **close** ()

  Close the current output stream.
- virtual void **publish** (**const LogRecord** &record)

  *Publish the Log Record to this **Handler** (p. 1085).*

6.160.1 Detailed Description

This **Handler** (p. 1085) publishes log records to System.err.

By default the **SimpleFormatter** (p. 1891) is used to generate brief summaries.

Configuration: By default each **ConsoleHandler** (p. 768) is initialized using the following **LogManager** (p. 1327) configuration properties. If properties are not defined (or have invalid values) then the specified default values are used.

ConsoleHandler.level specifies the default level for the **Handler** (p. 1085) (defaults to **Level.INFO** (p. 1256)). ConsoleHandler.filter specifies the name of a **Filter** (p. 1031) class to use (defaults to no **Filter** (p. 1031)). ConsoleHandler.formatter specifies the name of a **Formatter** (p. 1074) class to use (defaults to **SimpleFormatter** (p. 1891)).

Since

1.0

6.160.2 Constructor & Destructor Documentation

6.160.2.1 decaf::util::logging::ConsoleHandler::ConsoleHandler ( )

6.160.2.2 virtual decaf::util::logging::ConsoleHandler::~ConsoleHandler ( ) [inline, virtual]

6.160.3 Member Function Documentation

6.160.3.1 virtual void decaf::util::logging::ConsoleHandler::close ( ) [virtual]

Close the current output stream.

Override the **StreamHandler** (p. 2017) close to flush the Std Err stream but doesn't close.

Exceptions

IOException	

Reimplemented from **decaf::util::logging::StreamHandler** (p. 2019).

6.160.3.2 virtual void decaf::util::logging::ConsoleHandler::publish (const LogRecord & *record*) [virtual]

Publish the Log Record to this **Handler** (p. 1085).

Parameters

record	The **LogRecord** (p. 1333) to Publish

Reimplemented from **decaf::util::logging::StreamHandler** (p. 2019).

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**ConsoleHandler.h**

6.161.1 Constructor & Destructor Documentation

6.161.1.1 activemq::commands::ConsumerControl::ConsumerControl ( )

6.161.1.2 virtual activemq::commands::ConsumerControl::~ConsumerControl ( ) [virtual]

6.161.2 Member Function Documentation

6.161.2.1 virtual ConsumerControl* activemq::commands::ConsumerControl::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.161.2.2 virtual void activemq::commands::ConsumerControl::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.161.2.3 virtual bool activemq::commands::ConsumerControl::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.161.2.4 virtual const Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId ( ) const [virtual]

6.161.2.5 virtual Pointer<ConsumerId>& activemq::commands::ConsumerControl::getConsumerId ( ) [virtual]

6.161.2.6 virtual unsigned char activemq::commands::ConsumerControl::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.161.2.7 virtual const Pointer<ActiveMQDestination>& activemq::commands::ConsumerControl::getDestination ( ) const [virtual]

6.161.2.8 virtual Pointer<ActiveMQDestination>& activemq::commands::ConsumerControl::getDestination ( ) [virtual]

6.161.2.9 virtual int activemq::commands::ConsumerControl::getPrefetch ( ) const [virtual]

6.161.2.10 virtual bool activemq::commands::ConsumerControl::isClose ( ) const [virtual]

6.161.2.11 virtual bool activemq::commands::ConsumerControl::isFlush ( ) const [virtual]

6.161.2.12 virtual bool activemq::commands::ConsumerControl::isStart ( ) const [virtual]

6.161.2.13 virtual bool activemq::commands::ConsumerControl::isStop ( ) const [virtual]

6.161.2.14 virtual void activemq::commands::ConsumerControl::setClose (bool *close*) [virtual]

6.161.2.15 virtual void activemq::commands::ConsumerControl::setConsumerId (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.161.2.16 virtual void activemq::commands::ConsumerControl::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.161.2.17 virtual void activemq::commands::ConsumerControl::setFlush (bool *flush*) [virtual]

6.161.2.18 virtual void activemq::commands::ConsumerControl::setPrefetch (int *prefetch*) [virtual]

6.161.2.19 virtual void activemq::commands::ConsumerControl::setStart (bool *start*) [virtual]

6.161.2.20 virtual void activemq::commands::ConsumerControl::setStop (bool *stop*) [virtual]

6.161.2.21 virtual std::string activemq::commands::ConsumerControl::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.161.2.22 virtual Pointer<Command> activemq::commands::ConsumerControl::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.161.3 Field Documentation

6.162 activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller Class Reference

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 773).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/ConsumerControlMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller:

Public Member Functions

- **ConsumerControlMarshaller** ()
- virtual ~**ConsumerControlMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.162.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerControlMarshaller** (p. 773).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.162.2 Constructor & Destructor Documentation

6.162.2.1 activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::ConsumerControlMarshaller ( ) [inline]

6.162.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::~ConsumerControlMarshaller ( ) [inline, virtual]

6.162.3 Member Function Documentation

6.162.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.162.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.162.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.162.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.162.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.162.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.162.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

6.163.1 Member Typedef Documentation

6.163.1.1 typedef decaf::lang::PointerComparator<ConsumerId> activemq::commands::ConsumerId::COMPARATOR

6.163.2 Constructor & Destructor Documentation

6.163.2.1 activemq::commands::ConsumerId::ConsumerId ( )

6.163.2.2 activemq::commands::ConsumerId::ConsumerId (const ConsumerId & *other*)

6.163.2.3 activemq::commands::ConsumerId::ConsumerId (const SessionId & *sessionId,* long long *consumerIdd*)

6.163.2.4 virtual activemq::commands::ConsumerId::~ConsumerId ( ) [virtual]

6.163.3 Member Function Documentation

6.163.3.1 virtual ConsumerId* activemq::commands::ConsumerId::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.163.3.2 virtual int activemq::commands::ConsumerId::compareTo (const ConsumerId & *value*) const [virtual]

6.163.3.3 virtual void activemq::commands::ConsumerId::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.163.3.4 virtual bool activemq::commands::ConsumerId::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.163.3.5 virtual bool activemq::commands::ConsumerId::equals (const ConsumerId & *value*) const [virtual]

6.163.3.6 virtual const std::string& activemq::commands::ConsumerId::getConnectionId ( ) const [virtual]

6.163.3.7 virtual std::string& activemq::commands::ConsumerId::getConnectionId ( ) [virtual]

6.163.3.8 virtual unsigned char activemq::commands::ConsumerId::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.163.3.9 const Pointer<SessionId>& activemq::commands::ConsumerId::getParentId ( ) const

6.163.3.10 virtual long long activemq::commands::ConsumerId::getSessionId ( ) const [virtual]

6.163.3.12 virtual bool activemq::commands::ConsumerId::operator< (const ConsumerId & *value*) const [virtual]

6.163.3.13 ConsumerId& activemq::commands::ConsumerId::operator= (const ConsumerId & *other*)

6.163.3.14 virtual bool activemq::commands::ConsumerId::operator== (const ConsumerId & *value*) const [virtual]

6.163.3.15 virtual void activemq::commands::ConsumerId::setConnectionId (const std::string & *connectionId*) [virtual]

6.163.3.16 virtual void activemq::commands::ConsumerId::setSessionId (long long *sessionId*) [virtual]

6.163.3.17 virtual void activemq::commands::ConsumerId::setValue (long long *value*) [virtual]

6.163.3.18 virtual std::string activemq::commands::ConsumerId::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseDataStructure** (p. 411).

6.163.4 Field Documentation

6.163.4.1 std::string activemq::commands::ConsumerId::connectionId [protected]

6.163.4.2 const unsigned char activemq::commands::ConsumerId::ID_CONSUMERID = 122 [static]

Referenced by activemq::state::CommandVisitorAdapter::processRemoveInfo().

6.163.4.3 long long activemq::commands::ConsumerId::sessionId [protected]

6.163.4.4 long long activemq::commands::ConsumerId::value [protected]

6.164.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::~ConsumerIdMarshaller ( ) [inline, virtual]

6.164.3 Member Function Documentation

6.164.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.164.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.164.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.164.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.164.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.164.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.164.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.165.1 Constructor & Destructor Documentation

6.165.1.1 activemq::commands::ConsumerInfo::ConsumerInfo ( )

6.165.1.2 virtual activemq::commands::ConsumerInfo::~ConsumerInfo ( ) [virtual]

6.165.2 Member Function Documentation

6.165.2.1 virtual ConsumerInfo* activemq::commands::ConsumerInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.165.2.2 virtual void activemq::commands::ConsumerInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.165.2.3 Pointer<RemoveInfo> activemq::commands::ConsumerInfo::createRemoveCommand ( ) const

6.165.2.4 virtual bool activemq::commands::ConsumerInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.165.2.5 virtual const Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate ( ) const [virtual]

6.165.2.6 virtual Pointer<BooleanExpression>& activemq::commands::ConsumerInfo::getAdditionalPredicate ( ) [virtual]

6.165.2.35 virtual void **activemq::commands::ConsumerInfo::setConsumerId** (const Pointer< ConsumerId > & *consumerId*) [virtual]

6.165.2.36 virtual void **activemq::commands::ConsumerInfo::setDestination** (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.165.2.37 virtual void **activemq::commands::ConsumerInfo::setDispatchAsync** (bool *dispatchAsync*) [virtual]

6.165.2.38 virtual void **activemq::commands::ConsumerInfo::setExclusive** (bool *exclusive*) [virtual]

6.165.2.39 virtual void **activemq::commands::ConsumerInfo::setMaximumPendingMessageLimit** (int *maximumPendingMessageLimit*) [virtual]

6.165.2.40 virtual void **activemq::commands::ConsumerInfo::setNetworkConsumerPath** (const std::vector< decaf::lang::Pointer< ConsumerId > > & *networkConsumerPath*) [virtual]

6.165.2.41 virtual void **activemq::commands::ConsumerInfo::setNetworkSubscription** (bool *networkSubscription*) [virtual]

6.165.2.42 virtual void **activemq::commands::ConsumerInfo::setNoLocal** (bool *noLocal*) [virtual]

6.165.2.43 virtual void **activemq::commands::ConsumerInfo::setNoRangeAcks** (bool *noRangeAcks*) [virtual]

6.165.2.44 virtual void **activemq::commands::ConsumerInfo::setOptimizedAcknowledge** (bool *optimizedAcknowledge*) [virtual]

6.165.2.45 virtual void **activemq::commands::ConsumerInfo::setPrefetchSize** (int *prefetchSize*) [virtual]

6.165.2.46 virtual void **activemq::commands::ConsumerInfo::setPriority** (unsigned char *priority*) [virtual]

6.165.2.47 virtual void **activemq::commands::ConsumerInfo::setRetroactive** (bool *retroactive*) [virtual]

6.165.2.48 virtual void **activemq::commands::ConsumerInfo::setSelector** (const std::string & *selector*) [virtual]

6.165.2.49 virtual void **activemq::commands::ConsumerInfo::setSubscriptionName** (const std::string & *subscriptionName*) [virtual]

6.165.2.50 virtual std::string **activemq::commands::ConsumerInfo::toString** ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.165.2.51 virtual **Pointer**<**Command**> **activemq::commands::ConsumerInfo::visit (** **activemq::state::CommandVisitor** * ***visitor*** **)** [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.166.1 Detailed Description

Marshaling code for Open Wire Format for **ConsumerInfoMarshaller** (p. 789).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.166.2 Constructor & Destructor Documentation

6.166.2.1 activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::ConsumerInfoMarshaller ( ) [inline]

6.166.2.2 virtual activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::~ConsumerInfoMarshaller ( ) [inline, virtual]

6.166.3 Member Function Documentation

6.166.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.166.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.166.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.166.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.166.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.166.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.166.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ConsumerInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

- virtual std::string & **getCommand** ()
- virtual void **setCommand** (**const** std::string &**command**)
- virtual **Pointer**< **Command** > **visit** (**activemq::state::CommandVisitor** *visitor)

  Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

Static Public Attributes

- static **const** unsigned char **ID_CONTROLCOMMAND** = 14

Protected Attributes

- std::string **command**

6.168.1 Constructor & Destructor Documentation

6.168.1.1 activemq::commands::ControlCommand::ControlCommand ( )

6.168.1.2 virtual activemq::commands::ControlCommand::~ControlCommand ( ) [virtual]

6.168.2 Member Function Documentation

6.168.2.1 virtual ControlCommand* activemq::commands::ControlCommand::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.168.2.2 virtual void activemq::commands::ControlCommand::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.168.2.3 virtual bool activemq::commands::ControlCommand::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.168.2.4 virtual const std::string& activemq::commands::ControlCommand::getCommand ( ) const [virtual]

6.168.2.5 virtual std::string& activemq::commands::ControlCommand::getCommand ( ) [virtual]

6.168.2.6 virtual unsigned char activemq::commands::ControlCommand::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.168.2.7 virtual void activemq::commands::ControlCommand::setCommand (const std::string & *command*) [virtual]

6.168.2.8 virtual std::string activemq::commands::ControlCommand::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.168.2.9 virtual Pointer<Command> activemq::commands::ControlCommand::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.168.3 Field Documentation

6.169.3 Member Function Documentation

6.169.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.169.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.169.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.169.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.169.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.169.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.169.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ControlCommandMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**ControlCommandMarshaller.h**

6.170 decaf::util::concurrent::CopyOnWriteArrayList< E > Class Template Reference

`#include <src/main/decaf/util/concurrent/CopyOnWriteArrayList.h>`

Inheritance diagram for decaf::util::concurrent::CopyOnWriteArrayList< E >:

Data Structures

- class **ArrayListIterator**

Public Member Functions

- **CopyOnWriteArrayList** ()
- **CopyOnWriteArrayList** (**const Collection**< E > &collection)
- **CopyOnWriteArrayList** (**const CopyOnWriteArrayList**< E > &collection)
- **CopyOnWriteArrayList** (**const** E *array, int **size**)
- virtual ~**CopyOnWriteArrayList** ()
- **CopyOnWriteArrayList**< E > & **operator=** (**const CopyOnWriteArrayList**< E > &list)
- **CopyOnWriteArrayList**< E > & **operator=** (**const Collection**< E > &list)
- virtual void **copy** (**const Collection**< E > &collection)

  *Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).*

- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.
- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
- virtual bool **containsAll** (**const Collection**< E > &collection) **const**

  Returns true if this collection contains all of the elements in the specified collection.
- virtual bool **equals** (**const Collection**< E > &collection) **const**

  Compares the passed collection to this one, if they contain the same elements, i.e.
- virtual bool **isEmpty** () **const**
- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
- virtual bool **removeAll** (**const Collection**< E > &collection)

  Removes all this collection's elements that are also contained in the specified collection (optional operation).
- virtual bool **retainAll** (**const Collection**< E > &collection)

  Retains only the elements in this collection that are contained in the specified collection (optional operation).
- virtual int **size** () **const**

  Returns the number of elements in this collection.
- virtual std::vector< E > **toArray** () **const**

  Returns an array containing all of the elements in this collection.
- virtual **decaf::util::Iterator**
  < E > ∗ **iterator** ()
- virtual **decaf::util::Iterator**
  < E > ∗ **iterator** () **const**
- virtual **ListIterator**< E > ∗ **listIterator** ()
- virtual **ListIterator**< E > ∗ **listIterator** () **const**
- virtual **ListIterator**< E > ∗ **listIterator** (int index)
- virtual **ListIterator**< E > ∗ **listIterator** (int index) **const**
- virtual int **indexOf** (**const** E &value) **const**

  Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual int **lastIndexOf** (**const** E &value) **const**

  Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.
- virtual E **get** (int index) **const**

  Gets the element contained at position passed.
- virtual E **set** (int index, **const** E &element)

  Replaces the element at the specified position in this list with the specified element.
- virtual void **add** (int index, **const** E &element)

  Inserts the specified element at the specified position in this list.
- virtual bool **addAll** (int index, **const Collection**< E > &collection)

  Inserts all of the elements in the specified collection into this list at the specified position (optional operation).
- virtual E **removeAt** (int index)

  Removes the element at the specified position in this list.
- virtual std::string **toString** () **const**
- bool **addIfAbsent** (**const** E &value)

  *Adds the given value to the end of this **List** (p. 1286) if it is not already contained in this **List** (p. 1286).*
- int **addAllAbsent** (**const Collection**< E > &collection)

*Every element in the given collection that is not already contained in this **Collection** (p. 660) is added to the end of this collection.*

- int **lastIndexOf** (**const** E &value, int index)

  *Searches backwards through the **List** (p. 1286) for the given element starting at the index specified.*

- int **indexOf** (**const** E &value, int index) **const**

  *Searches the **List** (p. 1286) starting from the specified index and returns the index of the first item in the list that is equal to the given value.*

- virtual void **lock** ()

  Locks the object.

- virtual bool **tryLock** ()

  *Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.*

- virtual void **unlock** ()

  Unlocks the object.

- virtual void **wait** ()

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **wait** (long long millisecs, int nanos)

  Waits on a signal from this object, which is generated by a call to Notify.

- virtual void **notify** ()

  Signals a waiter on this object that it can now wake up and continue.

- virtual void **notifyAll** ()

  Signals the waiters on this object that it can now wake up and continue.

6.170.1 Constructor & Destructor Documentation

6.170.1.1 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList ( ) [inline]

6.170.1.2 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const Collection< E > & *collection*) [inline]

6.170.1.3 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const CopyOnWriteArrayList< E > & *collection*) [inline]

6.170.1.4 template<typename E> decaf::util::concurrent::CopyOnWriteArrayList< E >::CopyOnWriteArrayList (const E * *array,* int *size*) [inline]

6.170.1.5 template<typename E> virtual decaf::util::concurrent::CopyOnWriteArrayList< E >::~CopyOnWriteArrayList ( ) [inline, virtual]

6.170.2 Member Function Documentation

6.170.2.1 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection**< **E** > (p. 662).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent().

6.170.2.2 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::add (int *index*, const E & *element*) [inline, virtual]

Inserts the specified element at the specified position in this list.

Shifts the element currently at that position (if any) and any subsequent elements to the right (adds one to their indices).

Parameters

index	The index at which the specified element is to be inserted.
element	The element to be inserted in this **List** (p. 1286).

Exceptions

IndexOutOfBounds-Exception	if the index is greater than size of the **List** (p. 1286).
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List**< **E** > (p. 1287).

6.170.2.3 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 663).

6.170.2.4 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addAll (int *index*, const Collection< E > & *source*) [inline, virtual]

Inserts all of the elements in the specified collection into this list at the specified position (optional operation).

Shifts the element currently at that position (if any) and any subsequent elements to the right (increases their indices). The new elements will appear in this list in the order that they are returned by the specified collection's iterator. The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (Note that this will occur if the specified collection is this list, and it's nonempty.)

Parameters

index	The index at which to insert the first element from the specified collection
source	The **Collection** (p. 660) containing elements to be added to this list

Returns

true if this list changed as a result of the call

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1288).

6.170.2.5 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::addAllAbsent (const Collection< E > & *collection*) [inline]

Every element in the given collection that is not already contained in this **Collection** (p. 660) is added to the end of this collection.

The order that the elements are added is ditacted by the order that the collection's iterator returns them.

Parameters

collection	The collection whose elements are to be added if not already in this **List** (p. 1286).

Returns

the number of elements that are added to this **List** (p. 1286).

6.170.2.6 template<typename E> bool decaf::util::concurrent::CopyOnWriteArrayList< E >::addIfAbsent (const E & *value*) [inline]

Adds the given value to the end of this **List** (p. 1286) if it is not already contained in this **List** (p. 1286).

Parameters

value	The element to be added if not already contained in this **List** (p. 1286).

Returns

true if the element is added to this **List** (p. 1286).

6.170.2.7 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

This collection will be empty after this method returns unless it throws an exception.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Implements **decaf::util::Collection< E >** (p. 663).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::operator=().

6.170.2.8 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

Implements **decaf::util::Collection< E >** (p. 664).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::containsAll().

6.170.2.9 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The **Collection** (p. 660) to compare to this one.

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

Implements **decaf::util::Collection< E >** (p. 665).

6.170.2.10 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection< E >** (p. 666).

6.170.2.11 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::equals (const Collection< E > & *value*) const [inline, virtual]

Compares the passed collection to this one, if they contain the same elements, i.e.

all their elements are equivalent, then it returns true.

Returns

true if the Collections contain the same elements.

Implements **decaf::util::Collection< E >** (p. 666).

6.170.2.12 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::get (int *index*) const [inline, virtual]

Gets the element contained at position passed.

Parameters

index	The position to get.

Returns

value at index specified.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.

Implements **decaf::util::List< E >** (p. 1289).

6.170.2.13 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf (const E & *value*) const [inline, virtual]

Returns the index of the first occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the lowest index i such that get(i) == value, or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the first occurrence of the specified element in this list,

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1290).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::remove().

6.170.2.14 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::indexOf (const E & *value,* int *index*) const [inline]

Searches the **List** (p. 1286) starting from the specified index and returns the index of the first item in the list that is equal to the given value.

Parameters

value	The value to search for in the **List** (p. 1286).
index	The index in the **List** (p. 1286) to begin the search from.

Returns

the index in the **List** (p. 1286) that matches the given element or -1 if not found.

Exceptions

IndexOutOfBounds-Exception	if the given index is negative.

6.170.2.15 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::isEmpty ( ) const [inline, virtual]

Returns

true if this collection contains no elements.

Implements **decaf::util::Collection< E >** (p. 667).

6.170.2.16 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::equals().

6.170.2.17 template<typename E> virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

6.170.2.18 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf (const E & *value*) const [inline, virtual]

Returns the index of the last occurrence of the specified element in this list, or -1 if this list does not contain the element.

More formally, returns the highest index i such that get(i) == value or -1 if there is no such index.

Parameters

value	The element to search for in this **List** (p. 1286).

Returns

the index of the last occurrence of the specified element in this list.

Exceptions

NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::List< E >** (p. 1290).

6.170.2.19 template<typename E> int decaf::util::concurrent::CopyOnWriteArrayList< E >::lastIndexOf (const E & *value*, int *index*) [inline]

Searches backwards through the **List** (p. 1286) for the given element starting at the index specified.

Parameters

value	The value to search for in the **List** (p. 1286).
index	The index in the list to begin the search from.

Returns

the index in the list that matches the value given, or -1 if not found.

Exceptions

IndexOutOfBounds-Exception	if the given index is greater than or equal to the **List** (p. 1286) size.

6.170.2.20 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator ( ) [inline, virtual]

Returns

a list iterator over the elements in this list (in proper sequence).

Implements **decaf::util::List< E >** (p. 1291).

6.170.2.21 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator ( ) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1291).

6.170.2.22 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator (int *index*) [inline, virtual]

Parameters

index	index of first element to be returned from the list iterator (by a call to the next method).

Returns

a list iterator of the elements in this list (in proper sequence), starting at the specified position in this list. The specified index indicates the first element that would be returned by an initial call to next. An initial call to previous would return the element with the specified index minus one.

Exceptions

IndexOutOfBounds-Exception	if the index is out of range (index < 0 || index > **size()** (p. 811))

Implements **decaf::util::List< E >** (p. 1292).

6.170.2.23 template<typename E> virtual ListIterator<E>* decaf::util::concurrent::CopyOnWriteArrayList< E >::listIterator (int index) const [inline, virtual]

Implements **decaf::util::List< E >** (p. 1293).

6.170.2.24 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::lock ( ) [inline, virtual]

Locks the object.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2046).

6.170.2.25 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::notify ( ) [inline, virtual]

Signals a waiter on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying one of the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2047).

6.170.2.26 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::notifyAll ( ) [inline, virtual]

Signals the waiters on this object that it can now wake up and continue.

Must have this object locked before calling.

Exceptions

IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.
RuntimeException	if an error occurs while notifying the waiting threads.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.170.2.27 template<typename E> CopyOnWriteArrayList<E>& decaf::util::concurrent::CopyOnWriteArrayList< E >::operator= (const CopyOnWriteArrayList< E > & *list*) [inline]

6.170.2.28 template<typename E> CopyOnWriteArrayList<E>& decaf::util::concurrent::CopyOnWriteArrayList< E >::operator= (const Collection< E > & *list*) [inline]

6.170.2.29 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::Collection< E >** (p. 667).

6.170.2.30 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be removed from this one.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::Collection< E >** (p. 668).

6.170.2.31 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::removeAt (int *index*) [inline, virtual]

Removes the element at the specified position in this list.

Shifts any subsequent elements to the left (subtracts one from their indices). Returns the element that was removed from the list.

Parameters

index	- the index of the element to be removed.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.

Implements **decaf::util::List< E >** (p. 1293).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::remove().

6.170.2.32 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be retained.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

Implements **decaf::util::Collection< E >** (p. 669).

6.170.2.33 template<typename E> virtual E decaf::util::concurrent::CopyOnWriteArrayList< E >::set (int *index*, const E & *element*) [inline, virtual]

Replaces the element at the specified position in this list with the specified element.

Parameters

index	The index of the element to replace.
element	The element to be stored at the specified position.

Returns

the element previously at the specified position.

Exceptions

IndexOutOfBounds-Exception	if the index given is less than zero or greater than the **List** (p. 1286) size.
UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::List< E >** (p. 1294).

6.170.2.34 template<typename E> virtual int decaf::util::concurrent::CopyOnWriteArrayList< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

Referenced by decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::add(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addAllAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::addIfAbsent(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::CopyOnWriteArrayList(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::equals(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAll(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::removeAt(), decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::retainAll(), and decaf::util::concurrent::CopyOnWriteArrayList< ServiceListener * >::set().

6.170.2.35 template<typename E> virtual std::vector<E> decaf::util::concurrent::CopyOnWriteArrayList< E >::toArray ( ) const [inline, virtual]

Returns an array containing all of the elements in this collection.

If the collection makes any guarantees as to what order its elements are returned by its iterator, this method must return the elements in the same order.

This method acts as bridge between array-based and collection-based APIs.

Returns

an array of the elements in this collection in the form of an STL vector.

Implements **decaf::util::Collection< E >** (p. 670).

6.170.2.36 template<typename E> virtual std::string decaf::util::concurrent::CopyOnWriteArrayList< E >::toString ( ) const [inline, virtual]

6.170.2.37 template<typename E> virtual bool decaf::util::concurrent::CopyOnWriteArrayList< E >::tryLock ( ) [inline, virtual]

Attempts to **Lock** (p. 1304) the object, if the lock is already held by another thread than this method returns false.

Returns

true if the lock was acquired, false if it is already held by another thread.

Exceptions

RuntimeException	if an error occurs while locking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2048).

6.170.2.38 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::unlock ( ) [inline, virtual]

Unlocks the object.

Exceptions

RuntimeException	if an error occurs while unlocking the object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2049).

6.170.2.39 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait ( ) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling.

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2050).

6.170.2.40 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait (long long *millisecs*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE

Exceptions

RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2051).

6.170.2.41 template<typename E> virtual void decaf::util::concurrent::CopyOnWriteArrayList< E >::wait (long long *millisecs,* int *nanos*) [inline, virtual]

Waits on a signal from this object, which is generated by a call to Notify.

Must have this object locked before calling. This wait will timeout after the specified time interval. This method is similar to the one argument wait function except that it add a finer grained control over the amount of time that it waits by adding in the additional nanosecond argument.

NOTE: The ability to wait accurately at a nanosecond scale depends on the platform and OS that the Decaf API is running on, some systems do not provide an accurate enough clock to provide this level of granularity.

Parameters

millisecs	the time in milliseconds to wait, or WAIT_INIFINITE
nanos	additional time in nanoseconds with a range of 0-999999

Exceptions

IllegalArgumentException	if an error occurs or the nanos argument is not in the range of [0-999999]
RuntimeException	if an error occurs while waiting on the object.
InterruptedException	if the wait is interrupted before it completes.
IllegalMonitorState-Exception	- if the current thread is not the owner of the the **Synchronizable** (p. 2045) Object.

Implements **decaf::util::concurrent::Synchronizable** (p. 2052).

6.170.3 Friends And Related Function Documentation

6.170.3.1 template<typename E> friend class CopyOnWriteArraySet [friend]

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CopyOnWriteArrayList.h**

6.171 decaf::util::concurrent::CopyOnWriteArraySet< E > Class Template Reference

Since the **CopyOnWriteArraySet** (p. 813) and the **CopyOnWriteArrayList** (p. 798) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 798) for all its underlying operations.

`#include <src/main/decaf/util/concurrent/CopyOnWriteArraySet.h>`

Inheritance diagram for decaf::util::concurrent::CopyOnWriteArraySet< E >:

  Returns the number of elements in this collection.
- virtual bool **isEmpty** () **const**

  Returns true if this collection contains no elements.
- virtual bool **add** (**const** E &value)

  Returns true if this collection changed as a result of the call.
- virtual bool **addAll** (**const Collection**< E > &collection)

  Adds all of the elements in the specified collection to this collection.
  The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

  Parameters

collection	*The **Collection** (p. 660) whose elements are added to this one.*

  Returns

  true if this collection changed as a result of the call

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*
IllegalArgumentException	*if some property of an element prevents it from being added to this collection*
IllegalStateException	*if an element cannot be added at this time due to insertion restrictions.*

  This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.
  Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).
- virtual void **clear** ()

  Removes all of the elements from this collection (optional operation).
- virtual bool **contains** (**const** E &value) **const**

  Returns true if this collection contains the specified element.
  More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

  Parameters

value	*The value to check for presence in the collection.*

  Returns

  true if there is at least one of the elements in the collection

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

  This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.
- virtual bool **containsAll** (**const Collection**< E > &collection) **const**

  Returns true if this collection contains all of the elements in the specified collection.

  Parameters

collection	*The **Collection** (p. 660) to compare to this one.*

  Exceptions

NullPointerException	*if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).*

  This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

- virtual bool **remove** (**const** E &value)

  Removes a single instance of the specified element from the collection.
  More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

  Parameters

value	*The reference to the element to remove from this **Collection** (p. 660).*

  Returns

  true if the collection was changed, false otherwise.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

  This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.
  Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

- virtual bool **removeAll** (**const Collection**< E > &collection)

  Removes all this collection's elements that are also contained in the specified collection (optional operation).
  After this call returns, this collection will contain no elements in common with the specified collection.

  Parameters

collection	*The **Collection** (p. 660) whose elements are to be removed from this one.*

  Returns

  true if the collection changed as a result of this call.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

  This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.
  This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.
  Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

- virtual bool **retainAll** (**const Collection**< E > &collection)

  Retains only the elements in this collection that are contained in the specified collection (optional operation).
  In other words, removes from this collection all of its elements that are not contained in the specified collection.

  Parameters

collection	*The **Collection** (p. 660) whose elements are to be retained.*

  Returns

  true if the collection changed as a result of this call.

