## 3.2 Activation

### Defines

- **#define GLOBUS\_GSI\_CREDENTIAL\_MODULE**

### 3.2.1 Detailed Description

Globus GSI Credential uses standard Globus module activation and deactivation. Before any Globus GSI - Credential functions are called, the following function must be called:

```
globus_module_activate(GLOBUS_GSI_CREDENTIAL_MODULE)
```

This function returns GLOBUS\_SUCCESS if Globus GSI Credential was successfully initialized, and you are therefore allowed to subsequently call Globus GSI Credential functions. Otherwise, an error code is returned, and Globus GSI Credential functions should not be subsequently called. This function may be called multiple times.

To deactivate Globus GSI Credential, the following function must be called:

```
globus_module_deactivate(GLOBUS_GSI_CREDENTIAL_MODULE)
```

This function should be called once for each time Globus GSI Credential was activated.

#### 3.3.1 Detailed Description

Create/Destroy/Modify a GSI Credential Handle. Within the Globus GSI Credential Library, all credential operations require a handle parameter. Currently only one operation may be in progress at once per credential handle.

This section defines operations to create, modify and destroy GSI Credential handles.

### 3.3.2 Typedef Documentation

#### 3.3.2.1 typedef struct globus\_l\_gsi\_cred\_handle\_s\* globus\_gsi\_cred\_handle\_t

GSI Credential Handle.

A GSI Credential handle keeps track of state relating to a credential. Handles can have immutable **attributes** (p. 14) associated with them. All credential **operations** (p. 17) take a credential handle pointer as a parameter.

#### 3.5.1 Detailed Description

Read/Write a GSI Credential Handle. This section defines operations to read and write GSI Credential handles.

### 3.5.2 Function Documentation

#### 3.5.2.1 `globus_result_t globus_gsi_cred_read ( globus_gsi_cred_handle_t handle, X509_NAME * desired_subject )`

Read a Credential from a filesystem location.

The credential to read will be determined by the search order specified in the handle attributes.

##### Parameters

<i>handle</i>	The credential handle to set. This credential handle should already be initialized using <code>globus_gsi_cred_handle_init</code> .
<i>desired_subject</i>	The subject to check for when reading in a credential. The <code>desired_subject</code> should be either a exact match of the read cert's subject or should just contain the /CN entry. If null, the credential read in is the first match based on the system configuration (paths and environment variables)

##### Returns

GLOBUS\_SUCCESS if no errors occurred, otherwise, an error object identifier is returned.

##### See also

`globus_gsi_cred_read_proxy()` (p. 18)  
`globus_gsi_cred_read_cert_and_key()`

##### Note

This function always searches for the desired credential. If you don't want to perform a search, then don't use this function. The search goes in the order of the handle attributes' search order.

#### 3.5.2.2 `globus_result_t globus_gsi_cred_read_proxy ( globus_gsi_cred_handle_t handle, const char * proxy_filename )`

Read a proxy from a PEM file.

##### Parameters

<i>handle</i>	The credential handle to set based on the proxy credential read from the file
<i>proxy_filename</i>	The file containing the proxy credential

##### Returns

GLOBUS\_SUCCESS or an error object identifier

#### 3.5.2.3 `globus_result_t globus_gsi_cred_read_proxy_bio ( globus_gsi_cred_handle_t handle, BIO * bio )`

Read a Proxy Credential from a BIO stream and set the credential handle to represent the read credential.

The values read from the stream, in order, will be the signed certificate, the private key, and the certificate chain

##### Parameters

<i>handle</i>	The credential handle to set. The credential should handle be initialized (i.e. not NULL).
<i>bio</i>	The stream to read the credential from

## Returns

GLOBUS\_SUCCESS unless an error occurred, in which case an error object is returned

**3.5.2.4** `globus_result_t globus_gsi_cred_read_key ( globus_gsi_cred_handle_t handle, char * key_filename, int(*)() pw_cb )`

Read a key from a PEM file.

## Parameters

<i>handle</i>	the handle to set based on the key that is read