  Exceptions

UnsupportedOperationExceptio	*if this is an unmodifiable collection.*
NullPointerException	*if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.*

  This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's

contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.
Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

- virtual std::vector< E > **toArray** () **const**

  Answers an STL vector containing copies of all elements contained in this ***Collection*** *(*p. 660*).*

- virtual bool **equals** (**const Collection**< E > &collection) **const**

  Answers true if this ***Collection*** *(*p. 660*) and the one given are the same size and if each element contained in the* ***Collection*** *(*p. 660*) given is equal to an element contained in this collection.*

6.171.1 Detailed Description

template<typename E>class decaf::util::concurrent::CopyOnWriteArraySet< E >

Since the **CopyOnWriteArraySet** (p. 813) and the **CopyOnWriteArrayList** (p. 798) share much of the same operational semantics this class uses the **CopyOnWriteArrayList** (p. 798) for all its underlying operations.

This collection is best used in applications where the **Set** (p. 1857) size is usually small and write operations are minimal as they result in a copy of the underlying array being created. Reads are generally fast and the iterators provided by this collection do not block as they operate on a snapshot of the data taken at the time of their creation.

Since

1.0

6.171.2 Constructor & Destructor Documentation

6.171.2.1 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet ( ) [inline]

6.171.2.2 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet (const Collection< E > & *collection*) [inline]

References decaf::util::concurrent::CopyOnWriteArraySet< E >::copy().

6.171.2.3 template<typename E > decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet (const E * *array*, int *size*) [inline]

References decaf::util::concurrent::CopyOnWriteArraySet< E >::size().

6.171.2.4 template<typename E > virtual decaf::util::concurrent::CopyOnWriteArraySet< E >::~CopyOnWriteArraySet ( ) [inline, virtual]

6.171.3 Member Function Documentation

6.171.3.1 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::add (const E & *value*) [inline, virtual]

Returns true if this collection changed as a result of the call.

(Returns false if this collection does not permit duplicates and already contains the specified element.)

Collections that support this operation may place limitations on what elements may be added to this collection. In particular, some collections will refuse to add null elements, and others will impose restrictions on the type

of elements that may be added. **Collection** (p. 660) classes should clearly specify in their documentation any restrictions on what elements may be added.

If a collection refuses to add a particular element for any reason other than that it already contains the element, it must throw an exception (rather than returning false). This preserves the invariant that a collection always contains the specified element after this call returns.

For non-pointer values, i.e. class instances or string's the object will be copied into the collection, thus the object must support being copied, must not hide the copy constructor and assignment operator.

Parameters

value	The reference to the element to add to this **Collection** (p. 660).

Returns

true if the element was added to this **Collection** (p. 660).

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of the element prevents it from being added to this collection
IllegalStateException	if the element cannot be added at this time due to insertion restrictions.

Implements **decaf::util::Collection**< **E** > (p. 662).

6.171.3.2 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::addAll (const Collection< E > & *collection*) [inline, virtual]

Adds all of the elements in the specified collection to this collection.

The behavior of this operation is undefined if the specified collection is modified while the operation is in progress. (This implies that the behavior of this call is undefined if the specified collection is this collection, and this collection is nonempty.)

Parameters

collection	The **Collection** (p. 660) whose elements are added to this one.

Returns

true if this collection changed as a result of the call

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.
IllegalArgumentException	if some property of an element prevents it from being added to this collection
IllegalStateException	if an element cannot be added at this time due to insertion restrictions.

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

This implementation iterates over the specified collection, and adds each object returned by the iterator to this collection, in turn.

Note that this implementation will throw an UnsupportedOperationException unless add is overridden (assuming the specified collection is non-empty).

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 87).

6.171.3.3 template<typename E > virtual void decaf::util::concurrent::CopyOnWriteArraySet< E >::clear ( ) [inline, virtual]

Removes all of the elements from this collection (optional operation).

The collection will be empty after this method returns.

This implementation iterates over this collection, removing each element using the **Iterator.remove** (p. 1210) operation. Most implementations will probably choose to override this method for efficiency.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection is non-empty.

Exceptions

UnsupportedOperation-Exception	if the clear operation is not supported by this collection

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

6.171.3.4 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::contains (const E & *value*) const [inline, virtual]

Returns true if this collection contains the specified element.

More formally, returns true if and only if this collection contains at least one element e such that (value == NULL ? e == NULL : value == e).

Parameters

value	The value to check for presence in the collection.

Returns

true if there is at least one of the elements in the collection

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

This implementation iterates over the elements in the collection, checking each element in turn for equality with the specified element.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 88).

6.171.3.5 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::containsAll (const Collection< E > & *collection*) const [inline, virtual]

Returns true if this collection contains all of the elements in the specified collection.

Parameters

collection	The **Collection** (p. 660) to compare to this one.

Exceptions

NullPointerException	if the **Collection** (p. 660) contains pointers and the **Collection** (p. 660) does not allow for NULL elements (optional check).

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

This implementation iterates over the specified collection, checking each element returned by the iterator in turn to see if it's contained in this collection. If all elements are so contained true is returned, otherwise false.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

6.171.3.6 template<typename E > virtual void decaf::util::concurrent::CopyOnWriteArraySet< E >::copy (const Collection< E > & *collection*) [inline, virtual]

Renders this **Collection** (p. 660) as a Copy of the given **Collection** (p. 660).

The default implementation iterates over the contents of the given collection adding each to this collection after first calling this **Collection** (p. 660)'s clear method.

Parameters

collection	The collection to mirror.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
IllegalStateException	if the elements cannot be added at this time due to insertion restrictions.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 89).

Referenced by decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet().

6.171.3.7 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::equals (const Collection< E > & *collection*) const [inline, virtual]

Answers true if this **Collection** (p. 660) and the one given are the same size and if each element contained in the **Collection** (p. 660) given is equal to an element contained in this collection.

Parameters

collection	- The **Collection** (p. 660) to be compared to this one.

Returns

true if this **Collection** (p. 660) is equal to the one given.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

References decaf::lang::Iterable< E >::iterator(), decaf::util::concurrent::CopyOnWriteArraySet< E >::size(), and decaf::util::Collection< E >::size().

6.171.3.8 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::isEmpty ( ) const [inline, virtual]

Returns true if this collection contains no elements.

This implementation returns **size()** (p. 822) == 0.

Returns

true if the size method return 0.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 90).

6.171.3.9 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArraySet< E >::iterator ( ) [inline, virtual]

Returns

an iterator over a set of elements of type T.

Implements **decaf::lang::Iterable< E >** (p. 1207).

6.171.3.10 template<typename E > virtual decaf::util::Iterator<E>* decaf::util::concurrent::CopyOnWriteArraySet< E >::iterator ( ) const [inline, virtual]

Implements **decaf::lang::Iterable< E >** (p. 1208).

6.171.3.11 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::remove (const E & *value*) [inline, virtual]

Removes a single instance of the specified element from the collection.

More formally, removes an element e such that (value == NULL ? e == NULL : value == e), if this collection contains one or more such elements. Returns true if this collection contained the specified element (or equivalently, if this collection changed as a result of the call).

Parameters

value	The reference to the element to remove from this **Collection** (p. 660).

Returns

true if the collection was changed, false otherwise.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's

iterator method does not implement the remove method and this collection contains the specified object.

This implementation iterates over the collection looking for the specified element. If it finds the element, it removes the element from the collection using the iterator's remove method.

Note that this implementation throws an UnsupportedOperationException if the iterator returned by this collection's iterator method does not implement the remove method and this collection contains the specified object.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 92).

6.171.3.12 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::removeAll (const Collection< E > & *collection*) [inline, virtual]

Removes all this collection's elements that are also contained in the specified collection (optional operation).

After this call returns, this collection will contain no elements in common with the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be removed from this one.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements in common with the specified collection.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If it is so contained, it is removed from this set with the iterator's remove method. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

This implementation determines which is the smaller of this set and the specified collection, by invoking the size method on each. If this set has fewer elements, then the implementation iterates over this set, checking each element returned by the iterator in turn to see if it is contained in the specified collection. If the specified collection has fewer elements, then the implementation iterates over the specified collection, removing from this set each element returned by the iterator, using this set's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method.

Reimplemented from **decaf::util::AbstractSet< E >** (p. 119).

6.171.3.13 template<typename E > virtual bool decaf::util::concurrent::CopyOnWriteArraySet< E >::retainAll (const Collection< E > & *collection*) [inline, virtual]

Retains only the elements in this collection that are contained in the specified collection (optional operation).

In other words, removes from this collection all of its elements that are not contained in the specified collection.

Parameters

collection	The **Collection** (p. 660) whose elements are to be retained.

Returns

true if the collection changed as a result of this call.

Exceptions

UnsupportedOperation-Exceptio	if this is an unmodifiable collection.
NullPointerException	if the **Collection** (p. 660) is a container of pointers and does not allow NULL values.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

This implementation iterates over this collection, checking each element returned by the iterator in turn to see if it's contained in the specified collection. If it's not so contained, it's removed from this collection with the iterator's remove method.

Note that this implementation will throw an UnsupportedOperationException if the iterator returned by the iterator method does not implement the remove method and this collection contains one or more elements not present in the specified collection.

Reimplemented from **decaf::util::AbstractCollection< E >** (p. 93).

6.171.3.14 template<typename E > virtual int decaf::util::concurrent::CopyOnWriteArraySet< E >::size ( ) const [inline, virtual]

Returns the number of elements in this collection.

If this collection contains more than Integer::MAX_VALUE elements, returns Integer::MAX_VALUE.

Returns

the number of elements in this collection

Implements **decaf::util::Collection< E >** (p. 669).

Referenced by decaf::util::concurrent::CopyOnWriteArraySet< E >::CopyOnWriteArraySet(), and decaf::util::concurrent::CopyOnWriteArraySet< E >::equals().

6.171.3.15 template<typename E > virtual std::vector<E> decaf::util::concurrent::CopyOnWriteArraySet< E >::toArray ( ) const [inline, virtual]

Answers an STL vector containing copies of all elements contained in this **Collection** (p. 660).

All the elements in the array will not be referenced by the collection. The elements in the returned array will be sorted to the same order as those returned by the iterator of this collection itself if the collection guarantees the order.

Returns

an vector of copies of all the elements from this **Collection** (p. 660)

Reimplemented from **decaf::util::AbstractCollection**< **E** > (p. 94).

The documentation for this class was generated from the following file:

6.172 decaf::util::concurrent::CountDownLatch Class Reference

`#include <src/main/decaf/util/concurrent/CountDownLatch.h>`

Public Member Functions

- **CountDownLatch** (int count)

  Constructor.
- virtual ~**CountDownLatch** ()
- virtual void **await** ()

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted.
- virtual bool **await** (long long timeOut)

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.
- virtual bool **await** (long long timeout, **const TimeUnit** &unit)

  Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.
- virtual void **countDown** ()

  Counts down the latch, releasing all waiting threads when the count hits zero.
- virtual int **getCount** () **const**

  Gets the current count.

6.172.1 Constructor & Destructor Documentation

6.172.1.1 decaf::util::concurrent::CountDownLatch::CountDownLatch (int *count*)

Constructor.

Parameters

count	- number to count down from.

6.172.1.2 virtual decaf::util::concurrent::CountDownLatch::~CountDownLatch ( ) [virtual]

6.172.2 Member Function Documentation

6.172.2.1 virtual void decaf::util::concurrent::CountDownLatch::await ( ) [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted.

If the current count is zero then this method returns immediately.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of two things happen:

- The count reaches zero due to invocations of the **countDown()** (p. 825) method; or
  - Some other thread interrupts the current thread.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

Exceptions

InterruptedException	- if the current thread is interrupted while waiting.
Exception	- if any other error occurs.

6.172.2.2 virtual bool decaf::util::concurrent::CountDownLatch::await (long long *timeOut*) [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happen:

- The count reaches zero due to invocations of the **countDown()** (p. 825) method; or
  - Some other thread interrupts the current thread; or
  - The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

timeout	- Time in milliseconds to wait for the count to reach zero.

Exceptions

InterruptedException	- if the current thread is interrupted while waiting.
Exception	- if any other error occurs.

6.172.2.3 virtual bool decaf::util::concurrent::CountDownLatch::await (long long *timeout,* const TimeUnit & *unit*) [virtual]

Causes the current thread to wait until the latch has counted down to zero, unless the thread is interrupted, or the specified waiting time elapses.

If the current count is zero then this method returns immediately with the value true.

If the current count is greater than zero then the current thread becomes disabled for thread scheduling purposes and lies dormant until one of three things happen:

- The count reaches zero due to invocations of the **countDown()** (p. 825) method; or
  - Some other thread interrupts the current thread; or
  - The specified waiting time elapses.

If the count reaches zero then the method returns with the value true.

If the current thread:

- has its interrupted status set on entry to this method; or
  - is interrupted while waiting,

then InterruptedException is thrown and the current thread's interrupted status is cleared.

If the specified waiting time elapses then the value false is returned. If the time is less than or equal to zero, the method will not wait at all.

Parameters

timeout	- Time to wait for the count to reach zero.
unit	- The units that the timeout specifies.

Exceptions

InterruptedException	- if the current thread is interrupted while waiting.
Exception	- if any other error occurs.

6.172.2.4 virtual void decaf::util::concurrent::CountDownLatch::countDown ( ) [virtual]

Counts down the latch, releasing all waiting threads when the count hits zero.

6.172.2.5 virtual int decaf::util::concurrent::CountDownLatch::getCount ( ) const [inline, virtual]

Gets the current count.

Returns

int count value

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**CountDownLatch.h**

6.173 decaf::util::zip::CRC32 Class Reference

Class that can be used to compute a CRC-32 checksum for a data stream.

`#include <src/main/decaf/util/zip/CRC32.h>`

Inheritance diagram for decaf::util::zip::CRC32:

Public Member Functions

- **CRC32** ()
- virtual ~**CRC32** ()
- virtual long long **getValue** () **const**
- virtual void **reset** ()

  Reset the checksum to its initial value.
- virtual void **update** (**const** std::vector< unsigned char > &buffer)

  Updates the current checksum with the specified vector of bytes.
- virtual void **update** (**const** std::vector< unsigned char > &buffer, int offset, int length)

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (**const** unsigned char *buffer, int size, int offset, int length)

  Updates the current checksum with the specified array of bytes.
- virtual void **update** (int byte)

  Updates the current checksum with the specified byte value.

6.173.1 Detailed Description

Class that can be used to compute a CRC-32 checksum for a data stream.

Since

1.0

6.173.2 Constructor & Destructor Documentation

6.173.2.1 decaf::util::zip::CRC32::CRC32 ( )

6.173.2.2 virtual decaf::util::zip::CRC32::~CRC32 ( ) [virtual]

6.173.3 Member Function Documentation

6.173.3.1 virtual long long decaf::util::zip::CRC32::getValue ( ) const [virtual]

Returns

the current checksum value.

Implements **decaf::util::zip::Checksum** (p. 629).

6.173.3.2 virtual void decaf::util::zip::CRC32::reset ( ) [virtual]

Reset the checksum to its initial value.

Implements **decaf::util::zip::Checksum** (p. 629).

6.173.3.3 virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & *buffer*) [virtual]

Updates the current checksum with the specified vector of bytes.

Parameters

buffer	The buffer to read the updated bytes from.

Implements **decaf::util::zip::Checksum** (p. 629).

6.173.3.4 virtual void decaf::util::zip::CRC32::update (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 629).

6.173.3.5 virtual void decaf::util::zip::CRC32::update (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Updates the current checksum with the specified array of bytes.

Parameters

buffer	The buffer to read the updated bytes from.
size	The size of the passed buffer.
offset	The position in the buffer to start reading.
length	The amount of data to read from the byte buffer.

Exceptions

NullPointerException	if the passed buffer is NULL.
IndexOutOfBounds-Exception	if offset + length > size of the buffer.

Implements **decaf::util::zip::Checksum** (p. 629).

6.173.3.6 virtual void decaf::util::zip::CRC32::update (int *byte*) [virtual]

Updates the current checksum with the specified byte value.

Parameters

byte	The byte value to update the current **Checksum** (p. 628) with (0..255).

Implements **decaf::util::zip::Checksum** (p. 630).

6.175.1 Constructor & Destructor Documentation

6.175.1.1 activemq::commands::DataArrayResponse::DataArrayResponse ( )

6.175.1.2 virtual activemq::commands::DataArrayResponse::~DataArrayResponse ( ) [virtual]

6.175.2 Member Function Documentation

6.175.2.1 virtual DataArrayResponse* activemq::commands::DataArrayResponse::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 1782).

6.175.2.2 virtual void activemq::commands::DataArrayResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 1782).

6.175.2.3 virtual bool activemq::commands::DataArrayResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.175.2.4 virtual const std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData ( ) const [virtual]

6.175.2.5 virtual std::vector< decaf::lang::Pointer<DataStructure> >& activemq::commands::DataArrayResponse::getData ( ) [virtual]

6.175.2.6 virtual unsigned char activemq::commands::DataArrayResponse::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 1783).

6.175.2.7 virtual void activemq::commands::DataArrayResponse::setData (const std::vector< decaf::lang::Pointer< DataStructure > > & *data*) [virtual]

6.175.2.8 virtual std::string activemq::commands::DataArrayResponse::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.175.3 Field Documentation

6.175.3.1 std::vector< decaf::lang::Pointer<DataStructure> > activemq::commands::DataArrayResponse::data [protected]

- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.
- virtual void **tightUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn, **utils::BooleanStream** *bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut, **utils::BooleanStream** *bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataInputStream** *dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** *wireFormat, **commands::DataStructure** *dataStructure, **decaf::io::DataOutputStream** *dataOut)

  Tight Marhsal to the given stream.

6.176.1 Detailed Description

Marshaling code for Open Wire Format for **DataArrayResponseMarshaller** (p. 831).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.176.2 Constructor & Destructor Documentation

6.176.2.1 activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::DataArrayResponseMarshaller ( ) [inline]

6.176.2.2 virtual activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::~DataArrayResponseMarshaller ( ) [inline, virtual]

6.176.3 Member Function Documentation

6.176.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1789).

6.176.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.176.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.176.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.176.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.176.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.176.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DataArrayResponseMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1792).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**DataArrayResponseMarshaller.h**

6.177 decaf::util::zip::DataFormatException Class Reference

`#include <src/main/decaf/util/zip/DataFormatException.h>`

Inheritance diagram for decaf::util::zip::DataFormatException:

Public Member Functions

- **DataFormatException** () throw ()
  Default Constructor.
- **DataFormatException** (**const lang::Exception** &ex) throw ()
  Copy Constructor.
- **DataFormatException** (**const DataFormatException** &ex) throw ()
  Copy Constructor.
- **DataFormatException** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()
  Constructor - Initializes the file name and line number where this message occurred.
- **DataFormatException** (**const** std::exception ∗**cause**) throw ()
  Constructor.
- **DataFormatException** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()
  Constructor.
- virtual **DataFormatException** ∗ **clone** () **const**
  Clones this exception.
- virtual ∼**DataFormatException** () throw ()

6.177.1 Constructor & Destructor Documentation

6.177.1.1 decaf::util::zip::DataFormatException::DataFormatException ( ) throw ()

Default Constructor.

6.177.1.2 decaf::util::zip::DataFormatException::DataFormatException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.177.1.3 decaf::util::zip::DataFormatException::DataFormatException (const DataFormatException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.177.1.4 decaf::util::zip::DataFormatException::DataFormatException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.177.1.5 decaf::util::zip::DataFormatException::DataFormatException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.177.1.6 decaf::util::zip::DataFormatException::DataFormatException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.177.1.7 virtual decaf::util::zip::DataFormatException::~DataFormatException ( ) throw () [virtual]

6.177.2 Member Function Documentation

6.177.2.1 virtual DataFormatException* decaf::util::zip::DataFormatException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this instance.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/util/zip/**DataFormatException.h**

6.178 decaf::net::DatagramPacket Class Reference

Class that represents a single datagram packet.

`#include <src/main/decaf/net/DatagramPacket.h>`

Public Member Functions

- **DatagramPacket** (unsigned char *bytes, int size, int length)

  *Creates a new **DatagramPacket** (p. 836) for use in receiving a packet of the given length.*
- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length)

  *Creates a new **DatagramPacket** (p. 836) for use in receiving a packet of the given length starting at the specified offset into the buffer.*
- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length, **const InetAddress** &address, int port)

  *Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified host on the specified port.*
- **DatagramPacket** (unsigned char *bytes, int size, int length, **const InetAddress** &address, int port)

  *Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length to the specified host on the specified port.*
- **DatagramPacket** (unsigned char *bytes, int size, int length, **const SocketAddress** &address)

  *Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length into the buffer to the specified socket address.*
- **DatagramPacket** (unsigned char *bytes, int size, int offset, int length, **const SocketAddress** &address)

  *Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified socket address.*
- virtual ~**DatagramPacket** ()
- **InetAddress** * **getAddress** () **const**
- void **setAddress** (**const InetAddress** &address)

  Sets the IP address of the machine to which this datagram is being sent.
- **SocketAddress** * **getSocketAddress** () **const**

  *Gets the **SocketAddress** (p. 1913) (usually IP address + port number) of the remote host that this packet is being sent to or is coming from.*
- void **setSocketAddress** (**const SocketAddress** &address)

  *Sets the **SocketAddress** (p. 1913) (usually IP address + port number) of the remote host to which this datagram is being sent.*
- int **getPort** () **const**
- void **setPort** (int port)

  Sets the port number on the remote host to which this datagram is being sent.
- int **getOffset** () **const**
- void **setOffset** (int offset)

Sets the offset into the data buffer where data to sent is to be read from or where the data that is received should start writing to.

- int **getLength** () **const**
- void **setLength** (int length)

  Set the length for this packet.
- unsigned char * **getData** () **const**
- int **getSize** () **const**
- void **setData** (unsigned char *buffer, int size)

  Set the data buffer for this packet.
- void **setData** (unsigned char *buffer, int size, int offset, int length)

  Set the data buffer for this packet.

6.178.1 Detailed Description

Class that represents a single datagram packet.

Datagrams are sent in packets from machine to machine and can each be routed differently and can arrive in any order. Delivery of a packet is not guaranteed.

Since

1.0

6.178.2 Constructor & Destructor Documentation

6.178.2.1 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*)

Creates a new **DatagramPacket** (p. 836) for use in receiving a packet of the given length.

Parameters

bytes	The array of bytes to hold the incoming datagram buffer.
size	The size of the supplied byte array.
length	The number of byte to read starting at the supplied offset.

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to read exceeds the buffer size.

6.178.2.2 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*)

Creates a new **DatagramPacket** (p. 836) for use in receiving a packet of the given length starting at the specified offset into the buffer.

Parameters

bytes	The array of bytes to hold the incoming datagram buffer.
size	The size of the supplied byte array.
offset	The position in the array to start writing to.
length	The number of byte to read starting at the supplied offset.

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to copy exceeds the buffer size.

6.178.2.3 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*, const InetAddress & *address*, int *port*)

Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified host on the specified port.

Parameters

bytes	The array of bytes to hold the outgoing datagram buffer.
size	The size of the supplied byte array.
offset	The position in the array to start writing to.
length	The number of byte to read starting at the supplied offset.
address	The Address to send the packet to
port	The port on the destination that is to receive this packet.

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to copy exceeds the buffer size.

6.178.2.4 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*, const InetAddress & *address*, int *port*)

Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length to the specified host on the specified port.

Parameters

bytes	The array of bytes to hold the outgoing datagram buffer.
size	The size of the supplied byte array.
length	The number of byte to read starting at the supplied offset.
address	The Address to send the packet to
port	The port on the destination that is to receive this packet.

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to copy exceeds the buffer size.

6.178.2.5 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *length*, const SocketAddress & *address*)

Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length into the buffer to the specified socket address.

Parameters

bytes	The array of bytes to hold the outgoing datagram buffer.
size	The size of the supplied byte array.
length	The number of byte to read starting at the supplied offset.
address	The Address to send the packet to

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to copy exceeds the buffer size.

6.178.2.6 decaf::net::DatagramPacket::DatagramPacket (unsigned char * *bytes*, int *size*, int *offset*, int *length*, const SocketAddress & *address*)

Creates a new **DatagramPacket** (p. 836) for use in sending a packet of the given length starting at the specified offset into the buffer to the specified socket address.

Parameters

bytes	The array of bytes to hold the outgoing datagram buffer.
size	The size of the supplied byte array.
offset	The position in the array to start writing to.
length	The number of byte to read starting at the supplied offset.
address	The Address to send the packet to

Exceptions

NullPointerException	if the pointer to the buffer is NULL.
IndexOutOfBounds-Exception	if the number of bytes to copy exceeds the buffer size.

6.178.2.7 virtual decaf::net::DatagramPacket::~DatagramPacket ( ) [virtual]

6.178.3 Member Function Documentation

6.178.3.1 InetAddress* decaf::net::DatagramPacket::getAddress ( ) const

Returns

the IP address that this datagram packet is being sent to or was received from.

6.178.3.2 unsigned char* decaf::net::DatagramPacket::getData ( ) const

Returns

the data buffer. The data received or the data to be sent starts from the offset in the buffer, and continues for length bytes.

6.178.3.3 int decaf::net::DatagramPacket::getLength ( ) const

Returns

the length of the data to be sent or the length of the data received.

6.178.3.4 int decaf::net::DatagramPacket::getOffset ( ) const

Returns

the offset of the data to be sent or the offset of the data received.

6.178.3.5 int decaf::net::DatagramPacket::getPort ( ) const

Returns

the port number that this datagram packet is being sent to or was received from.

6.178.3.6 int decaf::net::DatagramPacket::getSize ( ) const

Returns

the size of the buffer used in this datagram packet.

6.178.3.7 SocketAddress* decaf::net::DatagramPacket::getSocketAddress ( ) const

Gets the **SocketAddress** (p. 1913) (usually IP address + port number) of the remote host that this packet is being sent to or is coming from.

Returns

the **SocketAddress** (p. 1913) for this datagram packet.

6.178.3.8 void decaf::net::DatagramPacket::setAddress (const InetAddress & *address*)

Sets the IP address of the machine to which this datagram is being sent.

Parameters

address	The IP address.

6.178.3.9 void decaf::net::DatagramPacket::setData (unsigned char * *buffer*, int *size*)

Set the data buffer for this packet.

With the offset of this **DatagramPacket** (p. 836) set to 0, and the length set to the size value specified.

Parameters

buffer	The new data buffer to use for this datagram packet.
size	The size of the buffer.

Exceptions

NullPointerException	if the buffer pointer is NULL.

6.178.3.10 void decaf::net::DatagramPacket::setData (unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Set the data buffer for this packet.

With the offset of this **DatagramPacket** (p. 836) set to 0, and the length set to the size value specified.

Parameters

buffer	The new data buffer to use for this datagram packet.
size	The size of the buffer.
offset	The position in the buffer to read from or write to.
length	The number of bytes that will be read into the buffer or sent from the buffer.

Exceptions

NullPointerException	if the buffer pointer is NULL.

6.178.3.11 void decaf::net::DatagramPacket::setLength (int *length*)

Set the length for this packet.

The length of the packet is the number of bytes from the packet's data buffer that will be sent, or the number of bytes of the packet's data buffer that will be used for receiving data. The length must be lesser or equal to the offset plus the length of the packet's buffer.

Parameters

length	The length value to set for this packet.

Exceptions

IllegalArgumentException	if the value is negative or exceeds the data buffers length.

6.178.3.12 void decaf::net::DatagramPacket::setOffset (int *offset*)

Sets the offset into the data buffer where data to sent is to be read from or where the data that is received should start writing to.

Parameters

offset	The buffer offset value.

Exceptions

IllegalArgumentException	if the offset value is greater than the buffer size.

6.178.3.13 void decaf::net::DatagramPacket::setPort (int *port*)

Sets the port number on the remote host to which this datagram is being sent.

Parameters

port	The port on the remote host.

Exceptions

IllegalArgumentException	if the port value is not in the range [0..65535].

6.178.3.14 void decaf::net::DatagramPacket::setSocketAddress (const SocketAddress & *address*)

Sets the **SocketAddress** (p. 1913) (usually IP address + port number) of the remote host to which this datagram is being sent.

Parameters

address	The **SocketAddress** (p. 1913) (IP + port) for this datagram packet.

Exceptions

IllegalArgumentException	if the subclass of address is not supported by this **Socket** (p. 1900).

The documentation for this class was generated from the following file:

- src/main/decaf/net/**DatagramPacket.h**

6.179 decaf::io::DataInput Class Reference

The **DataInput** (p. 842) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.

`#include <src/main/decaf/io/DataInput.h>`

Public Member Functions

- virtual ~**DataInput** ()
- virtual bool **readBoolean** ()=0

  Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.
- virtual char **readByte** ()=0

  Reads and returns one input byte.
- virtual unsigned char **readUnsignedByte** ()=0

  Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.
- virtual char **readChar** ()=0

  Reads an input char and returns the char value.
- virtual double **readDouble** ()=0

  Reads eight input bytes and returns a double value.
- virtual float **readFloat** ()=0

  Reads four input bytes and returns a float value.
- virtual int **readInt** ()=0

  Reads four input bytes and returns an int value.
- virtual long long **readLong** ()=0

  Reads eight input bytes and returns a long value.
- virtual short **readShort** ()=0

  Reads two input bytes and returns a short value.
- virtual unsigned short **readUnsignedShort** ()=0

  Reads two input bytes and returns an int value in the range 0 through 65535.
- virtual std::string **readString** ()=0

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

- virtual std::string **readLine** ()=0

  Reads the next line of text from the input stream.

- virtual std::string **readUTF** ()=0

  Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormat-Exception.

- virtual void **readFully** (unsigned char *buffer, int size)=0

  Reads some bytes from an input stream and stores them into the buffer array buffer.

- virtual void **readFully** (unsigned char *buffer, int size, int offset, int length)=0

  Reads length bytes from an input stream.

- virtual long long **skipBytes** (long long num)=0

  Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.179.1 Detailed Description

The **DataInput** (p. 842) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.

There is also a facility for reconstructing Strings from data in the Java standard modified UTF-8 format.

It is generally true of all the reading routines in this interface that if end of file is reached before the desired number of bytes has been read, an **EOFException** (p. 986) is thrown. If any byte cannot be read for any reason other than end of file, an **IOException** (p. 1198) other than **EOFException** (p. 986) is thrown. for example, an **IOException** (p. 1198) may be thrown if the underlying input stream has been closed.

Since

1.0

6.179.2 Constructor & Destructor Documentation

6.179.2.1 virtual decaf::io::DataInput::~DataInput ( ) [inline, virtual]

6.179.3 Member Function Documentation

6.179.3.1 virtual bool decaf::io::DataInput::readBoolean ( ) [pure virtual]

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns

the boolean value of the read in byte (0=false, 1=true).

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.2 virtual char decaf::io::DataInput::readByte ( ) [pure virtual]

Reads and returns one input byte.

The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns

the 8-bit value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.3 virtual char decaf::io::DataInput::readChar ( ) [pure virtual]

Reads an input char and returns the char value.

A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns

the 8 bit char read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.4 virtual double decaf::io::DataInput::readDouble ( ) [pure virtual]

Reads eight input bytes and returns a double value.

It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double::longBitsToDouble.

Returns

the double value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.5 virtual float decaf::io::DataInput::readFloat ( ) [pure virtual]

Reads four input bytes and returns a float value.

It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns

the float value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.6 virtual void decaf::io::DataInput::readFully (unsigned char * *buffer,* int *size*) [pure virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer.

The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs:

- buffer's size bytes of input data are available, in which case a normal return is made.
- End of file is detected, in which case an **EOFException** (p. 986) is thrown.
- An I/O error occurs, in which case an **IOException** (p. 1198) other than **EOFException** (p. 986) is thrown.

If buffer size is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters

buffer	The byte array to insert read data into.
size	The size in bytes of the given byte buffer.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
IndexOutOfBounds-Exception	if the size value is negative.

6.179.3.7 virtual void decaf::io::DataInput::readFully (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [pure virtual]

Reads length bytes from an input stream.

This method blocks until one of the following conditions occurs:

- length bytes of input data are available, in which case a normal return is made.
- End of file is detected, in which case an **EOFException** (p. 986) is thrown.
- An I/O error occurs, in which case an **IOException** (p. 1198) other than **EOFException** (p. 986) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters

buffer	The byte array to insert read data into.
size	The size in bytes of the given byte buffer.
offset	The location in buffer to start writing.
length	The number of bytes to read from the buffer.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
NullPointerException	if the buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length $>$ size, or an int param is negative.

6.179.3.8 virtual int decaf::io::DataInput::readInt ( ) [pure virtual]

Reads four input bytes and returns an int value.

Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

(((a & 0xff) $<<$ 24) | ((b & 0xff) $<<$ 16) | ((c & 0xff) $<<$ 8) | (d & 0xff))

Returns

the int value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.9 virtual std::string decaf::io::DataInput::readLine ( ) [pure virtual]

Reads the next line of text from the input stream.

It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character '

' is encountered, it is discarded and reading ceases. If the character " is encountered, it is discarded and, if the following byte converts to the character '

', then that is discarded also; reading then ceases. If end of file is encountered before either of the characters '

' and " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns

the next line of text read from the input stream or empty string if at EOF.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.

6.179.3.10 virtual long long decaf::io::DataInput::readLong ( ) [pure virtual]

Reads eight input bytes and returns a long value.

Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be

the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is:

(((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns

the 64 bit long long read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.11 virtual short decaf::io::DataInput::readShort ( ) [pure virtual]

Reads two input bytes and returns a short value.

Let a be the first byte read and b be the second byte. The value returned is:

(short)((a << 8) | (b & 0xff))

Returns

the 16 bit short value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.12 virtual std::string decaf::io::DataInput::readString ( ) [pure virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns

string object containing the string read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.13 virtual unsigned char decaf::io::DataInput::readUnsignedByte ( ) [pure virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns

the 8 bit unsigned value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.14 virtual unsigned short decaf::io::DataInput::readUnsignedShort ( ) [pure virtual]

Reads two input bytes and returns an int value in the range 0 through 65535.

Let a be the first byte read and b be the second byte. The value returned is:

(((a & 0xff) << 8) | (b & 0xff))

Returns

the 16 bit unsigned short read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.179.3.15 virtual std::string decaf::io::DataInput::readUTF ( ) [pure virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

This method reads String value written from a Java **DataOutputStream** (p. 860) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns

The decoded string read from stream.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
UTFDataFormatException *(p. 2228)*	if the bytes are not valid modified UTF-8 values.

6.179.3.16 virtual long long decaf::io::DataInput::skipBytes (long long *num*) [pure virtual]

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 986). The actual number of bytes skipped is returned.

Parameters

num	The number of bytes to skip over.

Returns

the total number of bytes skipped.

Exceptions

IOException *(*p. *1198)*	if an I/O Error occurs.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**DataInput.h**

6.180 decaf::io::DataInputStream Class Reference

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

  Reads length bytes from an input stream.
- virtual long long **skipBytes** (long long num)

  Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

6.180.1 Detailed Description

A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.

An application uses a data output stream to write data that can later be read by a data input stream.

Due to the lack of garbage collection in C++ a design decision was made to add a boolean parameter to the constructor indicating if the wrapped **InputStream** (p. 1134) is owned by this object. That way creation of the underlying stream can occur in a Java like way. Ex:

DataInputStream (p. 849) os = new **DataInputStream** (p. 849)(new **InputStream()** (p. 1135), true)

Since

1.0

6.180.2 Constructor & Destructor Documentation

6.180.2.1 decaf::io::DataInputStream::DataInputStream (InputStream * *inputStream*, bool *own* = false)

Creates a **DataInputStream** (p. 849) that uses the specified underlying **InputStream** (p. 1134).

Parameters

inputStream	the **InputStream** (p. 1134) instance to wrap.
own	indicates if this class owns the wrapped string defaults to false.

6.180.2.2 virtual decaf::io::DataInputStream::~DataInputStream ( ) [virtual]

6.180.3 Member Function Documentation

6.180.3.1 virtual bool decaf::io::DataInputStream::readBoolean ( ) [virtual]

Reads in one byte and returns true if that byte is nonzero, false if that byte is zero.

Returns

the boolean value of the read in byte (0=false, 1=true).

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.2 virtual char decaf::io::DataInputStream::readByte ( ) [virtual]

Reads and returns one input byte.

The byte is treated as a signed value in the range -128 through 127, inclusive.

Returns

the 8-bit value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.3 virtual char decaf::io::DataInputStream::readChar ( ) [virtual]

Reads an input char and returns the char value.

A ascii char is made up of one bytes. This returns the same result as `readByte`

Returns

the 8 bit char read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.4 virtual double decaf::io::DataInputStream::readDouble ( ) [virtual]

Reads eight input bytes and returns a double value.

It does this by first constructing a long long value in exactly the manner of the readlong method, then converting this long value to a double in exactly the manner of the method Double::longBitsToDouble.

Returns

the double value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.5 virtual float decaf::io::DataInputStream::readFloat ( ) [virtual]

Reads four input bytes and returns a float value.

It does this by first constructing an int value in exactly the manner of the readInt method, then converting this int value to a float in exactly the manner of the method Float::intBitsToFloat.

Returns

the float value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.6 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer,* int *size*) [virtual]

Reads some bytes from an input stream and stores them into the buffer array buffer.

The number of bytes read is equal to the length of buffer.

This method blocks until one of the following conditions occurs:

- buffer's size bytes of input data are available, in which case a normal return is made.
- End of file is detected, in which case an **EOFException** (p. 986) is thrown.
- An I/O error occurs, in which case an **IOException** (p. 1198) other than **EOFException** (p. 986) is thrown.

If buffer size is zero, then no bytes are read. Otherwise, the first byte read is stored into element b[0], the next one into buffer[1], and so on. If an exception is thrown from this method, then it may be that some but not all bytes of buffer have been updated with data from the input stream.

Parameters

buffer	The byte array to insert read data into.
size	The size in bytes of the given byte buffer.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
IndexOutOfBounds-Exception	if the size value is negative.

6.180.3.7 virtual void decaf::io::DataInputStream::readFully (unsigned char * *buffer,* int *size,* int *offset,* int *length*) [virtual]

Reads length bytes from an input stream.

This method blocks until one of the following conditions occurs:

- length bytes of input data are available, in which case a normal return is made.
- End of file is detected, in which case an **EOFException** (p. 986) is thrown.
- An I/O error occurs, in which case an **IOException** (p. 1198) other than **EOFException** (p. 986) is thrown.

If buffer is NULL, a NullPointerException is thrown. If offset+length is greater than the length of the array buffer, then an IndexOutOfBoundsException is thrown. If length is zero, then no bytes are read. Otherwise, the first byte read is stored into element buffer[off], the next one into buffer[offset+1], and so on. The number of bytes read is, at most, equal to length.

Parameters

buffer	The byte array to insert read data into.
size	The size in bytes of the given byte buffer.
offset	The location in buffer to start writing.
length	The number of bytes to read from the buffer.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
NullPointerException	if the buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length $>$ size.

6.180.3.8 virtual int decaf::io::DataInputStream::readInt ( ) [virtual]

Reads four input bytes and returns an int value.

Let a be the first byte read, b be the second byte, c be the third byte, and d be the fourth byte. The value returned is:

(((a & 0xff) $<<$ 24) | ((b & 0xff) $<<$ 16) | ((c & 0xff) $<<$ 8) | (d & 0xff))

Returns

the int value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.9 virtual std::string decaf::io::DataInputStream::readLine ( ) [virtual]

Reads the next line of text from the input stream.

It reads successive bytes, converting each byte to an ASCII char separately, until it encounters a line terminator or end of file; the characters read are then returned as a standard String. Note that because this method processes bytes, it does not support input of the full Unicode character set.

If end of file is encountered before even one byte can be read, then an empty string is returned. Otherwise, each byte that is read is converted to type char. If the character '

' is encountered, it is discarded and reading ceases. If the character " is encountered, it is discarded and, if the following byte converts to the character '

', then that is discarded also; reading then ceases. If end of file is encountered before either of the characters '

' and " is encountered, reading ceases. Once reading has ceased, a String is returned that contains all the characters read and not discarded, taken in order.

Returns

the next line of text read from the input stream or empty string if at EOF.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.

6.180.3.10 virtual long long decaf::io::DataInputStream::readLong ( ) [virtual]

Reads eight input bytes and returns a long value.

Let a be the first byte read, b be the second byte, c be the third byte, d be the fourth byte, e be the fifth byte, f be

the sixth byte, g be the seventh byte, and h be the eighth byte. The value returned is:

(((long)(a & 0xff) << 56) | ((long)(b & 0xff) << 48) | ((long)(c & 0xff) << 40) | ((long)(d & 0xff) << 32) | ((long)(e & 0xff) << 24) | ((long)(f & 0xff) << 16) | ((long)(g & 0xff) << 8) | ((long)(h & 0xff)))

Returns

the 64 bit long long read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.11 virtual short decaf::io::DataInputStream::readShort ( ) [virtual]

Reads two input bytes and returns a short value.

Let a be the first byte read and b be the second byte. The value returned is:

(short)((a << 8) | (b & 0xff))

Returns

the 16 bit short value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.12 virtual std::string decaf::io::DataInputStream::readString ( ) [virtual]

Reads an NULL terminated ASCII string to the stream and returns the string to the caller.

Returns

string object containing the string read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.13 virtual unsigned char decaf::io::DataInputStream::readUnsignedByte ( ) [virtual]

Reads one input byte, zero-extends it to type int, and returns the result, which is therefore in the range 0 through 255.

Returns

the 8 bit unsigned value read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.14 virtual unsigned short decaf::io::DataInputStream::readUnsignedShort ( ) [virtual]

Reads two input bytes and returns an int value in the range 0 through 65535.

Let a be the first byte read and b be the second byte. The value returned is:

(((a & 0xff) $<<$ 8) | (b & 0xff))

Returns

the 16 bit unsigned short read.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.

6.180.3.15 virtual std::string decaf::io::DataInputStream::readUTF ( ) [virtual]

Reads a modified UTF-8 encoded string in ASCII format and returns it, this is only useful if you know for sure that the string that is to be read was a string that contained all ASCII values (0-255), if so this method will throw a UTFFormatException.

This method reads String value written from a Java **DataOutputStream** (p. 860) and assumes that the length prefix the precedes the encoded UTF-8 bytes is an unsigned short, which implies that the String will be no longer than 65535 characters.

Returns

The decoded string read from stream.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.
EOFException *(p. 986)*	if the end of input is reached.
UTFDataFormatException *(p. 2228)*	if the bytes are not valid modified UTF-8 values.

6.180.3.16 virtual long long decaf::io::DataInputStream::skipBytes (long long *num*) [virtual]

Makes an attempt to skip over n bytes of data from the input stream, discarding the skipped bytes.

However, it may skip over some smaller number of bytes, possibly zero. This may result from any of a number of conditions; reaching end of file before n bytes have been skipped is only one possibility. This method never throws an **EOFException** (p. 986). The actual number of bytes skipped is returned.

Parameters

num	The number of bytes to skip over.

Returns

the total number of bytes skipped.

Exceptions

IOException *(p. 1198)*	if an I/O Error occurs.

The documentation for this class was generated from the following file:

- src/main/decaf/io/**DataInputStream.h**

6.181 decaf::io::DataOutput Class Reference

The **DataOutput** (p. 856) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.

`#include <src/main/decaf/io/DataOutput.h>`

Public Member Functions

- virtual ~**DataOutput** ()
- virtual void **writeBoolean** (bool value)=0

  Writes a boolean to the underlying output stream as a 1-byte value.
- virtual void **writeByte** (unsigned char value)=0

  Writes out a byte to the underlying output stream as a 1-byte value.
- virtual void **writeShort** (short value)=0

  Writes a short to the underlying output stream as two bytes, high byte first.
- virtual void **writeUnsignedShort** (unsigned short value)=0

  Writes a unsigned short to the bytes message stream as a 2 byte value.
- virtual void **writeChar** (char value)=0

  Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.
- virtual void **writeInt** (int value)=0

  Writes an int to the underlying output stream as four bytes, high byte first.
- virtual void **writeLong** (long long value)=0

  Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.
- virtual void **writeFloat** (float value)=0

  Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.
- virtual void **writeDouble** (double value)=0

  Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.
- virtual void **writeBytes** (**const** std::string &value)=0

  Writes out the string to the underlying output stream as a sequence of bytes.
- virtual void **writeChars** (**const** std::string &value)=0

  Writes a string to the underlying output stream as a sequence of characters.
- virtual void **writeUTF** (**const** std::string &value)=0

  Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

6.181.1 Detailed Description

The **DataOutput** (p. 856) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.

There is also a facility for converting Strings into the Java standard modified UTF-8 format and writing the resulting series of bytes.

If a method in this interface encounters an error while writing it will throw an **IOException** (p. 1198).

6.181.2 Constructor & Destructor Documentation

6.181.2.1 virtual decaf::io::DataOutput::~DataOutput ( ) [inline, virtual]

6.181.3 Member Function Documentation

6.181.3.1 virtual void decaf::io::DataOutput::writeBoolean (bool *value*) [pure virtual]

Writes a boolean to the underlying output stream as a 1-byte value.

The value true is written out as the value (byte)1; the value false is written out as the value (byte)0. If no exception is thrown, the counter written is incremented by 1.

Parameters

value	The boolean to write as a byte (1=true, 0=false).

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.2 virtual void decaf::io::DataOutput::writeByte (unsigned char *value*) [pure virtual]

Writes out a byte to the underlying output stream as a 1-byte value.

If no exception is thrown, the counter written is incremented by 1.

Parameters

value	The unsigned char value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.3 virtual void decaf::io::DataOutput::writeBytes (const std::string & *value*) [pure virtual]

Writes out the string to the underlying output stream as a sequence of bytes.

Each character in the string is written out, in sequence, by discarding its high eight bits. If no exception is thrown, the counter written is incremented by the length of value. The value written does not include a trailing null as that is not part of the sequence of bytes, if the null is needed, then use the writeChars method.

Parameters

value	The vector of bytes to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.4 virtual void decaf::io::DataOutput::writeChar (char *value*) [pure virtual]

Writes out a char to the underlying output stream as a one byte value If no exception is thrown, the counter written is incremented by 1.

Parameters

value	The signed char value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.5 virtual void decaf::io::DataOutput::writeChars (const std::string & *value*) [pure virtual]

Writes a string to the underlying output stream as a sequence of characters.

Each character is written to the data output stream as if by the writeChar method. If no exception is thrown, the counter written is incremented by the length of value. The trailing NULL character is written by this method.

Parameters

value	The string value to write as raw bytes.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.6 virtual void decaf::io::DataOutput::writeDouble (double *value*) [pure virtual]

Converts the double argument to a long using the doubleToLongBits method in class Double, and then writes that long value to the underlying output stream as an 8-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

value	The 64bit double value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.7 virtual void decaf::io::DataOutput::writeFloat (float *value*) [pure virtual]

Converts the float argument to an int using the floatToIntBits method in class Float, and then writes that int value to the underlying output stream as a 4-byte quantity, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

value	The 32bit floating point value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.8 virtual void decaf::io::DataOutput::writeInt (int *value*) [pure virtual]

Writes an int to the underlying output stream as four bytes, high byte first.

If no exception is thrown, the counter written is incremented by 4.

Parameters

value	The signed integer value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.9 virtual void decaf::io::DataOutput::writeLong (long long *value*) [pure virtual]

Writes an 64 bit long to the underlying output stream as eight bytes, high byte first.

If no exception is thrown, the counter written is incremented by 8.

Parameters

value	The signed 64bit long value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.10 virtual void decaf::io::DataOutput::writeShort (short *value*) [pure virtual]

Writes a short to the underlying output stream as two bytes, high byte first.

If no exception is thrown, the counter written is incremented by 2.

Parameters

value	The signed short value to write.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.11 virtual void decaf::io::DataOutput::writeUnsignedShort (unsigned short *value*) [pure virtual]

Writes a unsigned short to the bytes message stream as a 2 byte value.

Parameters

value	The unsigned short to write to the stream.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.

6.181.3.12 virtual void decaf::io::DataOutput::writeUTF (const std::string & *value*) [pure virtual]

Writes out the string to the underlying output stream as a modeified UTF-8 encoded sequence of bytes.

The first two bytes written are indicate its encoded length followed by the rest of the string's characters encoded as modified UTF-8. The length represent the encoded length of the data not the actual length of the string.

Parameters

value	The string value value to write as modified UTF-8.

Exceptions

IOException *(p. 1198)*	if an I/O error is encountered.
UTFDataFormatException *(p. 2228)*	if the encoded size if greater than 65535

6.182 decaf::io::DataOutputStream Class Reference

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

`#include <src/main/decaf/io/DataOutputStream.h>`

Inheritance diagram for decaf::io::DataOutputStream:

Public Member Functions

- **DataOutputStream** (**OutputStream** ∗**outputStream**, bool **own**=false)

Creates a new data output stream to write data to the specified underlying output stream.

- virtual ~**DataOutputStream** ()
- virtual long long **size** () **const**

  Returns the current value of the counter written, the number of bytes written to this data output stream so far.
- virtual void **writeBoolean** (bool value)
- virtual void **writeByte** (unsigned char value)
- virtual void **writeShort** (short value)
- virtual void **writeUnsignedShort** (unsigned short value)
- virtual void **writeChar** (char value)
- virtual void **writeInt** (int value)
- virtual void **writeLong** (long long value)
- virtual void **writeFloat** (float value)
- virtual void **writeDouble** (double value)
- virtual void **writeBytes** (**const** std::string &value)
- virtual void **writeChars** (**const** std::string &value)
- virtual void **writeUTF** (**const** std::string &value)

Protected Member Functions

- virtual void **doWriteByte** (unsigned char value)
- virtual void **doWriteArrayBounded** (**const** unsigned char *__buffer__, int **size**, int offset, int length)

Protected Attributes

- long long **written**
- unsigned char **buffer** [8]

6.182.1 Detailed Description

A data output stream lets an application write primitive Java data types to an output stream in a portable way.

An application can then use a data input stream to read the data back in.

6.182.2 Constructor & Destructor Documentation

6.182.2.1 decaf::io::DataOutputStream::DataOutputStream (OutputStream * *outputStream,* bool *own* = false)

Creates a new data output stream to write data to the specified underlying output stream.

Parameters

outputStream	a stream to wrap with this one.
own	true if this objects owns the stream that it wraps.

6.182.2.2 virtual decaf::io::DataOutputStream::~DataOutputStream ( ) [virtual]

6.182.3 Member Function Documentation

6.182.3.1 virtual void decaf::io::DataOutputStream::doWriteArrayBounded (const unsigned char * *buffer,* int *size,* int *offset,* int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.182.3.2 virtual void decaf::io::DataOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.182.3.3 virtual long long decaf::io::DataOutputStream::size ( ) const [inline, virtual]

Returns the current value of the counter written, the number of bytes written to this data output stream so far.

If the counter overflows, it will be wrapped to **decaf::lang::Long::MAX_VALUE** (p. 1351).

Returns

the value of the written field.

6.182.3.4 virtual void decaf::io::DataOutputStream::writeBoolean (bool *value*) [virtual]

Referenced by activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray().

6.182.3.5 virtual void decaf::io::DataOutputStream::writeByte (unsigned char *value*) [virtual]

6.182.3.6 virtual void decaf::io::DataOutputStream::writeBytes (const std::string & *value*) [virtual]

6.182.3.7 virtual void decaf::io::DataOutputStream::writeChar (char *value*) [virtual]

6.183.1 Constructor & Destructor Documentation

6.183.1.1 activemq::commands::DataResponse::DataResponse ( )

6.183.1.2 virtual activemq::commands::DataResponse::~DataResponse ( ) [virtual]

6.183.2 Member Function Documentation

6.183.2.1 virtual DataResponse* activemq::commands::DataResponse::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 1782).

6.183.2.2 virtual void activemq::commands::DataResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 1782).

6.183.2.3 virtual bool activemq::commands::DataResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.183.2.4 virtual const Pointer<DataStructure>& activemq::commands::DataResponse::getData ( ) const [virtual]

6.183.2.5 virtual Pointer<DataStructure>& activemq::commands::DataResponse::getData ( ) [virtual]

6.183.2.6 virtual unsigned char activemq::commands::DataResponse::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 1783).

6.183.2.7 virtual void activemq::commands::DataResponse::setData (const Pointer< DataStructure > & *data*) [virtual]

6.183.2.8 virtual std::string activemq::commands::DataResponse::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.183.3 Field Documentation

6.183.3.1 Pointer<DataStructure> activemq::commands::DataResponse::data [protected]

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.184.1 Detailed Description

Marshaling code for Open Wire Format for **DataResponseMarshaller** (p. 865).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.184.2 Constructor & Destructor Documentation

6.184.2.1 activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::DataResponseMarshaller ( ) [inline]

6.184.2.2 virtual activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::∼DataResponseMarshaller ( ) [inline, virtual]

6.184.3 Member Function Documentation

6.184.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1789).

6.184.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.184.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::looseMarshal (OpenWireFormat ∗ *format,* commands::DataStructure ∗ *command,* decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.184.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.184.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.184.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.184.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DataResponseMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1792).

6.185.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::DataStreamMarshaller::getDataStructureType ( ) const [pure virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 143), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 221), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 226), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 236), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 256), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 292), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 305), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 312), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 319), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 326), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 441), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 449), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 733), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 739), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 749), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 757), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 774), **activemq::wireformat::openwire::marshal::generated::**

6.185.3.3 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [pure virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 127), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 144), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 221), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 227), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 236), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 256), **activemq::wireformat::openwire-**

6.185.3.6 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [pure virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 145), **activemq::wireformat::openwire::marshal::generated::ActiveMQMapMessageMarshaller** (p. 222), **activemq::wireformat::openwire::marshal::generated::ActiveMQMessageMarshaller** (p. 228), **activemq::wireformat::openwire::marshal::generated::ActiveMQObjectMessageMarshaller** (p. 237), **activemq::wireformat::openwire::marshal::generated::ActiveMQQueueMarshaller** (p. 257), **activemq::wireformat::openwire::marshal::generated::ActiveMQStreamMessageMarshaller** (p. 293), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempQueueMarshaller** (p. 306), **activemq::wireformat::openwire::marshal::generated::ActiveMQTempTopicMarshaller** (p. 313), **activemq::wireformat::openwire::marshal::generated::ActiveMQTextMessageMarshaller** (p. 320), **activemq::wireformat::openwire::marshal::generated::ActiveMQTopicMarshaller** (p. 327), **activemq::wireformat::openwire::marshal::generated::BrokerIdMarshaller** (p. 442), **activemq::wireformat::openwire::marshal::generated::BrokerInfoMarshaller** (p. 450), **activemq::wireformat::openwire::marshal::generated::ConnectionControlMarshaller** (p. 735), **activemq::wireformat::openwire::marshal::generated::ConnectionErrorMarshaller** (p. 741), **activemq::wireformat::openwire::marshal::generated::ConnectionIdMarshaller** (p. 750), **activemq::wireformat::openwire::marshal::generated::ConnectionInfoMarshaller** (p. 758), **activemq::wireformat::openwire::marshal::generated::ConsumerControlMarshaller** (p. 775), **activemq::wireformat::openwire::marshal::generated::ConsumerIdMarshaller** (p. 782), **activemq::wireformat::openwire::marshal::generated::ConsumerInfo-**

6.185.3.7 virtual void activemq::wireformat::openwire::marshal::DataStreamMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [pure virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implemented in **activemq::wireformat::openwire::marshal::generated::ActiveMQBlobMessageMarshaller** (p. 128), **activemq::wireformat::openwire::marshal::generated::ActiveMQBytesMessageMarshaller** (p. 145),

6.186 activemq::commands::DataStructure Class Reference

`#include <src/main/activemq/commands/DataStructure.h>`

Inheritance diagram for activemq::commands::DataStructure:

Public Member Functions

- virtual ~**DataStructure** ()
- virtual unsigned char **getDataStructureType** () **const** =0

  *Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.*
- virtual **DataStructure** * **cloneDataStructure** () **const** =0

  Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.
- virtual void **copyDataStructure** (**const DataStructure** *src)=0

  Copy the contents of the passed object into this objects members, overwriting any existing data.
- virtual std::string **toString** () **const** =0

  *Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.*
- virtual bool **equals** (**const DataStructure** *value) **const** =0

  *Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.*

6.186.1 Constructor & Destructor Documentation

6.186.1.1 virtual activemq::commands::DataStructure::~DataStructure ( ) [inline, virtual]

6.186.2 Member Function Documentation

6.186.2.1 virtual DataStructure* activemq::commands::DataStructure::cloneDataStructure ( ) const [pure virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implemented in **activemq::commands::Message** (p. 1417), **activemq::commands::ActiveMQDestination** (p. 193), **activemq::commands::ConsumerInfo** (p. 785), **activemq::commands::MessageId** (p. 1480), **activemq::commands::SessionId** (p. 1844), **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::BrokerInfo** (p. 445), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::ProducerId** (p. 1692), **activemq::commands::ConnectionId** (p. 746), **activemq::commands::MessageAck** (p. 1449), **activemq::commands::ConsumerId** (p. 777), **activemq::commands::ConsumerControl** (p. 770), **activemq::commands::JournalTopicAck** (p. 1217), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::BrokerError** (p. 434), **activemq::commands::ConnectionControl** (p. 729), **activemq::commands::DestinationInfo** (p. 940), **activemq::commands::MessagePull** (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1460), **activemq::commands::MessageDispatchNotification** (p. 1470), **activemq::commands::SubscriptionInfo** (p. 2040), **activemq::commands::XATransactionId** (p. 2278), **activemq::commands::TransactionInfo** (p. 2149), **activemq::commands::ConnectionError** (p. 736), **activemq::commands::JournalQueueAck** (p. 1211), **activemq::commands::JournalTransaction** (p. 1229), **activemq::commands::RemoveSubscriptionInfo** (p. 1765), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::LocalTransactionId** (p. 1299), **activemq::commands::NetworkBridgeFilter** (p. 1528), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1759), **activemq::commands::DataArrayResponse** (p. 829), **activemq::commands::DataResponse** (p. 864), **activemq::commands::Discovery-**

Event (p. 950), **activemq::commands::ExceptionResponse** (p. 997), **activemq::commands::PartialCommand** (p. 1609), **activemq::commands::ReplayCommand** (p. 1771), **activemq::commands::BrokerId** (p. 438), **activemq::commands::ControlCommand** (p. 793), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1223), **activemq::commands::Response** (p. 1782), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::FlushCommand** (p. 1069), **activemq::commands::KeepAliveInfo** (p. 1234), **activemq::commands::LastPartialCommand** (p. 1246), **activemq::commands::ShutdownInfo** (p. 1884), **activemq::commands::TransactionId** (p. 2144), **activemq::commands::ActiveMQTempDestination** (p. 294), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::WireFormatInfo** (p. 2242), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTextMessage** (p. 315), **activemq::commands::ActiveMQMessage** (p. 224), **activemq::commands::ActiveMQTempQueue** (p. 301), **activemq::commands::ActiveMQTempTopic** (p. 308), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::BooleanExpression** (p. 427).

6.186.2.2 virtual void activemq::commands::DataStructure::copyDataStructure (const DataStructure * *src*) [pure virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implemented in **activemq::commands::Message** (p. 1417), **activemq::commands::ActiveMQDestination** (p. 193), **activemq::commands::ConsumerInfo** (p. 785), **activemq::commands::BrokerError** (p. 434), **activemq::commands::MessageId** (p. 1481), **activemq::commands::SessionId** (p. 1844), **activemq::commands::ActiveMQBytesMessage** (p. 131), **activemq::commands::BrokerInfo** (p. 445), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::ProducerId** (p. 1693), **activemq::commands::ConnectionId** (p. 747), **activemq::commands::MessageAck** (p. 1449), **activemq::commands::ConsumerId** (p. 778), **activemq::commands::ConsumerControl** (p. 771), **activemq::commands::JournalTopicAck** (p. 1217), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::ConnectionControl** (p. 730), **activemq::commands::DestinationInfo** (p. 940), **activemq::commands::MessagePull** (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1460), **activemq::commands::MessageDispatchNotification** (p. 1470), **activemq::commands::SubscriptionInfo** (p. 2040), **activemq::commands::XATransactionId** (p. 2279), **activemq::commands::TransactionInfo** (p. 2150), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::JournalQueueAck** (p. 1211), **activemq::commands::JournalTransaction** (p. 1229), **activemq::commands::RemoveSubscriptionInfo** (p. 1765), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::LocalTransactionId** (p. 1299), **activemq::commands::NetworkBridgeFilter** (p. 1528), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1759), **activemq::commands::DataArrayResponse** (p. 829), **activemq::commands::DataResponse** (p. 864), **activemq::commands::DiscoveryEvent** (p. 951), **activemq::commands::ExceptionResponse** (p. 997), **activemq::commands::PartialCommand** (p. 1609), **activemq::commands::ReplayCommand** (p. 1771), **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::BrokerId** (p. 439), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1223), **activemq::commands::Response** (p. 1782), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::FlushCommand** (p. 1069), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::LastPartialCommand** (p. 1246), **activemq::commands::ShutdownInfo** (p. 1884), **activemq::commands::TransactionId** (p. 2144), **activemq::commands::ActiveMQBlobMessage** (p. 123), **activemq::commands::WireFormatInfo** (p. 2242), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQTempQueue** (p. 301), **activemq::commands::ActiveMQTempTopic** (p. 308), **activemq::commands::ActiveMQObjectMessage** (p. 234), **activemq::commands::BaseCommand** (p. 382), and **activemq::commands::ActiveMQMessage** (p. 224).

6.186.2.3 virtual bool activemq::commands::DataStructure::equals (const DataStructure * *value*) const [pure virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implemented in **activemq::commands::Message** (p. 1417), **activemq::commands::ActiveMQDestination** (p. 194), **activemq::commands::ConsumerInfo** (p. 785), **activemq::commands::MessageId** (p. 1481), **activemq::commands::SessionId** (p. 1844), **activemq::commands::BaseCommand** (p. 382), **activemq::commands::ActiveMQBytesMessage** (p. 132), **activemq::commands::BrokerInfo** (p. 445), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::ProducerId** (p. 1693), **activemq::commands::ConnectionId** (p. 747), **activemq::commands::MessageAck** (p. 1450), **activemq::commands::ConsumerId** (p. 778), **activemq::commands::ConsumerControl** (p. 771), **activemq::commands::JournalTopicAck** (p. 1217), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::ConnectionControl** (p. 730), **activemq::commands::DestinationInfo** (p. 941), **activemq::commands::MessagePull** (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1460), **activemq::commands::MessageDispatchNotification** (p. 1470), **activemq::commands::SubscriptionInfo** (p. 2041), **activemq::commands::XATransactionId** (p. 2279), **activemq::commands::TransactionInfo** (p. 2150), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::JournalQueueAck** (p. 1211), **activemq::commands::JournalTransaction** (p. 1229), **activemq::commands::RemoveSubscriptionInfo** (p. 1765), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::LocalTransactionId** (p. 1299), **activemq::commands::NetworkBridgeFilter** (p. 1528), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1759), **activemq::commands::ActiveMQMapMessage** (p. 211), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 864), **activemq::commands::DiscoveryEvent** (p. 951), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::PartialCommand** (p. 1609), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::BrokerId** (p. 439), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1224), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1069), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::LastPartialCommand** (p. 1246), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::TransactionId** (p. 2144), **activemq::commands::ActiveMQMessageTemplate< T >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::BytesMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::MapMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::Message >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::StreamMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::TextMessage >** (p. 230), **activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >** (p. 230), **activemq::commands::ActiveMQBlobMessage** (p. 124), **activemq::commands::WireFormatInfo** (p. 2242), **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQTempQueue** (p. 301), **activemq::commands::ActiveMQTempTopic** (p. 309), **activemq::commands::ActiveMQObjectMessage** (p. 234), **activemq::commands::ActiveMQMessage** (p. 224), and **activemq::commands::BooleanExpression** (p. 427).

6.186.2.4 virtual unsigned char activemq::commands::DataStructure::getDataStructureType ( ) const [pure virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implemented in **activemq::commands::Message** (p. 1419), **activemq::commands::ActiveMQDestination** (p. 195), **activemq::commands::ConsumerInfo** (p. 786), **activemq::commands::MessageId** (p. 1481), **activemq::commands::SessionId** (p. 1845), **activemq::commands::ActiveMQBytesMessage** (p. 132), **activemq::commands::BrokerInfo** (p. 446), **activemq::commands::ConnectionInfo** (p. 753), **activemq::commands::ProducerId** (p. 1693), **activemq::commands::ConnectionId** (p. 747), **activemq::commands::MessageAck** (p. 1450), **activemq::commands::ConsumerId** (p. 778), **activemq::commands::ConsumerControl** (p. 771), **activemq::commands::JournalTopicAck** (p. 1218), **activemq::commands::ProducerInfo** (p. 1699), **activemq::commands::ConnectionControl** (p. 730), **activemq::commands::DestinationInfo** (p. 941), **activemq::commands::MessagePull** (p. 1504), **activemq::commands::SessionInfo** (p. 1850), **activemq::commands::MessageDispatch** (p. 1461), **activemq::commands::MessageDispatchNotification** (p. 1471), **activemq::commands::SubscriptionInfo** (p. 2041), **activemq::commands::XATransactionId** (p. 2280), **activemq::commands::TransactionInfo** (p. 2150), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::JournalQueueAck** (p. 1212), **activemq::commands::JournalTransaction** (p. 1229), **activemq::commands::RemoveSubscriptionInfo** (p. 1766), **activemq::commands::ActiveMQStreamMessage** (p. 281), **activemq::commands::LocalTransactionId** (p. 1300), **activemq::commands::NetworkBridgeFilter** (p. 1529), **activemq::commands::ProducerAck** (p. 1684), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 864), **activemq::commands::DiscoveryEvent** (p. 951), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::PartialCommand** (p. 1610), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::BrokerError** (p. 434), **activemq::commands::BrokerId** (p. 439), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1224), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1070), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::LastPartialCommand** (p. 1246), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::TransactionId** (p. 2145), **activemq::commands::ActiveMQTempDestination** (p. 295), **activemq::commands::ActiveMQMapMessage** (p. 213), **activemq::commands::ActiveMQBlobMessage** (p. 124), **activemq::commands::WireFormatInfo** (p. 2243), **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTextMessage** (p. 316), **activemq::commands::ActiveMQTempQueue** (p. 302), **activemq::commands::ActiveMQTempTopic** (p. 309), **activemq::commands::ActiveMQObjectMessage** (p. 234), and **activemq::commands::ActiveMQMessage** (p. 225).

6.186.2.5 virtual std::string activemq::commands::DataStructure::toString ( ) const [pure virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Implemented in **activemq::commands::Message** (p. 1424), **activemq::commands::ActiveMQDestination** (p. 198), **activemq::commands::ConsumerInfo** (p. 788), **activemq::commands::MessageId** (p. 1482), **activemq::commands::SessionId** (p. 1845), **activemq::commands::ActiveMQBytesMessage** (p. 138), **activemq::commands::BrokerInfo** (p. 447), **activemq::commands::ConnectionInfo** (p. 755), **activemq::commands::ProducerId** (p. 1694), **activemq::commands::ConnectionId** (p. 747), **activemq::commands::MessageAck** (p. 1451), **activemq::commands::ConsumerId** (p. 779), **activemq::commands::ConsumerControl** (p. 772), **activemq::commands::JournalTopicAck** (p. 1219), **activemq::commands::ProducerInfo** (p. 1700), **activemq::commands::ConnectionControl** (p. 731), **activemq::commands::DestinationInfo** (p. 942), **activemq::commands::MessagePull** (p. 1505), **activemq::commands::SessionInfo** (p. 1851), **activemq::commands::MessageDispatch** (p. 1461), **activemq::commands::MessageDispatchNotification** (p. 1472), **activemq::commands::SubscriptionInfo** (p. 2042), **activemq::commands::XATransactionId** (p. 2281), **activemq::commands::TransactionInfo** (p. 2151), **activemq::commands::ConnectionError** (p. 737), **activemq::commands::JournalQueueAck** (p. 1212), **activemq::commands::JournalTransaction** (p. 1230), **activemq::commands::RemoveSubscriptionInfo** (p. 1766), **activemq::commands::ActiveMQStreamMessage** (p. 286), **activemq::commands::ActiveMQTempDestination** (p. 296), **activemq::commands-**

::LocalTransactionId (p. 1300), **activemq::commands::NetworkBridgeFilter** (p. 1529), **activemq::commands::ProducerAck** (p. 1685), **activemq::commands::RemoveInfo** (p. 1760), **activemq::commands::ActiveMQMapMessage** (p. 219), **activemq::commands::DataArrayResponse** (p. 830), **activemq::commands::DataResponse** (p. 865), **activemq::commands::DiscoveryEvent** (p. 951), **activemq::commands::ExceptionResponse** (p. 998), **activemq::commands::PartialCommand** (p. 1610), **activemq::commands::ReplayCommand** (p. 1772), **activemq::commands::BrokerId** (p. 439), **activemq::commands::ControlCommand** (p. 794), **activemq::commands::IntegerResponse** (p. 1176), **activemq::commands::JournalTrace** (p. 1224), **activemq::commands::Response** (p. 1783), **activemq::commands::FlushCommand** (p. 1070), **activemq::commands::KeepAliveInfo** (p. 1235), **activemq::commands::LastPartialCommand** (p. 1247), **activemq::commands::ShutdownInfo** (p. 1885), **activemq::commands::TransactionId** (p. 2145), **activemq::commands::BaseCommand** (p. 386), **activemq::commands::ActiveMQBlobMessage** (p. 125), **activemq::commands::Command** (p. 674), **activemq::commands::WireFormatInfo** (p. 2247), **activemq::commands::ActiveMQQueue** (p. 252), **activemq::commands::BaseDataStructure** (p. 411), **activemq::commands::ActiveMQTopic** (p. 324), **activemq::commands::ActiveMQTextMessage** (p. 317), **activemq::commands::ActiveMQTempQueue** (p. 303), **activemq::commands::ActiveMQTempTopic** (p. 310), **activemq::commands::ActiveMQObjectMessage** (p. 235), **activemq::commands::ActiveMQMessage** (p. 225), and **activemq::commands::BooleanExpression** (p. 428).

6.187 decaf::util::Date Class Reference

Wrapper class around a time value in milliseconds.

`#include <src/main/decaf/util/Date.h>`

Inheritance diagram for decaf::util::Date:

Public Member Functions

- **Date** ()

  Default constructor - sets time to the current System time, rounded to the nearest millisecond.
- **Date** (long long milliseconds)

  Constructs the date with a given time value.
- **Date** (**const Date** &source)

  Copy constructor.
- **Date** & **operator=** (**const Date** &value)

  *Assigns the value of one **Date** (p. 882) object to another.*
- virtual ~**Date** ()
- long long **getTime** () **const**

  Gets the underlying time.
- void **setTime** (long long milliseconds)

  Sets the underlying time.
- bool **after** (**const Date** &when) **const**

  Determines whether or not this date falls after the specified time.
- bool **before** (**const Date** &when) **const**

  Determines whether or not this date falls before the specified time.
- std::string **toString** () **const**

  *Converts this **Date** (p. 882) object to a String of the form:*
- virtual int **compareTo** (**const Date** &value) **const**

- virtual bool **equals** (**const Date** &value) **const**
- virtual bool **operator==** (**const Date** &value) **const**
- virtual bool **operator<** (**const Date** &value) **const**

6.187.1 Detailed Description

Wrapper class around a time value in milliseconds.

This class is comparable to Java's java.util.Date class.

Since

1.0

6.187.2 Constructor & Destructor Documentation

6.187.2.1 decaf::util::Date::Date ( )

Default constructor - sets time to the current System time, rounded to the nearest millisecond.

6.187.2.2 decaf::util::Date::Date (long long *milliseconds*)

Constructs the date with a given time value.

Parameters

milliseconds	The time in milliseconds;

6.187.2.3 decaf::util::Date::Date (const Date & *source*)

Copy constructor.

Parameters

source	The **Date** (p. 882) instance to copy into this one.

6.187.2.4 virtual decaf::util::Date::~Date ( ) [virtual]

6.187.3 Member Function Documentation

6.187.3.1 bool decaf::util::Date::after (const Date & *when*) const

Determines whether or not this date falls after the specified time.

Parameters

when	The date to compare

Returns

true if this date falls after when.

6.187.3.2 bool decaf::util::Date::before (const Date & *when*) const

Determines whether or not this date falls before the specified time.

Parameters

when	The date to compare

Returns

true if this date falls before when.

6.187.3.3 virtual int decaf::util::Date::compareTo (const Date & *value*) const [virtual]

6.187.3.4 virtual bool decaf::util::Date::equals (const Date & *value*) const [virtual]

6.187.3.5 long long decaf::util::Date::getTime ( ) const

Gets the underlying time.

Returns

The underlying time value in milliseconds.

6.187.3.6 virtual bool decaf::util::Date::operator< (const Date & *value*) const [virtual]

6.187.3.7 Date& decaf::util::Date::operator= (const Date & *value*)

Assigns the value of one **Date** (p. 882) object to another.

Parameters

value	The value to be copied into this **Date** (p. 882) object.

Returns

reference to this object with the newly assigned value.

6.187.3.8 virtual bool decaf::util::Date::operator== (const Date & *value*) const [virtual]

6.187.3.9 void decaf::util::Date::setTime (long long *milliseconds*)

Sets the underlying time.

Parameters

milliseconds	The underlying time value in milliseconds.

6.187.3.10 std::string decaf::util::Date::toString ( ) const

Converts this **Date** (p. 882) object to a String of the form:

dow mon dd hh:mm:ss zzz yyyy

where:

- dow is the day of the week (Sun, Mon, Tue, Wed, Thu, Fri, Sat).
  - mon is the month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec).
  - dd is the day of the month (01 through 31), as two decimal digits.
  - hh is the hour of the day (00 through 23), as two decimal digits.
  - mm is the minute within the hour (00 through 59), as two decimal digits.
  - ss is the second within the minute (00 through 61, as two decimal digits.
  - zzz is the time zone (and may reflect daylight saving time). Standard time zone abbreviations include those recognized by the method parse. If time zone information is not available, then zzz is empty - that is, it consists of no characters at all.
  - yyyy is the year, as four decimal digits.

Returns

the String representation of the **Date** (p. 882) object.

The documentation for this class was generated from the following file:

- src/main/decaf/util/**Date.h**

6.188 decaf::internal::DecafRuntime Class Reference

Handles APR initialization and termination.

`#include <src/main/decaf/internal/DecafRuntime.h>`

Inheritance diagram for decaf::internal::DecafRuntime:

Public Member Functions

- **DecafRuntime** ()

  Initializes the APR Runtime for a library.
- virtual ~**DecafRuntime** ()

  Terminates the APR Runtime for a library.
- apr_pool_t * **getGlobalPool** () **const**

  Grants access to the Global APR Pool instance that should be used when creating new threads.
- **decaf::util::concurrent::Mutex** * **getGlobalLock** ()

  Gets a pointer to the Decaf Runtime's Global Lock object, this can be used by Decaf APIs to synchronize around certain actions such as adding or acquiring a resource that must be Thread safe.

6.188.1 Detailed Description

Handles APR initialization and termination.

6.188.2 Constructor & Destructor Documentation

6.188.2.1 decaf::internal::DecafRuntime::DecafRuntime ( )

Initializes the APR Runtime for a library.

6.188.2.2 virtual decaf::internal::DecafRuntime::~DecafRuntime ( ) [virtual]

Terminates the APR Runtime for a library.

6.188.3 Member Function Documentation

6.188.3.1 decaf::util::concurrent::Mutex* decaf::internal::DecafRuntime::getGlobalLock ( )

Gets a pointer to the Decaf Runtime's Global Lock object, this can be used by Decaf APIs to synchronize around certain actions such as adding or acquiring a resource that must be Thread safe.

The pointer returned is owned by the Decaf runtime and should not be deleted or copied by the caller.

Returns

a pointer to the Decaf Runtime's global Lock instance.

6.188.3.2 apr_pool_t* decaf::internal::DecafRuntime::getGlobalPool ( ) const

Grants access to the Global APR Pool instance that should be used when creating new threads.

The documentation for this class was generated from the following file:

- src/main/decaf/internal/**DecafRuntime.h**

6.189 activemq::threads::DedicatedTaskRunner Class Reference

`#include <src/main/activemq/threads/DedicatedTaskRunner.h>`

Inheritance diagram for activemq::threads::DedicatedTaskRunner:

Public Member Functions

- **DedicatedTaskRunner** (**Task** *task)
- virtual ~**DedicatedTaskRunner** ()
- virtual void **shutdown** (unsigned int timeout)

  Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.
- virtual void **shutdown** ()

  *Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.*
- virtual void **wakeup** ()

  *Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.*

Protected Member Functions

- virtual void **run** ()

  Run method - called by the Thread class in the context of the thread.

6.189.1 Constructor & Destructor Documentation

6.189.1.1 activemq::threads::DedicatedTaskRunner::DedicatedTaskRunner (Task * *task*)

6.189.1.2 virtual activemq::threads::DedicatedTaskRunner::~DedicatedTaskRunner ( ) [virtual]

6.189.2 Member Function Documentation

6.189.2.1 virtual void activemq::threads::DedicatedTaskRunner::run ( ) [protected, virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 1793).

6.189.2.2 virtual void activemq::threads::DedicatedTaskRunner::shutdown (unsigned int *timeout*) [virtual]

Shutdown after a timeout, does not guarantee that the task's iterate method has completed and the thread halted.

Parameters

timeout	- Time in Milliseconds to wait for the task to stop.

Implements **activemq::threads::TaskRunner** (p. 2074).

6.189.2.3 virtual void activemq::threads::DedicatedTaskRunner::shutdown ( ) [virtual]

Shutdown once the task has finished and the **TaskRunner** (p. 2074)'s thread has exited.

Implements **activemq::threads::TaskRunner** (p. 2074).

6.189.2.4 virtual void activemq::threads::DedicatedTaskRunner::wakeup ( ) [virtual]

Signal the **TaskRunner** (p. 2074) to wakeup and execute another iteration cycle on the task, the **Task** (p. 2073) instance will be run until its iterate method has returned false indicating it is done.

Implements **activemq::threads::TaskRunner** (p. 2074).

The documentation for this class was generated from the following file:

- src/main/activemq/threads/**DedicatedTaskRunner.h**

6.190 activemq::core::policies::DefaultPrefetchPolicy Class Reference

`#include <src/main/activemq/core/policies/DefaultPrefetchPolicy.h>`

Inheritance diagram for activemq::core::policies::DefaultPrefetchPolicy:

Public Member Functions

- **DefaultPrefetchPolicy** ()
- virtual ~**DefaultPrefetchPolicy** ()
- virtual void **setDurableTopicPrefetch** (int value)

Sets the amount of prefetched messages for a Durable Topic.

- virtual int **getDurableTopicPrefetch** () **const**

  Gets the amount of messages to prefetch for a Durable Topic.

- virtual void **setQueuePrefetch** (int value)

  Sets the amount of prefetched messages for a Queue.

- virtual int **getQueuePrefetch** () **const**

  Gets the amount of messages to prefetch for a Queue.

- virtual void **setQueueBrowserPrefetch** (int value)

  Sets the amount of prefetched messages for a Queue Browser.

- virtual int **getQueueBrowserPrefetch** () **const**

  Gets the amount of messages to prefetch for a Queue Browser.

- virtual void **setTopicPrefetch** (int value)

  Sets the amount of prefetched messages for a Topic.

- virtual int **getTopicPrefetch** () **const**

  Gets the amount of messages to prefetch for a Topic.

- virtual int **getMaxPrefetchLimit** (int value) **const**

  Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

- virtual **PrefetchPolicy** * **clone** () **const**

  Clone the Policy and return a new pointer to that clone.

Static Public Attributes

- static int **MAX_PREFETCH_SIZE**
- static int **DEFAULT_DURABLE_TOPIC_PREFETCH**
- static int **DEFAULT_QUEUE_PREFETCH**
- static int **DEFAULT_QUEUE_BROWSER_PREFETCH**
- static int **DEFAULT_TOPIC_PREFETCH**

6.190.1 Constructor & Destructor Documentation

6.190.1.1 activemq::core::policies::DefaultPrefetchPolicy::DefaultPrefetchPolicy ( )

6.190.1.2 virtual activemq::core::policies::DefaultPrefetchPolicy::~DefaultPrefetchPolicy ( ) [virtual]

6.190.2 Member Function Documentation

6.190.2.1 virtual PrefetchPolicy* activemq::core::policies::DefaultPrefetchPolicy::clone ( ) const [virtual]

Clone the Policy and return a new pointer to that clone.

Returns

pointer to a new **PrefetchPolicy** (p. 1635) instance that is a clone of this one.

Implements **activemq::core::PrefetchPolicy** (p. 1636).

6.190.2.2 virtual int activemq::core::policies::DefaultPrefetchPolicy::getDurableTopicPrefetch ( ) const [inline, virtual]

Gets the amount of messages to prefetch for a Durable Topic.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1636).

6.190.2.3 virtual int activemq::core::policies::DefaultPrefetchPolicy::getMaxPrefetchLimit (int *value*) const [inline, virtual]

Given a requested value for a new prefetch limit, compare it against some max prefetch value and return either the requested value or the maximum allowable value for prefetch.

Returns

the allowable value for a prefetch limit, either requested or the max.

Implements **activemq::core::PrefetchPolicy** (p. 1636).

6.190.2.4 virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueueBrowserPrefetch ( ) const [inline, virtual]

Gets the amount of messages to prefetch for a Queue Browser.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1637).

6.190.2.5 virtual int activemq::core::policies::DefaultPrefetchPolicy::getQueuePrefetch ( ) const [inline, virtual]

Gets the amount of messages to prefetch for a Queue.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1637).

6.190.2.6 virtual int activemq::core::policies::DefaultPrefetchPolicy::getTopicPrefetch ( ) const [inline, virtual]

Gets the amount of messages to prefetch for a Topic.

Returns

value of the number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1637).

6.190.2.7 virtual void activemq::core::policies::DefaultPrefetchPolicy::setDurableTopicPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Durable Topic.

Parameters

value	The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1637).

6.190.2.8 virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueueBrowserPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Queue Browser.

Parameters

value	The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1637).

6.190.2.9 virtual void activemq::core::policies::DefaultPrefetchPolicy::setQueuePrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Queue.

Parameters

value	The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1638).

6.190.2.10 virtual void activemq::core::policies::DefaultPrefetchPolicy::setTopicPrefetch (int *value*) [inline, virtual]

Sets the amount of prefetched messages for a Topic.

Parameters

value	The number of messages to prefetch.

Implements **activemq::core::PrefetchPolicy** (p. 1638).

6.191.1 Constructor & Destructor Documentation

6.191.1.1 activemq::core::policies::DefaultRedeliveryPolicy::DefaultRedeliveryPolicy ( )

6.191.1.2 virtual activemq::core::policies::DefaultRedeliveryPolicy::~DefaultRedeliveryPolicy ( ) [virtual]

6.191.2 Member Function Documentation

6.191.2.1 virtual RedeliveryPolicy* activemq::core::policies::DefaultRedeliveryPolicy::clone ( ) const [virtual]

Create a copy of this Policy and return it.

Returns

pointer to a new **RedeliveryPolicy** (p. 1744) that is a copy of this one.

Implements **activemq::core::RedeliveryPolicy** (p. 1745).

6.191.2.2 virtual double activemq::core::policies::DefaultRedeliveryPolicy::getBackOffMultiplier ( ) const [inline, virtual]

Returns

The value of the Back-Off Multiplier for Message Redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 1746).

6.191.2.3 virtual short activemq::core::policies::DefaultRedeliveryPolicy::getCollisionAvoidancePercent ( ) const [virtual]

Returns

the currently set Collision Avoidance percentage.

Implements **activemq::core::RedeliveryPolicy** (p. 1746).

6.191.2.4 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getInitialRedeliveryDelay ( ) const [inline, virtual]

Gets the initial time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed initially.

Implements **activemq::core::RedeliveryPolicy** (p. 1746).

6.191.2.5 virtual int activemq::core::policies::DefaultRedeliveryPolicy::getMaximumRedeliveries ( ) const [inline, virtual]

Gets the Maximum number of allowed redeliveries for a message before it will be discarded by the consumer.

Returns

maximum allowed redeliveries for a message.

Implements **activemq::core::RedeliveryPolicy** (p. 1746).

6.191.2.6 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getNextRedeliveryDelay (long long *previousDelay*) [virtual]

Given the last used redelivery delay calculate the next value of the delay based on the settings in this Policy instance.

Parameters

previousDelay	The last delay that was used between message redeliveries.

Returns

the new delay to use before attempting another redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 1746).

6.191.2.7 virtual long long activemq::core::policies::DefaultRedeliveryPolicy::getRedeliveryDelay ( ) const [inline, virtual]

Gets the time that redelivery of messages is delayed.

Returns

the time in milliseconds that redelivery is delayed.

Implements **activemq::core::RedeliveryPolicy** (p. 1747).

6.191.2.8 virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseCollisionAvoidance ( ) const [inline, virtual]

Returns

whether or not collision avoidance is enabled for this Policy.

Implements **activemq::core::RedeliveryPolicy** (p. 1747).

6.191.2.9 virtual bool activemq::core::policies::DefaultRedeliveryPolicy::isUseExponentialBackOff ( ) const [inline, virtual]

Returns

whether or not the exponential back off option is enabled.

Implements **activemq::core::RedeliveryPolicy** (p. 1747).

6.191.2.10 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setBackOffMultiplier (double *value*) [inline, virtual]

Sets the Back-Off Multiplier for Message Redelivery.

Parameters

value	The new value for the back-off multiplier.

Implements **activemq::core::RedeliveryPolicy** (p. 1747).

6.191.2.11 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setCollisionAvoidancePercent (short *value*) [virtual]

Parameters

value	The collision avoidance percentage setting.

Implements **activemq::core::RedeliveryPolicy** (p. 1747).

6.191.2.12 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setInitialRedeliveryDelay (long long *value*) [inline, virtual]

Sets the initial time that redelivery will be delayed.

Parameters

value	Time in Milliseconds to wait before starting redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 1748).

6.191.2.13 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setMaximumRedeliveries (int *maximumRedeliveries*) [inline, virtual]

Sets the Maximum allowable redeliveries for a Message.

Parameters

maximum-Redeliveries	The maximum number of times that a message will be redelivered.

Implements **activemq::core::RedeliveryPolicy** (p. 1748).

6.191.2.14 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setRedeliveryDelay (long long *value*) [inline, virtual]

Sets the time that redelivery will be delayed.

Parameters

value	Time in Milliseconds to wait before the next redelivery.

Implements **activemq::core::RedeliveryPolicy** (p. 1748).

6.191.2.15 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseCollisionAvoidance (bool *value*) [inline, virtual]

Parameters

value	Enable or Disable collision avoidance for this Policy.

Implements **activemq::core::RedeliveryPolicy** (p. 1748).

6.191.2.16 virtual void activemq::core::policies::DefaultRedeliveryPolicy::setUseExponentialBackOff (bool *value*) [inline, virtual]

Parameters

value	Enable or Disable the exponential back off multiplier option.

Implements **activemq::core::RedeliveryPolicy** (p. 1748).

6.192.1 Detailed Description

Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.

Since

1.0

6.192.2 Constructor & Destructor Documentation

6.192.2.1 decaf::internal::net::DefaultServerSocketFactory::DefaultServerSocketFactory ( )

6.192.2.2 virtual decaf::internal::net::DefaultServerSocketFactory::~DefaultServerSocketFactory ( ) [virtual]

6.192.3 Member Function Documentation

6.192.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket ( ) [virtual]

Create a new **ServerSocket** (p. 1816) that is unbound.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 1824).

6.192.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1824).

6.192.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port,* int *backlog*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will use the specified connection backlog setting.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

6.192.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::DefaultServerSocketFactory::createServerSocket (int *port,* int *backlog,* const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 1816) will listen on all interfaces.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

address	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

The documentation for this class was generated from the following file:

6.193.1 Detailed Description

SocketFactory implementation that is used to create Sockets.

Since

1.0

6.193.2 Constructor & Destructor Documentation

6.193.2.1 decaf::internal::net::DefaultSocketFactory::DefaultSocketFactory ( )

6.193.2.2 virtual decaf::internal::net::DefaultSocketFactory::~DefaultSocketFactory ( ) [virtual]

6.193.3 Member Function Documentation

6.193.3.1 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket ( ) [virtual]

Creates an unconnected **Socket** (p. 1900) object.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if the **Socket** (p. 1900) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 1917).

6.193.3.2 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.193.3.3 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

The **Socket** (p. 1900) will be bound to the specified local address and port.

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.193.3.4 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const std::string & *name,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

6.193.3.5 virtual decaf::net::Socket* decaf::internal::net::DefaultSocketFactory::createSocket (const std::string & *name,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

- virtual std::vector< std::string > **getDefaultCipherSuites** ()

  Returns the list of cipher suites which are enabled by default.
  Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

  Returns

  an STL vector containing the list of cipher suites enabled by default.

  See also

  ***getSupportedCipherSuites()** (p. 1947)*

- virtual std::vector< std::string > **getSupportedCipherSuites** ()

  Returns the names of the cipher suites which could be enabled for use on an SSL connection.
  Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

  Returns

  an STL vector containing the list of supported cipher suites.

  See also

  ***getDefaultCipherSuites()** (p. 1947)*

6.195.1 Detailed Description

Default implementation of the SSLServerSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

Since

1.0

6.195.2 Constructor & Destructor Documentation

6.195.2.1 decaf::internal::net::ssl::DefaultSSLServerSocketFactory::DefaultSSLServerSocketFactory (const std::string & *errorMessage*)

6.195.2.2 virtual decaf::internal::net::ssl::DefaultSSLServerSocketFactory::~DefaultSSLServerSocketFactory ( ) [virtual]

6.195.3 Member Function Documentation

6.195.3.1 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket ( ) [virtual]

Create a new **ServerSocket** (p. 1816) that is unbound.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Reimplemented from **decaf::net::ServerSocketFactory** (p. 1824).

6.195.3.2 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1824).

6.195.3.3 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port,* int *backlog*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will use the specified connection backlog setting.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

6.195.3.4 virtual decaf::net::ServerSocket* decaf::internal::net::ssl::DefaultSSLServerSocketFactory::createServerSocket (int *port,* int *backlog,* const decaf::net::InetAddress * *address*) [virtual]

Create a new **ServerSocket** (p. 1816) that is bound to the given port.

The **ServerSocket** (p. 1816) will have been configured with the defaults from the factory. The **ServerSocket** (p. 1816) will bind to the specified interface on the local host, and accept connections only on that interface. If the address parameter is NULL than the **ServerSocket** (p. 1816) will listen on all interfaces.

Parameters

port	The port to bind the **ServerSocket** (p. 1816) to.
backlog	The number of pending connect request the **ServerSocket** (p. 1816) can queue.
address	The address of the interface on the local machine to bind to.

Returns

new **ServerSocket** (p. 1816) pointer that is owned by the caller.

Exceptions

IOException	if the **ServerSocket** (p. 1816) cannot be created for some reason.

Implements **decaf::net::ServerSocketFactory** (p. 1825).

6.195.3.5 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getDefaultCipherSuites ( ) [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1947)

Implements **decaf::net::ssl::SSLServerSocketFactory** (p. 1947).

6.195.3.6 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLServerSocketFactory::getSupportedCipherSuites ( ) [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

an STL vector containing the list of supported cipher suites.

See also

getDefaultCipherSuites() *(p. 1956)*

- virtual **decaf::net::Socket** * **createSocket** (**decaf::net::Socket** *socket, std::string host, int port, bool autoClose)

  Returns a socket layered over an existing socket connected to the named host, at the given port.
  This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

  Parameters

socket	*The existing socket to layer over.*
host	*The server host the original **Socket** (p. 1900) is connected to.*
port	*The server port the original **Socket** (p. 1900) is connected to.*
autoClose	*Should the layered over **Socket** (p. 1900) be closed when the topmost socket is closed.*

  Returns

  *a new **Socket** (p. 1900) instance that wraps the given **Socket** (p. 1900).*

  Exceptions

IOException	*if an I/O exception occurs while performing this operation.*
UnknownHostException (p. 2181)	*if the host is unknown.*

6.196.1 Detailed Description

Default implementation of the SSLSocketFactory, this factory throws an Exception from all its create methods to indicate that SSL is not supported, this factory is used when OpenSSL is not enabled in the builds.

6.196.3 Member Function Documentation

6.196.3.1 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket ( ) [virtual]

Creates an unconnected **Socket** (p. 1900) object.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if the **Socket** (p. 1900) cannot be created.

Reimplemented from **decaf::net::SocketFactory** (p. 1917).

6.196.3.2 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.196.3.3 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const decaf::net::InetAddress * *host,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

The **Socket** (p. 1900) will be bound to the specified local address and port.

Parameters

host	The host to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1918).

6.196.3.4 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name,* int *port*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

6.196.3.5 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (const std::string & *name,* int *port,* const decaf::net::InetAddress * *ifAddress,* int *localPort*) [virtual]

Creates a new **Socket** (p. 1900) object and connects it to the specified remote host and port using the configuration of this **SocketFactory** (p. 1916).

Parameters

host	The host name or IP address to connect the socket to.
port	The port on the remote host to connect to.
ifAddress	The address on the local machine to bind the **Socket** (p. 1900) to.
localPort	The local port to bind the **Socket** (p. 1900) to.

Returns

a new **Socket** (p. 1900) object, caller must free this object when done.

Exceptions

IOException	if an I/O error occurs while creating the **Socket** (p. 1900) object.
UnknownHostException *(p. 2181)*	if the host name is not known.

Implements **decaf::net::SocketFactory** (p. 1919).

6.196.3.6 virtual decaf::net::Socket* decaf::internal::net::ssl::DefaultSSLSocketFactory::createSocket (decaf::net::Socket * *socket,* std::string *host,* int *port,* bool *autoClose*) [virtual]

Returns a socket layered over an existing socket connected to the named host, at the given port.

This constructor can be used when tunneling SSL through a proxy or when negotiating the use of SSL over an existing socket. The host and port refer to the logical peer destination. This socket is configured using the socket options established for this factory.

Parameters

socket	The existing socket to layer over.
host	The server host the original **Socket** (p. 1900) is connected to.
port	The server port the original **Socket** (p. 1900) is connected to.
autoClose	Should the layered over **Socket** (p. 1900) be closed when the topmost socket is closed.

Returns

a new **Socket** (p. 1900) instance that wraps the given **Socket** (p. 1900).

Exceptions

IOException	if an I/O exception occurs while performing this operation.
UnknownHostException *(p. 2181)*	if the host is unknown.

Implements **decaf::net::ssl::SSLSocketFactory** (p. 1955).

6.196.3.7 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getDefaultCipherSuites ( ) [virtual]

Returns the list of cipher suites which are enabled by default.

Unless a different list is enabled, handshaking on an SSL connection will use one of these cipher suites. The minimum quality of service for these defaults requires confidentiality protection and server authentication (that is, no anonymous cipher suites).

Returns

an STL vector containing the list of cipher suites enabled by default.

See also

getSupportedCipherSuites() (p. 1956)

Implements **decaf::net::ssl::SSLSocketFactory** (p. 1956).

6.196.3.8 virtual std::vector<std::string> decaf::internal::net::ssl::DefaultSSLSocketFactory::getSupportedCipherSuites ( ) [virtual]

Returns the names of the cipher suites which could be enabled for use on an SSL connection.

Normally, only a subset of these will actually be enabled by default, since this list may include cipher suites which do not meet quality of service requirements for those defaults. Such cipher suites are useful in specialized applications.

Returns

an STL vector containing the list of supported cipher suites.

6.197 activemq::transport::DefaultTransportListener Class Reference

A Utility class that create empty implementations for the **TransportListener** (p. 2176) interface so that a subclass only needs to override the one's its interested.

`#include <src/main/activemq/transport/DefaultTransportListener.h>`

Inheritance diagram for activemq::transport::DefaultTransportListener:

Public Member Functions

- virtual ~**DefaultTransportListener** ()
- virtual void **onCommand** (**const Pointer**< **Command** > &command AMQCPP_UNUSED)

  Event handler for the receipt of a command.
- virtual void **onException** (**const decaf::lang::Exception** &ex AMQCPP_UNUSED)

  Event handler for an exception from a command transport.
- virtual void **transportInterrupted** ()

  The transport has suffered an interruption from which it hopes to recover.
- virtual void **transportResumed** ()

  The transport has resumed after an interruption.

6.197.1 Detailed Description

A Utility class that create empty implementations for the **TransportListener** (p. 2176) interface so that a subclass only needs to override the one's its interested.

6.197.2 Constructor & Destructor Documentation

6.197.2.1 virtual activemq::transport::DefaultTransportListener::~DefaultTransportListener ( ) [inline, virtual]

6.197.3 Member Function Documentation

6.197.3.1 virtual void activemq::transport::DefaultTransportListener::onCommand (const Pointer< Command > &command *AMQCPP_UNUSED*) [inline, virtual]

Event handler for the receipt of a command.

The transport passes off all received commands to its listeners, the listener then owns the Object. If there is no registered listener the **Transport** (p. 2161) deletes the command upon receipt.

Parameters

command	the received command object.

6.197.3.2 virtual void activemq::transport::DefaultTransportListener::onException (const decaf::lang::Exception &ex *AMQCPP_UNUSED*) [inline, virtual]

Event handler for an exception from a command transport.

Parameters

ex	The exception.

6.197.3.3 virtual void activemq::transport::DefaultTransportListener::transportInterrupted ( ) [inline, virtual]

The transport has suffered an interruption from which it hopes to recover.

Implements **activemq::transport::TransportListener** (p. 2178).

6.197.3.4 virtual void activemq::transport::DefaultTransportListener::transportResumed ( ) [inline, virtual]

The transport has resumed after an interruption.

Implements **activemq::transport::TransportListener** (p. 2178).

The documentation for this class was generated from the following file:

- src/main/activemq/transport/**DefaultTransportListener.h**

6.198 decaf::util::zip::Deflater Class Reference

This class compresses data using the *DEFLATE* algorithm (see specification).

`#include <src/main/decaf/util/zip/Deflater.h>`

Public Member Functions

- **Deflater** (int level, bool nowrap=false)

  Creates a new compressor using the specified compression level.
- **Deflater** ()

  Creates a new compressor with the default compression level.
- virtual ~**Deflater** ()
- void **setInput** (**const** unsigned char *buffer, int size, int offset, int length)

  Sets input data for compression.
- void **setInput** (**const** std::vector< unsigned char > &buffer, int offset, int length)

  Sets input data for compression.
- void **setInput** (**const** std::vector< unsigned char > &buffer)

  Sets input data for compression.
- void **setDictionary** (**const** unsigned char *buffer, int size, int offset, int length)

  Sets preset dictionary for compression.
- void **setDictionary** (**const** std::vector< unsigned char > &buffer, int offset, int length)

  Sets preset dictionary for compression.
- void **setDictionary** (**const** std::vector< unsigned char > &buffer)

  Sets preset dictionary for compression.
- void **setStrategy** (int strategy)

  Sets the compression strategy to the specified value.
- void **setLevel** (int level)

  Sets the compression level to the specified value.
- bool **needsInput** () **const**
- void **finish** ()

When called, indicates that compression should end with the current contents of the input buffer.

- bool **finished** () **const**
- int **deflate** (unsigned char *buffer, int size, int offset, int length)

  Fills specified buffer with compressed data.
- int **deflate** (std::vector< unsigned char > &buffer, int offset, int length)

  Fills specified buffer with compressed data.
- int **deflate** (std::vector< unsigned char > &buffer)

  Fills specified buffer with compressed data.
- long long **getAdler** () **const**
- long long **getBytesRead** () **const**
- long long **getBytesWritten** () **const**
- void **reset** ()

  Resets deflater so that a new set of input data can be processed.
- void **end** ()

  Closes the compressor and discards any unprocessed input.

Static Public Attributes

- static **const** int **BEST_SPEED**

  Compression level for fastest compression.
- static **const** int **BEST_COMPRESSION**

  Compression level for best compression.
- static **const** int **DEFAULT_COMPRESSION**

  Default compression level.
- static **const** int **DEFLATED**

  Compression method for the deflate algorithm (the only one currently supported).
- static **const** int **NO_COMPRESSION**

  Compression level for no compression.
- static **const** int **FILTERED**

  Compression strategy best used for data consisting mostly of small values with a somewhat random distribution.
- static **const** int **HUFFMAN_ONLY**

  Compression strategy for Huffman coding only.
- static **const** int **DEFAULT_STRATEGY**

  Default compression strategy.

6.198.1 Detailed Description

This class compresses data using the *DEFLATE* algorithm (see `specification`).

Basically this class is part of the API to the stream based ZLIB compression library and is used as such by **DeflaterOutputStream** (p. 921) and its descendants.

The typical usage of a **Deflater** (p. 913) instance outside this package consists of a specific call to one of its constructors before being passed to an instance of **DeflaterOutputStream** (p. 921).

See also

DeflaterOutputStream (p. 921)
Inflater (p. 1121)

Since

1.0

6.198.2 Constructor & Destructor Documentation

6.198.2.1 decaf::util::zip::Deflater::Deflater (int *level,* bool *nowrap* = `false`)

Creates a new compressor using the specified compression level.

If 'nowrap' is true then the ZLIB header and checksum fields will not be used in order to support the compression format used in both GZIP and PKZIP.

Parameters

level	The compression level to use (0-9).
nowrap	If true uses GZip compatible compression (defaults to false).

6.198.2.2 decaf::util::zip::Deflater::Deflater ( )

Creates a new compressor with the default compression level.

Compressed data will be generated in ZLIB format.

6.198.2.3 virtual decaf::util::zip::Deflater::~Deflater ( ) [virtual]

6.198.3 Member Function Documentation

6.198.3.1 int decaf::util::zip::Deflater::deflate (unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 917) should be called in order to determine if more input data is required.

Parameters

buffer	The Buffer to write the compressed data to.
size	The size of the passed buffer.
offset	The position in the Buffer to start writing at.
length	The maximum number of byte of data to write.

Returns

the actual number of bytes of compressed data.

Exceptions

NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.2 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer,* int *offset,* int *length*)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 917) should be called in order to determine if more input data is required.

Parameters

buffer	The Buffer to write the compressed data to.
offset	The position in the Buffer to start writing at.
length	The maximum number of byte of data to write.

Returns

the actual number of bytes of compressed data.

Exceptions

IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.3 int decaf::util::zip::Deflater::deflate (std::vector< unsigned char > & *buffer*)

Fills specified buffer with compressed data.

Returns actual number of bytes of compressed data. A return value of 0 indicates that **needsInput()** (p. 917) should be called in order to determine if more input data is required.

Parameters

buffer	The Buffer to write the compressed data to.

Returns

the actual number of bytes of compressed data.

Exceptions

IllegalStateException	if in the end state.

6.198.3.4 void decaf::util::zip::Deflater::end ( )

Closes the compressor and discards any unprocessed input.

This method should be called when the compressor is no longer being used, but will also be called automatically by the destructor. Once this method is called, the behavior of the **Deflater** (p. 913) object is undefined.

6.198.3.5 void decaf::util::zip::Deflater::finish ( )

When called, indicates that compression should end with the current contents of the input buffer.

6.198.3.6 bool decaf::util::zip::Deflater::finished ( ) const

Returns

true if the end of the compressed data output stream has been reached.

6.198.3.7 long long decaf::util::zip::Deflater::getAdler ( ) const

Returns

the ADLER-32 value of the uncompressed data.

Exceptions

IllegalStateException	if in the end state.

6.198.3.8 long long decaf::util::zip::Deflater::getBytesRead ( ) const

Returns

the total number of uncompressed bytes input so far.

Exceptions

IllegalStateException	if in the end state.

6.198.3.9 long long decaf::util::zip::Deflater::getBytesWritten ( ) const

Returns

the total number of compressed bytes output so far.

Exceptions

IllegalStateException	if in the end state.

6.198.3.10 bool decaf::util::zip::Deflater::needsInput ( ) const

Returns

true if the input data buffer is empty and **setInput()** (p. 919) should be called in order to provide more input

6.198.3.11 void decaf::util::zip::Deflater::reset ( )

Resets deflater so that a new set of input data can be processed.

Keeps current compression level and strategy settings.

Exceptions

IllegalStateException	if in the end state.

6.198.3.12 void decaf::util::zip::Deflater::setDictionary (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1124), **Inflater.getAdler()** (p. 1123) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

buffer	The buffer containing the preset dictionary.
size	The size of the passed dictionary buffer.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.13 void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & *buffer,* int *offset,* int *length*)

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1124), **Inflater.getAdler()** (p. 1123) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

buffer	The buffer containing the preset dictionary.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.14 void decaf::util::zip::Deflater::setDictionary (const std::vector< unsigned char > & *buffer*)

Sets preset dictionary for compression.

A preset dictionary is used when the history buffer can be predetermined. When the data is later uncompressed with **Inflater.inflate()** (p. 1124), **Inflater.getAdler()** (p. 1123) can be called in order to get the Adler-32 value of the dictionary required for decompression.

Parameters

buffer	The buffer containing the preset dictionary.

Exceptions

IllegalStateException	if in the end state.

6.198.3.15 void decaf::util::zip::Deflater::setInput (const unsigned char * *buffer,* int *size,* int *offset,* int *length*)

Sets input data for compression.

This should be called whenever **needsInput()** (p. 917) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for compression.
size	The size in bytes of the buffer passed.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

NullPointerException	if buffer is NULL.
IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.16 void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & *buffer*, int *offset*, int *length*)

Sets input data for compression.

This should be called whenever **needsInput()** (p. 917) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for compression.
offset	The position in the Buffer to start reading from.
length	The number of bytes to read from the input buffer.

Exceptions

IndexOutOfBounds-Exception	if the offset + length > size of the buffer.
IllegalStateException	if in the end state.

6.198.3.17 void decaf::util::zip::Deflater::setInput (const std::vector< unsigned char > & *buffer*)

Sets input data for compression.

This should be called whenever **needsInput()** (p. 917) returns true indicating that more input data is required.

Parameters

buffer	The Buffer to read in for compression.

Exceptions

IllegalStateException	if in the end state.

6.198.3.18 void decaf::util::zip::Deflater::setLevel (int *level*)

Sets the compression level to the specified value.

Parameters

level	The new Compression level to use.

Exceptions

IllegalArgumentException	if the level value is invalid.
IllegalStateException	if in the end state.

6.198.3.19 void decaf::util::zip::Deflater::setStrategy (int *strategy*)

Sets the compression strategy to the specified value.

Parameters

strategy	The new Compression strategy to use.

Exceptions

IllegalArgumentException	if the strategy value is invalid.
IllegalStateException	if in the end state.

6.198.4 Field Documentation

6.198.4.1 const int decaf::util::zip::Deflater::BEST_COMPRESSION [static]

Compression level for best compression.

6.198.4.2 const int decaf::util::zip::Deflater::BEST_SPEED [static]

Compression level for fastest compression.

6.198.4.3 const int decaf::util::zip::Deflater::DEFAULT_COMPRESSION [static]

Default compression level.

6.198.4.4 const int decaf::util::zip::Deflater::DEFAULT_STRATEGY [static]

Default compression strategy.

6.198.4.5 const int decaf::util::zip::Deflater::DEFLATED [static]

Compression method for the deflate algorithm (the only one currently supported).

6.198.4.6 const int decaf::util::zip::Deflater::FILTERED [static]

Compression strategy best used for data consisting mostly of small values with a somewhat random distribution.

Forces more Huffman coding and less string matching.

6.198.4.7 const int decaf::util::zip::Deflater::HUFFMAN_ONLY [static]

Compression strategy for Huffman coding only.

6.198.4.8 const int decaf::util::zip::Deflater::NO_COMPRESSION [static]

Compression level for no compression.

6.199.1 Detailed Description

Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.

Since

1.0

6.199.2 Constructor & Destructor Documentation

6.199.2.1 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream,* bool *own* = `false`)

Creates a new DeflateOutputStream with a Default **Deflater** (p. 913) and buffer size.

Parameters

outputStream	The OutputStream instance to wrap.
own	Should this filter take ownership of the OutputStream pointer (default is false).

6.199.2.2 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream,* Deflater * *deflater,* bool *own* = `false`, bool *ownDeflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 913) and a default buffer size.

When the user supplied a **Deflater** (p. 913) instance the DeflaterOutpotStream does not take ownership of the **Deflater** (p. 913) pointer unless the ownDeflater parameter is set to true, the caller is still responsible for deleting the **Deflater** (p. 913) when ownDeflater is false.

Parameters

outputStream	The OutputStream instance to wrap.
deflater	The user supplied **Deflater** (p. 913) to use for compression. (
own	Should this filter take ownership of the OutputStream pointer (default is false).
ownDeflater	Should the filter take ownership of the passed **Deflater** (p. 913) object (default is false).

Exceptions

NullPointerException	if the **Deflater** (p. 913) given is NULL.

6.199.2.3 decaf::util::zip::DeflaterOutputStream::DeflaterOutputStream (decaf::io::OutputStream * *outputStream,* Deflater * *deflater,* int *bufferSize,* bool *own* = `false`, bool *ownDeflater* = `false`)

Creates a new DeflateOutputStream with a user supplied **Deflater** (p. 913) and specified buffer size.

When the user supplied a **Deflater** (p. 913) instance the DeflaterOutpotStream does not take ownership of the

Deflater (p. 913) pointer unless the ownDeflater parameter is set to true, otherwise the caller is still responsible for deleting the **Deflater** (p. 913).

Parameters

outputStream	The OutputStream instance to wrap.
deflater	The user supplied **Deflater** (p. 913) to use for compression.
bufferSize	The size of the input buffer.
own	Should this filter take ownership of the OutputStream pointer (default is false).
ownDeflater	Should the filter take ownership of the passed **Deflater** (p. 913) object (default is false).

Exceptions

NullPointerException	if the **Deflater** (p. 913) given is NULL.
IllegalArgumentException	if bufferSize is 0.

6.199.2.4 virtual decaf::util::zip::DeflaterOutputStream::~DeflaterOutputStream ( ) [virtual]

6.199.3 Member Function Documentation

6.199.3.1 virtual void decaf::util::zip::DeflaterOutputStream::close ( ) [virtual]

Closes this object and deallocates the appropriate resources.

The object is generally no longer usable after calling close.

Exceptions

IOException *(p. 1198)*	if an error occurs while closing.

The default implementation of this method does nothing.

The close method of **FilterOutputStream** (p. 1037) calls its flush method, and then calls the close method of its underlying output stream.

Finishes writing any remaining data to the OutputStream then closes the stream.

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.199.3.2 virtual void decaf::util::zip::DeflaterOutputStream::deflate ( ) [protected, virtual]

Writes a buffers worth of compressed data to the wrapped OutputStream.

6.199.3.3 virtual void decaf::util::zip::DeflaterOutputStream::doWriteArrayBounded (const unsigned char * *buffer*, int *size*, int *offset*, int *length*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.199.3.4 virtual void decaf::util::zip::DeflaterOutputStream::doWriteByte (unsigned char *value*) [protected, virtual]

Reimplemented from **decaf::io::FilterOutputStream** (p. 1039).

6.199.3.5 virtual void decaf::util::zip::DeflaterOutputStream::finish ( ) [virtual]

Finishes writing any remaining data to the wrapped OutputStream but does not close it upon completion.

Exceptions

IOException	if an I/O error occurs.

6.199.4 Field Documentation

6.199.4.1 std::vector<unsigned char> decaf::util::zip::DeflaterOutputStream::buf [protected]

The Buffer to use for.

6.199.4.2 const std::size_t decaf::util::zip::DeflaterOutputStream::DEFAULT_BUFFER_SIZE [static, protected]

6.199.4.3 Deflater* decaf::util::zip::DeflaterOutputStream::deflater [protected]

The **Deflater** (p. 913) for this stream.

6.199.4.4 bool decaf::util::zip::DeflaterOutputStream::isDone [protected]

6.199.4.5 bool decaf::util::zip::DeflaterOutputStream::ownDeflater [protected]

6.200 decaf::util::concurrent::Delayed Class Reference

A mix-in style interface for marking objects that should be acted upon after a given delay.

`#include <src/main/decaf/util/concurrent/Delayed.h>`

Inheritance diagram for decaf::util::concurrent::Delayed:

Public Member Functions

- virtual ~**Delayed** ()
- virtual long long **getDelay** (**const TimeUnit** &unit)=0

  Returns the remaining delay associated with this object, in the given time unit.

6.200.1 Detailed Description

A mix-in style interface for marking objects that should be acted upon after a given delay.

An implementation of this interface must define a Comparable methods that provides an ordering consistent with its getDelay method.

6.200.2 Constructor & Destructor Documentation

6.200.2.1 virtual decaf::util::concurrent::Delayed::~Delayed ( ) [inline, virtual]

6.200.3 Member Function Documentation

6.200.3.1 virtual long long decaf::util::concurrent::Delayed::getDelay (const TimeUnit & *unit*) [pure virtual]

Returns the remaining delay associated with this object, in the given time unit.

Parameters

unit	The time unit

Returns

the remaining delay; zero or negative values indicate that the delay has already elapsed

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**Delayed.h**

6.201 cms::DeliveryMode Class Reference

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

`#include <src/main/cms/DeliveryMode.h>`

Public Types

- enum **DELIVERY_MODE** { **PERSISTENT** = 0, **NON_PERSISTENT** = 1 }

  *Enumeration values for **Message** (p. 1426) Delivery Mode.*

Public Member Functions

- virtual ~**DeliveryMode** ()

6.201.1 Detailed Description

This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.

When a client sends a **cms::Message** (p. 1426) it can mark the **Message** (p. 1426) as either Persistent or Non-Persistent. If the client feels that the **Message** (p. 1426) cannot be lost in transit it should mark it as Persistent, otherwise if it is allowable for a **Message** (p. 1426) to occasionally be lost it can mark it as Non-Persistent. This allows the Provider to balance make tradeoffs between balance and **Message** (p. 1426) throughput.

The **DeliveryMode** (p. 925) covers only the transport of the **Message** (p. 1426) for sending client to its destination and doesn't apply to the receiving **Message** (p. 1426) consumer. The receiving Consumer can drop **Message** (p. 1426)'s based on configuration such as memory limits or **Message** (p. 1426) filtering.

A message is guaranteed to be delivered once and only once by a CMS provider if the delivery mode of the message is PERSISTENT and the configuration of the **Message** (p. 1426) consumer allows for it.

Since

1.0

6.201.2 Member Enumeration Documentation

6.201.2.1 enum cms::DeliveryMode::DELIVERY_MODE

Enumeration values for **Message** (p. 1426) Delivery Mode.

Enumerator:

PERSISTENT

NON_PERSISTENT

6.201.3 Constructor & Destructor Documentation

6.201.3.1 virtual cms::DeliveryMode::~DeliveryMode ( ) [virtual]

6.202 decaf::util::Deque< E > Class Template Reference

Defines a 'Double ended **Queue** (p. 1723)' interface that allows for insertion and removal of elements from both ends.

`#include <src/main/decaf/util/Deque.h>`

Inheritance diagram for decaf::util::Deque< E >:

Public Member Functions

- virtual ~**Deque** ()
- virtual void **addFirst** (**const** E &**element**)=0

  *Inserts an element onto the front of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.*
- virtual void **addLast** (**const** E &**element**)=0

  *Inserts an element onto the end of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.*
- virtual bool **offerFirst** (**const** E &**element**)=0

  *This method attempts to insert the given element into the **Deque** (p. 926) at the front end.*
- virtual bool **offerLast** (**const** E &**element**)=0

  *This method attempts to insert the given element into the **Deque** (p. 926) at the end.*
- virtual E **removeFirst** ()=0

  *Removes the topmost element from the **Deque** (p. 926) and returns it.*
- virtual E **removeLast** ()=0

  *Removes the last element from the **Deque** (p. 926) and returns it.*
- virtual bool **pollFirst** (E &**element**)=0

  *Removes the first element from the **Deque** (p. 926) assigns it to the element reference passed.*
- virtual bool **pollLast** (E &**element**)=0

  *Removes the last element from the **Deque** (p. 926) assigns it to the element reference passed.*
- virtual E & **getFirst** ()=0

  *Attempts to fetch a reference to the first element in the **Deque** (p. 926).*

- virtual **const** E & **getFirst** () **const** =0
- virtual E & **getLast** ()=0

  *Attempts to fetch a reference to the last element in the **Deque** (p. 926).*
- virtual **const** E & **getLast** () **const** =0
- virtual bool **peekFirst** (E &value) **const** =0

  *Retrieves the first element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).*
- virtual bool **peekLast** (E &value) **const** =0

  *Retrieves the last element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).*
- virtual bool **removeFirstOccurrence** (**const** E &value)=0

  *Removes the first occurrence of the specified element from this **Deque** (p. 926).*
- virtual bool **removeLastOccurrence** (**const** E &value)=0

  *Removes the last occurrence of the specified element from this **Deque** (p. 926).*
- virtual void **push** (**const** E &**element**)=0

  Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.
- virtual E **pop** ()=0

  *Treats this **Deque** (p. 926) as a stack and attempts to pop an element off the top.*
- virtual **Iterator**< E > * **descendingIterator** ()=0

  *Provides an **Iterator** (p. 1209) over this **Collection** (p. 660) that traverses the element in reverse order.*
- virtual **Iterator**< E > * **descendingIterator** () **const** =0

6.202.1 Detailed Description

template<typename E>class decaf::util::Deque< E >

Defines a 'Double ended **Queue** (p. 1723)' interface that allows for insertion and removal of elements from both ends.

Generally there is no limit on the number of elements that can be placed into a **Deque** (p. 926).

Unlike a **List** (p. 1286) the **Deque** (p. 926) doesn't provide index element based access, however methods are provided to grant access to interior elements.

Since

1.0

6.202.2 Constructor & Destructor Documentation

6.202.2.1 template<typename E> virtual decaf::util::Deque< E >::~Deque ( ) [inline, virtual]

6.202.3 Member Function Documentation

6.202.3.1 template<typename E> virtual void decaf::util::Deque< E >::addFirst (const E & *element*) [pure virtual]

Inserts an element onto the front of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.

For a capacity restricted **Deque** (p. 926) it is preferable to call offerFirst instead.

Parameters

element	The element to be placed at the front of the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1274), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1274), **decaf::util::LinkedList< CompositeTask * >** (p. 1274), **decaf::util::LinkedList< URI >** (p. 1274), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1274), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1274), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1274), **decaf::util::LinkedList< Pointer< Command > >** (p. 1274), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1274), **decaf::util::LinkedList< cms::Destination * >** (p. 1274), **decaf::util::LinkedList< cms::Session * >** (p. 1274), and **decaf::util::LinkedList< cms::Connection * >** (p. 1274).

6.202.3.2 template<typename E> virtual void decaf::util::Deque< E >::addLast (const E & *element*) [pure virtual]

Inserts an element onto the end of the **Deque** (p. 926) if possible without violating the implementations capacity restrictions.

For a capacity restricted **Deque** (p. 926) it is preferable to call offerLast instead.

Parameters

element	The element to be placed at the end of the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1274), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1274), **decaf::util::LinkedList< CompositeTask * >** (p. 1274), **decaf::util::LinkedList< URI >** (p. 1274), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1274), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1274), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1274), **decaf::util::LinkedList< Pointer< Command > >** (p. 1274), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1274), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1274), **decaf::util::LinkedList< cms::Destination * >** (p. 1274), **decaf::util::LinkedList< cms::Session * >** (p. 1274), and **decaf::util::LinkedList< cms::Connection * >** (p. 1274).

6.202.3.3 template<typename E> virtual Iterator<E>* decaf::util::Deque< E >::descendingIterator ( ) [pure virtual]

Provides an **Iterator** (p. 1209) over this **Collection** (p. 660) that traverses the element in reverse order.

Returns

a new **Iterator** (p. 1209) instance that moves from last to first.

Implemented in **decaf::util::LinkedList< E >** (p. 1275), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1275), **decaf::util::LinkedList< CompositeTask * >** (p. 1275), **decaf::util::LinkedList< URI >** (p. 1275), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1275), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1275), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1275), **decaf::util::LinkedList< Pointer< Command > >**

(p. 1275), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1275), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1275), **decaf::util::LinkedList< cms::Destination * >** (p. 1275), **decaf::util::LinkedList< cms::Session * >** (p. 1275), and **decaf::util::LinkedList< cms::Connection * >** (p. 1275).

6.202.3.4 template<typename E> virtual Iterator<E>* decaf::util::Deque< E >::descendingIterator ( ) const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1276), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1276), **decaf::util::LinkedList< CompositeTask * >** (p. 1276), **decaf::util::LinkedList< URI >** (p. 1276), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1276), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1276), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1276), **decaf::util::LinkedList< Pointer< Command > >** (p. 1276), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1276), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1276), **decaf::util::LinkedList< cms::Destination * >** (p. 1276), **decaf::util::LinkedList< cms::Session * >** (p. 1276), and **decaf::util::LinkedList< cms::Connection * >** (p. 1276).

6.202.3.5 template<typename E> virtual E& decaf::util::Deque< E >::getFirst ( ) [pure virtual]

Attempts to fetch a reference to the first element in the **Deque** (p. 926).

This method does not remove the element from the **Deque** (p. 926) but simply returns a reference to it.

Returns

reference to the first element in the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.202.3.6 template<typename E> virtual const E& decaf::util::Deque< E >::getFirst ( ) const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.202.3.7 template<typename E> virtual E& decaf::util::Deque< E >::getLast ( ) [pure virtual]

Attempts to fetch a reference to the last element in the **Deque** (p. 926).

This method does not remove the element from the **Deque** (p. 926) but simply returns a reference to it.

Returns

reference to the last element in the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.202.3.8 template<typename E> virtual const E& decaf::util::Deque< E >::getLast ( ) const [pure virtual]

Implemented in **decaf::util::LinkedList< E >** (p. 1277), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1277), **decaf::util::LinkedList< CompositeTask * >** (p. 1277), **decaf::util::LinkedList< URI >** (p. 1277), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1277), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1277), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1277), **decaf::util::LinkedList< Pointer< Command > >** (p. 1277), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1277), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1277), **decaf::util::LinkedList< cms::Destination * >** (p. 1277), **decaf::util::LinkedList< cms::Session * >** (p. 1277), and **decaf::util::LinkedList< cms::Connection * >** (p. 1277).

6.202.3.9 template<typename E> virtual bool decaf::util::Deque< E >::offerFirst (const E & *element*) [pure virtual]

This method attempts to insert the given element into the **Deque** (p. 926) at the front end.

Unlike the addFirst method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters

element	The element to add to this **Deque** (p. 926).

Returns

true if the element was added, false otherwise.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1279), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1279), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1279), **decaf::util::LinkedList< CompositeTask * >** (p. 1279), **decaf::util::LinkedList< URI >** (p. 1279), **decaf::util::LinkedList< Pointer<**

MessageDispatch > > (p. 1279), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1279), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1279), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1279), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1279), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1279), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1279), **decaf::util::LinkedList**< **cms::Session** * > (p. 1279), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1279).

6.202.3.10 template<typename E> virtual bool decaf::util::Deque< E >::offerLast (const E & *element*) [pure virtual]

This method attempts to insert the given element into the **Deque** (p. 926) at the end.

Unlike the addLast method that throws an exception if it cannot insert the element due to capacity restrictions etc this method returns false if it cannot insert the element.

Parameters

element	The element to add to this **Deque** (p. 926).

Returns

true if the element was added, false otherwise.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList**< **E** > (p. 1280), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1280), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1280), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1280), **decaf::util::LinkedList**< **URI** > (p. 1280), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1280), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1280), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1280), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1280), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1280), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1280), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1280), **decaf::util::LinkedList**< **cms::Session** * > (p. 1280), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1280).

6.202.3.11 template<typename E> virtual bool decaf::util::Deque< E >::peekFirst (E & *value*) const [pure virtual]

Retrieves the first element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).

If this call is successful it returns true. Unlike getFirst this method does not throw an exception if the **Deque** (p. 926) is empty.

Returns

true if an element was assigned to the reference passed, false otherwise.

Implemented in **decaf::util::LinkedList**< **E** > (p. 1281), **decaf::util::LinkedList**< **Pointer**< **Transport** > > (p. 1281), **decaf::util::LinkedList**< **cms::MessageConsumer** * > (p. 1281), **decaf::util::LinkedList**< **CompositeTask** * > (p. 1281), **decaf::util::LinkedList**< **URI** > (p. 1281), **decaf::util::LinkedList**< **Pointer**< **MessageDispatch** > > (p. 1281), **decaf::util::LinkedList**< **Pointer**< **DestinationInfo** > > (p. 1281), **decaf::util::LinkedList**< **PrimitiveValueNode** > (p. 1281), **decaf::util::LinkedList**< **Pointer**< **Command** > > (p. 1281), **decaf::util::LinkedList**< **Pointer**< **BackupTransport** > > (p. 1281), **decaf::util::LinkedList**< **cms::MessageProducer** * > (p. 1281), **decaf::util::LinkedList**< **cms::Destination** * > (p. 1281), **decaf::util::LinkedList**< **cms::Session** * > (p. 1281), and **decaf::util::LinkedList**< **cms::Connection** * > (p. 1281).

6.202.3.12 template<typename E> virtual bool decaf::util::Deque< E >::peekLast (E & *value*) const [pure virtual]

Retrieves the last element contained in this **Deque** (p. 926) and assigns its value to the reference value passed the value however is not removed from the **Deque** (p. 926).

If this call is successful it returns true. Unlike getLast this method does not throw an exception if the **Deque** (p. 926) is empty.

Returns

true if an element was assigned to the reference passed, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1281), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1281), **decaf::util::LinkedList< CompositeTask * >** (p. 1281), **decaf::util::LinkedList< URI >** (p. 1281), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1281), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1281), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1281), **decaf::util::LinkedList< Pointer< Command > >** (p. 1281), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1281), **decaf::util::LinkedList< cms::Destination * >** (p. 1281), **decaf::util::LinkedList< cms::Session * >** (p. 1281), and **decaf::util::LinkedList< cms::Connection * >** (p. 1281).

6.202.3.13 template<typename E> virtual bool decaf::util::Deque< E >::pollFirst (E & *element*) [pure virtual]

Removes the first element from the **Deque** (p. 926) assigns it to the element reference passed.

Parameters

element	Reference to an variable that can be assigned the value of the head of this **Deque** (p. 926).

Returns

true if an element was available to remove, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1281), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1281), **decaf::util::LinkedList< CompositeTask * >** (p. 1281), **decaf::util::LinkedList< URI >** (p. 1281), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1281), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1281), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1281), **decaf::util::LinkedList< Pointer< Command > >** (p. 1281), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1281), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1281), **decaf::util::LinkedList< cms::Destination * >** (p. 1281), **decaf::util::LinkedList< cms::Session * >** (p. 1281), and **decaf::util::LinkedList< cms::Connection * >** (p. 1281).

6.202.3.14 template<typename E> virtual bool decaf::util::Deque< E >::pollLast (E & *element*) [pure virtual]

Removes the last element from the **Deque** (p. 926) assigns it to the element reference passed.

Parameters

element	Reference to an variable that can be assigned the value of the tail of this **Deque** (p. 926).

Returns

true if an element was available to remove, false otherwise.

Implemented in **decaf::util::LinkedList< E >** (p. 1282), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1282), **decaf::util::LinkedList< CompositeTask * >** (p. 1282), **decaf::util::LinkedList< URI >** (p. 1282), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1282), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1282), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1282), **decaf::util::LinkedList< Pointer< Command > >** (p. 1282), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1282), **decaf::util::LinkedList< cms::Destination * >** (p. 1282), **decaf::util::LinkedList< cms::Session * >** (p. 1282), and **decaf::util::LinkedList< cms::Connection * >** (p. 1282).

6.202.3.15 template<typename E> virtual E decaf::util::Deque< E >::pop ( ) [pure virtual]

Treats this **Deque** (p. 926) as a stack and attempts to pop an element off the top.

If there's no element to pop then a NuSuchElementException is thrown, otherwise the top element is removed and assigned to the reference passed.

This operation performs the same basic function as the removeFirst method.

Returns

the element at the front of this deque which would be the top of a stack.

Exceptions

NoSuchElementException *(p. 1537)*	if there is nothing on the top of the stack.

Implemented in **decaf::util::LinkedList< E >** (p. 1282), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1282), **decaf::util::LinkedList< CompositeTask * >** (p. 1282), **decaf::util::LinkedList< URI >** (p. 1282), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1282), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1282), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1282), **decaf::util::LinkedList< Pointer< Command > >** (p. 1282), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1282), **decaf::util::LinkedList< cms::Destination * >** (p. 1282), **decaf::util::LinkedList< cms::Session * >** (p. 1282), and **decaf::util::LinkedList< cms::Connection * >** (p. 1282).

6.202.3.16 template<typename E> virtual void decaf::util::Deque< E >::push (const E & *element*) [pure virtual]

Pushes an element onto the stack represented by this deque (in other words, at the head of this deque) if it is possible to do so immediately without violating capacity restrictions, otherwise it throwing an IllegalStateException if no space is currently available.

This method performs the same basic operation as the addFirst method.

Parameters

element	The element to be pushed onto the **Deque** (p. 926).

Exceptions

IllegalStateException	if the element cannot be added at this time due to capacity restrictions
NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.
IllegalArgumentException	if some property of the specified element prevents it from being added to this deque.

Implemented in **decaf::util::LinkedList< E >** (p. 1282), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1282), **decaf::util::LinkedList< CompositeTask * >** (p. 1282), **decaf::util::LinkedList< URI >** (p. 1282), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1282), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1282), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1282), **decaf::util::LinkedList< Pointer< Command > >** (p. 1282), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1282), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1282), **decaf::util::LinkedList< cms::Destination * >** (p. 1282), **decaf::util::LinkedList< cms::Session * >** (p. 1282), and **decaf::util::LinkedList< cms::Connection * >** (p. 1282).

6.202.3.17 template<typename E> virtual E decaf::util::Deque< E >::removeFirst ( ) [pure virtual]

Removes the topmost element from the **Deque** (p. 926) and returns it.

Unlike the pollFirst method this method throws a NuSuchElementException if the **Deque** (p. 926) is empty.

Returns

the element at the Head of the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1284), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1284), **decaf::util::LinkedList< CompositeTask * >** (p. 1284), **decaf::util::LinkedList< URI >** (p. 1284), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1284), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1284), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1284), **decaf::util::LinkedList< Pointer< Command > >** (p. 1284), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1284), **decaf::util::LinkedList< cms::Destination * >** (p. 1284), **decaf::util::LinkedList< cms::Session * >** (p. 1284), and **decaf::util::LinkedList< cms::Connection * >** (p. 1284).

6.202.3.18 template<typename E> virtual bool decaf::util::Deque< E >::removeFirstOccurrence (const E & *value*) [pure virtual]

Removes the first occurrence of the specified element from this **Deque** (p. 926).

If there is no matching element then the **Deque** (p. 926) is left unchanged.

Parameters

value	The value to be removed from this **Deque** (p. 926).

Returns

true if the **Deque** (p. 926) was modified as a result of this operation.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.

Implemented in **decaf::util::LinkedList< E >** (p. 1284), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1284), **decaf::util::LinkedList< CompositeTask * >** (p. 1284), **decaf::util::LinkedList< URI >** (p. 1284), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1284), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1284), **decaf-**

::util::LinkedList< PrimitiveValueNode > (p. 1284), **decaf::util::LinkedList< Pointer< Command > >** (p. 1284), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1284), **decaf::util::LinkedList< cms::Destination * >** (p. 1284), **decaf::util::LinkedList< cms::Session * >** (p. 1284), and **decaf::util::LinkedList< cms::Connection * >** (p. 1284).

6.202.3.19 template<typename E> virtual E decaf::util::Deque< E >::removeLast ( ) [pure virtual]

Removes the last element from the **Deque** (p. 926) and returns it.

Unlike the pollLast method this method throws a NuSuchElementException if the **Deque** (p. 926) is empty.

Returns

the element at the Tail of the **Deque** (p. 926).

Exceptions

NoSuchElementException *(p. 1537)*	if the **Deque** (p. 926) is empty.

Implemented in **decaf::util::LinkedList< E >** (p. 1284), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1284), **decaf::util::LinkedList< CompositeTask * >** (p. 1284), **decaf::util::LinkedList< URI >** (p. 1284), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1284), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1284), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1284), **decaf::util::LinkedList< Pointer< Command > >** (p. 1284), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1284), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1284), **decaf::util::LinkedList< cms::Destination * >** (p. 1284), **decaf::util::LinkedList< cms::Session * >** (p. 1284), and **decaf::util::LinkedList< cms::Connection * >** (p. 1284).

6.202.3.20 template<typename E> virtual bool decaf::util::Deque< E >::removeLastOccurrence (const E & *value*) [pure virtual]

Removes the last occurrence of the specified element from this **Deque** (p. 926).

If there is no matching element then the **Deque** (p. 926) is left unchanged.

Parameters

value	The value to be removed from this **Deque** (p. 926).

Returns

true if the **Deque** (p. 926) was modified as a result of this operation.

Exceptions

NullPointerException	if the specified element is NULL and this deque is a **Collection** (p. 660) of pointers and does not permit null elements.

Implemented in **decaf::util::LinkedList< E >** (p. 1285), **decaf::util::LinkedList< Pointer< Transport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageConsumer * >** (p. 1285), **decaf::util::LinkedList< CompositeTask * >** (p. 1285), **decaf::util::LinkedList< URI >** (p. 1285), **decaf::util::LinkedList< Pointer< MessageDispatch > >** (p. 1285), **decaf::util::LinkedList< Pointer< DestinationInfo > >** (p. 1285), **decaf::util::LinkedList< PrimitiveValueNode >** (p. 1285), **decaf::util::LinkedList< Pointer< Command > >** (p. 1285), **decaf::util::LinkedList< Pointer< BackupTransport > >** (p. 1285), **decaf::util::LinkedList< cms::MessageProducer * >** (p. 1285), **decaf::util::LinkedList< cms::Destination * >** (p. 1285), **decaf::util::LinkedList< cms::Session * >** (p. 1285), and **decaf::util::LinkedList< cms::Connection * >** (p. 1285).

  *Compares two **Destination** (p. 936) instances to determine if they represent the same logic **Destination** (p. 936).*
- virtual **const CMSProperties** & **getCMSProperties** () **const** =0

  Retrieve any properties that might be part of the destination that was specified.

6.203.1 Detailed Description

A **Destination** (p. 936) object encapsulates a provider-specific address.

There is no standard definition of a **Destination** (p. 936) address, each provider can provide its own definition and there can be configuration data attached to the **Destination** (p. 936) address.

All CMS **Destination** (p. 936) objects support concurrent use.

Creates a new instance of this destination type that is a copy of this one, and returns it.

Returns

cloned copy of this object

Implemented in **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTempQueue** (p. 300), and **activemq::commands::ActiveMQTempTopic** (p. 308).

Referenced by activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setCMSDestination(), and activemq::commands::ActiveMQMessageTemplate< cms::ObjectMessage >::setCMSReplyTo().

6.203.4.2 virtual void cms::Destination::copy (const cms::Destination & *source*) [pure virtual]

Copies the contents of the given **Destination** (p. 936) object to this one.

Parameters

source	The source **Destination** (p. 936) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 250), **activemq::commands::ActiveMQTopic** (p. 322), **activemq::commands::ActiveMQTempQueue** (p. 301), and **activemq::commands::ActiveMQTempTopic** (p. 308).

6.203.4.3 virtual bool cms::Destination::equals (const cms::Destination & *other*) const [pure virtual]

Compares two **Destination** (p. 936) instances to determine if they represent the same logic **Destination** (p. 936).

Parameters

other	The other destination to compare this one to.

Returns

true if the two destinations are the same.

Implemented in **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTempQueue** (p. 302), and **activemq::commands::ActiveMQTempTopic** (p. 309).

6.203.4.4 virtual const CMSProperties& cms::Destination::getCMSProperties ( ) const [pure virtual]

Retrieve any properties that might be part of the destination that was specified.

This is a deviation from the JMS spec but necessary due to C++ restrictions.

Returns

A {const} reference to a **CMSProperties** (p. 644) object.

Implemented in **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 323), **activemq::commands::ActiveMQTempQueue** (p. 302), and **activemq::commands::ActiveMQTempTopic** (p. 309).

6.203.4.5 virtual DestinationType cms::Destination::getDestinationType ( ) const [pure virtual]

Retrieve the **Destination** (p. 936) Type for this **Destination** (p. 936).

Returns

The **Destination** (p. 936) Type

Implemented in **activemq::commands::ActiveMQQueue** (p. 251), **activemq::commands::ActiveMQTopic** (p. 324), **activemq::commands::ActiveMQTempQueue** (p. 303), and **activemq::commands::ActiveMQTempTopic** (p. 310).

6.205.1 Constructor & Destructor Documentation

6.205.1.1 activemq::commands::DestinationInfo::DestinationInfo ( )

6.205.1.2 virtual activemq::commands::DestinationInfo::~DestinationInfo ( ) [virtual]

6.205.2 Member Function Documentation

6.205.2.1 virtual DestinationInfo* activemq::commands::DestinationInfo::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.205.2.2 virtual void activemq::commands::DestinationInfo::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.205.2.3 virtual bool activemq::commands::DestinationInfo::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 382).

6.205.2.4 virtual const std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath ( ) const [virtual]

6.205.2.5 virtual std::vector< decaf::lang::Pointer<BrokerId> >& activemq::commands::DestinationInfo::getBrokerPath ( ) [virtual]

6.205.2.6 virtual const Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId ( ) const [virtual]

6.205.2.7 virtual Pointer<ConnectionId>& activemq::commands::DestinationInfo::getConnectionId ( ) [virtual]

6.205.2.8 virtual unsigned char activemq::commands::DestinationInfo::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.205.2.9 virtual const Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination ( ) const [virtual]

Referenced by activemq::state::ConnectionState::removeTempDestination().

6.205.2.10 virtual Pointer<ActiveMQDestination>& activemq::commands::DestinationInfo::getDestination ( ) [virtual]

6.205.2.11 virtual unsigned char activemq::commands::DestinationInfo::getOperationType ( ) const [virtual]

6.205.2.12 virtual long long activemq::commands::DestinationInfo::getTimeout ( ) const [virtual]

6.205.2.13 virtual void activemq::commands::DestinationInfo::setBrokerPath (const std::vector< decaf::lang::Pointer< BrokerId > > & *brokerPath*) [virtual]

6.205.2.14 virtual void activemq::commands::DestinationInfo::setConnectionId (const Pointer< ConnectionId > & *connectionId*) [virtual]

6.205.2.15 virtual void activemq::commands::DestinationInfo::setDestination (const Pointer< ActiveMQDestination > & *destination*) [virtual]

6.205.2.16 virtual void activemq::commands::DestinationInfo::setOperationType (unsigned char *operationType*) [virtual]

6.205.2.17 virtual void activemq::commands::DestinationInfo::setTimeout (long long *timeout*) [virtual]

6.205.2.18 virtual std::string activemq::commands::DestinationInfo::toString ( ) const [virtual]

Returns a string containing the information for this **DataStructure** (p. 877) such as its type and value of its elements.

Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 386).

6.205.2.19 virtual Pointer<Command> activemq::commands::DestinationInfo::visit (activemq::state::CommandVisitor * *visitor*) [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

Returns

a **Response** (p. 1781) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 674).

6.205.3 Field Documentation

6.205.3.1 std::vector< decaf::lang::Pointer<BrokerId> > activemq::commands::DestinationInfo::brokerPath [protected]

6.206.2 Constructor & Destructor Documentation

6.206.2.1 activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::DestinationInfoMarshaller ( ) [inline]

6.206.2.2 virtual activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::∼DestinationInfoMarshaller ( ) [inline, virtual]

6.206.3 Member Function Documentation

6.206.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.206.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.206.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::looseMarshal (OpenWireFormat ∗ *format*, commands::DataStructure ∗ *command*, decaf::io::DataOutputStream ∗ *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 387).

6.206.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 388).

6.206.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 389).

6.206.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 390).

6.206.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DestinationInfoMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::BaseCommandMarshaller** (p. 391).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/generated/**DestinationInfoMarshaller.h**

6.207 activemq::cmsutil::DestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DestinationResolver.h>`

Inheritance diagram for activemq::cmsutil::DestinationResolver:

Public Member Functions

- virtual ~**DestinationResolver** () throw ()
- virtual void **init** (**ResourceLifecycleManager** *mgr)=0

  Initializes this destination resolver for use.
- virtual void **destroy** ()=0

  Destroys any allocated resources.
- virtual **cms::Destination** * **resolveDestinationName** (**cms::Session** *session, **const** std::string &destName, bool pubSubDomain)=0

  Resolves the given name to a destination.

6.207.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.207.2 Constructor & Destructor Documentation

6.207.2.1 virtual activemq::cmsutil::DestinationResolver::~DestinationResolver ( ) throw () [inline, virtual]

6.207.3 Member Function Documentation

6.207.3.1 virtual void activemq::cmsutil::DestinationResolver::destroy ( ) [pure virtual]

Destroys any allocated resources.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 985).

6.207.3.2 virtual void activemq::cmsutil::DestinationResolver::init (ResourceLifecycleManager * *mgr*) [pure virtual]

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 946)).

Parameters

mgr	the resource lifecycle manager.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 985).

6.207.3.3 virtual cms::Destination* activemq::cmsutil::DestinationResolver::resolveDestinationName (cms::Session * *session,* const std::string & *destName,* bool *pubSubDomain*) [pure virtual]

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

session	the session for which to retrieve resolve the destination.
destName	the name to be resolved.
pubSubDomain	If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

cms::CMSException *(p. 640)*	if resolution failed.

Implemented in **activemq::cmsutil::DynamicDestinationResolver** (p. 985).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DestinationResolver.h**

6.208 decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy Class Reference

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2110) this class always destroys the oldest unexecuted task in the **Queue** (p. 1723) and then attempts to execute the rejected task using the passed in executor.

`#include <src/main/decaf/util/concurrent/ThreadPoolExecutor.h>`

Inheritance diagram for decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy:

Public Member Functions

- **DiscardOldestPolicy** ()
- virtual ~**DiscardOldestPolicy** ()
- virtual void **rejectedExecution** (**decaf::lang::Runnable** *task, **ThreadPoolExecutor** *executer)

  *Method that may be invoked by a **ThreadPoolExecutor** (p. 2104) when **execute** (p. 2110) cannot accept a task.*

6.208.1 Detailed Description

Handler policy for tasks that are rejected upon a call to **ThreadPoolExecutor::execute** (p. 2110) this class always destroys the oldest unexecuted task in the **Queue** (p. 1723) and then attempts to execute the rejected task using the passed in executor.

6.208.3 Member Function Documentation

6.208.3.1 virtual void decaf::util::concurrent::ThreadPoolExecutor::CallerRunsPolicy::DiscardOldestPolicy::rejectedExecution (decaf::lang::Runnable * *r*, ThreadPoolExecutor * *executer*) [inline, virtual]

Method that may be invoked by a **ThreadPoolExecutor** (p. 2104) when **execute** (p. 2110) cannot accept a task.

This may occur when no more threads or queue slots are available because their bounds would be exceeded, or upon shutdown of the **Executor** (p. 1004).

In the absence of other alternatives, the method may throw an **RejectedExecutionException** (p. 1755), which will be propagated to the caller of **execute** (p. 2110).

Parameters

r	The pointer to the runnable task requested to be executed.
executor	The pointer to the executor attempting to execute this task.

Exceptions

RejectedExecution-Exception *(p. 1755)*	if there is no remedy.

Implements **decaf::util::concurrent::RejectedExecutionHandler** (p. 1757).

References decaf::util::concurrent::ThreadPoolExecutor::execute(), decaf::util::concurrent::ThreadPoolExecutor::getQueue(), and decaf::util::concurrent::ThreadPoolExecutor::isShutdown().

6.210.1 Constructor & Destructor Documentation

6.210.1.1 activemq::commands::DiscoveryEvent::DiscoveryEvent ( )

6.210.1.2 virtual activemq::commands::DiscoveryEvent::~DiscoveryEvent ( ) [virtual]

6.210.2 Member Function Documentation

6.210.2.1 virtual DiscoveryEvent* activemq::commands::DiscoveryEvent::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 878).

6.210.2.2 virtual void activemq::commands::DiscoveryEvent::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Implements **activemq::commands::DataStructure** (p. 879).

6.210.2.3 virtual bool activemq::commands::DiscoveryEvent::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Implements **activemq::commands::DataStructure** (p. 879).

6.210.2.4 virtual const std::string& activemq::commands::DiscoveryEvent::getBrokerName ( ) const [virtual]

6.210.2.5 virtual std::string& activemq::commands::DiscoveryEvent::getBrokerName ( ) [virtual]

6.210.2.6 virtual unsigned char activemq::commands::DiscoveryEvent::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Implements **activemq::commands::DataStructure** (p. 880).

6.210.2.7 virtual const std::string& activemq::commands::DiscoveryEvent::getServiceName ( ) const [virtual]

6.210.2.8 virtual std::string& activemq::commands::DiscoveryEvent::getServiceName ( ) [virtual]

6.210.2.9 virtual void activemq::commands::DiscoveryEvent::setBrokerName (const std::string & *brokerName*) [virtual]

6.211 activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller Class Reference

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 952).

`#include <src/main/activemq/wireformat/openwire/marshal/generated/DiscoveryEventMarshaller.h>`

Inheritance diagram for activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller:

Public Member Functions

- **DiscoveryEventMarshaller** ()
- virtual ~**DiscoveryEventMarshaller** ()
- virtual **commands::DataStructure** * **createObject** () **const**

  Creates a new instance of the class that this class is a marshaling director for.
- virtual unsigned char **getDataStructureType** () **const**

  Gets the DataStructureType that this class marshals/unmarshals.

- virtual void **tightUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn, **utils::BooleanStream** ∗bs)

  Tight Un-marhsal to the given stream.
- virtual int **tightMarshal1** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **tightMarshal2** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut, **utils::BooleanStream** ∗bs)

  Tight Marhsal to the given stream.
- virtual void **looseUnmarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataInputStream** ∗dataIn)

  Loose Un-marhsal to the given stream.
- virtual void **looseMarshal** (**OpenWireFormat** ∗wireFormat, **commands::DataStructure** ∗dataStructure, **decaf::io::DataOutputStream** ∗dataOut)

  Tight Marhsal to the given stream.

6.211.1 Detailed Description

Marshaling code for Open Wire Format for **DiscoveryEventMarshaller** (p. 952).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

6.211.2 Constructor & Destructor Documentation

6.211.2.1 activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::DiscoveryEventMarshaller ( ) [inline]

6.211.2.2 virtual activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::∼DiscoveryEventMarshaller ( ) [inline, virtual]

6.211.3 Member Function Documentation

6.211.3.1 virtual commands::DataStructure∗ activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 869).

6.211.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 870).

6.211.3.3 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::looseMarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 871).

6.211.3.4 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::looseUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 872).

6.211.3.5 virtual int activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightMarshal1 (OpenWireFormat * *format*, commands::DataStructure * *command*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 874).

6.211.3.6 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightMarshal2 (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataOutputStream * *ds*, utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 875).

6.211.3.7 virtual void activemq::wireformat::openwire::marshal::generated::DiscoveryEventMarshaller::tightUnmarshal (OpenWireFormat * *format*, commands::DataStructure * *command*, decaf::io::DataInputStream * *dis*, utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 876).

6.212 activemq::core::DispatchData Class Reference

Simple POCO that contains the information necessary to route a message to a specified consumer.

`#include <src/main/activemq/core/DispatchData.h>`

Public Member Functions

- **DispatchData** ()
- **DispatchData** (**const decaf::lang::Pointer**< **commands::ConsumerId** > &consumer, **const decaf::lang::Pointer**< **commands::Message** > &message)
- **const decaf::lang::Pointer** < **commands::ConsumerId** > & **getConsumerId** ()

- **const decaf::lang::Pointer**
  < **commands::Message** > & **getMessage** ()

6.212.1 Detailed Description

Simple POCO that contains the information necessary to route a message to a specified consumer.

6.212.2 Constructor & Destructor Documentation

6.212.2.1 activemq::core::DispatchData::DispatchData ( ) [inline]

6.212.2.2 activemq::core::DispatchData::DispatchData (const decaf::lang::Pointer< commands::ConsumerId > & *consumer,* const decaf::lang::Pointer< commands::Message > & *message*) [inline]

6.212.3 Member Function Documentation

6.212.3.1 const decaf::lang::Pointer<commands::ConsumerId>& activemq::core::DispatchData::getConsumerId ( ) [inline]

6.212.3.2 const decaf::lang::Pointer<commands::Message>& activemq::core::DispatchData::getMessage ( ) [inline]

The documentation for this class was generated from the following file:

- src/main/activemq/core/**DispatchData.h**

6.213 activemq::core::Dispatcher Class Reference

Interface for an object responsible for dispatching messages to consumers.

`#include <src/main/activemq/core/Dispatcher.h>`

Inheritance diagram for activemq::core::Dispatcher:

Public Member Functions

- virtual ~**Dispatcher** ()
- virtual void **dispatch** (**const Pointer**< **MessageDispatch** > &message)=0

  Dispatches a message to a particular consumer.

6.213.1 Detailed Description

Interface for an object responsible for dispatching messages to consumers.

6.213.2 Constructor & Destructor Documentation

6.213.2.1 virtual activemq::core::Dispatcher::~Dispatcher ( ) [inline, virtual]

6.213.3 Member Function Documentation

6.213.3.1 virtual void activemq::core::Dispatcher::dispatch (const Pointer< MessageDispatch > & *message*) [pure virtual]

Dispatches a message to a particular consumer.

Parameters

message	The message to be dispatched to a waiting consumer.

Implemented in **activemq::core::ActiveMQSession** (p. 268), and **activemq::core::ActiveMQConsumer** (p. 185).

The documentation for this class was generated from the following file:

- src/main/activemq/core/**Dispatcher.h**

6.214 decaf::lang::Double Class Reference

`#include <src/main/decaf/lang/Double.h>`

Inheritance diagram for decaf::lang::Double:

Public Member Functions

- **Double** (double value)

  *Constructs a new instance of a **Double** (p. 956) object and assigns it the given value.*
- **Double** (**const** std::string &value)

  *Constructs a new **Double** (p. 956) and attempts to convert the given string to a double value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted double.*
- virtual ~**Double** ()
- virtual int **compareTo** (**const Double** &d) **const**

  *Compares this **Double** (p. 956) instance with another.*
- bool **equals** (**const Double** &d) **const**
- virtual bool **operator==** (**const Double** &d) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const Double** &d) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- virtual int **compareTo** (**const** double &d) **const**

  *Compares this **Double** (p. 956) instance with another.*
- bool **equals** (**const** double &d) **const**
- virtual bool **operator==** (**const** double &d) **const**

  Compares equality between this object and the one passed.
- virtual bool **operator<** (**const** double &d) **const**

  Compares this object to another and returns true if this object is considered to be less than the one passed.
- std::string **toString** () **const**
- virtual double **doubleValue** () **const**

  Answers the double value which the receiver represents.
- virtual float **floatValue** () **const**

  Answers the float value which the receiver represents.

- virtual unsigned char **byteValue** () **const**

  Answers the byte value which the receiver represents.
- virtual short **shortValue** () **const**

  Answers the short value which the receiver represents.
- virtual int **intValue** () **const**

  Answers the int value which the receiver represents.
- virtual long long **longValue** () **const**

  Answers the long value which the receiver represents.
- bool **isInfinite** () **const**
- bool **isNaN** () **const**

Static Public Member Functions

- static int **compare** (double d1, double d2)

  Compares the two specified double values.
- static long long **doubleToLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.
- static long long **doubleToRawLongBits** (double value)

  Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.
- static bool **isInfinite** (double value)
- static bool **isNaN** (double value)
- static double **longBitsToDouble** (long long bits)

  Returns the double value corresponding to a given bit representation.
- static double **parseDouble** (**const** std::string value)

  *Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 956).*
- static std::string **toHexString** (double value)

  Returns a hexadecimal string representation of the double argument.
- static std::string **toString** (double value)

  Returns a string representation of the double argument.
- static **Double valueOf** (double value)

  *Returns a **Double** (p. 956) instance representing the specified double value.*
- static **Double valueOf** (**const** std::string &value)

  *Returns a **Double** (p. 956) instance that wraps a primtive double which is parsed from the string value passed.*

Static Public Attributes

- static **const** int **SIZE** = 64

  The size in bits of the primitive int type.
- static **const** double **MAX_VALUE**

  The maximum value that the primitive type can hold.
- static **const** double **MIN_VALUE**

  The minimum value that the primitive type can hold.
- static **const** double **NaN**

  *Constant for the Not a **Number** (p. 1543) Value.*
- static **const** double **POSITIVE_INFINITY**

  Constant for Positive Infinity.
- static **const** double **NEGATIVE_INFINITY**

  Constant for Negative Infinitiy.

6.214.1 Constructor & Destructor Documentation

6.214.1.1 decaf::lang::Double::Double (double *value*)

Constructs a new instance of a **Double** (p. 956) object and assigns it the given value.

Parameters

value	The primitive type to wrap.

6.214.1.2 decaf::lang::Double::Double (const std::string & *value*)

Constructs a new **Double** (p. 956) and attempts to convert the given string to a double value, assigning it to the new object is successful or throwing a NumberFormatException if the string is not a properly formatted double.

Parameters

value	The string to convert to a primitive type to wrap.

Exceptions

NumberFormatException	if the string is not a a valid double.

6.214.1.3 virtual decaf::lang::Double::~Double ( ) [inline, virtual]

6.214.2 Member Function Documentation

6.214.2.1 virtual unsigned char decaf::lang::Double::byteValue ( ) const [inline, virtual]

Answers the byte value which the receiver represents.

Returns

byte the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1544).

6.214.2.2 static int decaf::lang::Double::compare (double *d1*, double *d2*) [static]

Compares the two specified double values.

The sign of the integer value returned is the same as that of the integer that would be returned by the call: new Double(d1).compareTo(new Double(d2))

Parameters

d1	- the first double to compare
d2	- the second double to compare

Returns

the value 0 if d1 is numerically equal to d2; a value less than 0 if d1 is numerically less than d2; and a value greater than 0 if d1 is numerically greater than d2.

6.214.2.3 virtual int decaf::lang::Double::compareTo (const Double & *d*) const [virtual]

Compares this **Double** (p. 956) instance with another.

Parameters

d	- the **Double** (p. 956) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object repesents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **Double** > (p. 687).

6.214.2.4 virtual int decaf::lang::Double::compareTo (const double & *d*) const [virtual]

Compares this **Double** (p. 956) instance with another.

Parameters

d	- the **Double** (p. 956) instance to be compared

Returns

zero if this object represents the same integer value as the argument; a positive value if this object represents a value greater than the passed in value, and -1 if this object represents a value less than the passed in value.

Implements **decaf::lang::Comparable**< **double** > (p. 687).

6.214.2.5 static long long decaf::lang::Double::doubleToLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout.

Bit 63 (the bit that is selected by the mask 0x8000000000000000L) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000L. If the argument is negative infinity, the result is 0xfff0000000000000L. If the argument is NaN, the result is 0x7ff8000000000000L.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToLongBits (except all NaN values are collapsed to a single "canonical" NaN value).

Parameters

value	- double to be converted

Returns

the long long bits that make up the double

6.214.2.6 static long long decaf::lang::Double::doubleToRawLongBits (double *value*) [static]

Returns a representation of the specified floating-point value according to the IEEE 754 floating-point "double format" bit layout, preserving Not-a-Number (NaN) values.

Bit 63 (the bit that is selected by the mask 0x8000000000000000LL) represents the sign of the floating-point number. Bits 62-52 (the bits that are selected by the mask 0x7ff0000000000000L) represent the exponent. Bits 51-0 (the bits that are selected by the mask 0x000fffffffffffffL) represent the significand (sometimes called the mantissa) of the floating-point number.

If the argument is positive infinity, the result is 0x7ff0000000000000LL. If the argument is negative infinity, the result is 0xfff0000000000000LL. If the argument is NaN, the result is the long integer representing the actual NaN value. Unlike the doubleToLongBits method, doubleToRawLongBits does not collapse all the bit patterns encoding a NaN to a single "canonical" NaN value.

In all cases, the result is a long integer that, when given to the longBitsToDouble(long) method, will produce a floating-point value the same as the argument to doubleToRawLongBits.

Parameters

value	- double to be converted

Returns

the long long bits that make up the double

6.214.2.7 virtual double decaf::lang::Double::doubleValue ( ) const [inline, virtual]

Answers the double value which the receiver represents.

Returns

double the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.214.2.8 bool decaf::lang::Double::equals (const Double & *d*) const [inline, virtual]

Parameters

d	- the **Double** (p. 956) object to compare against.

Returns

true if the two **Double** (p. 956) Objects have the same value.

Implements **decaf::lang::Comparable**< **Double** > (p. 688).

6.214.2.9 bool decaf::lang::Double::equals (const double & *d*) const [inline, virtual]

Parameters

d	- the **Double** (p. 956) object to compare against.

Returns

true if the two **Double** (p. 956) Objects have the same value.

Implements **decaf::lang::Comparable**< **double** > (p. 688).

6.214.2.10 virtual float decaf::lang::Double::floatValue ( ) const [inline, virtual]

Answers the float value which the receiver represents.

Returns

float the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.214.2.11 virtual int decaf::lang::Double::intValue ( ) const [inline, virtual]

Answers the int value which the receiver represents.

Returns

int the value of the receiver.

Implements **decaf::lang::Number** (p. 1544).

6.214.2.12 bool decaf::lang::Double::isInfinite ( ) const

Returns

true if the double is equal to positive infinity.

6.214.2.13 static bool decaf::lang::Double::isInfinite (double *value*) [static]

Parameters

value	- The double to check.

Returns

true if the double is equal to infinity.

6.214.2.14 bool decaf::lang::Double::isNaN ( ) const

Returns

true if the double is equal to NaN.

6.214.2.15 static bool decaf::lang::Double::isNaN (double *value*) [static]

Parameters

value	- The double to check.

Returns

true if the double is equal to NaN.

6.214.2.16 static double decaf::lang::Double::longBitsToDouble (long long *bits*) [static]

Returns the double value corresponding to a given bit representation.

The argument is considered to be a representation of a floating-point value according to the IEEE 754 floating-point "double format" bit layout.

If the argument is 0x7ff0000000000000L, the result is positive infinity. If the argument is 0xfff0000000000000L, the result is negative infinity. If the argument is any value in the range 0x7ff0000000000001L through 0x7fffffffffffffffL or in the range 0xfff0000000000001L through 0xffffffffffffffffL, the result is a NaN. No IEEE 754 floating-point operation provided by C++ can distinguish between two NaN values of the same type with different bit patterns. Distinct values of NaN are only distinguishable by use of the **Double.doubleToRawLongBits** (p. 960) method.

Parameters

bits	- the long long bits to convert to double

Returns

the double converted from the bits

6.214.2.17 virtual long long decaf::lang::Double::longValue ( ) const [inline, virtual]

Answers the long value which the receiver represents.

Returns

long the value of the receiver.

Implements **decaf::lang::Number** (p. 1545).

6.214.2.18 virtual bool decaf::lang::Double::operator< (const Double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

d	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable< Double >** (p. 688).

6.214.2.19 virtual bool decaf::lang::Double::operator< (const double & *d*) const [inline, virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

Parameters

d	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **double** > (p. 688).

6.214.2.20 virtual bool decaf::lang::Double::operator== (const Double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

d	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **Double** > (p. 688).

6.214.2.21 virtual bool decaf::lang::Double::operator== (const double & *d*) const [inline, virtual]

Compares equality between this object and the one passed.

Parameters

d	- the value to be compared to this one.

Returns

true if this object is equal to the one passed.

Implements **decaf::lang::Comparable**< **double** > (p. 688).

6.214.2.22 static double decaf::lang::Double::parseDouble (const std::string *value*) [static]

Returns a new double initialized to the value represented by the specified string, as performed by the valueOf method of class **Double** (p. 956).

Parameters

value	- The string to parse to an double

Returns

a double parsed from the passed string

Exceptions

NumberFormatException	

6.214.2.23 virtual short decaf::lang::Double::shortValue ( ) const [inline, virtual]

Answers the short value which the receiver represents.

Returns

short the value of the receiver.

Reimplemented from **decaf::lang::Number** (p. 1545).

6.214.2.24 static std::string decaf::lang::Double::toHexString (double *value*) [static]

Returns a hexadecimal string representation of the double argument.

All characters mentioned below are ASCII characters.

- If the argument is NaN, the result is the string "NaN".
  - Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the string "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the string "0x0.0p0"; thus, negative zero produces the result "-0x0.0p0" and positive zero produces the result "0x0.0p0". o If m is a double value with a normalized representation, substrings are used to represent the significand and exponent fields. The significand is represented by the characters "0x1." followed by a lowercase hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed unless all the digits are zero, in which case a single zero is used. Next, the exponent is represented by "p" followed by a decimal string of the unbiased exponent as if produced by a call to **Integer.toString** (p. 1173) on the exponent value. o If m is a double value with a subnormal representation, the significand is represented by the characters "0x0." followed by a hexadecimal representation of the rest of the significand as a fraction. Trailing zeros in the hexadecimal representation are removed. Next, the exponent is represented by "p-126". Note that there must be at least one nonzero digit in a subnormal significand.

Parameters

value	- The double to convert to a string

Returns

the Hex formatted double string.

6.214.2.25 std::string decaf::lang::Double::toString ( ) const

Returns

this **Double** (p. 956) Object as a **String** (p. 2031) Representation

6.214.2.26 static std::string decaf::lang::Double::toString (double *value*) [static]

Returns a string representation of the double argument.

All characters mentioned below are ASCII characters.

If the argument is NaN, the result is the string "NaN". Otherwise, the result is a string that represents the sign and magnitude (absolute value) of the argument. If the sign is negative, the first character of the result is '-'; if the sign

is positive, no sign character appears in the result. As for the magnitude m: o If m is infinity, it is represented by the characters "Infinity"; thus, positive infinity produces the result "Infinity" and negative infinity produces the result "-Infinity". o If m is zero, it is represented by the characters "0.0"; thus, negative zero produces the result "-0.0" and positive zero produces the result "0.0". o If m is greater than or equal to 10-3 but less than 107, then it is represented as the integer part of m, in decimal form with no leading zeroes, followed by '.', followed by one or more decimal digits representing the fractional part of m. o If m is less than 10-3 or greater than or equal to 107, then it is represented in so-called "computerized scientific notation." Let n be the unique integer such that 10n <= m < 10n+1; then let a be the mathematically exact quotient of m and 10n so that 1 <= a < 10. The magnitude is then represented as the integer part of a, as a single decimal digit, followed by '.', followed by decimal digits representing the fractional part of a, followed by the letter 'E', followed by a representation of n as a decimal integer, as produced by the method **Integer.toString(int)** (p. 1173).

Parameters

value	- The double to convert to a string

Returns

the formatted double string.

6.214.2.27 static Double decaf::lang::Double::valueOf (double *value*) [static]

Returns a **Double** (p. 956) instance representing the specified double value.

Parameters

value	- double to wrap

Returns

new **Double** (p. 956) instance wrapping the primitive value

6.214.2.28 static Double decaf::lang::Double::valueOf (const std::string & *value*) [static]

Returns a **Double** (p. 956) instance that wraps a primtive double which is parsed from the string value passed.

Parameters

value	- the string to parse

Returns

a new **Double** (p. 956) instance wrapping the double parsed from value

Exceptions

NumberFormatException	on error.

6.214.3 Field Documentation

6.214.3.1 const double decaf::lang::Double::MAX_VALUE [static]

The maximum value that the primitive type can hold.

6.214.3.2 const double decaf::lang::Double::MIN_VALUE [static]

The minimum value that the primitive type can hold.

6.214.3.3 const double decaf::lang::Double::NaN [static]

Constant for the Not a **Number** (p. 1543) Value.

6.214.3.4 const double decaf::lang::Double::NEGATIVE_INFINITY [static]

Constant for Negative Infinitiy.

6.214.3.5 const double decaf::lang::Double::POSITIVE_INFINITY [static]

Constant for Positive Infinity.

6.214.3.6 const int decaf::lang::Double::SIZE = 64 [static]

The size in bits of the primitive int type.

The documentation for this class was generated from the following file:

- src/main/decaf/lang/**Double.h**

6.215 decaf::internal::nio::DoubleArrayBuffer Class Reference

`#include <src/main/decaf/internal/nio/DoubleArrayBuffer.h>`

Inheritance diagram for decaf::internal::nio::DoubleArrayBuffer:

Public Member Functions

- **DoubleArrayBuffer** (int **capacity**, bool readOnly=false)

  *Creates a **DoubleArrayBuffer** (p. 966) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*
- **DoubleArrayBuffer** (double ∗**array**, int size, int offset, int length, bool readOnly=false)

  *Creates a **DoubleArrayBuffer** (p. 966) object that wraps the given array.*
- **DoubleArrayBuffer** (**const decaf::lang::Pointer**< **ByteArrayAdapter** > &**array**, int offset, int length, bool readOnly=false)

  Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.
- **DoubleArrayBuffer** (**const DoubleArrayBuffer** &other)

  *Create a **DoubleArrayBuffer** (p. 966) that mirrors this one, meaning it shares a reference to this buffers ByteArrayAdapter and when changes are made to that data it is reflected in both.*
- virtual ∼**DoubleArrayBuffer** ()
- virtual double ∗ **array** ()

  Returns the double array that backs this buffer (optional operation).
  Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

*the array that backs this **Buffer** (p. 451).*

Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual int **arrayOffset** ()

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).
  Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

  Returns

  The offset into the backing array where index zero starts.

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this **Buffer** (p. 451) is read only.*
UnsupportedOperation-Exception	*if the underlying store has no array.*

- virtual **DoubleBuffer** * **asReadOnlyBuffer** () **const**

  Creates a new, read-only double buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.
  If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

  Returns

  The new, read-only double buffer which the caller then owns.

- virtual **DoubleBuffer** & **compact** ()

  Compacts this buffer.
  *The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.*
  The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

  Returns

  *a reference to this **DoubleBuffer** (p. 975).*

  Exceptions

ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **DoubleBuffer** * **duplicate** ()

  Creates a new double buffer that shares this buffer's content.
  The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
  The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

  Returns

  *a new double **Buffer** (p. 451) which the caller owns.*

- virtual double **get** ()

  Relative get method.
  Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

BufferUnderflowException (p. 474)	*if there no more data to return.*

- virtual double **get** (int index) **const**

Absolute get method.
Reads the value at the given index.

Parameters

index	*The index in the **Buffer** (p. 451) where the double is to be read.*

Returns

the double that is located at the given index.

Exceptions

IndexOutOfBoundsException	*if index is not smaller than the buffer's limit*

- virtual bool **hasArray** () **const**

Tells whether or not this buffer is backed by an accessible double array.
If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

- virtual bool **isReadOnly** () **const**

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

- virtual **DoubleBuffer** & **put** (double value)

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value	*The doubles value to be written.*

Returns

a reference to this buffer.

Exceptions

BufferOverflowException (p. 472)	*if this buffer's current position is not smaller than its limit.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **DoubleBuffer** & **put** (int index, double value)

Writes the given doubles into this buffer at the given index.

Parameters

index	*The position in the **Buffer** (p. 451) to write the data.*
value	*The doubles to write.*

Returns

a reference to this buffer

Exceptions

IndexOutOfBoundsException	*if index greater than the buffer's limit minus the size of the type being written, or the index is negative.*
ReadOnlyBufferException (p. 1739)	*if this buffer is read-only.*

- virtual **DoubleBuffer** ∗ **slice** () **const**

*Creates a new **DoubleBuffer** (p. 975) whose content is a shared subsequence of this buffer's content.*
The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.
The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

*the newly create **DoubleBuffer** (p. 975) which the caller owns.*

Protected Member Functions

- virtual void **setReadOnly** (bool value)

  *Sets this **DoubleArrayBuffer** (p. 966) as Read-Only or not Read-Only.*

6.215.1 Constructor & Destructor Documentation

6.215.1.1 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (int *capacity,* bool *readOnly =* `false`)

Creates a **DoubleArrayBuffer** (p. 966) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

size	The size of the array, this is the limit we read and write to.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

IllegalArguementException	if the capacity value is negative.

6.215.1.2 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (double * *array,* int *size,* int *offset,* int *length,* bool *readOnly =* `false`)

Creates a **DoubleArrayBuffer** (p. 966) object that wraps the given array.

If the own flag is set then it will delete this array when this object is deleted.

Parameters

array	The actual array to wrap.
size	The size of the given array.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if buffer is NULL
IndexOutOfBounds-Exception	if offset is greater than array capacity.

6.215.1.3 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const decaf::lang::Pointer< ByteArrayAdapter > & *array,* int *offset,* int *length,* bool *readOnly* = false)

Creates a byte buffer that wraps the passed ByteArrayAdapter and start at the given offset.

The capacity and limit of the new **DoubleArrayBuffer** (p. 966) will be that of the remaining capacity of the passed buffer.

Parameters

array	The ByteArrayAdapter to wrap.
offset	The position that is this buffers start position.
length	The limit of how many bytes into the array this Buffer can write.
readOnly	Boolean indicating if this buffer should be read-only, default as false.

Exceptions

NullPointerException	if array is NULL
IndexOutOfBounds-Exception	if offset + length is greater than array size.

6.215.1.4 decaf::internal::nio::DoubleArrayBuffer::DoubleArrayBuffer (const DoubleArrayBuffer & *other*)

Create a **DoubleArrayBuffer** (p. 966) that mirrors this one, meaning it shares a reference to this buffers ByteArray-Adapter and when changes are made to that data it is reflected in both.

Parameters

other	The **DoubleArrayBuffer** (p. 966) this one is to mirror.

6.215.1.5 virtual decaf::internal::nio::DoubleArrayBuffer::~DoubleArrayBuffer ( ) [virtual]

6.215.2 Member Function Documentation

6.215.2.1 virtual double* decaf::internal::nio::DoubleArrayBuffer::array ( ) [virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 977).

6.215.2.2 virtual int decaf::internal::nio::DoubleArrayBuffer::arrayOffset ( ) [virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implements **decaf::nio::DoubleBuffer** (p. 977).

6.215.2.3 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::asReadOnlyBuffer ( ) const [virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implements **decaf::nio::DoubleBuffer** (p. 978).

6.215.2.4 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::compact ( ) [virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer** (p. 975).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 978).

6.215.2.5 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::duplicate ( ) [virtual]

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double **Buffer** (p. 451) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 978).

6.215.2.6 virtual double decaf::internal::nio::DoubleArrayBuffer::get ( ) [virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implements **decaf::nio::DoubleBuffer** (p. 979).

6.215.2.7 virtual double decaf::internal::nio::DoubleArrayBuffer::get (int *index*) const [virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the double is to be read.

Returns

the double that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit

Implements **decaf::nio::DoubleBuffer** (p. 979).

6.215.2.8 virtual bool decaf::internal::nio::DoubleArrayBuffer::hasArray ( ) const [inline, virtual]

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implements **decaf::nio::DoubleBuffer** (p. 980).

6.215.2.9 virtual bool decaf::internal::nio::DoubleArrayBuffer::isReadOnly ( ) const [inline, virtual]

Tells whether or not this buffer is read-only.

Returns

true if, and only if, this buffer is read-only.

Implements **decaf::nio::Buffer** (p. 454).

6.215.2.10 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (double *value*) [virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value	The doubles value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 982).

6.215.2.11 virtual DoubleBuffer& decaf::internal::nio::DoubleArrayBuffer::put (int *index*, double *value*) [virtual]

Writes the given doubles into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or the index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implements **decaf::nio::DoubleBuffer** (p. 982).

6.215.2.12 virtual void decaf::internal::nio::DoubleArrayBuffer::setReadOnly (bool *value*) [inline, protected, virtual]

Sets this **DoubleArrayBuffer** (p. 966) as Read-Only or not Read-Only.

Parameters

value	Boolean value, true if this buffer is to be read-only, false otherwise.

6.215.2.13 virtual DoubleBuffer* decaf::internal::nio::DoubleArrayBuffer::slice ( ) const [virtual]

Creates a new **DoubleBuffer** (p. 975) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer, and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** (p. 975) which the caller owns.

Implements **decaf::nio::DoubleBuffer** (p. 983).

The documentation for this class was generated from the following file:

- src/main/decaf/internal/nio/**DoubleArrayBuffer.h**

6.216 decaf::nio::DoubleBuffer Class Reference

This class defines four categories of operations upon double buffers:

`#include <src/main/decaf/nio/DoubleBuffer.h>`

Inheritance diagram for decaf::nio::DoubleBuffer:

Public Member Functions

- virtual ~**DoubleBuffer** ()
- virtual std::string **toString** () **const**
- virtual double * **array** ()=0

Returns the double array that backs this buffer (optional operation).

- virtual int **arrayOffset** ()=0

  Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

- virtual **DoubleBuffer** * **asReadOnlyBuffer** () **const** =0

  Creates a new, read-only double buffer that shares this buffer's content.

- virtual **DoubleBuffer** & **compact** ()=0

  Compacts this buffer.

- virtual **DoubleBuffer** * **duplicate** ()=0

  Creates a new double buffer that shares this buffer's content.

- virtual double **get** ()=0

  Relative get method.

- virtual double **get** (int index) **const** =0

  Absolute get method.

- **DoubleBuffer** & **get** (std::vector< double > buffer)

  Relative bulk get method.

- **DoubleBuffer** & **get** (double *buffer, int size, int offset, int length)

  Relative bulk get method.

- virtual bool **hasArray** () **const** =0

  Tells whether or not this buffer is backed by an accessible double array.

- **DoubleBuffer** & **put** (**DoubleBuffer** &src)

  This method transfers the doubles remaining in the given source buffer into this buffer.

- **DoubleBuffer** & **put** (**const** double *buffer, int size, int offset, int length)

  This method transfers doubles into this buffer from the given source array.

- **DoubleBuffer** & **put** (std::vector< double > &buffer)

  This method transfers the entire content of the given source doubles array into this buffer.

- virtual **DoubleBuffer** & **put** (double value)=0

  Writes the given doubles into this buffer at the current position, and then increments the position.

- virtual **DoubleBuffer** & **put** (int index, double value)=0

  Writes the given doubles into this buffer at the given index.

- virtual **DoubleBuffer** * **slice** () **const** =0

  *Creates a new **DoubleBuffer** (p. 975) whose content is a shared subsequence of this buffer's content.*

- virtual bool **equals** (**const DoubleBuffer** &value) **const**

- virtual bool **operator==** (**const DoubleBuffer** &value) **const**

- virtual bool **operator<** (**const DoubleBuffer** &value) **const**

Static Public Member Functions

- static **DoubleBuffer** * **allocate** (int **capacity**)

  *Allocates a new **DoubleBuffer** (p. 975).*

- static **DoubleBuffer** * **wrap** (double ***array**, int size, int offset, int length)

  *Wraps the passed buffer with a new **DoubleBuffer** (p. 975).*

- static **DoubleBuffer** * **wrap** (std::vector< double > &buffer)

  *Wraps the passed STL double Vector in a **DoubleBuffer** (p. 975).*

Protected Member Functions

- **DoubleBuffer** (int **capacity**)

  *Creates a **DoubleBuffer** (p. 975) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.*

6.216.1 Detailed Description

This class defines four categories of operations upon double buffers:

o Absolute and relative get and put methods that read and write single doubles; o Relative bulk get methods that transfer contiguous sequences of doubles from this buffer into an array; and o Relative bulk put methods that transfer contiguous sequences of doubles from a double array or some other double buffer into this buffer o Methods for compacting, duplicating, and slicing a double buffer.

Double buffers can be created either by allocation, which allocates space for the buffer's content, by wrapping an existing double array into a buffer, or by creating a view of an existing byte buffer

Methods in this class that do not otherwise have a value to return are specified to return the buffer upon which they are invoked. This allows method invocations to be chained.

Since

1.0

6.216.2 Constructor & Destructor Documentation

6.216.2.1 decaf::nio::DoubleBuffer::DoubleBuffer (int *capacity*) [protected]

Creates a **DoubleBuffer** (p. 975) object that has its backing array allocated internally and is then owned and deleted when this object is deleted.

The array is initially created with all elements initialized to zero.

Parameters

capacity	The size and limit of the **Buffer** (p. 451) in doubles

Exceptions

IllegalArguementException	if capacity is negative.

6.216.2.2 virtual decaf::nio::DoubleBuffer::~DoubleBuffer ( ) [inline, virtual]

6.216.3 Member Function Documentation

6.216.3.1 static DoubleBuffer* decaf::nio::DoubleBuffer::allocate (int *capacity*) [static]

Allocates a new **DoubleBuffer** (p. 975).

The new buffer's position will be zero, its limit will be its capacity, and its mark will be undefined. It will have a backing array, and its array offset will be zero.

Parameters

capacity	The size of the Double buffer in doubles.

Returns

the **DoubleBuffer** (p. 975) that was allocated, caller owns.

Exceptions

IllegalArgumentException	is the capacity value is negative.

6.216.3.2 virtual double* decaf::nio::DoubleBuffer::array ( ) [pure virtual]

Returns the double array that backs this buffer (optional operation).

Modifications to this buffer's content will cause the returned array's content to be modified, and vice versa.

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

the array that backs this **Buffer** (p. 451).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 970).

6.216.3.3 virtual int decaf::nio::DoubleBuffer::arrayOffset ( ) [pure virtual]

Returns the offset within this buffer's backing array of the first element of the buffer (optional operation).

Invoke the hasArray method before invoking this method in order to ensure that this buffer has an accessible backing array.

Returns

The offset into the backing array where index zero starts.

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this **Buffer** (p. 451) is read only.
UnsupportedOperation-Exception	if the underlying store has no array.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 971).

6.216.3.4 virtual DoubleBuffer* decaf::nio::DoubleBuffer::asReadOnlyBuffer ( ) const [pure virtual]

Creates a new, read-only double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer; the new buffer itself, however, will be read-only and will not allow the shared content to be modified. The two buffers' position, limit, and mark values will be independent.

If this buffer is itself read-only then this method behaves in exactly the same way as the duplicate method.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer.

Returns

The new, read-only double buffer which the caller then owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 971).

6.216.3.5 virtual DoubleBuffer& decaf::nio::DoubleBuffer::compact ( ) [pure virtual]

Compacts this buffer.

The bytes between the buffer's current position and its limit, if any, are copied to the beginning of the buffer. That is, the byte at index p = **position()** (p. 455) is copied to index zero, the byte at index p + 1 is copied to index one, and so forth until the byte at index **limit()** (p. 455) - 1 is copied to index n = **limit()** (p. 455) - 1 - p. The buffer's position is then set to n+1 and its limit is set to its capacity. The mark, if defined, is discarded.

The buffer's position is set to the number of bytes copied, rather than to zero, so that an invocation of this method can be followed immediately by an invocation of another relative put method.

Returns

a reference to this **DoubleBuffer** (p. 975).

Exceptions

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 971).

6.216.3.6 virtual int decaf::nio::DoubleBuffer::compareTo (const DoubleBuffer & *value*) const [virtual]

6.216.3.7 virtual DoubleBuffer* decaf::nio::DoubleBuffer::duplicate ( ) [pure virtual]

Creates a new double buffer that shares this buffer's content.

The content of the new buffer will be that of this buffer. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's capacity, limit, position, and mark values will be identical to those of this buffer. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

a new double **Buffer** (p. 451) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 972).

6.216.3.8 virtual bool decaf::nio::DoubleBuffer::equals (const DoubleBuffer & *value*) const [virtual]

6.216.3.9 virtual double decaf::nio::DoubleBuffer::get ( ) [pure virtual]

Relative get method.

Reads the value at this buffer's current position, and then increments the position.

Returns

the double at the current position.

Exceptions

BufferUnderflowException *(p. 474)*	if there no more data to return.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 972).

6.216.3.10 virtual double decaf::nio::DoubleBuffer::get (int *index*) const [pure virtual]

Absolute get method.

Reads the value at the given index.

Parameters

index	The index in the **Buffer** (p. 451) where the double is to be read.

Returns

the double that is located at the given index.

Exceptions

IndexOutOfBounds-Exception	if index is not smaller than the buffer's limit

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 972).

6.216.3.11 DoubleBuffer& decaf::nio::DoubleBuffer::get (std::vector< double > *buffer*)

Relative bulk get method.

This method transfers values from this buffer into the given destination vector. An invocation of this method of the form src.get(a) behaves in exactly the same way as the invocation. The vector must be sized to the amount of data that is to be read, that is to say, the caller should call buffer.resize(N) before calling this get method.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	iIf there are fewer than length doubles remaining in this buffer

6.216.3.12 DoubleBuffer& decaf::nio::DoubleBuffer::get (double * *buffer*, int *size*, int *offset*, int *length*)

Relative bulk get method.

This method transfers doubles from this buffer into the given destination array. If there are fewer doubles remaining in the buffer than are required to satisfy the request, that is, if length > **remaining()** (p. 456), then no bytes are transferred and a **BufferUnderflowException** (p. 474) is thrown.

Otherwise, this method copies length doubles from this buffer into the given array, starting at the current position of this buffer and at the given offset in the array. The position of this buffer is then incremented by length.

Parameters

buffer	The pointer to an allocated buffer to fill.
size	The size of the buffer passed.
offset	The position in the buffer to start filling.
length	The amount of data to put in the passed buffer.

Returns

a reference to this **Buffer** (p. 451).

Exceptions

BufferUnderflowException *(p. 474)*	if there are fewer than length doubles remaining in this buffer
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.216.3.13 virtual bool decaf::nio::DoubleBuffer::hasArray ( ) const [pure virtual]

Tells whether or not this buffer is backed by an accessible double array.

If this method returns true then the array and arrayOffset methods may safely be invoked. Subclasses should override this method if they do not have a backing array as this class always returns true.

Returns

true if, and only if, this buffer is backed by an array and is not read-only

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 973).

6.216.3.14 virtual bool decaf::nio::DoubleBuffer::operator< (const DoubleBuffer & *value*) const [virtual]

6.216.3.15 virtual bool decaf::nio::DoubleBuffer::operator== (const DoubleBuffer & *value*) const [virtual]

6.216.3.16 DoubleBuffer& decaf::nio::DoubleBuffer::put (DoubleBuffer & *src*)

This method transfers the doubles remaining in the given source buffer into this buffer.

If there are more doubles remaining in the source buffer than in this buffer, that is, if src.remaining() > **remaining()** (p. 456), then no doubles are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies n = src.remaining() doubles from the given buffer into this buffer, starting at each buffer's current position. The positions of both buffers are then incremented by n.

Parameters

src	The buffer to take doubles from an place in this one.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer for the remaining doubles in the source buffer
IllegalArgumentException	if the source buffer is this buffer.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.216.3.17 DoubleBuffer& decaf::nio::DoubleBuffer::put (const double * *buffer*, int *size*, int *offset*, int *length*)

This method transfers doubles into this buffer from the given source array.

If there are more doubles to be copied from the array than remain in this buffer, that is, if length > **remaining()** (p. 456), then no doubles are transferred and a **BufferOverflowException** (p. 472) is thrown.

Otherwise, this method copies length bytes from the given array into this buffer, starting at the given offset in the array and at the current position of this buffer. The position of this buffer is then incremented by length.

Parameters

buffer	The array from which doubles are to be read.
size	The size of the buffer passed.
offset	The offset within the array of the first char to be read.
length	The number of doubles to be read from the given array.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only
NullPointerException	if the passed buffer is null.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.216.3.18 DoubleBuffer& decaf::nio::DoubleBuffer::put (std::vector< double > & *buffer*)

This method transfers the entire content of the given source doubles array into this buffer.

This is the same as calling put(&buffer[0], 0, buffer.size().

Parameters

buffer	The buffer whose contents are copied to this **DoubleBuffer** (p. 975).

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if there is insufficient space in this buffer.

ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

6.216.3.19 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (double *value*) [pure virtual]

Writes the given doubles into this buffer at the current position, and then increments the position.

Parameters

value	The doubles value to be written.

Returns

a reference to this buffer.

Exceptions

BufferOverflowException *(p. 472)*	if this buffer's current position is not smaller than its limit.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 973).

6.216.3.20 virtual DoubleBuffer& decaf::nio::DoubleBuffer::put (int *index*, double *value*) [pure virtual]

Writes the given doubles into this buffer at the given index.

Parameters

index	The position in the **Buffer** (p. 451) to write the data.
value	The doubles to write.

Returns

a reference to this buffer

Exceptions

IndexOutOfBounds-Exception	if index greater than the buffer's limit minus the size of the type being written, or the index is negative.
ReadOnlyBufferException *(p. 1739)*	if this buffer is read-only.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 974).

6.216.3.21 virtual DoubleBuffer* decaf::nio::DoubleBuffer::slice ( ) const [pure virtual]

Creates a new **DoubleBuffer** (p. 975) whose content is a shared subsequence of this buffer's content.

The content of the new buffer will start at this buffer's current position. Changes to this buffer's content will be visible in the new buffer, and vice versa; the two buffers' position, limit, and mark values will be independent.

The new buffer's position will be zero, its capacity and its limit will be the number of bytes remaining in this buffer,

and its mark will be undefined. The new buffer will be read-only if, and only if, this buffer is read-only.

Returns

the newly create **DoubleBuffer** (p. 975) which the caller owns.

Implemented in **decaf::internal::nio::DoubleArrayBuffer** (p. 974).

6.216.3.22 virtual std::string decaf::nio::DoubleBuffer::toString ( ) const [virtual]

Returns

a std::string describing this object

6.216.3.23 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (double * *array,* int *size,* int *offset,* int *length*) [static]

Wraps the passed buffer with a new **DoubleBuffer** (p. 975).

The new buffer will be backed by the given double array; that is, modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity will be array.length, its position will be offset, its limit will be offset + length, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

array	The array that will back the new buffer.
size	The size of the passed in array.
offset	The offset of the subarray to be used.
length	The length of the subarray to be used.

Returns

a new **DoubleBuffer** (p. 975) that is backed by buffer, caller owns.

Exceptions

NullPointerException	if the array pointer is NULL.
IndexOutOfBounds-Exception	if the preconditions of size, offset, or length are not met.

6.216.3.24 static DoubleBuffer* decaf::nio::DoubleBuffer::wrap (std::vector< double > & *buffer*) [static]

Wraps the passed STL double Vector in a **DoubleBuffer** (p. 975).

The new buffer will be backed by the given double array; modifications to the buffer will cause the array to be modified and vice versa. The new buffer's capacity and limit will be buffer.size(), its position will be zero, and its mark will be undefined. Its backing array will be the given array, and its array offset will be zero.

Parameters

buffer	The vector that will back the new buffer, the vector must have been sized to the desired size already by calling vector.resize(N).

Returns

a new **DoubleBuffer** (p. 975) that is backed by buffer, caller owns.

6.218 activemq::cmsutil::DynamicDestinationResolver Class Reference

Resolves a CMS destination name to a `Destination`.

`#include <src/main/activemq/cmsutil/DynamicDestinationResolver.h>`

Inheritance diagram for activemq::cmsutil::DynamicDestinationResolver:

Data Structures

- class **SessionResolver**

  Manages maps of names to topics and queues for a single session.

Public Member Functions

- **DynamicDestinationResolver** ()
- virtual ∼**DynamicDestinationResolver** () throw ()
- virtual void **init** (**ResourceLifecycleManager** ∗mgr)

  Initializes this destination resolver for use.
- virtual void **destroy** ()

  Destroys any allocated resources.
- virtual **cms::Destination** ∗ **resolveDestinationName** (**cms::Session** ∗session, **const** std::string &destName, bool pubSubDomain)

  Resolves the given name to a destination.

6.218.1 Detailed Description

Resolves a CMS destination name to a `Destination`.

6.218.2 Constructor & Destructor Documentation

6.218.2.1 activemq::cmsutil::DynamicDestinationResolver::DynamicDestinationResolver ( )

6.218.2.2 virtual activemq::cmsutil::DynamicDestinationResolver::~DynamicDestinationResolver ( ) throw () [virtual]

6.218.3 Member Function Documentation

6.218.3.1 virtual void activemq::cmsutil::DynamicDestinationResolver::destroy ( ) [virtual]

Destroys any allocated resources.

Implements **activemq::cmsutil::DestinationResolver** (p. 946).

6.218.3.2 virtual void activemq::cmsutil::DynamicDestinationResolver::init (ResourceLifecycleManager * *mgr*) [inline, virtual]

Initializes this destination resolver for use.

Ensures that any previously allocated resources are first destroyed (e.g. calls **destroy()** (p. 985)).

Parameters

mgr	the resource lifecycle manager.

Implements **activemq::cmsutil::DestinationResolver** (p. 947).

6.218.3.3 virtual cms::Destination* activemq::cmsutil::DynamicDestinationResolver::resolveDestinationName (cms::Session * *session,* const std::string & *destName,* bool *pubSubDomain*) [virtual]

Resolves the given name to a destination.

If `pubSubDomain` is true, a topic will be returned, otherwise a queue will be returned.

Parameters

session	the session for which to retrieve resolve the destination.
destName	the name to be resolved.
pubSubDomain	If true, the name will be resolved to a Topic, otherwise a Queue.

Returns

the resolved destination

Exceptions

cms::CMSException *(p. 640)*	if resolution failed.

Implements **activemq::cmsutil::DestinationResolver** (p. 947).

The documentation for this class was generated from the following file:

- src/main/activemq/cmsutil/**DynamicDestinationResolver.h**

6.220.1 Constructor & Destructor Documentation

6.220.1.1 decaf::io::EOFException::EOFException ( ) throw () [inline]

Default Constructor.

6.220.1.2 decaf::io::EOFException::EOFException (const lang::Exception & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy

6.220.1.3 decaf::io::EOFException::EOFException (const EOFException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	the exception to copy, which is an instance of this type

6.220.1.4 decaf::io::EOFException::EOFException (const char ∗ *file,* const int *lineNumber,* const std::exception ∗ *cause,* const char ∗ *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.220.1.5 decaf::io::EOFException::EOFException (const std::exception ∗ *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.220.1.6 decaf::io::EOFException::EOFException (const char * *file,* const int *lineNumber,* const char * *msg,* ...) throw () [inline]

Constructor.

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.220.1.7 virtual decaf::io::EOFException::~EOFException ( ) throw () [inline, virtual]

6.220.2 Member Function Documentation

6.220.2.1 virtual EOFException* decaf::io::EOFException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 1200).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**EOFException.h**

6.221 decaf::util::logging::ErrorManager Class Reference

ErrorManager (p. 988) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1085) during Logging.

`#include <src/main/decaf/util/logging/ErrorManager.h>`

Public Member Functions

- **ErrorManager** ()
- virtual ~**ErrorManager** ()
- virtual void **error** (**const** std::string &message, **decaf::lang::Exception** *ex, int **code**)

  *The error method is called when a **Handler** (p. 1085) failure occurs.*

Static Public Attributes

- static **const** int **GENERIC_FAILURE**

  GENERIC_FAILURE is used for failure that don't fit into one of the other categories.
- static **const** int **WRITE_FAILURE**

  WRITE_FAILURE is used when a write to an output stream fails.
- static **const** int **FLUSH_FAILURE**

FLUSH_FAILURE is used when a flush to an output stream fails.

- static **const** int **CLOSE_FAILURE**

  CLOSE_FAILURE is used when a close of an output stream fails.

- static **const** int **OPEN_FAILURE**

  OPEN_FAILURE is used when an open of an output stream fails.

- static **const** int **FORMAT_FAILURE**

  FORMAT_FAILURE is used when formatting fails for any reason.

6.221.1 Detailed Description

ErrorManager (p. 988) objects can be attached to Handlers to process any error that occur on a **Handler** (p. 1085) during Logging.

When processing logging output, if a **Handler** (p. 1085) encounters problems then rather than throwing an Exception back to the issuer of the logging call (who is unlikely to be interested) the **Handler** (p. 1085) should call its associated **ErrorManager** (p. 988).

Since

1.0

6.221.2 Constructor & Destructor Documentation

6.221.2.1 decaf::util::logging::ErrorManager::ErrorManager ( )

6.221.2.2 virtual decaf::util::logging::ErrorManager::~ErrorManager ( ) [virtual]

6.221.3 Member Function Documentation

6.221.3.1 virtual void decaf::util::logging::ErrorManager::error (const std::string & *message,* decaf::lang::Exception * *ex,* int *code*) [virtual]

The error method is called when a **Handler** (p. 1085) failure occurs.

This method may be overridden in subclasses. The default behavior in this base class is that the first call is reported to System.err, and subsequent calls are ignored.

Parameters

msg	- a descriptive string (may be empty)
ex	- an exception (may be NULL)
code	- an error code defined in **ErrorManager** (p. 988)

6.221.4 Field Documentation

6.221.4.1 const int decaf::util::logging::ErrorManager::CLOSE_FAILURE [static]

CLOSE_FAILURE is used when a close of an output stream fails.

6.221.4.2 const int decaf::util::logging::ErrorManager::FLUSH_FAILURE [static]

FLUSH_FAILURE is used when a flush to an output stream fails.

6.221.4.3 const int decaf::util::logging::ErrorManager::FORMAT_FAILURE [static]

FORMAT_FAILURE is used when formatting fails for any reason.

6.221.4.4 const int decaf::util::logging::ErrorManager::GENERIC_FAILURE [static]

GENERIC_FAILURE is used for failure that don't fit into one of the other categories.

6.221.4.5 const int decaf::util::logging::ErrorManager::OPEN_FAILURE [static]

OPEN_FAILURE is used when an open of an output stream fails.

6.221.4.6 const int decaf::util::logging::ErrorManager::WRITE_FAILURE [static]

WRITE_FAILURE is used when a write to an output stream fails.

The documentation for this class was generated from the following file:

- src/main/decaf/util/logging/**ErrorManager.h**

6.222 decaf::lang::Exception Class Reference

`#include <src/main/decaf/lang/Exception.h>`

Inheritance diagram for decaf::lang::Exception:

Public Member Functions

- **Exception** () throw ()

  Default Constructor.
- **Exception** (**const Exception** &ex) throw ()

  Copy Constructor.
- **Exception** (**const** std::exception ∗**cause**) throw ()

  Constructor.
- **Exception** (**const** char ∗file, **const** int lineNumber, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- **Exception** (**const** char ∗file, **const** int lineNumber, **const** std::exception ∗**cause**, **const** char ∗msg,...) throw ()

  Constructor - Initializes the file name and line number where this message occurred.
- virtual ∼**Exception** () throw ()
- virtual std::string **getMessage** () **const**

  Gets the message for this exception.
- virtual **const** std::exception ∗ **getCause** () **const**

  Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.
- virtual void **initCause** (**const** std::exception ∗**cause**)

  Initializes the contained cause exception with the one given.
- virtual **const** char ∗ **what** () **const** throw ()

  Implement method from std::exception.

- virtual void **setMessage** (**const** char *msg,...)

  Sets the cause for this exception.
- virtual void **setMark** (**const** char *file, **const** int lineNumber)

  Adds a file/line number to the stack trace.
- virtual **Exception** * **clone** () **const**

  Clones this exception.
- virtual std::vector< std::pair < std::string, int > > **getStackTrace** () **const**

  Provides the stack trace for every point where this exception was caught, marked, and rethrown.
- virtual void **printStackTrace** () **const**

  Prints the stack trace to std::err.
- virtual void **printStackTrace** (std::ostream &stream) **const**

  Prints the stack trace to the given output stream.
- virtual std::string **getStackTraceString** () **const**

  Gets the stack trace as one contiguous string.
- **Exception** & **operator=** (**const Exception** &ex)

  Assignment operator.

Protected Member Functions

- virtual void **setStackTrace** (**const** std::vector< std::pair< std::string, int > > &trace)
- virtual void **buildMessage** (**const** char *format, va_list &vargs)

Protected Attributes

- std::string **message**

  The cause of this exception.
- std::exception * **cause**

  *The **Exception** (p. 990) that caused this one to be thrown.*
- std::vector< std::pair < std::string, int > > **stackTrace**

  The stack trace.

6.222.1 Constructor & Destructor Documentation

6.222.1.1 decaf::lang::Exception::Exception ( ) throw ()

Default Constructor.

6.222.1.2 decaf::lang::Exception::Exception (const Exception & *ex*) throw ()

Copy Constructor.

Parameters

ex	The **Exception** (p. 990) instance to copy.

6.222.1.3 decaf::lang::Exception::Exception (const std::exception * *cause*) throw ()

Constructor.

Parameters

cause	**Pointer** (p. 1614) to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.222.1.4 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
msg	The message to report
...	list of primitives that are formatted into the message

6.222.1.5 decaf::lang::Exception::Exception (const char * *file*, const int *lineNumber*, const std::exception * *cause*, const char * *msg*, ...) throw ()

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	The file name where exception occurs
lineNumber	The line number where the exception occurred.
cause	The exception that was the cause for this one to be thrown.
msg	The message to report
...	list of primitives that are formatted into the message

6.222.1.6 virtual decaf::lang::Exception::~Exception ( ) throw () [virtual]

6.222.2 Member Function Documentation

6.222.2.1 virtual void decaf::lang::Exception::buildMessage (const char * *format*, va_list & *vargs*) [protected, virtual]

Referenced by decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.222.2.2 virtual Exception* decaf::lang::Exception::clone ( ) const [virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

Copy of this **Exception** (p. 990) object

Implements **decaf::lang::Throwable** (p. 2117).

Reimplemented in **decaf::net::URISyntaxException** (p. 2216), **decaf::internal::net::ssl::openssl::OpenSSLSocketException** (p. 1574), **decaf::lang::exceptions::InvalidStateException** (p. 1198), **decaf::lang::exceptions::IllegalMonitorStateException** (p. 1098), **decaf::lang::exceptions::InterruptedException** (p. 1187), **decaf::security::GeneralSecurityException** (p. 1081), **decaf::security::NoSuchProviderException** (p. 1541), **decaf::security::NoSuchAlgorithmException** (p. 1537), **decaf::security::SignatureException** (p. 1891), **decaf::lang::exceptions::IllegalStateException** (p. 1101), **decaf::lang::exceptions::IllegalThreadStateException** (p. 1103), **decaf::lang::exceptions::NullPointerException** (p. 1543), **decaf::security::InvalidKeyException** (p. 1193), **decaf::lang::exceptions::IllegalArgumentException** (p. 1096), **decaf::util::concurrent::BrokenBarrierException** (p. 432), **decaf::lang::exceptions::RuntimeException** (p. 1796), **decaf::security::KeyException** (p. 1242), **decaf::security::KeyManagementException** (p. 1245), **decaf::util::concurrent::ExecutionException** (p. 1003), **decaf::util::concurrent::TimeoutException** (p. 2122), **decaf::util::NoSuchElementException** (p. 1539), **decaf::lang::exceptions::ClassCastException** (p. 632), **decaf::lang::exceptions::IndexOutOfBoundsException** (p. 1108), **decaf::lang::exceptions::NumberFormatException** (p. 1547), **decaf::util::concurrent::CancellationException** (p. 582), **decaf::util::concurrent::RejectedExecutionException** (p. 1757), **decaf::net::BindException** (p. 413), **decaf::lang::exceptions::UnsupportedOperationException** (p. 2189), **decaf::net::ConnectException** (p. 724), **decaf::nio::InvalidMarkException** (p. 1195), **decaf::io::UTFDataFormatException** (p. 2230), **decaf::io::UnsupportedEncodingException** (p. 2187), **decaf::net::HttpRetryException** (p. 1092), **decaf::net::MalformedURLException** (p. 1371), **decaf::net::NoRouteToHostException** (p. 1534), **decaf::net::PortUnreachableException** (p. 1634), **decaf::net::ProtocolException** (p. 1715), **decaf::net::SocketTimeoutException** (p. 1934), **decaf::net::UnknownHostException** (p. 2183), **decaf::net::UnknownServiceException** (p. 2185), **decaf::util::zip::ZipException** (p. 2292), **decaf::io::EOFException** (p. 988), **decaf::io::InterruptedIOException** (p. 1189), **decaf::nio::ReadOnlyBufferException** (p. 1741), **decaf::util::ConcurrentModificationException** (p. 701), **decaf::util::zip::DataFormatException** (p. 835), **decaf::io::IOException** (p. 1200), **decaf::nio::BufferOverflowException** (p. 474), **decaf::nio::BufferUnderflowException** (p. 476), **decaf::net::SocketException** (p. 1916), **decaf::security::cert::CertificateExpiredException** (p. 590), **decaf::security::cert::CertificateNotYetValidException** (p. 591), **decaf::security::cert::CertificateParsingException** (p. 593), **decaf::security::cert::CertificateEncodingException** (p. 587), **decaf::security::cert::CertificateException** (p. 588), **activemq::exceptions::ActiveMQException** (p. 204), **activemq::exceptions::BrokerException** (p. 437), and **activemq::exceptions::ConnectionFailedException** (p. 745).

6.222.2.3 virtual const std::exception* decaf::lang::Exception::getCause ( ) const [inline, virtual]

Gets the exception that caused this one to be thrown, this allows for chaining of exceptions in the case of a method that throws only a particular exception but wishes to allow for the real causal exception to be passed only in case the caller knows about that type of exception and wishes to respond to it.

Returns

a const pointer reference to the causal exception, if there was no cause associated with this exception then NULL is returned.

Implements **decaf::lang::Throwable** (p. 2118).

6.222.2.4 virtual std::string decaf::lang::Exception::getMessage ( ) const [inline, virtual]

Gets the message for this exception.

Returns

Text formatted error message

Implements **decaf::lang::Throwable** (p. 2118).

Referenced by activemq::exceptions::BrokerException::BrokerException().

6.222.2.5 virtual std::vector< std::pair< std::string, int> > decaf::lang::Exception::getStackTrace ( ) const [virtual]

Provides the stack trace for every point where this exception was caught, marked, and rethrown.

The first item in the returned vector is the first point where the mark was set (e.g. where the exception was created).

Returns

the stack trace.

Implements **decaf::lang::Throwable** (p. 2119).

6.222.2.6 virtual std::string decaf::lang::Exception::getStackTraceString ( ) const [virtual]

Gets the stack trace as one contiguous string.

Returns

string with formatted stack trace data

Implements **decaf::lang::Throwable** (p. 2119).

6.222.2.7 virtual void decaf::lang::Exception::initCause (const std::exception * *cause*) [virtual]

Initializes the contained cause exception with the one given.

A copy is made to avoid ownership issues.

Parameters

cause	The exception that was the cause of this one.

Implements **decaf::lang::Throwable** (p. 2119).

6.222.2.8 Exception& decaf::lang::Exception::operator= (const Exception & *ex*)

Assignment operator.

Parameters

ex	const reference to another **Exception** (p. 990)

6.222.2.9 virtual void decaf::lang::Exception::printStackTrace ( ) const [virtual]

Prints the stack trace to std::err.

Implements **decaf::lang::Throwable** (p. 2119).

6.222.2.10 virtual void decaf::lang::Exception::printStackTrace (std::ostream & *stream*) const [virtual]

Prints the stack trace to the given output stream.

Parameters

stream	the target output stream.

Implements **decaf::lang::Throwable** (p. 2119).

6.222.2.11 virtual void decaf::lang::Exception::setMark (const char * *file*, const int *lineNumber*) [virtual]

Adds a file/line number to the stack trace.

Parameters

file	The name of the file calling this method (use **FILE**).
lineNumber	The line number in the calling file (use **LINE**).

Implements **decaf::lang::Throwable** (p. 2119).

Referenced by decaf::lang::exceptions::NumberFormatException::NumberFormatException().

6.222.2.12 virtual void decaf::lang::Exception::setMessage (const char * *msg*, ...) [virtual]

Sets the cause for this exception.

Parameters

msg	the format string for the msg.
...	params to format into the string

6.222.2.13 virtual void decaf::lang::Exception::setStackTrace (const std::vector< std::pair< std::string, int > > & *trace*) [protected, virtual]

6.222.2.14 virtual const char* decaf::lang::Exception::what ( ) const throw () [inline, virtual]

Implement method from std::exception.

Returns

the const char* of **getMessage()** (p. 993).

6.222.3 Field Documentation

6.222.3.1 std::exception* decaf::lang::Exception::cause [protected]

The **Exception** (p. 990) that caused this one to be thrown.

6.222.3.2 std::string decaf::lang::Exception::message [protected]

The cause of this exception.

6.222.3.3 std::vector< std::pair< std::string, int> > decaf::lang::Exception::stackTrace [protected]

The stack trace.

6.223 cms::ExceptionListener Class Reference

If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 996) that is registered with the **Connection** (p. 725).

`#include <src/main/cms/ExceptionListener.h>`

Public Member Functions

- virtual ~**ExceptionListener** ()
- virtual void **onException** (**const cms::CMSException** &ex)=0

  Called when an exception occurs.

6.223.1 Detailed Description

If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 996) that is registered with the **Connection** (p. 725).

An exception listener allows a client to be notified of a problem asynchronously. Some connections only consume messages via the asynchronous event mechanism so they would have no other way to learn that their connection has failed.

Since

1.0

6.223.2 Constructor & Destructor Documentation

6.223.2.1 virtual cms::ExceptionListener::~ExceptionListener ( ) [virtual]

6.223.3 Member Function Documentation

6.223.3.1 virtual void cms::ExceptionListener::onException (const cms::CMSException & *ex*) [pure virtual]

Called when an exception occurs.

Once notified of an exception the caller should no longer use the resource that generated the exception.

Parameters

ex	Exception Object that occurred.

The documentation for this class was generated from the following file:

- src/main/cms/**ExceptionListener.h**

6.224 activemq::commands::ExceptionResponse Class Reference

6.224.1.2 virtual activemq::commands::ExceptionResponse::~ExceptionResponse ( ) [virtual]

6.224.2 Member Function Documentation

6.224.2.1 virtual ExceptionResponse* activemq::commands::ExceptionResponse::cloneDataStructure ( ) const [virtual]

Clone this obbject and return a new instance that the caller now owns, this will be an exact copy of this one.

Returns

new copy of this object.

Reimplemented from **activemq::commands::Response** (p. 1782).

6.224.2.2 virtual void activemq::commands::ExceptionResponse::copyDataStructure (const DataStructure * *src*) [virtual]

Copy the contents of the passed object into this objects members, overwriting any existing data.

Returns

src - Source Object

Reimplemented from **activemq::commands::Response** (p. 1782).

6.224.2.3 virtual bool activemq::commands::ExceptionResponse::equals (const DataStructure * *value*) const [virtual]

Compares the **DataStructure** (p. 877) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

Returns

true if **DataStructure** (p. 877)'s are Equal.

Reimplemented from **activemq::commands::Response** (p. 1783).

6.224.2.4 virtual unsigned char activemq::commands::ExceptionResponse::getDataStructureType ( ) const [virtual]

Get the **DataStructure** (p. 877) Type as defined in CommandTypes.h.

Returns

The type of the data structure

Reimplemented from **activemq::commands::Response** (p. 1783).

6.224.2.5 virtual const Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException ( ) const [virtual]

6.224.2.6 virtual Pointer<BrokerError>& activemq::commands::ExceptionResponse::getException ( ) [virtual]

6.225.3 Member Function Documentation

6.225.3.1 virtual commands::DataStructure* activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::createObject ( ) const [virtual]

Creates a new instance of the class that this class is a marshaling director for.

Returns

newly allocated Command

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1789).

6.225.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::getDataStructureType ( ) const [virtual]

Gets the DataStructureType that this class marshals/unmarshals.

Returns

byte Id of this classes DataStructureType

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.225.3.3 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::looseMarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- DataOutputStream to marshal to

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.225.3.4 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::looseUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis*) [virtual]

Loose Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1790).

6.225.3.5 virtual int activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightMarshal1 (OpenWireFormat * *format,* commands::DataStructure * *command,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	The OpenwireFormat properties
command	The object to Marshal
bs	The boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.225.3.6 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightMarshal2 (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataOutputStream * *ds,* utils::BooleanStream * *bs*) [virtual]

Tight Marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Marshal
ds	- the DataOutputStream to Marshal to
bs	- boolean stream to marshal to.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1791).

6.225.3.7 virtual void activemq::wireformat::openwire::marshal::generated::ExceptionResponseMarshaller::tightUnmarshal (OpenWireFormat * *format,* commands::DataStructure * *command,* decaf::io::DataInputStream * *dis,* utils::BooleanStream * *bs*) [virtual]

Tight Un-marhsal to the given stream.

Parameters

format	- The OpenwireFormat properties
command	- the object to Un-Marshal
dis	- the DataInputStream to Un-Marshal from
bs	- boolean stream to unmarshal from.

Exceptions

IOException	if an error occurs.

Reimplemented from **activemq::wireformat::openwire::marshal::generated::ResponseMarshaller** (p. 1792).

The documentation for this class was generated from the following file:

6.226.1 Constructor & Destructor Documentation

6.226.1.1 decaf::util::concurrent::ExecutionException::ExecutionException ( ) throw () [inline]

Default Constructor.

6.226.1.2 decaf::util::concurrent::ExecutionException::ExecutionException (const decaf::lang::Exception & *ex*) throw () [inline]

Conversion Constructor from some other Exception.

Parameters

ex	- An exception that should become this type of Exception

6.226.1.3 decaf::util::concurrent::ExecutionException::ExecutionException (const ExecutionException & *ex*) throw () [inline]

Copy Constructor.

Parameters

ex	- The Exception to copy in this new instance.

6.226.1.4 decaf::util::concurrent::ExecutionException::ExecutionException (const std::exception * *cause*) throw () [inline]

Constructor.

Parameters

cause	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.

6.226.1.5 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file,* const int *lineNumber,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
msg	- The message to report
...	- The list of primitives that are formatted into the message

6.226.1.6 decaf::util::concurrent::ExecutionException::ExecutionException (const char * *file,* const int *lineNumber,* const std::exception * *cause,* const char * *msg, ...*) throw () [inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

Parameters

file	- The file name where exception occurs
lineNumber	- The line number where the exception occurred.
cause	- The exception that was the cause for this one to be thrown.
msg	- The message to report
...	- list of primitives that are formatted into the message

6.226.1.7 virtual decaf::util::concurrent::ExecutionException::~ExecutionException ( ) throw () [inline, virtual]

6.226.2 Member Function Documentation

6.226.2.1 virtual ExecutionException* decaf::util::concurrent::ExecutionException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

Returns

a new instance of an exception that is a clone of this one.

Reimplemented from **decaf::lang::Exception** (p. 992).

The documentation for this class was generated from the following file:

- src/main/decaf/util/concurrent/**ExecutionException.h**

6.227 decaf::util::concurrent::Executor Class Reference

An object that executes submitted **decaf.lang.Runnable** (p. 1792) tasks.

`#include <src/main/decaf/util/concurrent/Executor.h>`

Inheritance diagram for decaf::util::concurrent::Executor:

Public Member Functions

- virtual ~**Executor** ()
- virtual void **execute** (**decaf::lang::Runnable** *command)=0

  Executes the given command at some time in the future.

6.227.1 Detailed Description

An object that executes submitted **decaf.lang.Runnable** (p. 1792) tasks.

This interface provides a way of decoupling task submission from the mechanics of how each task will be run, including details of thread use, scheduling, etc. An **Executor** (p. 1004) is normally used instead of explicitly creating threads. For example, rather than invoking `new Thread(new(RunnableTask())).start()` for each of a set of tasks, you might use:

```
Executor (p. 1004) executor =  anExecutor;
executor->execute( new RunnableTask1() );
executor->execute( new RunnableTask2() );
...
```

However, the **Executor** (p. 1004) interface does not strictly require that execution be asynchronous. In the simplest case, an executor can run the submitted task immediately in the caller's thread:

```
class DirectExecutor : public Executor (p. 1004) {
public:

   void execute( Runnable* r ) {
        r->run();
    }

}
```

More typically, tasks are executed in some thread other than the caller's thread. The executor below spawns a new thread for each task.

```
class ThreadPerTaskExecutor : public Executor (p. 1004) {
public:
    std::vector<Thread*gt; threads;

   void execute( Runnable* r ) {
        threads.push_back( new Thread( r ) );
        threads.rbegin()->start();
    }

}
```

The **Executor** (p. 1004) implementations provided in this package implement **decaf.util.concurrent.-ExecutorService** (p. 1008), which is a more extensive interface. The **decaf.util.concurrent.ThreadPoolExecutor** (p. 2104) class provides an extensible thread pool implementation. The **decaf.util.concurrentExecutor** (p. **??**) class provides convenient factory methods for these **Executors** (p. 1005).

1.0

6.227.2 Constructor & Destructor Documentation

6.227.2.1 virtual decaf::util::concurrent::Executor::~Executor ( ) [inline, virtual]

6.227.3 Member Function Documentation

6.227.3.1 virtual void decaf::util::concurrent::Executor::execute (decaf::lang::Runnable * *command*) [pure virtual]

Executes the given command at some time in the future.

The command may execute in a new thread, in a pooled thread, or in the calling thread, at the discretion of the **Executor** (p. 1004) implementation.

Parameters

command	the runnable task

Exceptions

RejectedExecution-Exception *(p. 1755)*	if this task cannot be accepted for execution.
NullPointerException	if command is null

Implemented in **decaf::util::concurrent::ThreadPoolExecutor** (p. 2110).

The documentation for this class was generated from the following file:
